One experiment appears to me worthy of particular description. The assistant procured a thick paste board, which he held to the neck, and round the face of the girl, so that she could not see any thing before her. We sat down in front of her. The doctor rubbed the palm of one of her hands with a piece of lead the size of a pencil. He repeated the experiment several times, but no effect was visible. At length he rubbed the lead on a sovereign which he held in his hand, and then applied the lead to the girl's palm; instantly the hand was clenched into rigidity. The doctor now took me to the door, and said, "Tell me how many times I shall repeat the rubbing with the lead alone, and at what time I shall touch the gold." I answered, "Touch the gold in your hand at the fifth time." We returned to our seats, and the experiment being repeated, he rubbed four times without effect; when, at the fifth time, having, as I perceived, touched the lead with the gold, her hand became clenched like a vice. While these experiments were performing, her face was so enveloped with the pasteboard, that she saw nothing of the operations; neither, I feel assured, could she hear any sound from the rubbing of the lead on the gold; if the operator or his assistant made any secret signal to cause her to clench her hand, nothing of the kind was apparent.

These, and most of the other experiments, were performed on Jane, the younger sister. Elizabeth, the elder of the two, a beautiful girl of a dark complexion, with finely moulded features, and who had been amusing herself meanwhile in running over the keys of a piano, was now experimented upon. She possesses a degree of mesmeric susceptibility which permits the performance of an experiment very elegant in its nature. By certain passes of the hands, and other means, she was thrown by Dr Elliotson into the somnambulist condition. In this she stood fixed in the most graceful attitude for several minutes, her eyes open, but looking vaguely forward, while an innocent smile played upon her countenance. The doctor spoke softly to her as she thus stood gazing in a statue-like attitude (harsh speaking being, as he said, hurtful and displeasing to her while in the somnambulist state); he asked how long she would remain in the way she was, and she replied "ten minutes." At about the eleventh minute, as I reckoned by my watch, she passed out of the somnambulist condition by falling back in a kind of swoon or sleep, and was immediately recovered by being blown upon by the breath: she awoke to her condition of infantile playfulness. While this experiment was performed on Elizabeth, my companions were chatting with Jane, and, as I afterwards learned, experimenting upon her. My medical friend, by a pass of his hand when her back was turned towards him, threw her at once into a sleep, and she would have dropped but for the timely support which was given. This extraordinary susceptibility, and to all appearance the entire absence of deception, astonished my friends not a little.

The experiments were altogether so curious, and so unexplainable by any known laws, that I felt my mind bewildered. I told Dr Elliotson that I had now seen what seemed very extraordinary, and almost magical; still that I was not convinced, and should like to see something more; however, that could scarcely be, as I intended to leave London next day. Dr Elliotson now mentioned that he was to have a public exhibition next day at three o'clock, and that he should be glad if I would remain in town one day longer, and make one of the company. I agreed to this polite proposal, and returned next day accordingly.

I found on this occasion from thirty to forty

* It may be proper to state that the writer of the above paper, and witness of the transactions described in it, is one of the conductors of the Journal.

ladies and gentlemen in the room, along with Dr Elliotson, his assistant, and the two patients, as before. The company being all met, a series of experiments commenced, similar to those which I had already witnessed, with a few others that I had not seen. Not to be tiresome, I shall briefly describe those that were new to me. Jane was placed in a chair, beside which stood on the ground three iron weights tied together, making eighty-six pounds, which she was told to lift by the ring of the principal weight. At first she could not perform this feat; but, her hand being placed on the ring, Dr Elliotson drew his hands upwards several times, as if drawing something out of her hand, and, after a certain number of these upward passes, her hand actually lifted the eighty-six pounds off the floor, and swung the weights round. Being relieved, she rose up, and I among others advanced to try our powers of lifting; but not one of those who attempted it could raise the weights in the sitting position. Several gentlemen lifted them standing. The circumstance of a feeble girl of sixteen years of age, with one hand, lifting or swaying off the ground a weight of eighty-six pounds, and at the time sitting in the worst possible attitude for performing such a feat, is of itself a most extraordinary fact, and the cause of it altogether baffles my comprehension.

The next thing done was the recovering of the same girl, Jane, from her condition of imbecility to that of sound reason. This was a disagreeable experiment. The doctor closely pressed her face with his hands, while his assistant similarly pressed the back of her head. This mode of applying the hands was peculiar. They were placed across the face and across the back of the head. We were told that if they were placed up and down the face and head, the desired effect could not be produced. The point of the patient's nose was only visible, and left at liberty for breathing. A wave of the hand downwards first sent her to sleep, and the process of pressure, as I have described it, proceeded. Once or twice she seemed to be recovering, but by an instantaneous application of the hand longitudinally, the sleep was continued, it being important that she should not recover too soon, for then her irrational condition would not be dissipated. After some minutes were spent in this manner, the doctor said he believed she would now certainly recover to consciousness. She heaved sundry deep sighs, the operators took off their hands, and she awoke to all appearance a new creature. She seemed astonished to see such a crowd of persons, stood up and curtsied to the ladies, and spoke with modest diffidence on being addressed. She had no remembrance of any thing that had taken place while in her former condition; she did not know who I was, although she had known and named me previously, from having seen me the day before; she knew her sister, however, from early recollections in her rational condition, but her sister did not know her. After a little time, she was allowed to go out of the apartment. At a subsequent part of the proceedings, she was recalled, and, by a pressure of the doctor's thumbs on her palms, sent back into her infantile condition, when she immediately began to speak and act nonsense.

The reader will here naturally ask a question which occurred to my own mind, and which I put to Dr Elliotson—if the patient can thus be restored to reason at the will of the operator, why not allow her to remain in that condition, and so restore her to society? The doctor, in answer, explained, that the infantile condition would seem to be a state of mind most suitable for the progressive strengthening of the physical frame, and so permitting a cure of that nervous irritability which in the first instance produced epileptic fits—that while in the infantile condition she was gaining health and strength—that, in point of fact, both girls had greatly improved in intelligence since they came into his charge—and that ultimately the nervous irritability would possibly be so much allayed, that a final and complete restoration to reason might be ventured on with safety. This, as far as I can recollect, was the substance of Dr Elliotson's explanations, and I gathered his meaning so far as to comprehend that it was in reality an act of humanity to allow the two girls to remain in the mean time in the half-idiot condition in which I saw them. I further learned that the doctor had cured other patients of epilepsy by mesmeric treatment, and that all persons were less or more liable to be acted upon, though in many cases a month's treatment (that is, waving the hand towards them for a few minutes once a day for a month) would be required before they could be rendered so susceptible as to be thrown into the magnetic sleep.

Dr Elliotson now proceeded to show another experiment, that of drawing the girl, Elizabeth, after him, by the action of his hands, although at a con-

siderable distance from her. Having placed her in an easy-chair, and set her to sleep, he retreated slowly from her backwards, his eyes looking steadily at her, and his hands held together and pointed towards her. As he retreated, he repeatedly drew in his hands towards him, as if drawing something in the air along with him. He thus retreated the breadth of the room and across a lobby into another apartment, a distance of perhaps fifty or sixty feet. As he retreated, the girl at intervals appeared convulsed, and endeavoured to raise herself, or to bend forward as if desirous of following the operator, but always fell back into her position of repose. The experiment being performed, the girl was recovered.

This experiment did not make a deep impression on the company, for the phenomena it exhibited could be too easily accounted for by supposing that the girl simulated. The next, which was the touching the palms of Elizabeth with unanuried and afterwards anuried lead, was more striking and unaccountable. Determined to prevent collusion betwixt the operator and patient, if such existed, I solicited the office of performer, and the doctor being quite willing, I forthwith began. All was expectation. Fancy the girl reclining in an easy chair, with a thick pasteboard held sloping upwards close round her neck, so that she could see nothing but the roof; I sitting in a chair in front of her; the crowd of spectators behind me on seats; and the doctor, by my request, placed out of sight near the door. In the right hand I held the stalk of lead, in the other a sovereign. I told the girl to open her hand, and I then rubbed it with the lead—perhaps twenty or thirty rubbings on the palm. I told her to close her hand; she did so. I told her again to open her hand; and she did so. I thus rubbed her palm *thrice*, and at each time caused her to close and then open her hand. It was evident to all that the lead had no effect. I now rubbed the lead on the sovereign, and rubbed her palm as before. I then asked her to shut her hand, and she did so. Now came the trying moment. I asked her to open her hand, but she could not; it was stiff and clenched. A murmur of surprise burst from all around. It appeared as if the contact of the gold with the lead had caused this remarkable phenomenon; and it was equally apparent that there was no collusion. I feel satisfied that the girl did not see what I was doing. How the anuried lead should have had the effect it appeared to have (granting there was no deception in the case), is beyond my power to explain.

I next proceeded to perform the experiment of streaking the fingers of the patient with water. Two wine-glasses were half filled with common water from a jug, and into each was put a camel-hair pencil. Into the water in one glass the doctor's assistant put two of his fingers, and also breathed several times, as if to affect it with some kind of influence. To the water in the other glass nothing was done. The girl sat on the chair in a deep magnetic sleep, with her face shielded by the pasteboard. Using the common water, I now streaked the back of the first and third finger of her left hand, which was lying conveniently on her knee, and then streaked the second and fourth with the mesmerised water. I repeated the streakings three or four times. After an interval of a minute, and while all anxiously looked on, the fingers touched with mesmerised water moved and pointed outwards, but the other fingers continued fixed as they happened to lie. On touching both thumbs with the mesmerised water, they shortly moved in the same manner. The patient was now recovered by the usual means, though with some difficulty, as the mesmerised water has, as I said, a very powerful effect.

Both before and after this experiment, I had, unperceived by Jane, waved my hand behind her, and it uniformly and constantly fixed her into rigidity. Other gentlemen present took similar opportunities of magnetising her by a pass of the hand, and always with the same result, for the power seems to reside in any one. I need hardly say that this bye-play caused extreme astonishment to every one who saw it practised, and all confessed that they could not previously have the smallest conception of its effects. Towards the conclusion of the proceedings, a cockatoo was brought into the room, and when the girl rubbed it with her hand, the same kind of stupor was produced in her person; the lower animals as well as mankind being agents, as I was told, of this mysterious power.

Before my departure, I took out my watch and held it towards her, as a person holds a watch before a child's face to engage its attention. I asked her to kiss the watch, and doing so she was instantly fixed in a stupor in a bending attitude: the gold, as was explained, had produced this effect. She recovered by my blowing in her face. Again she became fixed by taking hold of the chain; but on afterwards kissing the glass of the watch, she was not in any way affected. I touched the back of her neck with the gold side of the watch, and it stupified her; on touching her with the glass, no effect, as before, was produced.

I now finish the account of this very strange exhibition; it will be perhaps asked by the reader, what is my opinion on the subject, but I profess my inability to give one. My feelings are those of astonishment. I cannot believe that any deception was practised, although I possess no proof that there was not. Dr Elliotson pledged his honour that there was no collusion; and as he is a man of education and fortune above being acted upon by sordid or mean motives, I cannot imagine that the phenomena which I have

described occurred from any trick on his part. I, however, leave the reader to think for himself, and simply content myself with having given an account of certainly one of the most curious "sights" of London.

THE HON. C. A. MURRAY'S WORK ON AMERICA.

SECOND NOTICE.

A CONTINUOUS flow of lively description and abundance of incident were formerly mentioned as the chief characteristics of Mr Murray's volumes. To such an extent, in truth, are they distinguished by these qualities, that, even after the lengthened notice in our previous number, our only difficulty is still in selection. On the present occasion we propose to give our readers some idea of the general style and tenor of that portion of the work relating to the American Union, various districts of which the author visited both before and after his ramble among the Pawnees.

While America excels all other countries in the number and extent of its canals and railways, its ordinary roads, even in important districts, appear to be of the most execrable kind. For example, in performing a day's journey of thirty-two miles between Washington, the legislative metropolis of the Union, and the village of Leesburgh, Mr Murray found that "in one place the road, or rather the passage, with a high bank on one side and a canal on the other, was so thickly strewn with rocks, that it was impossible to guide either horse or wheels between them; the aforesaid flank barricades prevented the attainment of the usual remedial luxury in this country, of driving by the side of the road over stumps of trees or through a morass. My little Indian leader (for I drove my pair of ponies *tandem*) was now perched on a stone with his tail above the wheeler's head, then descended into a pool where he was hardly visible;" and, in short, the whole progress of the author and his vehicle was something like that agreeable journey (he says) described by Milton:—

"Nigh foundered, on he fares,
O'er bog, or steep, through straits, rough, dense, or race,
With head, hands, wings, or feet, pursues his way."

So much for a sample of a rocky journey. Leaving Washington in another direction a short time afterwards, our traveller descended the Potomac for sixty miles, and then, quitting the river, took the road by Fredericksburgh for Richmond, the capital of Virginia. Let the reader keep in mind that this road is the great highway between the Virginian metropolis and the seat of the federal government, and then peruse the following description of the route from the landing-place on the Potomac to Fredericksburgh. "I was informed that the distance was only twelve miles, and I was weak enough (in spite of my previous experience) to imagine that two hours would bring me thither, especially as the stage was drawn by six good nags, and driven by a lively cheerful fellow; but the road bade defiance to all these advantages—it was, indeed, such as to compel me to laugh outright, notwithstanding the constant and severe bumping to which it subjected both the intellectual and sedentary parts of my person. I had before tasted the sweets of mud-holes, huge stones, and remnants of pine-trees, standing and cut down; but here was something new, namely, a bed of reddish-coloured clay, from one to two feet deep, so adhesive that the wheels were at times literally not visible in any one spot from the box to the tire, and the poor horses' feet sounded, when they drew them out (as a fellow-traveller observed), like the report of a pistol. I am sorry that I was not sufficiently acquainted with chemistry or mineralogy to analyse that wonderful clay, and state its constituent parts; but if I were now called upon to give a receipt for a mess most nearly resembling it, I would write, 'Recipe—(nay, I must write the ingredients in English, for fear of taxing my Latin learning too severely)—

Ordinary clay	-	-	-	1 lb.
Do. pitch	-	-	-	1 lb.
Bird-lime	-	-	-	6 oz.
Putty	-	-	-	6 oz.
Glue	-	-	-	1 lb.
Red lead, or colouring matter	-	-	-	6 oz.

Fiat haustus—agrot. terq. quaterq. quatiend.'

Whether the foregoing, with a proper admixture of hills, holes, stumps and rocks, made a satisfactory draught or not, I will refer to the unfortunate team—I, alas! can answer for the effectual application of the second part of the prescription, according to the Joe Miller version of "When taken, to be well shaken!"

It has been already remarked, that the author of this work abstains from lengthened and invidious comparisons between American and European or British manners and customs. At the same time he records always what he saw and heard, and the following extract will give an example of his way of showing both sides of the question. Speaking of his passage along the rail and canal line to Pittsburgh, he says, "The company on board these packet-boats is very mixed, including every grade, from the operative to the highest class in Philadelphia. I was very fortunate in meeting with an elderly gentleman well known as one of the most eminent and accurate reporters in this country. I enjoyed much agreeable and not un-instructive conversation with this gentleman, and I never saw the autumn of life adorned with more sober or more cheerful hues: happy in his home, honoured by his children, with a good constitution and a religious

and contented spirit, and maintaining his opinions, which were strong and somewhat peculiar, with all the warmth and energy of youth, I could not help wishing, that thirty years hence, if I am destined so long to live, my mind and body might be in a similarly happy frame.

I found an amusing contrast in the manners of some western travellers, who were cast in a rougher mould: they were not satisfied till they had found out who I was, where I came from, *why* I came, where I was going to, how long I meant to stay, and, in addition to these particulars, how much my umbrella cost, and what was the price of my hat. This last inquiry was followed by the party taking it up from the bench, and putting it on his *head*, which was not very cool, neither did it appear to have suffered much annoyance from water or from comb; luckily the hat did not fit, and after giving it two or three stout pulls in a vain attempt to draw it over his scalp, he returned it to me. Another fellow saw me smoking a Carbanos cigar; he asked me, 'Stranger, have you got another of them things? I will give you a cent for one' (a halfpenny). I immediately gave him one, saying, in perfect good humour, 'I will not sell you one, but I shall be very glad if you will accept this.' To my surprise he became irritated and angry, and tried two or three times to force the cent upon me. I refused as stoutly; and at length told him, that if he was determined to buy, and not to accept the cigar, I should charge him half a dollar for it. This view of the case induced him to take it gratis, but he seemed annoyed, and by no means grateful.

Mr Murray simply remarks, after relating this anecdote, that he does not believe these men to be "less civil and good-humoured than those of a similar class in Lancashire or Yorkshire." He discriminates between manners and intentions, and, conceiving them not to have the intention to be impertinent, does not hold them to be so, because their manners wear that aspect to one otherwise trained. Their behaviour to one another, being precisely the same as their conduct to strangers, shows them to have no wish to be specially rude to the latter. One example of the equality they preserve among themselves will amuse the reader. While Mr Murray was sailing in a steamer down the Mississippi, it chanced that he and the "captain went ashore at a wood-yard; and on entering the log-butt, the housewife, a woman about thirty-five, seemed to recognise his features (they had once lived in the same neighbourhood), and she addressed him thus: 'Why, you ar'n't Wilson?' He answered, 'No, madam; my name is Fox.' She replied (holding out her hand to him in the most friendly manner), 'Why, Fox, *conserve your old skin!* is that you?' Keeping such things in mind, our author, like a sensible man, only laughed good-humouredly, when, on the very first night of his stay with a worthy Virginian farmer, "not only my host, but his farm-assistants and labourers, called me *Charlie*."

While in the States, Mr Murray saw much reason to regret and condemn the system of duelling there practised. In the army and navy, duels are fearfully frequent, though it is among civilians that the practice usually appears in its most detestable form. When at Leesburgh, near Washington, "I became acquainted (says he) with a gentleman, Colonel M—, who had been concerned in one of those extraordinary duels unheard of in any other civilised nation. He had quarrelled with General M—, to whom he was related (they were either first-cousins or brothers-in-law, I forget which), and upon some occasion of meeting and dispute, the colonel knocked the general down. Of course he immediately challenged Colonel M—, leaving him the choice of any medium of destruction which suited his fancy. Colonel M—, knowing the general to be an experienced swordsman and an unerring shot, proposed to the gentleman who came to settle the preliminaries of this 'mighty pretty quarrel,' that he and the general should sit upon the same barrel of gunpowder, and by the application of a match, both take a trip into the aerial regions. This very sociable proposal was declined by the general; and the colonel, still determined to have the honour of his relation's company in the long journey 'from which no traveller returns,' suggested the propriety of their taking hands and jumping together off the top of the Capitol. This courteous (query, *Curtius*) offer was also declined by the unaccommodating and unreasonable general; and the third proposal of the colonel was *musket and ball, at five or ten paces* (I forget which). To this arrangement there could be no objection. They met—fired together by signal—the general was shot through the heart, while his ball, which was pursuing its true course to his opponent's breast, struck against the breech of his musket, glanced off, and did no further injury than shattering a part of one of his wrists; he showed me the scar of this wound. I have given this story exactly as it was told me by several of the colonel's own acquaintances in the town where he lives, and have no reason to doubt its correctness. It is only necessary to add, that both these parties were men of as high standing as any in their district, both members of the legislature, and that this duel was fought within fifty miles of the capital of the United States." This system of fighting differs very little from deliberate murder; and that it prepares the mind for the perpetration of that worse crime, is shown by such incidents as the following, which occurred in the state of Louisiana. "On the 3d of February 1835, a little before the usual time of the meeting of the House of

Representatives, Mr J. Grymes, a distinguished lawyer of New Orleans, entered the hall; and advancing towards Mr Labranche, the *Speaker* of the House, raised his cane and struck him; whereupon Mr Labranche drew a pistol, and fired at Mr Grymes. The ball passed through the lapet of his coat; he immediately drew a pistol, and fired at Mr Labranche, who fell, wounded. After a long dispute as to the right of the house to try Mr Grymes for this assault, it was carried in the affirmative, and he was brought up to the bar and—*reprimanded!*"

It is to be feared that such exhibitions as these, where the actors are men filling high stations in the republic, cannot be without their effect in encouraging that cruel style of fighting, with the practice of which the lower orders have been charged in some parts of the Union. Both are abominable modes of settling personal quarrels. It is in Kentucky that the "rough-and-tumble" method of fighting, where eyes are occasionally pulled out, has been most practised; but Mr Murray's observations on the spot led him to the conclusion that "the stories current respecting 'gouging,' as it is called, are exaggerated, and mostly *intended*." In place, however, of pursuing this disagreeable subject, we prefer to turn to some of our author's remarks on Kentucky, where he was for some time a guest of Mr Clay, the celebrated senator and orator. With a party from this gentleman's hospitable mansion, he went to see a farm near Lexington, belonging to General Shelby, one of the most famous agriculturists and cattle-breeders in the province.

"General Shelby's pastures are on a fine virgin soil, well shaded by noble forest-timber, with here and there an open glade (something like an English park). It is scarcely credible, but undoubtedly true, as I have it from the lips of these gentlemen in company, that this beautiful farm of two thousand acres, together with another in the neighbourhood (of eighteen hundred acres), were bought by Mr Shelby's father for an old rifle—at least, for a rifle, whether old or new I know not! The property is now worth at least sixty dollars an acre (besides the houses, &c.), which, according to Cocker, would give a sum of £45,000 sterling, as the value of an estate sold only fifty years since for a rifle! It makes one angry to see or hear of such luck happening to a fellow-worm; and when I looked at General Shelby, I almost felt that I had as good a right to the farm as he had." General Shelby showed his visitors a large and most excellent stock of cattle and mules. "The former are mostly crossed, more or less nearly, from the Durham breed; one lot, of three years old, was in prime order, and would have extracted a nod of approbation from a Lincolnshire grazer. They were probably worth *here* about 70 dollars, or £14, a-head. Mr Shelby told me that last year he sold a lot of fifty, averaging twelve hundred-weight each! The mules are becoming the most lucrative farm-stock in this state; they are found to be so much more serviceable and tough than horses, especially on plantations worked by slaves, where they are apt to be ill fed and ill attended to, that a good mule sells here for 150 dollars, which is a very high price for a horse. As an illustration, I will merely mention one instance, given to me by Mr E—. He bought a fine female ass, two years ago (in foal), for 100 dollars; she produced a fine male, which he sold for 400 dollars; she produced a foal again this spring, for which he has refused 300 dollars; and he sold the dam herself lately for 600 dollars; so, in this instance, there was a clear gain of 1200 dollars from one ass in two years! Mr Shelby has a great number of mules; he sold last year 3000 dollars' worth of them."

One of the few instances in which Mr Murray departs temporarily from his own straightforward narration to advert to what has been said by preceding travellers in the United States, occurs on the occasion of his visit to Cincinnati. He describes the situation of this city as at once beautiful and convenient, and its numerous edifices, holding forty thousand people, as handsome and regular. He then challenges the justice of Mrs Trollope's remarks on the inhabitants. "I have been in company with ten or twelve of the resident families, and have not seen one single instance of rudeness, vulgarity, or incivility, while the shortness of the invitations, and absence of constraint and display, render the society more agreeable, in some respects, than that of more fashionable cities. If the proposition stated is merely this, 'that the manners of Cincinnati are not so polished as those of the best circles in London, Paris, or Berlin, that her luxuries, whether culinary or displayed in carriages, houses, or amusements, are also of a lower cast,' I suppose none would be so absurd as to deny it. I hope few would be weak enough gravely to inform the world of so self-evident a truth; but I will, without fear of contradiction, assert, that the history of the world does not produce a parallel to Cincinnati in rapid growth of wealth and population. Of all the cities that have been founded by mighty sovereigns or nations, with an express view to their becoming the capitals of empires, there is not one that, in twenty-seven years from its foundation, could show such a mass of manufacture, enterprise, population, wealth, and social comfort, as Cincinnati, and which owes its magnitude to no adscititious favour or encouragement, but to the judgment with which the situation was chosen, and to the admirable use which its inhabitants have made thereof."

When I think of the short period that has elapsed since the red Indian, the bear, the elk, and the buffalo,

roamed through these hills; since the river (bearing on its bosom nothing but the bark canoe, or the flat-bottomed boat of the Indian trader) flowed in silence through the massive and impenetrable forest; and turn from that fancied picture to the one now before my eyes, displaying crowded and busy streets, rattling with drays and carriages; factories on all sides, resounding with the regular and mighty swing of the engine; numerous taper spires pointing to heaven; thence turn to the river, and see it alive with streaming commerce; and look beyond over the villages, the neat farms, the orchards, and the gardens—I am filled with astonishment and admiration at the energy and industry of man, and with pride at the self-suggested reflection, that this metamorphosed wilderness is the work of Britain's sons; and I do pity, from the bottom of my heart, the man (and, above all others, the Englishman) who can see nothing in such a scene but food for unjust comparisons, sneers, railery, and ridicule!"

Though in the recently settled quarters of the Union our author found himself exposed to great inconveniences in the inns and taverns, he speaks most favourably of the accommodations and treatment he met with in the older or long-settled districts, such as New York, Vermont, and New Hampshire. "I never had reason (he says) to complain of want of cleanliness, good victuals, or civility." It is true (he continues) that "upon entering or driving up to a tavern, the landlord will sometimes continue smoking his pipe without noticing your entrance; and if you ask whether you can have dinner, you may be told 'dinner is over, but I guess you can have something.' If you are a true John Bull, you will fret and sulk; and silently comparing this with the bustling attention and *empressment* of an English waiter or boots, you walk about by yourself, chewing the bitter cud of your wrath: but if you are a traveller, or formed by nature to become one (which John Bull is not), you will take this reception as you find it and as the usage of the country, and in a few minutes *he* of the pipe will be assisting to arrange your baggage, to dry your wet great-coat, and a tolerable dinner will be in preparation." Mr Murray also informs us, that upon one occasion, when accidental circumstances had rendered such civility desirable, one of these same landlords, though a perfect stranger to him, accepted his draft on New York for the price of a pony; and at another time, an individual of the same class advanced him fifty dollars, by indorsing his draft on New York, and cashing it at the nearest local bank. Our author justly doubts whether a stranger would meet with the same liberality in a country town in Britain; and observes, that these circumstances are at least very inconsistent with the charge of eagerness and suspiciousness in money matters which we are too apt to bring against the Yankees.

We must now part with this entertaining production, and we do so with the recommendation to our country friends to put it into their district libraries as soon as they conveniently can.

SNOW'S LEGENDS OF THE RHINE.*

In the preface to this work, the author mentions that "the wild and wondrous legends which appertain to each particular castle on the Rhine—the extraordinary traditions which attach themselves to almost every spot on its shores—the spirit-stirring histories connected with its cities, and towns, and hamlets, through the long period when it was, not alone the sole highway of central Europe, but the centre of European civilisation, have never yet been gathered together, nor given in a complete shape to the world." It has been his object to perform this task to the English public, and the result is before us. The book is a very elegant one, being beautifully printed, and embellished with a great number of plates, chiefly representing the cities and castles of the Rhine, besides a number of woodcuts illustrative of the legendary narrations. The author has evidently exercised great activity in collecting the romantic stories of the Rhine, as well as considerable powers of graceful narration in his manner of working them up. The great majority refer to the middle ages, and involve many supernatural details; but we prefer a specimen of a different description, in

THE MILLER'S WATD.

There is a lonely mill, close beside the little hamlet of Udorf, near the Rhine shore, between the villages of Hessel and Ursel, on the left bank below Bonn. This mill is said to have been the scene of the following story.

It was on a Sunday morning, "ages long ago," that the miller of this mill, and his whole family, went forth to hear the holy mass at the nearest church, in the village of Hessel. The mill, which was also his residence, was left in charge of a servant-girl named Hännchen, or Jenny, a stout-hearted lass, who had long lived with him in that capacity. An infant child, of an age unfit for church, was left in her charge likewise.

The girl was busily employed in preparing dinner

* The Rhine—Legends, Traditions, History—from Cologne to Mainz. By Joseph Snows, Esq. 2 vols. London, F. C. Westley.

for the return of her master and his family, when who should enter all of a sudden but an old sweetheart of hers, named Heinrich Botteler. He was an idle, graceless fellow, whom the miller had forbidden his house, but whom Jenny, with the amiable perversity peculiar to her sex, only liked, perhaps, all the better because others gave him no countenance. She was glad to see him, and she told him so too; and although in the midst of her work, she not only got him something to eat at once, but also found time to sit down with him and have a gossip, while he dispatched the food she set before him. As he ate, however, he let fall his knife.

"Pick that up, my lass," said he, in a joking way, to the good-natured girl.

"Nay, Heinrich," she replied, "your back should be more supple than mine, for you have less work to make it stiff. I labour all day long, and you do nothing. But, never mind! 'twould go hard with me an I refused to do more than that for you, had though you be."

This was spoken half sportively, and half in good earnest; for, kind-hearted as the girl was, and much as she liked the scapegrace, she was too honest and industrious herself to encourage or approve of idleness and a suspicious course of life in any one else, however dear to her. She stooped down, accordingly, to pick up the knife. As she was in the act of rising, however, the treacherous villain drew a dagger from under his coat, and caught her by the nape of the neck, gripping her throat firmly with his fingers to prevent her screaming the while.

"Now, lass," he said, swearing out a bad oath at the same time, "where is master's money? I'll have that or your life; so take your choice."

The terrified girl would fain have parleyed with the ruffian, but he would hear nothing she could say.

"Master's money or your life, lass!" was all the answer he vouchsafed to her entreaties and adjurations. "Choose at once," was the only alternative he offered her; "the grave or the gold!"

She saw that there was no hope of mercy at his hands; and, as she saw it, her native resolution awoke in her bosom. Like the generality of her gentle sex, she was timid at trifles: a scratch was a subject of fear to her; a drop of blood caused her to faint; an unwonted sound filled her soul with fear in the night. But when her energies were aroused by any adequate cause, she proved, as her sex have ever done, that in courage, in endurance, in presence of mind, and in resources for every emergency, she far surpassed the bravest and coolest men.

"Well, well, Heinrich!" she said, resignedly, "what is to be, must be. But if you take the money, I shall even go along with ye. This will be no home for me any more. But ease your gripe of my neck a little—don't squeeze so hard; I can't move, you hug me so tight. And if I can't stir, you can't get the money; that's clear, you know. Besides, time presses; and if it be done at all, it must be done quickly, as the household will shortly be back from Hersel."

The ruffian relaxed his gripe, and, finally, let go his hold. Her reasons were all cogent with his cupidity.

"Come," she said; "quick! quick!—no delay. The money is in master's bedroom."

She tripped up stairs, gaily as a lark; he followed closely at her heels. She led the way into her master's bedroom, and pointed out the coffer in which his money was secured.

"Here," she said, reaching him an axe which lay in a corner of the room, "this will wrench it open at once: and while you are tying it up, I shall just step up stairs to my own apartment, and get a few things ready for our flight, as well as my own little savings for the last five years."

The ruffian was thrown off his guard by her openness and apparent anxiety to accompany him. Like all egotists, he deceived himself, when self-deceit was most certain to be his destruction.

"Go, lass," was all he said; "but be not long. This job will be done in a twinkling."

She disappeared at the words. He immediately broke open the chest, and was soon engaged in rummaging its contents.

As he was thus employed, however, absorbed in the contemplation of his prey, and eagerly occupied in securing it on his person, the brave-hearted girl stole down the stairs on tip-toe. Creeping softly along the passages, she speedily gained the door of the chamber unseen by him, and likewise unheard. It was but the work of a moment for her to turn the key in the wards and lock him in. This done, she rushed forth to the outer door of the mill, and gave the alarm.

"Fly! fly!" she shrieked to the child, her master's little boy, an infant five years old, the only being within sight or sound of her. "Fly! fly to father! fly on your life! Tell him we shall all be murdered an he haste not back! Fly! fly!"

The child, who was at play before the door, at once obeyed the energetic command of the brave girl, and sped as fast as his tiny legs could carry him on the road by which he knew his parents would return from church. Hänchen cheered him onward, and inspired his little heart as he ran.

"Bless thee, boy! bless thee!" she exclaimed, in the gladness of her heart; "an master arrives in time, I will offer up a taper on the altar of our blessed Lady of the Kreutzberg, by Bonn."

She sat down on the stone bench by the mill door to ease her over-excited spirit; and she wept, as she sat, at the thoughts of her happy deliverance.

"Thank God!" she ejaculated, "thank God for this escape. Oh! the deadly villain! and I so fond of him, too!"

A shrill whistle from the grated window of the chamber in which she had shut up the ruffian Heinrich, caught her ear, and made her start at once to her feet.

"Diether! Diether!" she heard him shout, "catch the child, and come hither! I am fast. Come hither! Bring the boy here, and kill the girl!"

She glanced hastily up at the casement from which the imprisoned villain's hand beckoned to some one in the distance, and then looked anxiously after her infant emissary. The little messenger held on his way unharmed, however; and she thought to herself that the alarm was a false one, raised to excite her fear, and overcome her resolution. Just, however, as the child reached a hollow spot in the next field—the channel of a natural drain, then dry with the heats of summer—she saw another ruffian start up from the bed of the drain, and, catching him in his arms, hasten towards the mill, in accordance with the directions of his accomplice. In a moment she perceived her danger, and in a moment more she formed her future plan of proceeding. Retreating into the mill, she double-locked and bolted the door—the only apparent entrance to the edifice, every other means of obvious access to the interior being barred by means of strong iron gratings fixed against all the windows; and then took her post at an upper casement, determined to await patiently either her master's return, and her consequent delivery from that dangerous position, or her own death, if it were inevitable.

"Never," said she to herself, "never shall I leave my master's house a prey to such villains, or permit his property to be carried off before my eyes by them, while I have life and strength to defend it."

She had barely time to secure herself within, when the ruffian from without, holding the hapless child in one hand, and a long sharp knife in the other, assailed the door with kicks, and curses, and imprecations of the most dreadful character.

"Confound thee!" he cried, applying the foulest epithets of which the free-speaking Teutonic languages are so copious; "open the door, or I'll break it in on ye!"

"If you can, you may," was all the noble girl replied. "God is greater than you, and in him I put my trust."

"Cut the brat's throat!" roared the imprisoned ruffian above; "that will bring her to reason."

Stout-hearted as poor Hänchen was, she quailed at this cruel suggestion. For a moment her resolution wavered; but it was only for a moment. She saw that her own death was certain if she admitted the assailant, and she knew that her master would be robbed. She had no reason to hope that even the life of the infant would be spared by her compliance. It was to risk all against nothing. Like a discreet girl, she consequently held fast in her resolve to abide as she was while life remained, or until assistance should reach her.

"An ye open not the door," shouted the villain from without, accompanying his words with the vilest abuse, and the fiercest imprecations, "I'll hack this whelp's limbs to pieces with my knife, and then burn the mill over your head. 'Twill be a merry blaze, I trow."

"I put my trust in God," replied the dauntless girl; "never shall ye set foot within these walls whilst I have life to prevent ye."

The ruffian laid the infant for a moment on the sward as he sought about for combustibles wherewith to execute his latter threat. In this search he espied, perhaps, the only possible clandestine entrance to the building. It was a large aperture in the wall, communicating with the great wheel and the other machinery of the mill, and was a point entirely unprotected, for the reason that the simple occupants had never supposed it feasible for any one to seek admission through such a dangerous inlet. Elated with his discovery, the ruffian returned to the infant, and, tying the hands and feet of the little innocent, threw it on the ground even as a butcher will fling a lamb destined for the slaughter, to await his time for slaying. He then stole back to the aperture, by which he hoped to effect an entrance. All this was unseen by the dauntless girl within.

In the meanwhile her mind was busied with a thousand cogitations. She clearly perceived that no means would be left untried to effect an entrance, and she knew that on the exclusion of her foe depended her own existence. A thought struck her.

"It is Sunday," said she to herself; "the mill never works on the Sabbath; suppose I set it a-going now! It can be seen afar off; and haply my master, or some of his neighbours, wondering at the sight, may haste hither to know the cause. A lucky thought," she exclaimed; "'tis God sent it to me!"

No sooner said than done. Being all her life accustomed to mill-gear, it was but the work of a moment for her to set the machinery in motion. A brisk breeze which sprang up, as it were by the special interposition of Providence, at once set the sails flying. The arms of the huge engine whirled round with fearful rapidity; the great wheel slowly revolved on its axle; the smaller gear turned, and creaked, and groaned, according as they came into action: the mill was in full operation.

It was in that very instant that the ruffian Diether had succeeded in squeezing himself through the aper-

ture in the wall, and getting safely lodged in the interior of the great drum-wheel. His dismay, however, was indescribable when he began to be whirled about with its rotation, and found that all his efforts to put a stop to the powerful machinery which set it in motion, or to extricate himself from his perilous situation, were fruitless. His cries were most appalling; his shrieks were truly fearful; his curses and imprecations were horrible to hear. Hänchen hastened to the spot, and saw him caught, like a reptile as he was, in his own trap. It need not be added that she did not liberate him. She knew that he would be more frightened than hurt, if he kept within his rotatory prison; and she knew, also, that unless he attempted to escape, there was no danger of his falling out of it, even though he were insensible and inanimate all the while. In the mean time, the wheel went round and round with its steady unceasing motion; and round and round went the ruffian along with it, steadily and unceasingly, too. In vain did he promise the stout-hearted girl to work her no harm; in vain did he implore her pity on his helpless condition; in vain did he pray to all the powers of heaven, and adjure all the powers of hell, to his aid. She would not hear nor heed him; and, unheard and unheeded of them likewise, muttering curses, he was whirled round and round in the untiring wheel, until at last feeling and perception failed him, and he saw and heard no more. He fell senseless on the bottom of the engine, but even then his inanimate body continued to be whirled round, and round, and round, as before; the brave girl not daring to trust to appearances in connection with such a villain, and being, therefore, afraid to suspend the working of the machinery, or stop the mill-gear and tackle from running at their fullest speed.

A loud knocking at the door was shortly after heard, and she hastened thither. It was her master and his family, accompanied by several of their neighbours. The unaccustomed appearance of the mill-sails in full swing on the Sunday, had, as she anticipated, attracted their attention, and they had hastened home from church for the purpose of ascertaining the cause of the phenomenon. The father bore his little boy in his arms; he had cut the cords wherewith the child was tied, but he was unable to obtain any account of the extraordinary circumstances that had occurred from the affrighted innocent.

Hänchen, in a few words, told all; and then the spirit which had sustained her so long and so well while the emergency lasted, forsook her at once as it passed away. She fell senseless into the arms of the miller's eldest son, and was with great difficulty recovered.

The machinery of the mill was at once stopped, and the inanimate ruffian dragged forth from the great wheel. The other ruffian was brought down from his prison. Both were then bound, and sent off to Bonn under a strong escort; and, in due course, came under the hands of the town executioner.

It was not long till Hänchen became a bride. The bridegroom was the miller's son, who had loved her long and well, but with a passion previously unrequited. They lived thenceforward happily together for many years, and died at a good old age, surrounded by a flourishing family. To the latest hour of her life, this brave-hearted woman would shudder as she told the tale of her danger, and her deliverance.

OCCASIONAL NOTES.

MISTAKES OF WELL-KNOWN WRITERS.

PERHAPS of all the things which the world, from prejudice or ignorance, habitually misunderstands, there is nothing more largely misunderstood than Malthus's theory of population. Mr Thomas Hood, in one of his witty works, says, "I concede not to that modern doctrine which supposes a world on short allowance, or a generation without a ration. There is no mentionable overgrowth likely to happen in life or literature. Wholesome checks are appointed against overfecundity in any species. Thus the whale thins the myriads of herrings, the teeming rabbit makes Thyesian family dinners on her own offspring, and the hyænas devour themselves. Death is never backward when the human race wants hoeing; nor the critic to thin the propagation of the press. The surplus children that would encumber the earth are thrown back into the grave; the superfluous works into coffins prepared for them by the trunk-maker. Nature provides thus equally against scarcity and repletion. There are a thousand blossoms for the one fruit that ripens, and numberless buds for every prosperous flower. Those for which there is no space or sustenance, drop early from the bough," &c. It may safely be said that Mr Hood never made a better joke than this, for, while evidently inspired with antipathy to the name of the Malthus doctrines, and anxious to show that he does not believe them, he actually states these very doctrines as his belief—the theory of Malthus being, not that the numbers of mankind become too many for the food, but that they have a tendency to become so, and are prevented from doing so by the insufficiency of aliment—exactly what Mr Hood says in the above extract.

Confucius says, "Never contract friendship with a man that is not better than thyself." What a saying for a sage! What is the superior person to do? Is he also only to contract friendship with his superiors? In that case, his inferiors have, we suspect, a poor

chance of obtaining his regard. In fact, the thing altogether defeats itself, and is simply impracticable. There is a similar error in a poem of Burns :—

"Keep yourself
Free critical dissection;
But keep through every other man,
We sharpened sly inspection."

If every one is to arm himself in complete mail, how is any one to get in his dagger-point at all? Such mistakes arise from a confusion of mind as to particular and general. The advice may serve for one, as far as the possibility of realising it is concerned, though founded on gross selfishness; but it will not serve for the whole; and this simply, because we cannot have all sharpeners, or all victims.

THE SPANIEL OF DARMSTADT.

A NEW phenomenon has recently appeared in the musical world. Marvels of this kind are not uncommon, in the shape of little biped urchins, not yet out of petticoats, who execute variations upon the fourth string, and write fugues without knowing a note of music. But this novel phenomenon is of an entirely different order, being a modest quadruped of the canine race. Dogs have been occasionally observed, both in modern and past days, to show an extreme sensibility to music. On some of them, fine music has been known to produce an apparently painful effect, causing them gradually to become restless, to moan piteously, and, finally, to fly from the spot with every sign of suffering and distress. Others have been seen to sit and listen to music with seeming delight, and even to go every Sunday to church, with the obvious purpose of enjoying the solemn and powerful strains of the organ. All these displays, however, of musical tendencies on the part of the canine race, are as nothing in comparison with the following, which a recent German paper gives an account of, for the amusement of the world of harmony.

Frederick S—, a musical amateur of Darmstadt, in the grand duchy of Hesse, possesses a female spaniel, which has become a strange source of terror to all the mediocre musicians of the place and its vicinity. Having acquired a competency by commercial industry, Mr S— retired from business, and devoted himself, heart and soul, to the daily and hourly enjoyment of his favourite science. Every member of his little household was by degrees involved more or less in the same occupation, and even the housemaid could in time bear a part in a chorus, or decipher a melody of Schubert. One individual alone in the family seemed to resist this musical enticement; this was a small spaniel, the sole specimen of the canine race in the mansion. Mr S— felt the impossibility of instilling the theory of sounds into the head of Poodle, but he firmly resolved to make the animal bear some part or other in the general domestic concert, and by perseverance, and the adoption of ingenious means, he attained his object. Every time that a false note escaped either from instrument or voice—as often as any blunder, of whatever kind, was committed by the members of the musical family (and such blunders were sometimes committed intentionally)—down came its master's cane on the back of the unfortunate Poodle, till she howled and growled again. By and by, simple menaces with the stick were substituted for blows, and at a still more advanced period of this extraordinary training, a mere glance of Mr S—'s eye was sufficient to make the animal howl to admiration. In the end, Poodle became so thoroughly acquainted with, and attentive to, false notes and other musical barbarisms, that the slightest mistake of the kind was infallibly signalled by a yell from her, forming the most expressive commentary upon the misperformance.

When extended trials were made of the animal's acquirements, they were never found to fail, and Poodle became, what she still is, the most famous, impartial, and conscientious connoisseur in the duchy of Hesse. But, as may be imagined, her musical appreciation is entirely negative; if you sing with expression, and play with ability, she will remain cold and impassible. But let your execution exhibit the slightest defect, and you will have her instantly showing her teeth, whisking her tail, yelping, barking, and growling. At the present time there is not a concert or an opera at Darmstadt to which Mr Frederick S— and his wonderful dog are not invited, or, at least, the dog. The voice of the prima donna, the instruments of the band, whether violin, clarinet, hautbois, or bugle—all of them must execute their parts in perfect harmony, otherwise Poodle looks at its master, erects its ears, shows its grinders, and howls outright. Old or new pieces, known or unknown to the dog, produce on it the same effect.

It must not be supposed that the discrimination of the creature is confined to the mere execution of musical compositions. Whatever may have been the case at the outset of its training, its present and perfected intelligence extends even to the secrets of composition. Thus, if a vicious modulation, or a false relation of parts, occurs in a piece of music, the animal shows symptoms of uneasy hesitation, and if the error be continued, will infallibly give the grand condemnatory howl. In short, Poodle is the terror of all the middling composers of Darmstadt, and a perfect nightmare to the imagination of all poor singers and players. Sometimes Mr S— and his friends take a pleasure in annoying the canine critic, by emitting all sorts of discordant sounds, from instrument and voice. On such occasions the creature loses all self-command, its

eyes shoot forth fiery flashes, and long and frightful howls respond to the immelodious concert of the mischievous bipeds. But the latter must be careful not to go too far; for when the dog's patience is tried to excess, it becomes altogether wild, and flies fiercely at the tormentors and their instruments.

This dog's case is a very curious one, and the attendant phenomena not very easy of explanation. From the animal's power of discerning the correctness of musical composition, as well as of execution, one would be inclined to imagine that Mr S—, in training his dog, had only called into play faculties existing (but latent) before, and that dogs have in them the natural germs of a fine musical ear. This seems more likely to be the case, than that the animal's perfect musical taste was wholly an acquirement, resulting from the training. However this may be, the Darmstadt dog is certainly a marvellous creature, and we are surprised that, in these exhibiting times, its powers have not been displayed on a wider stage. The operatic establishments of London and Paris might be greatly the better, perhaps, of a visit from the critical Poodle.*

THE MAN OF ROSS.

"Rise, honest muse, and sing the Man of Ross."

THE true history and character of the individual, to whom the muse of Pope, thus invoked, arose and gave immortality in song, are but little known to the world at large, although almost every reader of the poet's lines must have felt an interest in a being so noble as the Man of Ross was there represented to be. John Kyrle was the proper appellation of the person whom local circumstances, as will be explained in the sequel, caused to bear the title of the Man of Ross. He was a native of the parish of Dymock, in the county of Gloucester, and was born on the 22d of May 1637. He was descended from a respectable family, once possessed of considerable estates on the borders of Gloucester and Hereford shires, and one of his immediate progenitors filled the office of high-sheriff of the latter county. The paternal grandmother and great-grandmother of the subject of our memoir were both personages of distinguished extraction, the former being the sister of Waller the poet, while the other stood in the same degree of relationship to John Hampden the patriot. Though the patrimonial property of the Kyrles (or Crulls, or Curls, as they had occasionally been named) had greatly decreased in extent previously to the time of John Kyrle, his father was yet in a comfortable position in society, and able to give the son a most liberal training, and every educational advantage which the country and time could afford. Being intended for the bar, young Kyrle was entered a commoner of Balliol College, Oxford, on the 21st of April 1654. On his admission, he presented a piece of plate to the college, in the form of a tankard, promising to enlarge this donation when any other person gave a better. Apparently, such an event really happened, since the plate, which weighed originally little more than eighteen ounces, was increased, in or before the year 1670, to a degree of gravity exceeding sixty-one ounces. The tankard is understood to be still in use in Balliol College.

At the decease of his father, John Kyrle, who was the elder of two sons, found himself inheritor of little more than the family dwelling-house in the town of Ross in Herefordshire, together with a few patches of land in the neighbourhood. But these possessions seem to have been quite sufficient to maintain him respectably, as he did not follow up the profession of the law, but permanently took up his residence in the district of his nativity. In truth, his frugal way of life, as well as his economical and judicious mode of managing his property, soon placed him in the most easy circumstances, and enabled him to make repeated accessions, by purchase, to the patrimony which had descended to him. But, though frugal in his habits, the subject of our notice was far, very far indeed, from exhibiting at any period of his career a spirit of avarice or money-hoarding. On the contrary, he was endowed with one of the most generous and noble hearts that ever fell to the lot of man, and hence, in reality, his celebrity—hence the immortality of his name as the Man of Ross. It was as a most extensive and unostentatious benefactor of his species that Pope enshrined John Kyrle in undying verse, and gave his name to all coming time. Before quoting the poet's lines, we may briefly describe to the reader the personal appearance and habits of Mr Kyrle, as far as any records on these points permit us to do.

The portraits of the Man of Ross display a regular, well-formed countenance, rather square in general outline, and strikingly expressive of mild cheerfulness and benevolence. The brow is open and expansive. In person, Mr Kyrle was tall, thin, and well shaped, and during his whole life his usual attire was a suit of brown, after the fashion of the day. He maintained his health by regular exercise from his youth upwards, turning his own hands to service in his favourite pursuits of horticulture and planting. A spade and a watering-pot were usually seen in his grasp, as he passed backwards and forwards between his dwelling and his fields. Having speedily increased his means, as we have said, and made his income re-

spectable, he lived well, and enjoyed himself frequently with his friends, though much company was not agreeable to him. It was his practice, as his habits became fixed, to entertain a party of his acquaintances on every market-day, and on every fair-day, in the town of Ross. Nine, eleven, or thirteen (he seemed partial to odd numbers), were the usual sum of the guests at his invitation dinners, including himself and a kinswoman, Miss Bubb. His dishes were plain and good, and the only beverages which appeared on his table were malt liquor and cider. At ordinary times, moreover, he loved dearly to see his neighbours dropping in upon him in the evening, was cheerful always with them, enjoyed a pleasant tale, and was uniformly discomposed and sad when time brought round the parting hour.

Such were the personal peculiarities and the merely personal habits of the Man of Ross. Let us now depict him in his character of a member of society, and display his conduct in his relations to his neighbours, to the poor around him, and to his fellow-creatures at large. Did that conduct justify these high commendations of the poet Pope?

P. "But all our praises why should lords engross?
Rise, honest muse! and sing the Man of Ross:
Pleased Vaga echoes through her winding bounds,
And rapid Severn hoarse applause resounds.
Who hung with woods yon mountain's sultry brow?
From the dry rock who bade the water flow?
Not to the skies in useless columns tost,
Or in proud falls magnificently lost,
But clear and artless, pouring through the plain
Health to the sick, and solace to the swain.
Whose causeway parts the vale with shady rows?
Whose seats the weary traveller repose?
Who taught that heav'n-directed spire to rise?
'THE MAN OF ROSS,' each lisping babe replies!
Behold the market-place with poor o'erspread—
The Man of Ross divides the weekly bread.
He feeds yon almshouse, neat, but void of state,
Where Age and Want sit smiling at the gate.
Him portioned maids, apprenticed orphans bless'd,
The young who labour, and the old who rest.
Is any sick? the Man of Ross relieves,
Prescribes, attends, the medicine makes, and gives.
Is there a variance? enter but his door,
Balked are the courts, and contest is no more.
Despairing quacks with curses fled the place,
And vile attorneys, now an useless race.
B. Thrice happy man, enabled to pursue
What all so wish, but want the power to do!
O! say, what sums that generous hand supply,
What mines, to swell that boundless charity?
P. Of debts and taxes, wife and children clear,
This man possessed—five hundred pounds a year.
Blush, grandeur, blush! proud courts, withdraw your blaze!
Ye little stars, hide your diminished rays!
B. And what! no monument, inscription, stone?
His race, his form, almost his name unknown?
P. Who builds a church to God, and not to Fame,
Will never mark the marble with his name.
Go, search it there, where to be born and die,
Of rich and poor makes all the history.
Enough, that virtue filled the space between—
Proved, by the ends of being, to have been."

In every particular item of this panegyric, the poet's assertions were founded in strict truth. Pope acquired his intimate knowledge of the circumstances from being in the habit of occasionally visiting a Roman Catholic family resident in the immediate vicinity of Ross. We shall not attempt to tell at what periods of Mr Kyrle's life, which was extended to the term of eighty-seven years, the individual actions and events to be alluded to took place. Some of these acts were continued, indeed, through a long series of years. The clothing of "the sultry mountain with woods," and the bestowal of the blessing of "water upon the swains of the vale," to which Pope refers, were public acts, performed for the service of the people of Ross, at great private cost to Mr Kyrle. The "causeway," and the "seats for weary travellers," were matters of a similar character, and the "heav'n-directed spire" was another benefit, or rather ornament perhaps, to the town of Ross, conferred by its indefatigable MAN. Mr Kyrle thought the old spire in danger of falling, and his humane mind never rested till a new one was substituted, to the erection of which he contributed most amply. These are but one or two of the public benefits which so deeply endeared him to the people of Ross. But higher and nobler deeds are to be mentioned. His care of the poor was incessant. He fed them, clothed them, and cared for them every way, and this not for a time, or to relieve a passing necessity, but for long years—from the time, in truth, when he was in his manhood's pride, to the term when his head was white and hoary.

"Behold the market-place with poor o'erspread,
The Man of Ross divides the weekly bread."

This was strictly true. Some pious bishop or lord of former times had decreed that the tolls paid for all corn brought to the Ross market should be the property of the poor, and the grant remained long in force. But the poor, through imperfect management, derived no good from the privilege, until the Man of Ross took the matter under his care, ground the toll-corn, and had it baked into bread at his own house, after which he distributed it every Saturday with his own hands in front of the market-house. "Tradition reports in homely language (to use the words of a notice of Mr Kyrle), that it would 'have done one's heart good to see how cheerful the old gentleman looked (for he was then very old) when engaged in distributing the bread.'" The "almshouse" to which Pope refers was one in reality "fed" daily by the Man of Ross, since every day saw food taken from his own table to that of the charity. But, to speak the truth, any person who claimed this benevolent being's hospitable assistance received it, and that again and again. To poor girls

* Adapted from a French newspaper of recent date.

he often gave marriage portions, and paid the apprentice fees for poor orphan boys. At his kitchen fire-place was placed a large wooden block for poor people to sit on, and to the poor, also, a piece of boiled beef, and three pecks of flour, in bread, were given every Sunday.

"Him portioned maids, apprenticed orphans blest'd,
The young who labour and the poor who rest."

"Is any sick?" continues Pope, and describes the attention of the Man of Ross to the sick poor; his purse, his medicine chest, and, what was more, his personal ministrings, being ever ready for their relief. The passage, "Is there a variance," &c., has reference to another feature in the life of the subject of our memoir. Himself averse to all quarrelling, legal or otherwise, he exerted himself to maintain harmony among his neighbours, and for much more than half a century he was arbitrator in all their disputes—the chosen judge, in fact, of all civil causes in the district. Perhaps, in this character, his influence was more beneficial than in any other. In closing now our comment upon the text of Pope, we come to the most remarkable point in this whole history. Upon what mines, says the bard, did this mirror of benevolence draw to supply the demands of his boundless charity? No princely or ducal estates were his.

"This man possessed—five hundred pounds a-year."

A truly wonderful instance this is, indeed, of the vast amount of good which prudent management may put in the power of those even of limited fortunes. Yet the whole is but another proof that Will and Skill can accomplish all things.

The town which Mr Kyrle so long adorned was justly proud of him during his life, and deeply revered his memory, when he was laid in the tomb. The name of the Man of Ross was not bestowed in the first instance by Pope, but was previously the common and popular designation of Mr Kyrle in the country around Ross. The subject of our notice never married. The poor of his district were his children and his family. From them he was removed at the venerable age we have mentioned, and the whole population of Ross and its vicinity followed the remains of the good man to the grave. Numerous as were the eyes that beheld the earth closed over the Man of Ross, perhaps not one individual there could not say, "There is the last sight of my benefactor." The day of his death was November the 20th, 1724, and he was laid in the chancel of Ross in Herefordshire. For a long time no other monument marked the place where he lay, than a flat stone with the initials J. K. But in later years a handsome stone has been erected over the body of the Man of Ross. The spot is a hallowed one to the inhabitants, and, indeed, every thing connected in the remotest degree with his memory is matter of reverence to the people of the place. One striking proof of this was afforded recently, when the church underwent a repair or renovation of its pews. The community with one voice exclaimed against the removal of one portion of John Kyrle's pew. It was left precisely in the position in which it was, when occupied by him.

ANECDOTES OF CIRCUMSTANTIAL EVIDENCE.

THE following narrative, while it strikingly exhibits the fallible and uncertain nature of circumstantial evidence, affords also a convincing proof of the indispensable necessity of procuring medical testimony of the highest order, in all criminal cases relating to injuries of the person. The narrator, Mr Perfect, a surgeon at Hammersmith, sent the statement to the editor of the *Lancet* (Mr Wakley) in January of the present year, and as its diffusion is likely to do good, we take leave to transfer it from the pages of that periodical into our own:—

"It is now thirty years ago, that, accidentally passing the Pack-Horse, Turnham-green, my attention was attracted by a mob of persons of the lowest order, assembled around the door of that inn, who were very leud in their execrations against some person who was suspected of having murdered his brother; in corroboration of which, I was told that his bones were found near the premises where he formerly resided, upon view of which a jury was then sitting, after an adjournment from the day preceding. I found that two surgeons had been subpoenaed to inspect the remains, and I had no doubt but that every information as to their character had been obtained; curiosity alone, therefore, induced me to make way into the room, where I found that the coroner, and, I believe, a double jury, were sitting for the second day, and were engaged in an investigation which tended to show that a farmer and market-gardener at Sutton-court Farm, had, a few years before, a brother living with him, who was engaged in the farm, but whose conduct was dissolute and irregular, to a degree that often provoked the anger of his elder brother, and sometimes begat strife and violence between them; that the temper of the elder brother was as little under control as the conduct of the younger; and, in fine, that they lived very uncomfortably together.

One winter's night, when the ground was covered with snow, the younger brother absconded from the house (for they both lived together), by letting himself down from his chamber window; and when he was missed the ensuing morning, his footsteps were clearly tracked in the snow to a considerable distance, nor were there any other footsteps but his own: time passed

on, and after a lapse of some few years no tidings were heard of his retreat, nor perhaps have there ever been since. Some alterations in the grounds surrounding the house having been undertaken by a subsequent tenant (for the elder brother had then left the farm), a skeleton was dug up, and the circumstance appeared so conclusive that one brother had murdered the other, that the popular clamour was raised to the utmost, and a jury empanelled to investigate the case.

After listening attentively to these details, I ventured to request of the coroner to be allowed to examine the bones, which I found were contained in a hamper basket at the farther end of the room, and I felt much flattered by his immediate compliance, for he desired the parish beadle, who was in attendance, to place them upon the table; and having myself disposed them in their natural order, I found that they represented a person of short stature, and from the obliteration of the sutures of the skull, and the worn down state of the teeth, must have belonged to an aged person. But what was my surprise when I reconstructed the bones of the skeleton, and found the lower bones of the trunk to be those of a female. I immediately communicated the fact to the jury, and requested that the two medical men who had before given their opinions might be sent for, one of whom attended, and without a moment's hesitation corroborated my report.

I need not add that the proceedings were instantly at an end, and an innocent man received the *amende honorable*, in the shape of an apology, from all present, in which the coroner heartily joined. It has since been proved, beyond all doubt, that the spot where the bones were found was formerly the site of a large gravel-pit, in which hordes of gipsies not only assembled, but occasionally buried their dead, and, perhaps, more skeletons are yet to be found in that vicinity."

At the distance of thirty years, the narrator of this occurrence may well look back upon it with pleasure, and congratulate himself upon having been "the happy instrument in the hands of Providence of rescuing a worthy and innocent man from the obloquy, and perhaps the fate, of a murderer."

Not so fortunate in its issue was the case which we subjoin to this, and which occurred in England previously to the reign of Charles II. The narrative is given in one of the early volumes of the *Gentleman's Magazine*.

"A gentleman died possessed of a very considerable fortune, which he left to his only child, a daughter, appointing his brother to be her guardian, and executor of his will. The young lady was then about eighteen; and if she happened to die unmarried, or, if married, without children, her fortune was left to her guardian and to his heirs. As the interest of the uncle was now incompatible with the life of the niece, several other relations hinted that it would not be proper for them to live together. Whether they were willing to prevent any occasion of slander against the uncle, in case of the young lady's death; whether they had any apprehension of her being in danger; or whether they were only discontented with the father's disposition of his fortune, and therefore propagated rumours to the prejudice of those who possessed it, cannot be known; the uncle, however, took his niece to his house near Epping Forest, and soon afterwards she disappeared.

Great inquiry was made after her, and it appearing that on the day she was missing she went out with her uncle into the forest, and that he returned without her, he was taken into custody. A few days afterwards he went through a long examination, in which he acknowledged that he went out with her, and pretended that she found means to loiter behind him as they were returning home; that he sought her in the forest as soon as he missed her; and that he knew not where she was, or what was become of her. This account was thought improbable, and his apparent interest in the death of his ward, and perhaps the petulant zeal of other relations, concurred to raise and strengthen suspicions against him, and he was detained in custody. Some new circumstances were every day rising against him. It was found that the young lady had been addressed by a neighbouring gentleman, who had, a few days before she was missing, set out on a journey to the north, and that she had declared she would marry him when he returned; that her uncle had frequently expressed his disapprobation of the match in very strong terms; that she had often wept and reproached him with unkindness and an abuse of his power. A woman was also produced, who swore that on the day the young lady was missing, about eleven o'clock in the forenoon, she was coming through the forest, and heard a woman's voice expostulating with great eagerness; upon which she drew nearer the place, and, before she saw any person, heard the same voice say, 'Don't kill me, uncle; don't kill me; upon which she was greatly terrified, and immediately hearing the report of a fire-arm very near, she made all the haste she could from the spot, but could not rest in her mind till she had told what had happened.

Such was the general impatience to punish a man who had murdered his niece to inherit her fortune, that upon this evidence he was condemned and executed.

About ten days after the execution, the young lady came home. It appeared, however, that what all the witnesses had sworn was true, and the fact was found to be thus circumstanced:—

The young lady declared, that having previously agreed to go off with the gentleman that courted her, he had given out that he was going a journey to the north, but that he waited concealed at a little house near the skirts of the forest, till the time appointed, which was the day she disappeared. That he had horses ready for himself and her, and was attended by two servants also on horseback. That as she was walking with her uncle, he reproached her with persisting in her resolution to marry a man of whom he disapproved; and after much altercation, she said, with some heat, 'I have set my heart upon it; if I do not marry him, it will be my death; and don't kill me, uncle; don't kill me; that just as she had pronounced these words, she heard a fire-arm discharged very near her, at which she started, and immediately afterwards saw a man come forward from among the trees, with a wood-pigeon in his hand, that he had just shot. That coming near the place appointed for their rendezvous, she formed a pretence to let her uncle go on before her, and her suitor being waiting for her with a horse, she mounted, and immediately rode off. That instead of going into the north, they retired to a house in which he had taken lodgings, near Windsor, where they were married the same day, and in about a week went a journey of pleasure to France, from whence, when they returned, they first heard of the misfortune which they had inadvertently brought upon their uncle.

So uncertain is human testimony, even when the witnesses are sincere, and so necessary is a cool and dispassionate inquiry and determination, with respect to crimes that are enormous in the highest degree, and committed with every possible aggravation."

GREAT WESTERN RAILWAY—THE BOX TUNNEL.

ONE of the greatest obstacles to the accomplishment of this stupendous undertaking was found to exist in Box Hill, a large extent of elevated ground lying directly between, and about equidistant from, Chippenham and Bath. This hill, the highest part of which is about 400 feet above the proposed level of the railroad, could not be avoided; to make an open cutting through it was impossible, and to perforate it was thought by many equally so. Nevertheless, Mr Brunel, with that boldness for which he is so celebrated, adopted the latter plan, and, accordingly, it was determined that a tunnel, one mile and three quarters in length, forty feet in height, and thirty in width, should be made through the hill. The extraordinary attempt of boring through this immense mass, consisting in great part of solid beds of freestone, was commenced in the summer of 1836, and will, it is hoped, be completed in 1841. The difficulties that have stood in the way of the performance of this great work, particularly that part of it on the east, or Chippenham side, have been appalling; but hitherto they have been surmounted by the enterprise, skill, and perseverance of Mr Brewer, of Rudloe, and Mr Lewis, of Bath, the gentlemen who contracted with the directors for the completion of that portion of the work. The contract extends from Shaft No. 8, which is sunk at the proposed mouth of the tunnel on the east side, to a point 300 yards towards Shaft No. 6, and altogether 2418 feet from the entrance at the Chippenham end; this portion Messrs Brewer and Lewis confidently expect to be able to finish in January next. Independent of the difficulties arising from the laborious nature of the undertaking, the constant flow of water into the works from the numerous fissures in the rock, has been most annoying, and in the rainy season so formidable as almost to destroy all hope of being able to contend with it. In November 1837, the steam-pump then employed being quite inadequate to the task of making head against it, the water increased so fearfully, having filled the tunnel and risen to the height of 56 feet in the shaft, as to cause the total suspension of the work till the July following. This would have induced many persons to have abandoned the work in despair; but Messrs Brewer and Lewis, determined to fulfil their contract if possible, erected a second pump, worked by a steam-engine of 50 horse-power, and had the satisfaction of vanquishing their enemy and resuming their work. A few months afterwards (in November 1838), the works were again stopped by an influx of water, which, however, was got under in ten days, the engine discharging 32,000 hogheads of water a-day. The tunnel between Shafts No. 7 and No. 8 (1520 feet in length) is entirely finished at the roof, and for six feet below it, where the base is fourteen feet wide; but half way between the two shafts there still remain about 350 feet of cutting to be done, which is expected to be cleared away some time next month. In this portion of the work Messrs Brewer and Lewis commenced their operations at each end, working towards the centre; and when the two cuttings closely approximated, much anxiety was felt lest a straight line should not have been kept, and the union of the two portions of the work should not have been true; but on breaking through the last intervening portion of rock, the accuracy of the headings was proved, and to the joy of the workmen, who took a lively interest in the result, and to the triumph of Messrs Brewer and Lewis's scientific working, it was found that the junction was perfect to a hair as to the level, the two roofs forming an unvarying line; while at the sides the utmost deviation from a straight line was only one inch and a quarter. This, in a cutting of 1520 feet in length, begun at opposite ends, and worked towards a common centre, is perhaps unexampled in the annals of tunnelling. Notwithstanding the unfortunate accidents with which Messrs Brewer and Lewis have had to contend, and the probability that these accidents will deprive them of that fair profit which ought to attend such an adventure, their spirits have never given way; and the obstacles which have crossed their path, have only incited them to greater efforts to complete their undertaking in the time stipulated for in the contract. At this time they are using extraordinary efforts to make up for the delay which the interruption of

the water occasioned; upwards of 300 labourers being now employed by them. The cutting on the Chippenham side has hitherto been, and it has already extended 2000 feet, through one solid bed of freestone or superior oolite, in many places 130 feet thick, and lying upon a bed of fuller's earth, or clay, 120 feet in thickness; under which blue marl, resting upon lias clay, is found. So uninterrupted and compact is the rock through which this end of the tunnel passes, that no masonry is required on any part of it, the stone itself forming sides and roof, and nothing being required at the bottom but the rails on which the carriages will run.—*Abridged from the Wiltshire Independent.*

THE KENT DISTURBANCES OF MAY 1838.

SECOND ARTICLE.

WE are now to give an abridgement of the report made by Mr Liardet to the Central Society of Education, with regard to the moral and intellectual condition of the district in which these disturbances took place. This district comprehends the parishes of Herne-hill and Boughton, together with the ville of Dunkirk; but most of the rioters belonged to Herne-hill. "The scenery of this little region is peculiarly English. Gently rising hills, and picturesque vales, covered with a rich herbage, or bearing the show of a minute and skilful husbandry, succeed to each other. Fields of waving corn are interspersed with gardens, hop-grounds, and orchards."

Mr Liardet was at first incredulous as to the faith alleged to have been reposed by the country people in the pretensions of Thoms. For the purpose of ascertaining the truth on this important point, he questioned almost every person with whom he came in contact, in cottages, in beer-shops, and the fields; and their testimony was all concurrent to the effect that the greater part of Thoms's followers believed him to be what he had represented himself, and considered that they were not only justified in obeying him as their lord, but that disobedience would entail upon them the most tremendous of calamities.

Of eight persons killed in the riots, Mr Liardet gives the following account:—

"Edward Wraight was a substantial yeoman, farming about sixty acres of his own land. He had received the usual education of persons of his class, and could read and write. He is represented by those who knew him, as a man of a sullen, uncommunicative character, extremely tenacious of his rights. He never went to church or chapel; and when pressed upon the subject, said he would not go to hear a man who robbed him every day of his life by taking tithe. He was not in the habit of reading much, and had only a few books, chiefly of a religious character. He was more than sixty years of age, and his children are all capable of providing for themselves.

William Foster was a labourer, in the service of Mr Smoulton of Canterbury, and received two shillings and sixpence per diem. He was a good workman, always employed, a quiet, well-behaved man, and in the constant habit of attending church. Foster could read, and in his cottage were a Testament and a few religious books. He has left a widow and five children.

William Rye, an industrious labourer, in constant employment, receiving two shillings and sixpence per diem; an attendant at church. He has left a widow and four children. Rye had never learnt to read, and had no books in his cottage.

George Branchett had been a private in the East Kent militia. He was a labourer, an industrious man, but during the last winter had fallen into great distress, and was taken, with his family, into the Union workhouse at Faversham. While there, his wife and two of his children died; and shortly after leaving it, two more children died. He has left three other children, two of whom have since his death been received back into the workhouse. This poor man had received no education, and his misfortunes and distresses left him peculiarly open to the alluring promises of Thoms.

Stephen Baker was an inoffensive young man, in constant employment at the rate of two shillings and threepence per diem. He could read a little, and was in the habit of attending church. He has left a widow, but no child.

William Burford was a labourer, and the only one killed who was known as a decidedly bad character. He was a reputed sheep-stealer, and suspected to be concerned in several depredations that had been committed. I could not ascertain whether he had received any education. In his cottage were a Testament and one or two other books of a religious nature. He has left a widow and child.

George Griggs was a regular farm-servant, with good board and wages. He had been in his youth a constant attendant at the Sunday school, and is mentioned as having made great progress in religious knowledge, and as being capable of returning very suitable answers to questions on such subjects. He was unmarried.

Phineas Harvey, another single man, was a sober industrious labourer. He was in constant employ, and receiving two shillings and threepence per diem. I could not ascertain what degree of education he had received; but he was represented as a quiet, well-conducted man, and usually attended church.

Of the sixteen persons now in jail at Maidstone, and eleven others discharged on their own recognizances,

nearly the whole were men of steady, reputable character. Four only of them were in distressed circumstances; the remainder were either labourers in well-paid, constant employment, or possessing tenements of their own. Of these last there were no fewer than six."

Mr Liardet gives a minute statistical account of the district, from which, however, little more appears than that the bulk of the people are agricultural labourers, and by no means destitute of physical comfort. With regard to the moral condition of Herne-hill, he says, "Of the fifty-one families examined, seven parents only ever opened a book after the labours of the day were closed. To the inquiry how they passed their time in the long winter evenings, the answer in most cases was, 'About home, doing sometimes one thing sometimes another; but, in most instances, going early to bed for want of something to do.' In two cases only was the alehouse confessed to be the usual resort, though there is little doubt but that these candid persons were not so wholly without the countenance of their neighbours as the answers would imply. Indeed, if they were, the landlords of the two public-houses and two beer-houses (for that is the number in the village) might long ago have taken down their signs.

The number of books in the possession of the cottagers corresponded with their indifference and inaptitude to mental recreation of any sort. Out of the fifty-one families, four only are mentioned as possessing any books besides the Bible, Testament, prayer and hymn books. In thirty-four cottages, one or other of the last-mentioned books was found, and, in some instances, a few religious tracts. These constituted the whole of the mental aliment of the district. Not a Penny Magazine, nor any of the other cheap publications of the day, which convey so much useful instruction and amusement to the working-classes in the towns, was to be seen.

The returns give to the fifty-one families forty-five children above the age of fourteen years, and one hundred and seventeen under that age. Of the first class, eleven only can read and write, twenty-one can read a little, and the remainder cannot. In the second class, forty-two attend school, but several of these go only occasionally. The rest do not go at all. Six only can read and write; of twenty-two who can read, only thirteen read fluently, and nine very little; and the remainder cannot read at all. In twelve families, the boys are instructed in gardening, husbandry, or in something distinct from reading and writing. This, however, must be taken with some qualification; for, in most cases where the inquiry was pursued, it proved that the boys were merely employed in assisting their father in his labours, in doing which they seldom received any instruction. In fifteen families, the girls were said to learn brewing, baking, and other household matters, independent of sewing; while in thirty-four families they practised nothing but washing and needle-work.

The parish possesses a Sunday school, and three others, in one only of which is writing taught. This school is kept by a master, who, being from physical infirmity incapable of labour, was obliged to adopt this mode of life. He has only eighteen scholars, and half of this number come from neighbouring parishes. The mode of instruction is the old system, and the instruction itself of the simplest kind. The only books used are the Universal Spelling Book, Vyse's Spelling Book, Duncan's English Expositor, Eticck's Dictionary, the Bible and Testament, and one of the old manuals of arithmetic. Not more than one-half of the scholars can write, and of these a few only are instructed in the rudiments of arithmetic. History, geography, and grammar, do not form a part of even the nominal scheme of instruction. It is, however, the high school of the place, and those parents who sent their children there took credit for the sacrifice they made. The terms are—for reading only, sixpence a-week; and for reading, writing, and arithmetic, 13s. 5d. a-quarter. The village, however, is unable to support even such a school as this; for, as before stated, one-half of the scholars come from other places.

The two other schools are merely dame-schools, in which nothing but sewing and reading are taught. Many of the children attend so irregularly, and are often absent for such long periods, that they forget all they have learned. Owing to this, some children are unable to read, after being members of the school two or three years. The books in use are the Bible, the Testament, Catechism, and some religious tracts. From being confined constantly to these books, the children imagine they cannot read others. When asked if they could read, a common answer was, 'Yes, a little in the Testament.' Children who could read this book fluently enough, instantly began to spell and hesitate when desired to read out of another. The reason is, they have read, and heard read, the same thing so often, that the sound of one word suggests the following one. They even remember some words from their length or form, and the position they occupy in the page, which they would not know in another book. This accounts in some measure for instances, not very uncommon, of boys of thirteen or fourteen, who have left school two or three years, answering, when asked if they could read, that 'they could once, but have forgot now, since they left school.'

The largest of the two dame-schools is chiefly supported by the vicar of the parish. For this purpose he allows the schoolmistress to convey rent free, the

vicarage-house, a small building well adapted for a school, and the garden and some land belonging to it. In return, the vicar retains the right of sending to the school such children as he chooses without payment, though for some he pays voluntarily fourpence a-week. The parents of the other children pay threepence a-week for each child. The number attending the school varies very much, being sometimes as low as thirty, and at others as high as fifty. It is remarkable that the last mistress who kept this school, the husband of the present one, and the husband of the mistress of the other school, were the three staunchest adherents of Thoms, and put more faith in his absurd pretensions than any others of his followers.

The Sunday school is also supported chiefly at the expense of the vicar, and the superintendence of it is undertaken by his lady. The school is held in their residence, and they have been at great pains to increase the number of those intended to be benefited by their laudable endeavours. The instruction given, as in most Sunday schools, is entirely of a religious nature. The object (as described) has been to make the children practically acquainted with moral and religious truths. With this view, after repeating the answers in the Catechism, the children are required to give the substance of the answers in their own language. By these means many of them became (to use the words of my informant) as well instructed in the principles of religion, and were as capable of giving pertinent answers to questions concerning them, as the generality of the children of the opulent. There were, however, complaints that, notwithstanding this apparent progress, the children could never be brought to connect what they learned in school with their practice in life, and remained as idle, mischievous, and vicious, as before. A young lad, named Griggs, who was killed in the affray, had been one of the most promising pupils while in the school, and she said it was impossible to attribute his conduct in joining Thoms to any want of religious instruction.

The schools above described are the only means of instruction open to the children of the parish; and how utterly incapable they are of affording even the lowest degree of education required in the present day, need not be said. In justice, however, to the present incumbent of the parish, it should be recollected, in addition to what has before been stated, that no school of any kind existed before his appointment to it.

The facts ascertained respecting the other portions of the district were of the same character, and need not be repeated. Mr Liardet adds, that an inquiry made two years ago respecting eight parishes in Kent, gave exactly similar results:—"It would be easy," he further says, "if it were required, to adduce reasons for believing that the gross ignorance shown to exist in these districts is not confined to them, but that their condition may be regarded as a fair sample of that of the same class in other parts of the country."

He gives some curious illustrations of the tendency of this ignorance to bring about pauperism. Its tendency to occasion fanaticism is thus adverted to:—"A little consideration of the nature of rural life will show the danger of leaving the peasantry in such a state of ignorance. In the solitude of the country, the uncultivated mind is much more open to the impressions of fanaticism than in the bustle and collision of towns. In such a stagnant state of existence the mind acquires no activity, and is unaccustomed to make those investigations and comparisons necessary to detect imposture. The slightest semblance of evidence is often sufficient with them to support a deceit which elsewhere would not have the smallest chance of escaping detection. If we look for a moment at the absurdities and inconsistencies practised by Thoms, it appears at first utterly inconceivable that any persons out of a lunatic asylum could have been deceived by him. That an imposture so gross and so slenderly supported should have succeeded, must teach us, if any thing will, the folly and danger of leaving the agricultural population in the debasing ignorance which now exists among them."

From all that has been ascertained, the following deductions may, we think, be very fairly made. The English rural intellect is not naturally of an active or penetrating character. The people get little education, and that little is not conducted in such a way as to rouse the mind to a state of activity, so as to supply the want of natural shrewdness. What they learn, therefore, is only apparently learned. They become able to read certain pages of certain books by rote, but, for want of a right system of teaching, they never attain an understanding of what is written on these pages, and, when removed from school, retain no tincture whatever of their so-called education after forgetting the forms and local arrangement of the words composing their lessons. In such circumstances, it is obvious that the well-meant exertions of their superiors to inculcate religious truths, must be in a great measure baulked. With a people naturally of lively intellect, like the Scotch, those exertions would be effectual for their own particular end, and we should then have a rural class rationally pious, as the northern neighbours now are, and equally impenetrable to fanaticism. But as the case stands, the mind remains inert, and no real progress is made. What is immediately wanted is something to rouse or awake the mind, so that the limited education in the mean time given may become effectual. Were the intellectual mode of instruction introduced, it might further this end considerably. Something more, however, is

wanted. The intellect of the rural class must be subjected to an extensive training, not only in religious, but other kinds of knowledge. Only then, we are persuaded, can we attain success even with the religious part of education; still more can we only then fit the human being for all his various duties, and for becoming a sound and safe citizen.

ADVENTURE ON THE CLYDE.

AFTER an agreeable residence of a few weeks on the sea-shore near Gourock, which may be styled the Margate or Ramsgate of Glasgow, I went one day on board a steamer to re-ascend the Clyde. The weather was fine, and the deck of the boat was crowded with passengers of all kinds, from the portly manufacturer of the western capital, returning like myself from a little pleasurable rustication, to the poor shattered invalid, whom the beautiful day and the low fare had tempted to take a sail down the river and back again. Many were the vessels passing to and fro that day on the Clyde, but one only of these drew any particular attention from our company. This was a large Irish steamer, which shot past us just as we were opposite to Dumbarton, being probably on its way to Belfast or Dublin. Perhaps it was the number of genuine and unmistakable Milesians on the deck, all returning, ragged as they came, to their native soil, that made myself and others fix our gaze for a minute or two on this vessel. While doing so, we heard a loud cry emitted by some one on board, and saw a great bustle take place on the deck, all the passengers running to one side. Almost immediately the steam was let off, and the vessel brought to a stop. Our captain, on seeing these movements, said, "Surely there is some one overboard!" But the distance was every moment increasing, and we failed to satisfy ourselves that such was the cause of the stir. In a little while, the passengers, one after another, turned lounging and indifferently away, and the Irish steamer was soon alike out of sight and out of mind.

Our own vessel moved on. We passed the terminus of the Roman wall and site of Henry Bell's well-deserved monument. A fiddle, tolerably well played, was struck up by a musician hitherto undistinguished in the crowd of passengers. As we were approaching Erskine ferry, a female voice was heard exclaiming, "My bairn! my bairn! Where is my bairn!" and, on turning round, I found that the words proceeded from a young woman of six or seven and twenty, who bore one child in her arms, and led another in her hand. Her countenance was turned anxiously and imploringly to the captain, as she uttered the words just mentioned. The captain was close behind me. "My good woman," said he, "don't distress yourself. If you have missed one of your children, it cannot be far away." "Oh, sir," returned the mother, "I missed it but shortsyne; but I looked every where about the deck before I spoke. Oh, where is my bairn!" The passengers had assembled around the spot, and the poor woman's appealing eyes were cast on the circle, as she gave vent to the last exclamation. "Some of the men may have taken the child below for amusement," said the captain, soothingly, and away he went to ascertain the truth of his own conjecture. The young wife followed him. The result, however, was, that the child could not be seen or heard of in the ship. The captain began to look gloomy, and the company on board the steamer were again in a buzz of sympathising curiosity. Conjecture once more was busy, though it could only tend to one single point—that the child was overboard. But how it had got overboard was the question. Being but five years of age (the eldest of three who had been with the mother), he could scarcely be supposed to have climbed the side of the vessel, even if he had been desirous of looking over into the water. How then could the thing have happened?

One man only could throw a single ray of even conjectural light on the fate of the child. This passenger stated, that, while he had been seated by the side of the vessel occupied in reading, and in such a position that his eye could see the water nearly to the side of the boat, he had at one time got a momentary glance of what seemed to him a piece of paper or rag on the water; but, through the motion of the vessel, the object had been but an instant before his sight, and could scarcely be said to have occupied his thoughts for a second's duration, if at all. Shortly afterwards, he observed another circumstance which he did not then suppose to have any connection with what he had previously seen. This was the open state of the gangway door, or that portion of the bulwark which is so constructed as to open for the admission of passengers and goods. On observing it open, he had risen to shut it, but thought no more of the matter. Both incidents were so trifling that he could not say at what period of the voyage they had taken place.

The passengers and captain proceeded to the gangway door. The bolt was examined, and it was found on trial, that the wood beneath the staple, and the staple itself, were so much worn away, as to cause the door to burst open to the outside, on the instant that any force was applied to it from the deck or inside. Every face looked sad, and yet satisfied, at this discovery. Here was, in all human probability, the place and the cause of the child's unhappy disappearance; and the object seen on the water by the reading passenger confirmed the supposition. We remember feeling pleased with the conduct of an Englishman present on the occasion. With the straightforward

and fearless candour of his country, he openly administered a severe reprimand to the captain for his carelessness in permitting the gangway door to remain in such a condition. "It is nothing less," said the rebuker, "than a direct trap for children! Where can they think themselves safe, when agitated by natural fears at finding themselves for the first time in a ship, if not when they sent themselves on deck, and lean for firm support against the vessel's sides? This child has entertained the thought, and has fallen a victim to it."

Who can describe the state of the poor mother all this while? When the discoveries just related had been made, hope seemed to take flight for the first time. Her exclamations went to the heart of all on board. She was the wife of a humble tradesman in Glasgow, and her children having been attacked by an epidemic, she had been sent by her husband to take a trip down the Clyde and up again, in order to speed their convalescence. "Oh! what will their father say?" was her constant cry: "I took three away, and bring home but two! What will their father say!" The prospective distress of her husband seemed to pain her more than any thing else, yet, ever and anon, all feelings but the mother's departed, and she shed the agonising tears of a "Rachel weeping for her children." While glancing now and then at her grief-steeped countenance, which was naturally a comely and interesting one, every person on board that vessel would have given much to have been able to alleviate her distress, and when the boat landed at the Broomielaw, many were eager to assist her on her course homewards. But she was accompanied by a friend of her own sex, who precluded the necessity of any such aid. With this person, then, she wended her way to the home, which, for the first time, probably, she felt reluctant to enter. What were the feelings of the father on hearing of the accident, can only be imagined.

I afterwards learned that the distress of the honest pair lasted but one night. Joy came to them with the morning—and the Greenock coach; for in that vehicle, before breakfast-time, arrived the missing boy. As conjectured, he had fallen backwards through the treacherous gangway door, and been precipitated into the water. The receding tide had carried him rapidly down the river for a short space. Luckily he was observed from the Irish steamer, the captain of which instantly stopped to pick him up. This was the cause of the bustle we had observed in that vessel, and I now wondered that no one had thought of the possibility of such being the case when the mother was weeping for a lost son. By using the proper exertions life had been restored to the poor child, and when they reached Greenock, the parties on board left him to be sent back to his parents, each contributing a trifle to pay the necessary expenses. I could not help thinking it almost worth while to have a son thus endangered, and suffering the acutest pain on his account for a night, in order to draw forth so much good feeling from one's fellow-creatures, and experience so joyful a relief from temporary sorrow.

THE SHAH OF PERSIA.

His majesty was seated near the window, supported by a pile of cushions, while a single attendant knelt behind him, waving a broad fan of feathers above his head. His dress was, as usual, perfectly simple: the rich jewelled handle of his dagger alone betokened his rank. His age does not exceed one or two-and-thirty, but his thick beard and heavy figure make him appear an older man. His countenance is rather handsome, and, except when his anger is excited, of a prepossessing and good-humoured expression; his manner, especially towards Europeans, is extremely affable; he generally speaks Turkish, the language of his tribe, but, both in that and in Persian, his enunciation is so rapid, that it requires some practice to understand him. Compared with the generality of Asiatics, the Shah is a man of considerable energy, and by no means deficient in information; he is well versed in the history of his own country, and has a tolerably correct idea of the geography and political state of Europe. His army is his hobby, and to his thirst for military fame he sacrifices both his own ease and comfort, and the welfare and prosperity of his own country. His court is far inferior in style and splendour to that of his grandfather and predecessor, the principal offices of state being occupied by men of low origin, deficient in that magnificent courtliness of manner which formerly distinguished the Persian noble. The late king was always attended by a numerous and gallant retinue of princes of the blood and officers of state, besides a crowd of inferior retainers; the present monarch often rides out with a few ill-mounted and worse-appointed followers. The Shah is a strict and conscientious Mussulman; he never indulges in the forbidden juice of the grape, an abstinence rare in a royal family; nor does he follow the universal practice of smoking. His harem, unlike that of his grandfather, the number of which exceeded all credibility, is within the limits prescribed by the Mohammedan law. Well would it have been for Persia and Fatteh, had Ali Shah been as moderate; for every government, however significant, was conferred upon one of his countless sons, who drained the very heart's blood of the country. Since the accession of the present monarch, the greater part of these have been removed, and many of them are now reduced to the utmost distress, living from hand to mouth by the sale of shawls and jewels, the relics of better days. Some of the late king's wives have passed into the harem of private individuals; others, who had amassed some property, live in their respective villages. Mahommed Shah has two sons; the eldest, the destined successor, is now at Tabree, under

the care of Suleman Khan, his maternal uncle. The mother of the boy was of the royal tribe. The second, who resides at Tehran, is a chubby little fellow, about three years old, the son of a Koordish woman.—From *Wilbraham's Trans-Caucasian Travels*.

THE SABBATH MORN.

BY CHARLES SWAIN.

[From a Miscellany published at Huddersfield, in aid of the Sunday and Infants' School of that place.]

Light of the Sabbath—soul-awakening Morn,
Thou mirror of the mystery above!—
Oh! sainted day, on prophet pinions borne,
How waits the heart thy solemn rest to prove;
How longs the soul with Deity to move,
And drink thy deathless waters!—and to feel
Thy beauty—and thy wisdom—and thy love—
Sublimely o'er the soaring spirit steal,
Till ope the heavenly gates JEHOVAH to reveal!—

Whilst, mounting and expanding, the Mind's wings
Thus like a seraph's reach eternal day;—
Futurity its starry mantle flings
And shrinks the Past an atom in its ray!—
So mighty—so magnificent—the way
Which leads to God!—so endless,—so sublime!—
The skies grow dark, THEIR grandeur falls away
Before the wordless glory of that clime
Which feeds with light the suns and thousand worlds of Time!—

Light of the Sabbath—soul-awakening Morn;—
Take me, Religion, on thy holy quest;—
Lead me 'mid desert hills, the wild and lorn,
To mark the lowly shepherd hail his guest
And bless the Voice which ever leaves him blest!—
Makes his rude cot an altar to God's praise!—
Where 'neath a mother's pious bosom prest,
His child, with little hands, and upward gaze,
Pleads for its parents' health, and happy length of days!

Sun of the Sabbath—lead me to the vale
Whose verdant arms enfold yon village fair;—
Afar from towns where passions stern prevail,—
Afar from Commerce and her sons of care—
Guide me where maidens young for Church prepare
In cottage grace—and garments Sunday-white!
With reverent step, and mild submissive air,
Oft let me hear their tuneful lips unite
To hail with humble hearts the Sabbath's sacred light!

Oh, sight the loveliest human eyes e'er found!
To view two sisters o'er the same page bend,
Their lovely arms each other's waist around—
Their soft, bright hair in careless ringlets blend—
Their mingling breath like incense sweet ascend
Over God's Book—His angel-book of Truth!—
Their hearts, minds, feelings, all emotions lend
A vision of that paradise of youth
Ere Adah's beauteous form drooped 'neath the serpent's tooth!—

Morning of worship!—with thy beams arise
Devotions sanctified by memories dear;
With thee the hymns of Nations wake the skies!—
The broken prayer;—the sinner's contrite tear;
Hail, blessed morn, that brings the distant near;
Bids kindred meet the hallowed page around;—
Pours comfort in the friendless Widow's ear,
For Who the wild birds fed whilst Winter frowned,
Will succour her poor babes when she sleeps in the ground!

Some hand, she prays, an INFANT SCHOOL may raise!—
And learn—oh task divine!—their lips to bless!
Teach them that hope the Book of Christ conveys,
To be their consolation in distress!—
And He—the father of the fatherless—
The sheltering wing of the poor orphan dove,—
God,—more than words may show—or thought express,—

Shall aid them with his own almighty love!—
For Angels plead for these—the motherless!—above!
Hail Sabbath hour!—Hail comforter and guide!
Hour when the wanderer home a blessing sends;
Hour when the seaman o'er the surges wide
To every kindred roof his heart extends!—
Hour when to all that mourn thy peace descends!
When e'en the captive's bonds less sternly lower:—
Hour when the Cross of Christ all life defends;—
Hour of Salvation!—God's redeeming hour!—
Eternity is thine! and Heaven-exalting power!

PEOPLE'S EDITIONS

OF APPROVED WORKS IN ALL DEPARTMENTS OF LITERATURE.

Recently published in this series of cheap works,
THE SABBATH, & OTHER POEMS. By J. Grahame. Price 5d.
ADVENTURES OF CALEB WILLIAMS. By Godwin, (objectable passages expunged) 1s. 3d.
TRAVELS in the EAST, including a JOURNEY in the HOLY LAND. By A. de Lamartine. A New Translation from the French, with Notes, and a Memoir of the Author 3s. 9d.
INCIDENTS OF TRAVEL in EGYPT, ARABIA PETRÆA, and THE HOLY LAND. By George Stephens. (Reprinted from the Sixth American Edition) 1s. 10d.

Original Work, in connection with the People's Editions,
A TOUR in HOLLAND, the COUNTRIES on the RHINE, and BELGIUM, in 1838. By William Chambers 1s. 6d.

These works are published by W. and R. CHAMBERS, Edinburgh, and W. S. ORR and COMPANY, London; and are sold by all Booksellers.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE,"
"CHAMBERS'S EDUCATIONAL COURSE," &c.

PRINTED BY BRADBURY AND EVANS, WHITEFRIARS, LONDON.

NUMBER 397.

SATURDAY, SEPTEMBER 7, 1839.

PRICE THREE HALFPENCE.

A FEW HINTS RESPECTING MENTAL ABILITY.

MENTAL PHILOSOPHY is not, we believe, a favourite study. Its importance is not denied; but the power of comprehending it is felt by few. Is it not possible, nevertheless, that we might succeed, in our own way, in elucidating a few of the truths which bear the strongest reference to human convenience and happiness? Let us try.

In the general ignorance on the subject of mind, it is not wonderful that the very first principle has no abiding place amongst the ideas of most of us—namely, that the thinking, willing, and sentimental powers, are dependent, in our present form of existence, on that part of our organic structure termed the nervous system. From this not being generally acknowledged, or, if acknowledged, not seriously reflected on, very grave results arise. The intellect is used as if it were not capable of injury from any cause, whereas, in reality, it is as liable to be both structurally and functionally hurt as any other organ of the body. Were we to consider digestion as a total abstraction, and treat the stomach as if it were something which had nothing to do with food, we should not be committing a more dangerous mistake. On the contrary, if the true state of the case were thoroughly understood, a regard would be paid to the laws of the nervous system; its health would be sustained by an observance of the proper rules; or, if lost, would be restored by a recourse to the proper remedies. Many of the evils which at present beset the race, would be avoided, particularly in the more advanced countries, where mind is most apt to be kept in high action.

It is also very desirable that the fact should be generally known, that the mental system is not one, but a cluster of faculties, and that the endowment of different beings with each of these faculties in varied proportions, is what produces the wonderful variety of mental character observable in all kinds of society. There are no two trees alike; neither are there any two men. Some slight difference of organisation in one part is enough to produce a variety. As the twenty-four letters of the alphabet can be combined in a variety of ways amounting to millions of millions, so may the somewhat greater number of the mental faculties be combined in still a greater variety of proportions; so that it is not necessary that any two persons from the beginning of the world should have been quite alike. Seeing that this is a decree of nature, why should we so much fall out with each other for difference of character?

The providential end of a variety of endowment, is obviously variety of service in the general economy. Some are endowed for one purpose in life, and some for another. Difference of endowment is one thing; but the capability of each faculty to acquire, in the course of existence, both greater strength and greater facility of action, is another. This is to be done by exercise, just as the arm will get stronger and more ready to act, in consequence of its muscles being frequently brought into play. It is obvious that the different degrees of exercise given to faculties by different men, must add to that variety of character which is found in the race. Even were two men any where born alike, it is likely that the different circumstances in which they would be reared, and the different play thus given to various faculties, would ere long make them dissimilar. It is the efficacy of circumstances and training which causes each country to assume the character of the one preceding it, whether that character be barbarous or civilised. It is upon this fact that the views of modern educationists are founded; they wish, simply, to modify the native character to the utmost

possible advantage. The new generations, however, of a civilised country, are not exactly the same in native organisation as those of a barbarous one. Organisation itself becomes modified. The brain of the son is, in the generality of instances, the better that the brain of the father has been well exercised and kept in good regulation—an additional reason, of course, for all efforts being made to train the community as well as possible.

While acknowledging this great law, we must keep its limits steadily in view. Using the intellectual powers will improve them, but only to a certain extent. It will not make any one intellect as good as any other intellect. We often hear such maxims as that nothing is denied to diligence and application. Sir William Jones, singularly endowed as he was, used to say that no intellectual eminence which had ever been reached by one man was unattainable by any other; and even Franklin, with all his sagacity, was of opinion that the only differences amongst men were in their comparative industry. Under the influence of these delusive notions, young men are urged to prosecute tasks and enter professions for which they are unfit. In reality, a vast number of things are denied to diligence and perseverance. A faculty of certain power might exert itself never so much or so perseveringly, in a certain line of study, without success, if the study were of a nature to require such a degree of power as no exercise could ever give to that faculty. Intellect A may go the length of three inches by native power, and by diligence might be made to go six, but if Intellect B be only qualified to go one inch by nature and two by diligence, its going to three or six is a thing not within the bounds of possibility. All this may well be, though the important fact remains that each can be made to go to much more than its own native power by diligence. There is one feature of mind in which very great differences are seen to exist even amongst able persons. Some comprehend abstract subjects much better than others. In this line, above all others, we would say, it is hopeless to push one mind to the triumphs achieved by another. The narrative intellect of Scott might have been stretched to cracking before it would have taken up what was simplicity itself to the metaphysical Stewart. So may a youth of excellent intellect for high reasonings, but no great aptitude for the acquisition of language, be strained in vain to the latter pursuit, while perhaps a boy of only moderate reflective talent, but well endowed with the faculty for expression, will easily outstrip him in that walk. These are things which ought to be universally known, but in point of fact are scarcely known at all. With parents and teachers, diligence is every thing—natural power and aptitude nothing. Study is entirely a question of time. "How many hours a day does he devote to his books?" is the only consideration. The youth who gives fourteen is great, but he who gives sixteen is a hero—when the fact is, that more than ten is sure to injure health. A person of high reputation, on being elected a few years ago to the rectorship of the Glasgow University, chiefly insisted in his address on the value of diligence. The glories of a Smith, a Watt, and a Simson, were held up to imitation, as if all were capable of becoming Smiths, or Watts, or Simsons, if they chose. There is, in this, a cajolery that would be ludicrous were it not hurtful. Some years ago, when we chanced to visit this very university, we heard of an uncommonly diligent young man, the wonder and praise of all who knew him. It was told to his honour, that he was sometimes nineteen hours at his books in one day. Next time we visited the same city, on inquiring for the same person, we learned that he was in the asylum for the insane.

The frequent occurrence in our obituaries of such notices as—Died, aged nineteen, such a person, student of such a thing, to the great grief of his friends, and with the regrets of all who knew him—speaks to the same error. Such events are looked upon as inscrutable; and so they are in the great sense—but, as to their proximate causes, they are, to any one who has studied the laws of our mental organisation, no more mysterious than a cold from sitting in a draught, or a cholera from overloading the stomach. Ignorance is alone to blame. The error unfortunately is not confined to those whose children or pupils are of average or below the average intellect. All must be driven to top speed, the clever as well as the dull. We verily believe that, though a child were to master plane geometry at five years of age, the happy parents of the prodigy would not be satisfied till they had pushed him into conic sections. What a learner acquires easily by dint of natural aptitude, seems as nothing at all. There is no thorough satisfaction unless he devotes some preposterous and anti-natural space of time to his books, and encounters some tremendous difficulties, such as even mature intellects might shrink from. It is clear that there can be no great improvement till more correct notions are attained of intellect and its modes of manifestation. Till it is fully seen that the minds of individuals are different, have different powers, different aptitudes, different inclinations, and that one may easily master what another would vainly endeavour to comprehend, we shall witness the same monstrous mistakes, with all their fatal results.

It is remarkable that most of the mistakes about mind arise from well-meaning. The mind is not always in possession of its ordinary strength—neither at different times of the same day, nor at different times of the same life. One discovers in himself, we shall say, a disinclination to the continuance or renewal of a certain task. He would rather play. This, however, his conscientiousness sets down as an emotion of folly or love of nonsense; and resolving to check all such impulses, he forces himself to work. Now, in all probability the disinclination arose from nothing but the exhaustion of the organs. It was exactly the same phenomenon as the sense of a wearied pair of limbs after a walk of twenty miles, and a dislike to take once more to the road. The disposition to take a little amusement, or to do nothing, was simply the voice of nature prompting what was the proper course in the circumstances. That voice ought to have been attended to; but, such not having been the case, the organs of course are tasked beyond their strength, and a certain injury ensues. Many a man has thus had himself conscientiously *knocked up*, if not altogether destroyed. There is the best of meaning; but then there is ignorance too, and there are few more dangerous or mischievous things in the world than ignorant well-meaning. We have said that the powers of a certain mind will vary at different periods of the same life. It is in youth, chiefly, that these variations are observed. Many boys have what is called a dull year. It most frequently occurs about the ninth or tenth. They then disappoint all the hopes that were formed of them, by standing at the bottom instead of the top of their classes. They seem to have contracted a dislike for books, and are only anxious about play. These symptoms are bewailed and checked. The efforts of teachers, under the eager sanction of parents, are increased, but all in vain. The fact is, the muscular system has taken to growing, and is engrossing some influences which formerly went to the support of the nervous system. The latter is for the present in abeyance, to allow the former to make an advance which will ultimately be for the benefit of both. The

dispositions thought to mark a moral falling off in the boy, were only the voice of nature calling for exercise to what was growing, and repose to what was weak. Pushing a poor child in such circumstances is the height of cruelty, and apt to be grievously hurtful. Between fourteen and seventeen, another similar period of nervous inaction often takes place. At whatever time such an event should happen, it is the clear duty of those who have any interest in the patient (if satisfied that there is no shamming) to allow nature to have her way. Intellectual education ought then to be slackened, and physical education almost alone attended to.

The writing of the words within parentheses reminds us that, by the acknowledgment of some of the above truths, it may be presumed that illness receives some encouragement. Perhaps there is a little danger on that side too; but we are satisfied that there is not nearly so much as in the opposite direction. The misbeliefs arising from the overstraining of naturally weak faculties, or of faculties in a temporary state of weakness, are gross, open, palpable—while it seems extremely doubtful if any real good is ever realised from the same course. Let us, in the first place, get this evil corrected. If any idle fellow be disposed to take advantage of the doctrine to plead for his favourite indulgence, a little good sense will easily detect the trick.

THE LOST CHILD.

BY MISS TRAIL,

Author of "the Backwoods of Canada."

AMONG the many casualties and accidents that befall the inhabitants of this forest land, there is none of more frequent recurrence than that of persons being lost in the woods.

There are, I believe, few persons that have not at one time or other experienced the miserable consciousness of finding themselves bewildered in the trackless mazes of the forest, without possessing the most distant clue to guide them to their homes. Many are the interesting stories of this kind that have been related to me, and many are the facts that have fallen beneath my own knowledge; some of which have ended in melancholy tragedy, others more fortunately.

The following advertisement, which appeared in the *Cobourg Star*, dated August the 2d, 1837, excited the interest of all classes of people in the district, but more especially of those persons inhabiting the vicinity of the spot where the child's friends lived:—

"CHILD LOST! L50 REWARD.—Lost on Saturday last, the 29th of July, on the road leading from Bow-skill's mills to Foe's tavern, near the Rice Lake Plains, a child about six years old, the daughter of Mr Thomas Eyre of Hamilton, near Cobourg. She wore a blue plaided satin frock, and was without her bonnet. Whoever will give such information as may lead to her discovery, shall receive the above reward.

THOMAS EYRE."

I shall also copy the accompanying paragraph, which contains some particulars respecting the child not contained in the advertisement; it is as follows:—

"One of those afflicting accidents which occasionally call forth the sympathy of a whole community, has just transpired in this neighbourhood, and is now occupying the attention of all classes. Its nature is briefly told in the above announcement, which informs us that a child has been lost, and is now wandering alone on the Rice Lake Plains, or may be dead.

On Saturday last, Mr and Mrs Eyre of Hamilton, with a party of friends, went to gather huckleberries on the plain, and enjoy the pleasures of a picnic. Having dined, they proceeded to gather the berries, in which occupation the children participated with all the eagerness and heedless avidity that characterises their age, wandering gaily from bush to bush, thoughtless of any danger; but, alas! one of the little party was destined to pay fearfully for its temerity. On mustering to return home, Mr Eyre's little daughter, Jane, a fine child about six years of age, was missing from the party, and, notwithstanding an active and immediate search was commenced by the whole party, consisting of not less than thirty persons, and which has since been continued by hundreds of people from this and the adjacent townships, she still remains undiscovered, having been now four nights and three days alone in the wilderness, without food and without shelter, otherwise than what the bushes and trees may have afforded her.

We hear that nearly a thousand persons humanely assisted the distracted parents in their search for the poor little wanderer yesterday, and that a party of Indians started in quest of her, headed by Captain Pantosh. We sincerely hope before this time some trace of her may have been found.

In addition to the reward offered by Mr Eyre for the recovery of his child, we learn that Lieutenant Rowe, his neighbour, has most generously pledged himself to add a further sum to the Indians of 100 dollars, should they succeed in finding her alive. Mr Rowe has been indefatigable in his personal exertions, having been out night and day since the search began.

THE CHILD FOUND.—Intelligence has just reached us that the child was found this morning (Thursday) near Cold Spring, alive and well, after having wandered in the woods five days and nights."

I learned the following interesting particulars from a gentleman who was himself one of the active searchers for the lost child, and who arrived on the spot

where the Indians found her a few minutes after the poor thing had been conveyed to the arms of her afflicted parents: thither he followed at full speed, to learn the state in which she was. "I found the poor child," he said, "lying on the same bed with her father, who was completely worn out with grief and fatigue. The child was greatly emaciated, and presented a pitiable spectacle; her poor hands, face, and neck, were blistered and burned with the sun, while her clothes were rent in tatters, and her feet torn with briars. She never complained of hunger, though she said she only tasted a few berries from the time she was lost to that very day, but appeared to suffer the most tormenting agonies of thirst. It was thirst in the first instance that had led her to absent herself from the rest of the party. She had taken a saucer in her hand to search for drink; a hope she had never lost sight of, for she still retained the saucer in her feeble grasp when found. She said she had wandered a long way in search of water, but found neither creek nor spring. On being questioned if she had heard the voice of the party in search of her the first day, she said, 'Yes, but as she did not hear her papa's voice, she would not answer; she did not see any of her own folks, and she was afraid to speak.' This unaccountable timidity proved the cause of all her own prolonged suffering, and the anguish endured by her distracted parents. Each day, she said, she heard people out in search of her, and she grew more and more alarmed lest she should fall into the hands of strangers, who might take her away; so she hid herself, and once lay down under some logs and bushes when a party were coming near her; but the last day she was so thirsty, and felt so ill, that she thought she would not hide herself; so she climbed up on a high log, and held up her hand, hoping some one would see her, and take her to her papa, and give her drink. It was fortunate for the poor little wanderer that she came to this resolution before it was too late, for exhausted nature must soon have sunk under the privations she endured. It is remarkable that the spot where she was found was not a mile from the place where she was first missed, and where she must have been discovered very soon after she was missed from the party but for her singular timidity. A few days' careful treatment soon restored the runaway to her former health and spirits; and, young as she is, her adventure on the Rice Lake Plains will not easily be effaced from her mind."

A circumstance of a similar nature occurred some time back in the province of New Brunswick, in the township of Sidney (I think it was); but in this instance the little heroine of my tale displayed a very different disposition; and as it may not be uninteresting to trace the different workings of the infant mind under parallel situations, I shall simply record the circumstances as they occurred: to the best of my recollection they were as follow:—

Somewhere about three years ago, a young gentleman who had been out for some days on a hunting or shooting expedition, reached the banks of Bear Creek, which he was desirous of crossing, being anxious to make his way home before nightfall. To his disappointment, the log-bridge which he had passed the day before had been carried away by the current, which happened to be very strong in that place. Remembering, however, having noticed a fallen tree across the stream lower down, he pursued his way. Just as he had reached the spot, and was preparing to cross over, his ear was attracted by the sound of footsteps upon the dry sticks; the sound was accompanied by a cautious rustling movement among the thicket of wild raspberries that covered the opposite space; with the alertness of a sportsman anticipating a shot at a deer or bear, his finger rapidly found its way to the lock of his rifle; and while his keen eye was warily fixed on the bushes, a slight attenuated hand, stained purple with the juice of the berries, was quietly raised to reach down a loaded branch of fruit; another instant, and the fatal ball had been lodged in the heart of the unconscious victim. A cry of terror and of thankfulness burst from the lips of the hunter as he sprang with eager haste across the stream, and approached the child. It was a little girl, apparently not more than eight years old; her torn garments, soiled hands, dishevelled locks, and haggard face, betrayed the fact that she had strayed from the forest path, and been lost in the trackless wilderness. The child appeared overjoyed at the sight of the stranger, and told her artless tale with a clearness and simplicity that drew tears from the eyes of her preserver, who felt, indeed, as if he had been an instrument in the Divine hand sent to rescue the forlorn being before him from a melancholy and painful death. Had not the loss of the bridge led him to seek another spot whereby to gain the opposite bank, she would in all probability have perished on that lonely spot; but it was ordered otherwise, and the heart of the young man was filled with grateful emotion. He learned from the child that she had been sent by her mother to carry a basket of food to her father, who was chopping in the wood near the house, but that, by some mischance, she had strayed from the path, and, misled by the echo of her father's axe, she had wandered away in an opposite direction; every attempt to retrace her steps only led her deeper and deeper into the

wood; but still she went on. At first, she said, she cried a great deal, but finding her tears and lamentations brought no relief, she consoled herself with eating some of the food she had brought with her. When night came on, she was overcome with weariness, and lay down to sleep in a sheltered place, and rose with the first sound of the birds to pursue her hopeless way. When she had exhausted the provisions in the basket, she beguiled her sorrows by seeking for herbs and berries. Fortunately it was the season of summer fruits, else the poor wanderer must have perished. On the third night she lay down to sleep, and heard, as she supposed, the tread of cattle near her. She said she was very glad, for she thought the dark creatures she saw moving about in the dim light must be her father's oxen; and she called to them very often, "Buck, Bright," but they did not come nearer, and she wondered she did not hear the ox-bell. Another night, she said, she saw two great black shaggy dogs, which she thought were neighbour Hewet's dogs; but when she called them by their names, they stood up on their hind legs, and looked hard at her, but did not come near her, and soon went away into the wood; and she knew they were dogs, for that night she heard them howling. In all probability these animals were bears, for the woods abounded with those animals, and the stream the hunter had crossed bore the name of Bear Creek; the howling most probably arose from wolves, but her innocent heart knew no fear. The day after this she found herself near a deserted shanty; the clearing on which it stood was overgrown with strawberries and raspberry bushes; and here she remained picking the berries, and sleeping beneath its sheltering roof at night. She led the hunter to her solitary hut, where he proposed leaving her whilst he went in search of help to convey her home, or to some dwelling-house; but the little creature clung to him with passionate weeping, and implored him so pathetically not to leave her again alone in the dark lonely forest, that his heart was not proof against her entreaties, and, though weary with his own wandering, he took the little foundling on his back, and proceeded on his journey, occasionally resting on the fallen timbers to ease him of his burden. The shades of night were closing in fast upon them, and the weary pair were making up their minds to pass another night under the shade of the woods, when the sound of water, and the working of mill-wheels, broke upon their ears, and soon the light of the last glow of sunset broke through the trees in the distance, and the child, with a shout of joy, proclaimed they must be near a clearing at last, for she saw light through the stems of the trees. Gladly did the poor wayworn travellers hail the cheerful sight of the mill, and the neat log-house beside it, and gladly did the kind inmates of the place receive and cherish the poor lost child, who had been sought for till hope had departed from the hearts of her sorrowing friends, and she was reckoned among the dead. She had wandered away miles from her home, and been absent many many days; but she had been supplied with water and fruits, and her spirits had been wonderfully sustained during her wanderings.

MARSHALL ON MALINGERING.

"On the Enlisting, Discharging, and Pensioning of Soldiers, with the Official Documents on these Branches of Military Duty; by Henry Marshall, Deputy-Inspector-General of Army Hospitals," is a title from which the public at large could scarcely expect matter of a kind likely to interest them; yet the book so designated* does present a considerable range of facts of a curious and instructive nature. Those parts which relate to the discharging of soldiers, present some most remarkable details of what is usually called *malingering*, or the simulation of diseases, in order to effect a discharge from service. The practice of malingering has long prevailed in the army, to an extent of which the public at large have no conception. During the late war, or, to speak more correctly, between the years 1806 and 1829, a soldier had two prizes in view if he could successfully feign a disability for service, namely, his discharge, and an annuity for life. A strong temptation was thus held out to malingering. But, by a regulation or warrant of 1829, although a discharge may be obtained, there is no chance of a pension for life being granted without long previous service. The inducement being thus diminished, the practice has naturally become less common, and happily so for the military surgeons, who occasionally suffered an incredible degree of trouble and annoyance from this cause. With such a reward before them as a life of pensioned ease, the malingerers, to gain their end, resorted to the most ingenious tricks at times, bore with unflinching fortitude whatever trials they were subjected to, and often mutilated themselves in such a manner as to render limbs or eyes useless for life. In fact, by perseverance and constancy they very frequently attained the desired object. "Old soldiers (says Mr Marshall) who prosecute their schemes with art, who possess

* These plains are not, as their name would infer, mere level tracts of country, but comprise large extents of hill and dale, beautifully diversified with groves of oak and scrubby pine, rich pasture, and open spots of luxuriant herbage, intermixed with low shrubs, and an abundance of wild-fruits and flowers.

* Blacks, Edinburgh, 1830.

great fortitude and an inflexible resolution, will, I believe, commonly succeed in obtaining their discharge, either by making falsehood appear more probable than truth, or perhaps more frequently by exhausting the patience of medical and commanding officers. Many a simulator will hold out not only for months, but for a number of years, passing his time chiefly in hospitals." The strait-waistcoat, the log, and the solitary cell, have often been tried on them in vain.

Diseases of the eyes were very frequently counterfeited by malingerers, and for good reasons. "For a great number of years (says the volume before us), partial or total loss of sight was in an especial manner held to confer a claim to a large pension for life. The bounty of government was followed by a great increase in the number of men disabled by impaired vision; and factitious inflammation of the eyes was carried to a very great extent in the British army. The alleged means employed in factitious ophthalmia are lime, corrosive sublimate, tobacco, ashes, &c. As soon as a regiment was ordered to the West Indies, or any other unpopular station, disease of the eyes became common among the men, and continued so till the corps had embarked. The number of cases then decreased, and no more was heard of it until the period when a detachment was ordered to embark for the service companies." The following cases will give an idea of the means resorted to by the soldiery to produce inflammation of the eye. "In 1809, three hundred of the men of two regiments which were on duty at Chelmsford became affected with ophthalmia; the healthy men of both corps were transferred to another station, while the sick remained in hospital, but under strict military control. Information reached the commanding officer that one of the nurses was in the practice of going to a druggist's shop for the purpose of purchasing drugs, by which means his suspicions were excited, and, in conjunction with the medical officer, a successful attempt was made to discover whether the men had any articles in their possession which might be employed to excite inflammation of the eyes. The commanding officer entered one of the wards, which contained twenty-four men, about midnight, and ordered them to form rank entire in a state of nudity, and they were in that condition marched into an adjoining empty ward, which had been prepared for their reception. The old ward was secured for the night, and next day the beds were examined, when a number of parcels of corrosive sublimate were found concealed under the clothes. Means were taken to prevent a fresh supply of this drug, and in a very short time two hundred and fifty of the men recovered, and were transferred to their respective corps." Another common way of producing this disease was by anointing the organ of sight with the noxious matter of ulcers. But malingerers would often go the length of destroying one eye utterly. "The late Mr C—, surgeon to the — regiment, brought two men before a court-martial, one for submitting to have an eye destroyed, and the other for actively abetting him—in fact, for performing the work of destruction. The instrument employed was a common table-fork. Mr C— saw the operation performed through the key hole of the ward in which the men were accommodated." The men were found guilty, and punished. Under the old system, the loss of vision in one eye, provided the party could make out a plausible story of accidental injury, would have gained a discharge and pension for life; but, by a new regulation, the possession of perfect vision in one eye is held sufficient for the purposes of the service, and, accordingly, the crime alluded to is now unknown.

Deafness is another favourite pretence of malingerers, and as the defect may really exist without the slightest vestige of outward affection, there is great difficulty for the most part in detecting the imposture. Sometimes, after all ordinary means have been tried in vain—after pistols have been fired close to the patient's ear without seeming to startle him from his slumbers—a little finesse will throw the impostor off his guard, and lay bare his deception. "A recruit from Cork, who joined the depot of the East India Company at Chatham, alleged that he had almost totally lost the sense of hearing. Dr Davies, surgeon to the depot, admitted him into hospital, and put him upon spoon diet. For nine days Dr Davies passed his bed, during his daily visit to the hospital, without seeming to notice him. On the tenth day he felt his pulse, and made signs to him to put out his tongue; he then asked the hospital serjeant what diet he gave the man. 'Spoon diet,' replied the serjeant. The doctor affected to be displeased, and, in a low voice, said, 'Are you not ashamed of yourself? The poor fellow is almost starved to death. Let him instantly have a beefsteak and a pint of porter!' The recruit could contain himself no longer. With a countenance expressive of gladness and gratitude, he addressed Dr Davies by saying, 'God Almighty bless your honour; you are the best gentleman I have seen for many a day!' Thus by playing on the poor rogue's better feelings, he was led to forget his cue, and regained that sense which the harshest treatment might never have restored. As these deaf impostors are apt to be troubled by puzzling questions, some among them have found it convenient to lose the faculty of speech also. A trooper, named M'Keon, stationed at Piershill barracks, pretended one morning to have become both deaf and dumb. Every possible scheme was tried to discover whether the loss was real or otherwise, but no noise, however loud, sudden, or artfully employed,

seemed to have the slightest impression on his organs of hearing. He was sent to the Edinburgh Infirmary, and after a time was dismissed as incurable. At the end of a year his defects were fully believed to be real, and he was so much commiserated, that an order for his discharge was procured. The regiment was then at Dundalk, and M'Keon was sent off to Dublin to pass finally at the Invaliding Board. On the first day's march from Dundalk, however, M'Keon allowed his joy to get the better of his prudence. He got intoxicated, and recovered suddenly the use both of tongue and ears. His astonished escort carried him back to Dundalk, but, on arriving there, M'Keon became as deaf and as dumb as ever. He was now sentenced to receive eight hundred lashes, but his astonishing perseverance once more staggered his medical attendants, and in place of being lashed, he was thrown into solitary confinement on bread and water, seeing and hearing no one. For three months longer he held out, and then pretended all at once that his faculties had been restored to him in a dream. He returned to his duty, but ultimately deserted, and was not again heard of. The self-command displayed by this man was something altogether extraordinary.

Hæmoptysis, or spitting of blood, is a disease which soldiers sometimes contrive to simulate, by getting possession of bullock's blood, or the blood of some other animal. The detection is not difficult, however, unless some agent assists the man habitually in keeping up the trick. Ulcers are another fruitful source of deception. By applying various substances to sores, malingerers are in the habit of preventing them from healing, and causing them, in fact, to spread or increase in size at will. In the knapsack of one malingering receipt were found, giving instructions for injuring an eye and exciting an ulcer. "Factitious blindness was to be effected by 'the prog of a needle in the sight (pupil) of the eye,' and after a pension had been procured, soft soap was to be applied to the eye, by which means it was stated that vision would be restored. To excite or irritate an ulcer, yellow arsenic was to be employed." Swellings and ulcerations on the limbs are also kept up occasionally in the way described in the following case:—"Mr Jones, inspector-general of hospitals, had a serjeant under his care on account of swelling and inflammation of the right leg, and the means usually adopted in the like cases were employed without success. Mr Jones at one time thought there was an abscess in the leg, and had a lancet in his hand for the purpose of opening it, but desisted. From the anomalous character of the symptoms, Mr Jones suspected that some means were employed to excite and prolong the affection, and with the view of discovering whether his suspicions had a good foundation, he visited the hospital one evening when he was not expected, and, promptly proceeding to the serjeant's bed, turned off the bed-clothes, and discovered the trace of a ligature round the thigh; for, notwithstanding his expedition, the cord had been removed and concealed. The swelling had almost completely disappeared by the following morning. It is worthy of observation (as a proof how much they will unflinchingly endure to gain their end), that the serjeant did not show the slightest reluctance to the insertion of the lancet when Mr Jones had it in his hand for the purpose." Swellings in different parts of the body are frequently produced by introducing air below the skin, into the interstices of the cellular membrane. But this is a trick more often resorted to by beggars than by soldiers, as military medical men can too easily detect such proceedings.

Being a disease seldom marked by any exterior symptoms, rheumatism, as might be anticipated, is a familiar complaint with malingerers. But those who simulate this disease do not escape without smarting severely for their imposture, as blisters and issues constitute the usual remedial means, and, when suspicion is aroused, are inflicted most lavishly on the body of the malingeringer. It is amazing with what courage and constancy they will bear the hardest trials of this nature. Mr Marshall says that there is perhaps no class of disabilities which requires more care and caution on the part of medical officers, than cases of alleged pains, rheumatism, lumbago, &c. The most experienced may be here deceived. Mr Marshall advises that no treatment should ever be adopted in any suspected case, for which the surgeon would feel regret if the disease proved real. The counsel is judicious and humane, and applies to every instance of asserted disability. In the case of pains, a little finesse will often disclose the truth. "The late Dr Davies, surgeon to the East India Company's depot, had a young soldier under his care, who alleged that, in consequence of a severe pain in the back, he was unable to move or to be moved from his bed. His alleged pain had existed for about a month, and still no indication appeared that he intended to return to his duty. For the convenience of being watched, &c., he was accommodated in a ward by himself. Dr Davies, who considered him an impostor, saw no prospect of his giving in, a circumstance which induced him to adopt a very simple measure for his detection. He went to the window of the ward in the dusk of the evening, and, after gently tapping upon the glass, he in a low voice called the man by name. The patient was at the window in an instant, and the doctor had the pleasure of congratulating him upon the recovery of his locomotive faculty. This man went forthwith to his duty." Sometimes, when blistering, cauterising, cupping, and such like painful remedies, fail utterly in

shaking the firmness of the impostor, a few nauseating doses, calculated bitterly to offend the senses of taste and smell, will answer the purpose. Assafoetida is well known to military surgeons as having most wonderful sanative powers in this way; and Dr Fallois, a French surgeon, relates that he once cured an inveterate rheumatic malingeringer by ordering large draughts of warm water.

Rheumatic affections frequently leave behind them permanent contractions of the limbs and curvatures of various parts of the body. Malingerers are aware of this fact, and nothing in the whole history of imposture is so surprising as the perseverance with which such contractions have been simulated by individuals at the expense of keeping the body or its members in most unnatural and painful positions for a great length of time. A soldier in India, named Fitzgerald, walked for eighteen months with his body bent forward in such a manner that his fingers nearly touched the ground. He declared himself totally unable to stand upright. At the end of the period mentioned, an order arrived, authorising commanding officers to re-enlist men whose period of service had expired, and at the same time to give them a bounty of sixteen guineas. Immediately after the arrival of the order, Fitzgerald coolly and impudently presented himself, erect as a church-wall, to be inspected by the very surgeon under whose care he had so long been. A similar case of crooked back, where the patient had long preserved the rectangular position, was cured by a very ingenious manoeuvre. The malingeringer, who, like Sir Archy Macsycophant, was disposed to "boo, and boo, and boo" for ever, was placed in a wide and deep cask, and water gradually poured into it, till he was compelled, in order to avoid drowning, to raise his head inch by inch, until at length he stood bolt upright for the first time during many months. Having no idea that he was put into the cask for any other purpose than to get his limbs pleasantly bathed, the impostor himself was most thoroughly surprised at the issue. Another clever scheme was hit upon by General Ross, to cure a contraction of very long standing in the right-hand fingers of a soldier of the 52d regiment. The general "directed him to be confined in a solitary cell, in which was an elevated shelf; his left hand was secured to his body, and a loaf of bread and pitcher of water were so placed upon the shelf that he could not partake of them without employing the contracted hand. At the end of the first twenty-four hours, the bread and water were untouched; but, by the termination of another day, the bread had disappeared, and the pitcher was empty. The soldier returned to his duty." In another case, a soldier in India complained of immobility of the right shoulder-joint, and for the extraordinary space of sixteen months, his arm remained in a projected position, forming a right angle with the shoulder. As his comrades and medical attendants declared that the arm continued always in this position, he was recommended for discharge, and was about to be sent accordingly to Britain. "Just on the eve of embarkation, however, the man in question was walking with a large bottle of arrack under his left arm, when a person approached him unperceived, and seized the bottle. Fearing that the prize might be lost, the malingeringer instinctively bent the right shoulder-joint, and firmly grasped the bottle with the right hand. This circumstance was accidentally observed by an officer who knew him; the man was forthwith tried by a court-martial, and sentenced to receive 1000 lashes."

With another extract, referring to a case of simulated palsy, we shall conclude our notice of this agreeable production. "The courage and coolness (says Mr Marshall) with which some impostors resolve to brave pain, is very remarkable. A private belonging to the — regiment complained that he had lost the power of his right arm, but, from the absence of any physical evidence of disease, the medical officer considered him a malingeringer, and tried various means to induce him to return to his duty, but without success. With the view of intimidating him, a proposal was made to amputate the arm, and, in prosecution of this object, an unusual degree of solemnity was observed on the occasion. All the surgical instruments that could be collected were exhibited; but, nothing daunted, he allowed himself to be conducted to the chair preparatory to the operation. The tourniquet was put on, and the amputating knife placed under his arm, ready to make an incision. He sat unmoved; the surgeon was puzzled, and made the best excuse he could for deferring the operation. Being still impressed, however, with the opinion that the arm was not disabled, he resolved to attempt another means of reaching conviction. He recommended change of air for some of his patients, and among others the case of alleged palsy. To reach the place where the surgeon professed he intended to carry the sick, it was necessary to cross a river in a boat. The party embarked, accompanied by the surgeon, who, by a preconcerted signal, directed the boatmen to throw the man in question (who, he knew, was a good swimmer) into the river. At first he used his left arm only, and after a little time seemed to be much exhausted from the exertions necessary to keep himself afloat by means of it alone. The surgeon became alarmed, and had just resolved to take his patient on board, when the fellow uttered an exclamation, and struck out vigorously with both arms. The evidence was conclusive."

The evidence which has now been laid before the reader, will be equally conclusive, we imagine, as to

the merits of this production. Mr Marshall has accomplished a very difficult task, in so far as he has rendered his volume alike interesting to the professional and non-professional portions of the public.

PICTURES OF THE FRENCH, DRAWN BY THEMSELVES.

UNDER this title we have a clever and amusing work, now in the course of being published in numbers.* It is translated from a Parisian publication, the plates of which are, we presume, obtained for the English reprint. In each number there are four characters—for example, the Literary Adventurer, the Political Lady, the Monthly Nurse, and the "Rapun." The object is, by drawing and literary description, to set forth, in an individual, the lineaments which may be presumed generally to characterise the class to which he or she belongs. A late or still current London work, of considerable merit, entitled "Heads of the People," has given the hint for this entertaining publication—the original of both being, of course, the well-known "Characters" of Theophrastus, written more than two thousand years ago. The strength of such *faciæ* lies in the prints, and the letterpress becomes a comparatively subordinate matter; it is only, however, of the latter that we can present any specimen. The following are some of the best points in

THE MONTHLY NURSE.

In Paris there exists, and flourishes, a very lucrative trade for women, which, though in some respects fatiguing, is admirably suited to the habits of the idle; for idleness is not exactly the result of a wish to do nothing, but arises rather from a dislike to uniform and constantly recurring labour. Many an idle man would readily consent to gain his bread by running about Paris, from seven in the morning till five at night, who could never subject himself to the restraint of holding a pen for three hours consecutively in a counting-house: the difficulty to him, and that which he finds most repulsive to his nature, is the steady pursuit of a fixed and settled occupation. Witness, for example, those men, who, holding no place in any class of society, have taken up the "profession" of rope-dancers, street jugglers, and so forth; "professions" which, well or ill, they exercise in the open air, exposed to all the hardships of the seasons, and often at the peril of their lives, when, with infinitely less actual exertion, they might become decent and respectable workmen. To deceive idleness, it suffices that you give variety to the labour you impose. The trade to which I am about to refer, secures, to those who select it, a life the most varied that can well be imagined.

Every month, and sometimes more frequently, Madame Jacquemart changes her dwelling and her bed (when circumstances permit her to sleep in a bed): makes acquaintance with new faces, and finds herself obliged to study new characters, with whom she must sympathise, if she desire to secure herself good treatment in the several houses she inhabits. Whether Madame Jacquemart has, or has not, a family and connections, is of little consequence, since she could never go to visit them, or receive them at her temporary abode; the most she can do is to pass forty-eight hours together, some two or three times a-year, with Monsieur Jacquemart—for Madame Jacquemart is subjected, like every other woman, to the conjugal yoke: she was even in haste to be remarried on becoming a widow, seeing that not only does she wish to find some one to receive her on the rare occasions when she returns to her home, but she cannot confide the care of her dwelling, and of the rather handsome furniture her two rooms contain, except to a well-assured person. She chose three days, therefore, between an inflammation of the lungs and an acute rheumatism, which demanded her attentions, to espouse Monsieur Jacquemart, which Monsieur Jacquemart, an office-waiter of thirty-three years' standing to the Minister of the Interior, established himself, thereupon, in the little manor of two rooms aforesaid, and comes every week to the address she points out, to bring her a change of dress, give her intelligence of her little dog and her canary, and receive the five shillings produced to her by each day and night, together with baptismal fees, &c. &c.—a sum which he is charged to deposit in government securities, and which she invariably gives to him undiminished, for never has she occasion to expend three farthings.† Their interviews, which are often interrupted by the summons of a bell, never last more than ten minutes; they take place in the anteroom or entrance hall, and do not permit a superfluous word to be spoken: it will, therefore, be at once perceived that they are not likely to sue for a divorce on the ground of incompatibility of temper.

Madame Jacquemart is evidently deprived of all those pleasures in which many persons of her class so exceedingly delight: the public walks, the theatres, the dancing assemblies, are things of which she remembers to have heard spoken in her early youth, but from the enjoyment of which she is interdicted. Should some chance present her with a few hours of leisure, she takes care not to lose them in useless runnings hither and thither, but goes to visit those whom she calls "her ladies," informs herself as to their condition, takes those to task who have suffered the year

to pass without demanding her cares, and ascertains precisely at what period this or that person, among her customers, will send to summon her. * * * She has contracted the habit of sleeping equally well day or night, and that whether on a sofa, in an arm-chair, or even on a three-legged stool; nay, at need, she will sleep as she stands! Thus the principal difference is, that Morpheus gives her her due in small change instead of paying her in larger coins; and she suffers so little from this, that no sooner does one arouse her for the performance of some service, than she springs to her legs with a look as cheerful and ready as if she wakened up naturally after a rest of seven hours' duration. Breakfast time being come, Madame Jacquemart receives an enormous cup of coffee, well softened with cream; this is one of the pleasantest moments of her day, for a beneficent fate has decreed that Madame Jacquemart should be the least in the world of a "gourmande." Living always with rich people, or at least with people in easy circumstances, she participates daily with great delight in the various savoury and nourishing dishes, with which she could not regale herself in her narrow home. At her dinner, her supper, and even at intervals between these two meals, comes a good glass of wine to lighten her spirits and keep up her strength; then she has her snuff-box, and from this she extracts, every five minutes, an amusement which gratifies her exceedingly, with the additional merit of keeping her awake: moreover, she has the comfort of not having to pore over a needle from morning till night, as doth many a poor seamstress, for some tennepence a-day.

One other enjoyment of Madame Jacquemart, and doubtless the most vivid, if we may judge by the almost general inclination towards it of the whole human race, is the pleasure which results from the power to command; for excepting the ten minutes of the doctor's visit, when Madame Jacquemart lays down her sceptre and bends respectfully while receiving his orders for the day, it is she who reigns without a rival in the chamber of her patient. No one may half open a door, light a taper, or mend a fire, till she sees fit, in her wisdom, that it should be done. However gently one knocks at a door, it is never softly enough; and for this she will reprove the very master of the house himself. She suffers no visitor to pass without having first well assured herself that he is in no degree offensive, nor without entreating him to speak in the lowest tones. If the slightest noise is heard in the most distant room of the house, she rushes out in a fury, "to silence those people who are going to make her lady's head ache."

Take care how you speak before Madame Jacquemart of any one disease under the sun: she has suffered them all—each and every! On this subject her knowledge is inexhaustible. Not only will she discourse by the hour of such ills as threaten her peculiar patients, but of all the maladies that flesh is heir to. There is no disease for which our nurse has not a cure; and she would undertake the most dangerous, as well as the most simple, with an unshaken reliance on her own skill. Thus, in the house she inhabits, no soul can give himself a sprain, or venture on a cough, but she will instantly settle what species of bath he must submit to, or what decoction he must swallow. Then her memory is so crammed with anecdotes of such miracles as are worked by leeches, infusions, fumigations, and so forth, that one might fairly call her a walking dictionary of domestic medicine.

The consciousness of her importance never deserts Madame Jacquemart, but this does not prevent her from divesting herself, on proper occasions, of a certain respectful stiffness that distinguishes her manner, and assuming an air of cheerful benevolence. This metamorphosis is effected in the course of her transit from the palace of a duchess to the back shop of a tradesman. She arrives at the house of Monsieur Leroux, a fat butcher of the Rue St Jacques, whose wife requires her help for the third or fourth time: she enters smilingly, and without ceremony, greets the shop-boys with a look of old acquaintanceship, nods at the little nurse-maid, and accosts the master with a friendly remark; "Here I am again, Monsieur Leroux!—well, so much the better; that dear Mrs Leroux; let's hope that we shall get through this affair as well as we have got through all the others." Here, all proceeds simply, with round unvarnished phrase, and in good "hail-fellow-well-met" style: the gossip with her patient never ceases, for Madame Leroux is much amused by relations that give her a view of high life, that describe elegant ladies, magnificent hotels—a thousand things, in short, connected with the great world, of which she could have no notion but for the details of her nurse; and Madame Jacquemart fairly revels in the delight of pouring forth her store of histories, tragic and comic. She is besides in excellent temper here, exacts nothing, gives trouble to nobody, is always ready to offer her little services in the household, and goes to the narrow kitchen to prepare her own coffee, "for you are not to suppose that I take the airs of a princess, because I wait on great ladies." The result of all this is, that Madame Jacquemart is treated at Monsieur Leroux's like a friend of the family; she takes her meals with them, and is present with the guests at the christening feast. When they sit at their daily dessert of cheese, Monsieur Leroux brings a bottle of old brandy, which he calls Madame Jacquemart's ancient friend—then what laughing! what gabbling! or rather what listening to Madame Jacquemart's gabble—for she tells

stories of every kind and colour—what lingering at table, too, for we must not leave the renovating bottle in a hurry; Madame Jacquemart will certainly not be the first to rise, and has taken care to make known how "she has left Nanette with Madame Leroux, and Nanette will give her whatever she may happen to want."

In this place it is obvious there will be an absence of the thousand minute attentions usually demanded by ladies on these delicate occasions; not only are the doors of the house "slammed to" with violence on all sides and at every moment, but the patient's very chamber is pervaded by the fumes of tobacco, which rise from the shop below, where Monsieur Leroux is often smoking with his boys. Madame Jacquemart bears all this with as much indifference as Madame Leroux herself—nay, she seems to think "these dainty airs belong only to a parcel of puppets who have nerves that support nothing." The truth is, that Madame Leroux recovers with wonderful rapidity, rises on the fourth day, goes down to the shop on the tenth; and this day past, Madame Jacquemart is at liberty to "up anchor," and convey her cargo of precious cares to other latitudes.

WALKS OUT OF TOWN.

BY HUGH MILLER,

AUTHOR OF THE TRADITIONAL HISTORY OF CROMARTY.

* No. I.

ONE of my maternal uncles had sailed with Nelson and Lord Keith, and fought under Abercromby and Duncan. The happiest hours of his boyhood, like the happiest of my own, were spent on the neighbouring hill; and as he possessed a warm, appropriating imagination, its many beautiful scenes were converted by him into a species of mental property, which he carried about with him in all his wanderings. He had arranged them in his mind like pictures in a gallery, and had learned, when the monotonous languor of a long voyage began to prey on his spirits, to retire within himself to contemplate them, and found in the exercise a never-failing source of amusement. He would pass onward along the paths which wind through the woods of the hill, or over the narrower footways which ascend its cliffs, and as scene after scene has started up before him, in all its breadth of light and shadow, every object of the real scene of which he himself formed a part, has melted from before him. The wide sea and the sidelong vessel have disappeared amid the trees of a forest; the heroes of Camperdown and the Nile have paced unnoticed over the quarter-deck.

There are simple enough circumstances which serve to illustrate principles a good deal more complex than themselves, and the circumstance just related seems to be one of these. Men are first taught to love the beauties of external nature (a love of no very early development in the history of the species) in the way in which my relative learned to solace himself with his pictorial recollections. We have grown the artificial creatures which it is our nature to become. We have learned to build cities and ships, to take long voyages in the one, and to breathe for months together in the pent-up atmosphere of the other, ere our recollections of woods and fields and mountains resolve themselves into poetry. It is to the town we owe much of our love of the country; we stand indebted to art in no small measure for our admiration of nature. A conviction of this kind has ever prevented me from joining in the laugh, which has been raised with a good deal more than the merited success, at the poets of what has been termed the Cockney school; nor have I been at all surprised at finding their writings so filled with primroses and new hay. The Highland herd boy sits unmoved beside the Foyers, or amid the sublimities of Loch Marie; and as the love of such objects has not yet travelled to him from the town, he employs his imagination, like the shepherd in Virgil, with the town itself. And what more natural, on the other hand, to the men who toil on from month to month amid the smoke and dust of London, than an overweening love of the country, and an exaggerated estimate of even its humblest beauties? Had Homer written in an age as highly cultivated as our own, he would probably have told us less of the palace of Ithaca, with its seats of ivory, and its floors and stairs of marble. Scott, with his exquisite nature, is the true landscape painter of artificial life.

I shall attempt introducing the reader to those scenes, the contemplation of which afforded so much pleasure to my relative. Wander among them where we may, we shall find trees, and rocks, and water, and a clear sky overhead, all great matters to those who see them seldom; and should my companion be a dweller amid the bustle and turmoil of the town, and a cherisher of that love of the wild and the rural which springs up of itself in all the drier corners of civilised life, his mind's health may be the better for the walk.

* W. R. Orr and Company, London.

† The days of a nurse, comprising the nights, are always paid at the rate of six francs.

He may find, too, that some of the scenes to which I shall carry him are interesting independently of their great beauty, from the thoughts they are suited to awaken, and some from the little traditional anecdotes connected with them. Nothing is more refreshing than a walk on a quiet wooded hill in a sunshiny morning of early summer, or, more delicious still, on a calm balmy evening; and what better suited to heighten the pleasure than that a country in which almost every cliff, and cavern, and clear bubbling spring, has its wild old legend to connect it with the credulous and highly imaginative past, should spread out to the horizon around us?

After leaving town, our road ascends to the old time-broken chapel of St Regulus, through a natural gateway of hanging wood, which closes overhead, like the arched roof of a cathedral, at fully fifty feet from the ground. The ponderous trunks on either side, gnarled and twisted, and furrowed as if by the chisel, remind us of the columns of Thebes, or of Luxor; but they lighten gradually as they rise into a more elegant style of architecture, and terminate at the roof in a network of foliage and branches. The chapel, with its fields of tombs, rises beyond and nearly overtops the sylvan gateway, occupying the summit of an insulated eminence, separated from the other rising grounds by a deep ravine. We have reached the solitary burying-ground. The trees that rise thick and dark on every side of us, cast their undulating shadows over the graves; the sun hastens to his setting; and the long slanting stream of red light that comes pouring through the opening in the west, catches but the extreme tops of the loftier monuments, and the higher pinnacles of the ruin beyond. There is a little bird chirping among the graves; we may hear the hum of the bee as it speeds homeward, and the low soothing murmur of the stream in the dell below; all else is solemn and solitude in this field of the dead.

There are times when, amid scenes such as the present, one can almost forget the possible, and wish that the silence were less deep. The most contemplative of modern poets, in giving voice to a similar wish, has sublimed it into poetry. "Would," he says of his churchyard among the hills,

"Would that the silent earth
Of what it holds could speak, and every grave
Be as a volume, shut, yet capable
Of yielding its contents to ear and eye."

The dead of a thousand years are sleeping at our feet; the poor peasant serf of ten centuries ago, whom the neighbouring baron could have hung up at his cottage door, with the intelligent mechanic of yesterday, who took so deep an interest in the emancipation of the negroes. What strange stories of the past, what striking illustrations of the destiny and nature of men, how important a chronicle of the progress of society, would this solitary spot present us with, were it not that, like the mysterious volume in the Apocalypse, no man can open the book or unloose the seals thereof! There are recollections associated with some of the more recent graves, of interest enough to show us how curious a record the history of the whole would have furnished.

It is now well nigh fifty years since Willie Watson returned, after an absence of nearly a quarter of a century, to the neighbouring town. He had been employed as a ladies' shoemaker in some of the districts of the south; but no one at home had heard of Willie in the interval, and there was little known regarding him at his return, except that when he had quitted town so many years before, he had been a neat-handed, industrious workman, and what the elderly people called a quiet decent lad. And he was now, though somewhat in the wane of life, even a more thorough master of his trade than before. He was quiet and unobtrusive, too, as ever, and a great reader of serious books. The better sort of the people, therefore, were beginning to draw to Willie by a kind of natural sympathy; some of them had learned to saunter into his workshop in the long evenings, and some had grown hold enough to engage him in serious conversation when they met with him in his solitary walks; when out came the astounding fact—and important as it may seem, the simple-minded mechanic had taken no pains to conceal it—that, during his residence in the south country, he had become a member of the communion of Baptists. There was a sudden revulsion of feeling towards him, and all the people of the town began to speak of Willie Watson as "a poor lost lad."

The "poor lost lad," however, was unquestionably a very excellent workman; and as he made neater shoes than any body else, the ladies of the place could see no great harm in wearing them. He was singularly industrious, too, and indulged in no extraordinary expense, except when he now and then bought a good book, or a few flower-seeds for his garden. He was withal a single man, with only himself, and an elderly sister who lived with him, to provide for; and, what between the regularity of his gains on the one hand, and the moderation of his desires on the other, Willie, for a person of his condition, was in easy circumstances. It was found that all the children in the neighbourhood had taken a wonderful fancy to his shop. Willie was fond of telling them good little stories out of the Bible, and of explaining to them the parts which he had pasted on the walls. Above all, he was anxiously bent on teaching them to read. Some of their parents were poor, and some of them were careless; and he saw that unless they learned their letters from him, there was little chance of their ever learning them at all. Willie in a small way, and to a very small congrega-

tion, was a kind of missionary; and what between his stories and his pictures, and his flowers and his apples, his labours were wonderfully successful. Never yet was school or church half so delightful to the little men and women of the place as the workshop of Willie Watson, "the poor lost lad."

Years of scarcity came on; taxes were high, and crops not abundant; and the soldiery abroad, whom the country had employed to fight with Bonaparte, had got an appetite at their work, and were consuming a great deal of meat and corn. The price of food rose tremendously; and many of the townspeople, who were working for very little, were not in every case secure of that little when the work was done. Willie's small congregation began to find that the times were exceedingly bad; there were no more morning pieces among them, and the porridge was always less than enough. It was observed, however, that in the midst of their distresses Willie got in a large stock of meal, and that his sister began to bake as if she were making ready for a wedding. The children were wonderfully interested in the work, and watched it to the end; when, lo! to their great and joyous surprise, Willie divided the whole baking among them. Every member of the congregation got a cake; there were some who had little brothers and sisters at home who got two; and from that day forward, till times got better, none of Willie's young people lacked their morning piece. The neighbours marvelled at Willie; and all agreed that there was something strangely puzzling in the character of "the poor lost lad."

I have alluded to Willie's garden. Never was there a little bit of ground better occupied; it looked like a piece of rich needle-work. He had got wonderful flowers too—flesh-coloured carnations streaked with red, and double roses of a rich golden yellow. Even the commoner varieties—auriculas and anemones, and the particoloured polyanthus—grew better with Willie than with any body else. A Dutchman might have envied him his tulips, as they stood row beyond row on their elevated beds, like so many soldiers on a redoubt; and there was one mild dropping season in which two of these beautiful flowers, each perfect in its kind, and of different colours too, sprang apparently from the same stem. The neighbours talked of them as they would have talked of the Siamese Twins; but Willie, though it lessened the wonder, was at pains to show them that the flowers sprang from different roots, and that what seemed their common stem, was in reality but a green hollow sheath formed by one of the leaves. Proud as Willie was of his flowers, and with all his humility he could not help being a little proud of them, he was yet conscientiously determined to have no miracle among them, unless, indeed, the miracle should chance to be a true one. It was no fault of Willie's that all his neighbours had not as fine gardens as himself; he gave them slips of his best flowers, flesh-coloured carnation, yellow rose, and all; he grafted their trees for them too, and taught them the exact time for raising their tulip roots, and the best mode of preserving them. Nay, more than all this, he devoted whole hours at times to give the finishing touches to their parterres and borders, just in the way a drawing-master lays in the last shadings, and imparts the finer touches, to the landscapes of a favourite pupil. All seemed impressed by the unselfish kindness of his disposition; and all agreed that there could not be a warmer hearted or more obliging neighbour than Willie Watson, "the poor lost lad."

Every thing earthly must have its last day. Willie was rather an elderly than an old man, and the child-like simplicity of his tastes and habits made people think of him as younger than he really was; but his constitution, never a strong one, was gradually failing; he lost strength and appetite; and at length there came a morning in which he could no longer open his shop. He continued to creep out at noon, however, for a few days after, to enjoy himself among his flowers, with only the Bible for his companion; but in a few days more he had declined so much lower, that the effort proved too much for him, and he took to his bed. The neighbours came flocking in; all had begun to take an interest in poor Willie; and now they had learned he was dying, and the feeling had deepened immensely with the intelligence. They found him lying in his neat little room, with a table bearing the one beloved volume drawn in beside his bed. He was the same quiet placid creature he had ever been; grateful for the slightest kindness, and with a heart full of love for all—full to overflowing. He said nothing of the kirk, and nothing of the Baptists, but earnestly did he urge his visitors to be good men and women, and to be availing themselves of every opportunity of doing good. The volume on the table, he said, would best teach them how. As for himself, he had not a single anxiety; the great Being had been kind to him during all the long time he had been in the world, and He was now kindly calling him out of it. Whatever He did to him was good, and for his good, and why then should he be anxious or afraid? The hearts of Willie's visitors were touched, and they could no longer speak or think of him as "the poor lost lad."

A few short weeks went by, and Willie had gone the way of all flesh. There was silence in his shop, and his flowers opened their breasts to the sun, and bent their heads to the bee and the butterfly, with no one to take note of their beauty, or to sympathise in the delight of the little winged creatures that seemed so happy among them. There was many a wistful

eye cast at the closed door and melancholy shutters by the members of Willie's congregation, and they could all point out his grave. Yonder it lies, in the red light of the setting sun, with a carpeting of soft yellow moss spread over it. This little recess contains doubtless, to use Wordsworth's figure, many a curious and many an instructive volume, and all we lack is the ability of deciphering the characters; but a better or more practical treatise on toleration than that humble grave, it cannot contain. The point has often been argued in this part of the country, argued by men with long beards who preached bad grammar in behalf of Johanna Southcote, and by men who spoke middling good sense for other purposes, and shaved once a-day. But of all the arguments ever promulgated, those which told with best effect on the townspeople were the life and death of Willie Watson, "the poor lost lad."

THE NEW-ENGLAND WITCHES.

THE "Witches of Salem" are so frequently alluded to in works of ordinary reading, that some particulars respecting them and their proceedings may not prove uninteresting. The notoriety which their case attained arose chiefly from its being one of the last instances in which this unhappy and destructive delusion prevailed in the civilised world. It was in the end of the year 1691, when Sir William Phipps was governor of New England, then a colonial dependency of Britain, that the witchcraft mania first broke out in Salem, a town of no great size, yet ranking almost next in importance to Boston, the capital of the province. The Reverend Mr Paris, minister of Salem, had a daughter and a niece, respectively nine and eleven years of age, who on a sudden began to play odd and seemingly unaccountable pranks, such as creeping into holes, crawling under chairs, and the like. After some further time, they fell into convulsion-fits, and complained of being bitten, and scratched, and pinched, by invisible agents. On other occasions they were struck dumb, and their bodies and features became bent and distorted. Mr Paris was in great uneasiness, and formed the belief that the girls were under an evil eye or tongue. His suspicions fell upon an Indian man and his wife, who were servants in the family; and these parties, "after some severities had been used upon them" (to use the language of Neal's History of New England), confessed thus much, that they had tried some Indian ceremonies in private to find out the witch or evil spirit, said to afflict the children. This was an unlucky confession, as the children immediately afterwards declared themselves to be pinched, struck, and tormented by the Indian woman, while she was invisible to others. Upon this plea, Mr Paris treated Tituba, as the Indian was named, in such a manner that he extracted from her a confession that she was a witch, and one of three who had combined to annoy the two girls. Tituba was thrown into prison; but being a slave, and capable of fetching a good price in the market, it did not seem fitting to her prosecutors to press matters to extremity with her. After lying long in prison, she was liberated; and as the time had then arrived when she could speak freely, she declared that "her master (Mr Paris) had beat her, and in other ways abused her, to make her confess and accuse (such as he called) her sister-witches, and that whatsoever she had said by way of confessing or accusing others, was the effect of such ill usage."

We have related minutely the history of this case, because it was the forerunner of a mania so strange and universal, as to destroy for a time the peace of the whole province, and to cause the loss of many lives. Almost every man shared in time in the delusion, from the most ignorant labourer up to such persons as Governor Phipps and Dr Cotton Mather, the latter a divine of singular learning and piety, but who, in this instance, was as deplorably blinded as any savage of the woods. From the family of Mr Paris the infection soon spread to others, as has been said, until a great number of persons complained of being afflicted by witches, male and female, whom they pointed out and laid informations against. Dr Mather, who became the historian of these occurrences, gives the following account of the torments of which the afflicted persons complained. He says that "their limbs were horribly distorted and convulsed, that they were pinched black and blue, that pins were invisibly run into their flesh, and that they were scalded till they had blisters raised on them. One of them (he continues) was assaulted by a spectre with a spindle in its hand, which nobody else in the room could see, till the afflicted, in one of her agonies, snatched it out of the spectre's hand, and then all the company saw it. Another was haunted by a spectre in an invisible sheet; but the afflicted, in

one of her fits, tearing a piece of it away, it became visible. Sometimes they have complained of burning rags being forced into their mouths, which nobody else could see, yet the burns have remained on their mouths afterwards; sometimes they have complained of irons heating in the fire to brand them, the marks of which they have carried to their graves." With a perfect seeming belief in their truth, Dr Mather relates numberless other instances of injury from witches, visible (to the parties only) or invisible. "Some of the afflicted saw a devil of a little stature and a tawny colour, attended with spectres that appeared in more humane (human) circumstances; these tormentors used to tender the afflicted a book, requiring them to sign, or touch it at least, in token of their consenting to be enlisted in Satan's service, which if they refused, the spectres under command of the black man tortured them with prodigious molestations." These spectres, as they were called, usually bore the appearance of certain human beings, whom the afflicted named and accused. It was of no avail that persons thus charged could prove themselves to have been far distant and engaged in minding their own affairs. The presence of these spectral counterparts or counterfeits of them was held to be sufficient proof that they aided in tormenting the afflicted.

By such accusations as these, the prisons of the province of New England were filled to overflowing soon after the commencement of the year 1692. The whole country was thrown into confusion; every one was jealous of his neighbour; and, in truth, no one could find security against an accusation, except by becoming personally an accuser. To this cause the pretended sufferings from witches are in part to be ascribed. In a few other cases, the parties may have been weak enough to imagine themselves really under the influence of such tormentors as they described; but it is only too probable that the majority of accusers were actuated by malice and hate. Whatever might be their motives, the accusations laid by such parties were completely successful, in so far as they were listened to by the judges and magistrates in Salem, Beverley, Andover, and numerous other towns and villages, through which the infection gradually but rapidly spread. The delusion was much strengthened, unquestionably, by the confessions which many of the accused were tempted to make, under the influence of fear and severe treatment. They were told that their only chance of life depended on their disclosing their confederates in crime, and in some cases they were tied neck and heels till the blood gushed from their noses, with the view of inducing them to confession. It cannot be wondered at, that, under these circumstances, the number of confessing witches amounted to fifty, not one of whom was executed, with the exception of Samuel Wardwell, who publicly drew back from his first confession, and preferred to go to the scaffold, rather than continue "to take away the lives of his neighbours to save his own."

Some time having elapsed before the business assumed a regular and systematic form, no trials or executions took place till about the middle of 1692. In the months of June, July, August, and September, however, twenty-eight persons received sentence of death, and of these nineteen were executed, six of them being men and thirteen women. One other man perished in a more miserable way. Giles Cory, a person of bold and firm mind, being asked in court by whom he would be tried, refused to answer in the usual way, and declared that he would not voluntarily put his life into the hands of a jury that had condemned all brought before them. In consequence of this recusancy, Giles Cory was pressed to death, agreeably to the custom in such cases. Of the character of the ordinary trials, and the nature of the evidence there brought forward, the following specimen will give some idea to the reader, who should keep in mind that the lieutenant-governor of the province, with several of the principal colonial judges, sat on the bench on these occasions. "Bridget Bishop was tried upon five several indictments, June 2d, 1692, for using certain detestable arts called witchcraft, in, upon, and against, Mercy Lewis, and four other women; to all of which she pleaded not guilty." These five bewitched women were the first witnesses, and they testified that the prisoner was in the daily habit of choking, pinching, biting, and afflicting them; and that the sight of her caused them to fall down in fits (of which they gave a practical illustration when they met her in court).

Deliverance Hobbs, who had confessed herself a witch, testified that the prisoner had made her become so, and had whipped her with iron rods till she signed the devil's book; and that the prisoner had taken her to a general meeting of witches in a field near Salem village, where they had all partaken of an impious kind of sacrament.

John Cook testified, that about five or six years ago he "was assaulted by the shape of the prisoner in his chamber, and so terrified, that an apple that he had in his hand flew strangely from him into his mother's lap, at a distance of six or eight feet (!)"

Samuel Gray testified, that about fourteen years ago (!) he waked one night, and saw a woman in his chamber. No harm was done to him, but a child that was in the room died soon after. He confessed that he had never seen the prisoner before (that is, till the trial), but was now satisfied that it was her apparition.

John Bly and his wife testified, "that they bought a sow from the prisoner's husband, but having to pay

the money to a creditor of the seller, she (the prisoner) was so angry that she quarrelled with Bly, and soon afterwards the sow was taken with strange fits, jumping, and knocking her head against the fence, which made the witnesses conclude that the prisoner had bewitched it."

The rest of the evidence was of a similar cast, and there is no occasion for troubling the reader with more of it. One point only in the same case may be adverted to. Bridget Bishop was examined by a jury of women, who declared that they found upon her person the noted mark of witchcraft, a coloured spot that would not bleed on being pricked. The accused woman seems to have been so conscious of the erroneous nature of this conclusion, as to get a second examination ordered. The second examiners found no such mark; but, alas! instead of doing poor Bridget any good, the circumstance was held conclusive against her, as proving that the devil had in the interval removed the mark! It is difficult for people now-a-days to believe that comparatively enlightened men could have sentenced fellow-creatures to death upon such testimony as that given in the preceding case, which was no way different from the others. Nay, in some cases material portions of the evidence were shown to be grossly false, yet the fate of the unhappy accused was the same. "At the trial of Sarah Good (says a contemporary writer, Mr Calef of Boston), one of the accusers fell down in a fit, and cried out that the prisoner's spectre was stabbing her with a knife, but had broke it in her body; and to confirm the truth of her relation, she plucked a piece of the blade out of her breast, and showed it in court; but there was a young man present, who, seeing the blade, had the honesty and courage to claim it for his, and to declare before the judges that he broke his knife but the day before, and threw away part of the blade in presence of the accuser, but that he had the handle with the other part of the blade in his pocket, which he delivered into court, and upon comparing them together, they were found to be parts of the same knife; upon which the judge only reprimanded the false witness, and bade her tell no more lies." This incident, which ought to have invalidated the whole future testimonies of these afflicted persons, was of no avail even in the case of Sarah Good. She was one of the first victims of the period.

While the tide of deception and credulity was at its height, no person was sure of life and fortune for an hour. The state of things resembled, on a small scale, that which prevailed in France at the revolution, when each man, full of jealous terror for his own life, believed that he had no way of safety but by sacrificing others, and that to pause was to perish. If any individual did come to a stop through a qualm of conscience, the danger was indeed great, by reason of the time and opportunity thus afforded to enemies. One incident in this New-England reign of terror will illustrate the point. At Andover, in New England, a magistrate named Bradstreet, after granting thirty or forty warrants, came to the resolution of granting no more. The result was, that he and his wife were immediately afterwards accused of committing nine murders by witchcraft, and flight alone saved them from the gallows. Many other persons also fled from the country, preferring the loss of property to the risk of accusation and death. In some cases parents were condemned by the evidence of their own children! At the trial of Martha Carrier, several of her children confessed themselves witches, and that their mother had made them so; but, for the credit of human nature, it ought to be told that these children had been subjected to great suffering, ere they consented to make so unnatural a charge. "George Jacobs senior was condemned (says Mr Neal in his history) by the evidence of his own granddaughter, who, to save her own life, confessed herself a witch, and was forced to appear against her grandfather." Before the old man's execution, the poor girl could not bear up against the stings of conscience, and made a public confession of the falsity of her former story. But the only result of her recantation was the endangerment of her own life. Had it not been for a severe illness, indeed, which prevented her from being brought forward at the time appointed for her trial, she would assuredly have perished on the scaffold. These cases will give some idea of the deplorable state into which society was thrown in the New-England towns and villages, by the prevalence of this witchcraft mania. All the prisons were filled, as has been stated, with the accused, nearly two hundred persons being confined in them at one time.

The majority of these prisoners would certainly have suffered death, had not a striking change come over the public mind, after the executions of June, July, August, and September. The accusers, or witch-afflicted parties, remained as eager as ever in the prosecution of their game, and in truth their numbers continued daily on the increase. The importance attached to their pretended powers of detecting the spectres of witches, was the means of bringing forward many new claimants to the gift. Such persons were actually paid to travel from one place to another, in order to unravel cases of suspected witchcraft, by their powers of seeing what was invisible to others. But after the executions, an alteration took place in the popular feeling, and this was principally owing to the fact, that not one of the victims confessed, at their death, the truth of the charge brought against them. On the contrary, every one of them made a dying pro-

test of their innocence. This weighed strongly with the public, and "the afflicted" increased the impression by overacting their parts, and growing too numerous. They began, for want of less objectionable victims, to testify against persons of unimpeachable character; and the consequence was, that their representations speedily lost much of their efficacy. About the same time, a number of the unfortunate women who had confessed themselves witches, publicly expressed their sorrow for being induced, through fear, ill-treatment, and other influences, to state what was not the truth. Such was the effect of these combined causes, that, ere the close of 1692, all further prosecutions were stopped, and the accusations of the afflicted entirely disregarded and contemned. The prison doors were thrown open, and a free pardon was granted by the governor to all under sentence of condemnation.

Thus was this extraordinary delusion brought to an end, after enduring in all for about fifteen months. Had the people not been in many respects civilised and intelligent, the victims would have been much more numerous; but it required a long time ere the distemper raged so high as to bring them to the point of taking away life. The same civilisation rendered their sorrow deep and sincere when the illusion passed away. Almost all of those who had borne a part in the tragic affair, publicly declared their grief and repentance. The jurors who served at the trials signed a document, praying that "God would not impute the guilt of what had passed to themselves, nor others, and also entreating that they might be considered aright by the living sufferers, as being then under the influence of a strong and grievous delusion, utterly unacquainted with, and not experienced in, matters of that nature." The judges expressed similar sentiments. One of them gave in a paper to be read in open church at Boston, acknowledging that he had greatly erred with respect to the late trials, and begging the prayers of the congregation to be put up for him, that he might obtain pardon for the error. While this paper was reading, he stood up in view of the whole assembly.

It is by these circumstances that the story of Salem witchcraft is rendered chiefly remarkable. In earlier times, thousands of human beings perished on account of similar charges, but gross ignorance then existed among the nations, and we are in no wonder or doubt as to the cause of the barbarities practised. Here, however, the case was different. A film seemed merely to fall for a time over the eyes of comparatively enlightened men, and then to pass away, leaving the vision unclouded save by repentant tears. Let us hope, as we have reason to do, that the story of Salem witchcraft will be the last intermixed with the annals of men of British blood.

A VISIT TO NEWGATE IN MAY 1839.

BY GIBBONS MERLE.

A FEW years have worked great changes in Newgate. Here, as in all other well-conducted prisons, the unhappy position of the prisoner is no longer aggravated by the harsh regulations of a governor, or the brutal disposition of turnkeys, taken as formerly from the worst class of society. Not only have all the rules of the prison been ameliorated by the magistrates, but their mild and benevolent character is rendered still more admirable by the spirit of indulgence exercised by the governor and his subordinate officers in every thing consistent with the safe keeping of the offender. The privation of liberty has been admitted to be a sufficient punishment, without adding to its bitterness by cruel treatment. The presence of the turnkey is no longer dreaded by the unhappy inmates of the different wards, as he appears to take an interest in the persons who are committed to his charge. The head turnkey of Newgate, who is an intelligent man, of kind disposition, visits frequently every department of the prison, and urges the prisoners under sentence of transportation to good conduct, by informing them that notes are taken of their behaviour whilst in Newgate, which will materially affect their treatment when they arrive at the colony. The wards are all remarkable for their cleanliness, and in every one of them there is a good fire during the winter, even up to the 1st of May. The plan of warming by heated air, or by the radiation of heat from hot water, has not yet been introduced here, and there is therefore a sort of cheerfulness about the wards, which does not exist in other places of detention where open fireplaces have been abolished. Whatever may be the advantages of the new mode of warming prisons, it is certain that to an Englishman there is nothing so cheering as an open fireplace. This is a fact universally admitted under all circumstances, and it is considered by the prisoners in Newgate to be a great advantage, for as they group round the fireplace, and relate the stories of early life, they forget for a time the misery of their condition. The diet of the prison is abundant. Each person has twenty ounces of excellent bread per day, and on three days of the week they have also each for

dinner half a pound of good meat and a quantity of potatoes. On the other days they have pease-soup, and every person has a pint and a half of thick gruel at breakfast and at supper. The full allowance of twenty ounces of bread is given every day. They have only water to drink, unless they have the means of purchasing beer, in which case they are permitted to receive one pint per day. They are also permitted to purchase meat or any other kind of provisions on the meagre days, with their own funds. If a prisoner on his entrance be without good clothing, he receives a suit of apparel which has no distinguishing badge, and in the event of acquittal, he is allowed to retain it. His own clothing is put into an oven heated by warm air, and thus vermin and any kind of infection are effectually destroyed. The diet of the prisoner, after condemnation, is the same as before it. The only difference between those under accusation and those who have received sentence, is, that little indulgences are shown to the former which are withheld from the latter. The sleeping places resemble the berths of a ship. They are in tiers, and vary in number from three to twelve in each ward. The bedding consists of a good rope mat and three rugs for each person. There are in every ward a Bible and a Testament, but any other books are prohibited, except to offenders whose crimes are of a light dye, or to whom the indulgence is granted upon a special order. This regulation is one of a very questionable nature; for although upon the approach of the turnkey or governor, those prisoners who wish to obtain a favourable report as to their conduct in the prison affect to be eagerly engaged in the perusal of these holy works, it has been found, by the private inspection through the holes which are pierced in the wall for that purpose, that they are seldom so engaged when they are alone and not in expectation of a visit. It would probably be beneficial to permit the reading of amusing works having a moral tendency, for in this way the mind would be brought into a state which would dispose it to the reading of the Scriptures. It might even be well to encourage the reading aloud, at stated hours, books of this kind, in each ward, by the most competent prisoner, for the benefit of the whole, and this should be done in the presence of the turnkey. There are many books in which lessons of morality and virtue are conveyed in an agreeable manner; but if such were wanting, the authorities would find no difficulty in procuring new ones at a cheap rate, through one of the societies for the propagation of useful knowledge.

The punishments in this prison for infraction of the rules are, separation from the ward in which the offender was placed, and a diet of bread and water; but owing to the vigilant control of the turnkeys, this is not often necessary. Great attention is of course paid to the exercise of the prisoners as a means of keeping up bodily health. They are compelled to walk at fixed hours during the day in the yards, and to move briskly in a circle, the juvenile offenders having with them a well-behaved adult prisoner to maintain order. The condemned cells are not, as generally supposed, subterranean, but are small well-ventilated rooms in a separate part of the building, having two yards attached to them for exercise. In each cell is an iron bedstead, with the ordinary bedding of the prison. These are the cells in which prisoners are placed when ordered for execution. They are now very rarely tenanted, as nearly three years have elapsed without an execution. Nor is it probable that the scenes of horror for which these cells were the preparation, will be again witnessed except at rare intervals.

When I visited Newgate in the month of May, the number of persons in confinement, untried or sentenced, and waiting for removal to undergo their punishment, was 220, of whom 50 were females. Amongst the male prisoners, the majority was composed of persons under twenty-five years of age, and many of them were mere children, most of whom were in confinement for trial, or under sentence for a second or third offence. The conduct of these boys would be intolerable in prison if they were not kept under severe control. Those who have already undergone punishment in other prisons, make a parade of their accomplishments in vice to their fellow prisoners; and as the prison allowance, and, to them, prison comforts, are far greater than what they had been accustomed to when at liberty, they do not appear to suffer much moral depression. Although the system of classification is kept up as far as it is practicable in Newgate, it cannot, from the nature of the building, be carried to such an extent as would prevent the corruption of the comparatively innocent lad by these hardened offenders. The cunning and evasive answers made by such boys show the full perversity of their character; and it is found that when a truly contrite youth, imprisoned for the first time, weeps over his disgrace, the old offender taunts him with his pusillanimity, and but too frequently persuades him that it is less shameful to commit crime than to shed tears at the dread of punishment for the commission of it. It is in the nature of boys to ape the courage of men, and their model is almost necessarily a bad one. From the circumstances in which they are placed in life, they have before their eyes few examples of the courage of virtue in adults of their own class, and the virtuous example of those who are above them is seen only at a distance, and fails to produce any good effect; for the artificial state of society renders it a difficult, if not a hopeless task, for youths of the lower orders to take a place amongst the higher

classes. The young offender, however low born, has frequently a mental organisation, which, if developed under favourable external circumstances, would lead to noble acts; but as he cannot feel the ambition to be a great man when he sees how difficult it is to arrive at such greatness, he has the ambition to become a great scoundrel. Society has much to answer for in neglecting to open the avenues to distinction to the poorer classes, by a proper extension of the advantages of a sound education, the first principle of which should be to teach the possibility of becoming great by virtue. This is not done; and as boys are generally romantic, and are in the habit of reading the histories of thieves who have excited the admiration of the multitude by their cunning or their courage, such personages become the *beau idéal* of their minds, and the profligacy of the adult members of their own class offers but too much encouragement to their own vicious inclinations.

A great deal has lately been done by benevolent persons to provide employment for young criminals after their condemnation, and to prepare the way for their return to society. With this view an asylum has been formed in the Isle of Wight, to which very young persons are sent, and the different penitentiaries are intended for the same end. But whatever may be the gratification which the philanthropist derives from witnessing the benevolent anxiety of the public on this subject, there is a lamentable fact connected with it which must not be concealed. The principal turnkey of Newgate states, that since the formation of the establishment at the Isle of Wight, the number of juvenile offenders has much increased. The cause of this increase is thus explained by him. He states that among the lower orders it is a frequent practice for men to marry widows who have a family, or to live unmarried with women who have children; or for females to marry or live unmarried with men who are thus situated. The children in such cases are generally neglected or ill treated, and are driven into the streets to shift for themselves. In most cases they resort to theft, and if detected, are necessarily committed for trial. The unnatural authors of this mischief lay a kind of unction upon their conscience, if they have any, by the reflection that if the children be not detected, they have done them no harm, and that if they are detected and sent to prison, they will be merely sent to the depot at the Isle of Wight. If the fact be as this person has stated, there was formerly a certain degree of consideration in the parent or step-parent of such children, preventing their total abandonment; which virtue no longer exists. The number of females under twenty years of age in Newgate, is small as compared with that of the male youths. This may be accounted for partly by the difference in the habits of the two sexes, the male youths having a greater degree of liberty to herd together and acquire habits of theft from the more experienced with whom they associate, or a greater spirit of imitation, and partly by the fact that, whilst the viciously disposed of the female sex obtain the means of subsistence in prostitution, the male who is excluded by his habits from honest employment, has no other resource than theft. Those who live in large towns, and who see the streets infested by young females of from thirteen to eighteen years of age, will know what degree of importance to attach to this observation. There would be cruelty in a desire to see the prison allowance of Newgate diminished, or the indulgences to the prisoners abridged; but if some of the persons who are there *ex recedite* are to be believed, the remembrance of their treatment in prison, instead of deterring them from the repetition of crime, had a contrary effect. "What were we to do?" said some who had escaped conviction from informality; "nobody would employ us—we wanted bread, and we knew that in prison we should find a clean home, a good fire, and abundant food."

Two of the best wards of the prison were appropriated to the use of the Canadian insurgents, who had recently been brought to the country, under well-known circumstances. They were in Newgate awaiting the decision of the legislature on their case. Of the nine or ten in custody, some were of the class of small farmers in their own country; one of them, an intelligent young man, a native of the United States, was a clerk in a commercial house; another was a schoolmaster; and one, an elegant-looking man of good education, who appeared to be looked upon with great respect by his companions in misfortune, is said to have had a fortune of twenty thousand pounds, the greater part of which he had expended upon the cause in which he had embarked. Confinement had not daunted the spirit or subdued the energies of these men. Whilst they admitted that their leaders had probably been actuated by base motives, and that they would have acted more prudently if they had exercised a proper degree of judgment as to the resources which they possessed for working out the revolution, they would not allow that the conduct of the government had not been such as to justify their appeal to arms. Of their treatment in Newgate they spoke with a respect approaching to gratitude, for, contrasted with that which they had received from their captors, it assumed the character of benevolence. But the dread of transportation, of an eternal separation from the land of their birth, the fields which they had cultivated, and the homes in which they had enjoyed the prattle of their children, and the sympathy of the wives of their bosom, appeared to them a calamity far

more terrible than death. For death they had been prepared; they had reckoned upon its possibility as one of the chances of the bold and dangerous enterprise in which they had embarked; but they had never calculated on the chance of partaking of the lot of the common felon.*

FOOD OF WORKMEN.

[Translated from the Belgian Almanack for 1837.]

WHEN one considers the manner in which the French and Belgian workmen are nourished, in comparison with those of England, he is forcibly struck by the extreme contrast displayed between the two modes of living.

In various branches of trade, our Belgian workmen eat almost no butcher-meat during the week; if they use it on Sunday, it is solely as an object of luxury. The English operative, on the contrary, makes a habitual use of substantial animal nourishment.

"I have calculated (says M. Charles Dupin, member of the French Chamber of Deputies) the total weight and quantity of the animal substance applied to the sustenance of man, in France and in England, and the result of the calculation is as follows:—For every sixty-one kilogrammes of flesh eaten by a Frenchman, an Englishman takes upwards of 173; that is to say, about three times as much. This difference in the manner of living causes a very sensible difference in physical power. Animal nourishment bestows on man a much greater amount of physical force, for daily use and expenditure, than is derivable from vegetable diet. Hence we may account, in part at least, for the superior quantity of labour executed by English operatives."

It is necessary that our workmen should think of nourishing themselves in a more substantial manner. At this moment, in many departments of trade, those employed take an amount of nourishment very insufficient to repair the daily waste of their powers. The end of the week finds them in a state of great exhaustion. Every Sunday, they seek to regain their lost strength by a diet entirely different, both in nature and quantity, from the meat and drink which they have taken through the week; and it chances to them, as it does to men who suddenly satisfy their appetite after long abstinence, that they are rendered sick and ill, instead of feeling recruited and refreshed as they anticipated. Thus it is, that, on the Monday, the tradesman is found to be less capable of work than at the close of the week, and to the same cause is chiefly to be ascribed the evil custom, so prevalent among the workmen of large cities, of not going to labour at all on the first working-day of the week.

The best way of remedying this inconvenience would be to lead the artisans gradually, by temperate counsels, to make use habitually of better nourishment, which would soon be followed by the abandonment of the custom of Monday idleness; while all the expense consequent on the adoption of better diet during the six working days, would not exceed the gains of the recovered day's labour, and the men's outlay would therefore be no way increased. At the same time, in consequence of the change, they would find themselves able to produce a much greater quantity of work during the five other days, and, of course, to demand from their employers proportionate wages. They would avoid, also, the frequent maladies and the premature decrepitude which are the inseparable attendants of ill-regulated modes of life. They would greatly prolong their span of years, although these years are too apt at present to become to them years of misery, unless they have the prudence to gather up, in youth and manhood, wherewith to satisfy the ever increasing necessities of age.

As the injury which operatives do to themselves by idling all Monday, or making a holiday of it, is not known to themselves, at least in its full extent, it may be of some service to call their attention to the real state of the case. The workman who gains one franc and fifty centimes a day, loses annually fifty-two Mondays, which ought to have brought to him seventy-eight francs. If to this sum be added the extra or extraordinary expense which always attends the idle Monday, and which cannot be estimated at less than half a day's wage, or thirty-nine francs annually, the total annual loss will be found to be 117 francs (£4, 17s. 6d.)

But the matter does not rest here. The pecuniary loss may be the chief result with regard to unmarried men, but heads of families suffer much more, because their absence from home is the spring of many domestic disorders, whose consequences are incalculable. If those who devote the Monday to uncalled-for rest or idleness, would go to work on that day, and place in the Savings' Bank the sum they gained, as well as the sum which they would otherwise have bestowed on the Monday's extra expense (which it is fair to include), they would then, without being a whit worse off than they are in other points, find themselves masters, in a year or two, of a fund which would save them from destitution in case of any emergency, such as mortality seldom escapes at some period or another; or they might taste the joy of being able to dower a daughter, or might buy off from military service the son to whom they looked for support in old age.

Estimating 300,000 to be the number of operatives,

* Since this was written, the Canadian prisoners have been restored to freedom.—Ed. C. E. J.

throughout all Belgium, who idle away the Monday, and calculating the consequent annual loss of each man at the low sum of 100 francs, the total yearly loss resulting to the working orders from the custom, comes to be 30,000,000 of francs (£1,250,000). This is more than one-third of the taxes paid each year by the whole kingdom. This loss will appear still greater, when it is considered that the whole of the funds of the benevolent societies and hospitals appropriated to the comfort of the indigent of the land, does not exceed 10,000,000 of francs (£416,666, 13s. 6d.); and that the amount of the sums lent by the institutions, termed *Monts-de-Piété*, is no more than 7,000,000 of francs (£291,666, 13s. 4d.). It is evident, that were a spirit of economy better spread among them, the working classes might not only emancipate themselves, and that speedily, from the (at best) degrading necessity for charitable help, but might ensure to themselves the means of independence and comfort, which they have hitherto been without.

We have seen with regret, in a statement recently published of the principal articles from which the municipal taxes of Brussels are raised, that the augmentation, during the year 1835, in the article of gin, has been very considerable. The average annual quantity consumed, from the year 1828 to the year 1833, was about 5000 hectolitres, while, in 1835, the quantity consumed was about 12,000 hectolitres. We shall have further occasion to point out the consequences of the great diminution of the taxes upon gin; the immediate effect of that deduction has been to increase the sale of the liquor, and to augment the number of cases of intoxication, and instances of disorder and crime. The idleness of the Monday is particularly favourable to intemperance; it is the day consecrated to libations; and by taking the trouble of examining the admission registers of the hospitals and prisons, one would receive still more convincing proof of the baneful influence which this custom exercises, alike on the purse and personal comforts of the workman, as on his health and morality.

AN IRISH START.

It was market-day at Tralee, and we had great difficulty in getting through the streets, so great was the concourse of people, carts, horses, geese, turkeys, and pigs.

And now, after having passed in safety through many Irish towns on market-days, and started with a great variety of horses and post-boys, I, the most timid and nervous of all foolish women, would address a few words of encouragement to those who may happen to be placed in the like predicaments, with the same feelings of fear.

Never be afraid of an Irish start, even if the leaders come quite round to the carriage door. Never be afraid of having your carriage smashed, even if the narrow street of a little town be (as it generally is) so full of cars, people, pigs, poultry, and horses, that you cannot see the remotest possibility of a passage being obtained for the carriage through the dense mass. Do not be afraid either for yourself, or that any of the swarming population will be run over. The cars, the people, the pigs, &c., will indeed remain in the way, till the leaders which draw your carriage actually touch them. The whole scene looks in most dreadful confusion. The horses rear—the post-boys look as if they could not keep their seats, and had not the least power over the restive horses. The populace halloo, the pigs squeak, the jingle-men vociferate in Irish—jabbering it quicker and more vehemently than ever. But again I say it—do not be in the least afraid, for no accident ever happens.

There seems, indeed, a peculiar providence over Irish drivers, horses, and all the noisy occupants of a crowded street. Drunken men reel about on foot and on horseback, without ever seeming to do themselves or others any harm. At Bandon, I recollect seeing a drunken man gallop down the steep street, and as the horse turned short round at the bottom of it, the rider was precipitated off upon his head; but he very deliberately got up again, and endeavoured to lead his horse away by the tail!

There does in reality seem a special providence expressly provided for Irish men, women, and children, without which, what with fires, floods, burnings, house-fallings, car-upsettings, &c., there would not be a whole bone in the island. "I have been doing my best to drive over a child in this town for the last eight-and-twenty years," said an English mail-coach driver to his friend on the box, "and never could do it!" The risks that are run, the hazards encountered in every excursion by land or by water by these dare-devil people, would astonish and terrify their more civilised and cautious neighbours. At the top of one of the steepest mountain-roads in the west of Ireland, Lord Guillemore stopped the driver of the chaise he was seated in, proclaiming his intention to walk it down rather than proceed in the carriage—the rather as one of the horses, a young, long-tailed chestnut, had given, even on the level road, some very unequivocal signs of hot temper and unsteadiness.

"I'd rather get out here," said the Chief Baron.

"Anan!" said the postilion, purposely turning a deaf ear to what he conceived a slur upon his coachmanship. "I'll get down—open the door, my man," reiterated his lordship.

"True for ye, it's a fine bit of road, yer honour," said the incorrigible fellow, still pretending to mistake what was said, and all the while approaching slowly and insidiously to the verge of the hill. "Now, hold fast," said the wretch, as he laid the lash first over one, then over the other of his horses, and set off down the mountain at a most furious pace. The horses both flying out at either side from the pole, and the chaise spinning and bumping through ruts and over stones that every minute threatened annihilation—the long-tailed chestnut contriving,

even in his top speed, to show both his hind hoofs very near the judge's nose as he sat in the chaise, the postilion springing with wonderful agility from one side to the other, to avoid kicks that threatened every instant to smash his skull. Down they went, the pace increasing, the windows broken by the concussion, and one door flung wide open, and increasing by its banging noise the confusion of the scene. The road terminated at the foot of the mountain in a narrow bridge that led off at a very sharp angle from the line; and here the terrified judge expected as inevitable the fate that he had hitherto by miracle escaped. Down they came, the hot chestnut, now half mad from excitement, springing four or five feet every bound, and dragging along the other horse at the most terrific rate. They reached the bridge—round went the chaise on two wheels, and in a moment more they pulled up in safety at the opposite side, both the horses being driven, collar-up, into a quickset hedge. Before the Chief Baron had time to speak, the fellow was down mending the harness with a piece of cord, as leisurely as if nothing remarkable had happened.

"Tell me, my fine fellow," said his lordship, "was that chestnut ever in harness before?"

"Never, my lord; but the master says he'll give eight pound for her if she'd bring your lordship down this bit of Sliev-na-muck, without breaking the chaise or doing ye any harm."—From a review of *Lady Chatterton's Rambles in Ireland*, in the *Dublin University Magazine*.

THE WAKE OF THE KING OF SPAIN.*

Arrayed in robes of regal state,
But stiff and cold, the monarch sate;
In gorgeous vests, his chair beside,
Stood prince and peer, the nation's pride;
And paladin and high-born dame
Their place amid the circle claim:
And wands of office lifted high,
And arms and blazoned heraldry,—
All mute like marble statues stand,
Nor raise the eye, nor move the hand:
No voice, no sound to stir the air,
The silence of the grave is there.

The portal opens—hark, a voice!
"Come forth, O king! O king, rejoice!
The bowl is filled, the feast is spread,
Come forth, O king!"—The king is dead.
The bowl, the feast, he tastes no more,
The feast of life for him is o'er.

Again the sounding portals shake,
And speaks again the voice that spake:
—"The sun is high, the sun is warm,
Forth to the field the gallants swarm;
The foaming bit the courser clamps,
His hoof the turf impatient stamps;
Light on their steeds the hunters spring;
The sun is high—Come forth, O king!"
Along these melancholy walls

In vain the voice of pleasure calls:
The horse may neigh, and bay the hound,—
He hears no more; his sleep is sound.
Retire;—once more the portals close;
Leave, leave him to his dread repose.

—Mrs Barbauld's Works.

* The kings of Spain for nine days after death are placed sitting in robes of state with their attendants around them, and solemnly summoned by the proper officers to their meals and their amusements as if living.

THE ORIGIN OF TONTINES.

THE word Tontine is only a cant word, derived from the name of an Italian projector. This was one Laurence Tonti, a creature of Cardinal Mazarin; who, finding the people extremely out of humour with his eminence's administration, imagined he could reconcile them by a proposal of making people rich in an instant, without trouble or pains. His scheme was a lottery of annuities, with survivorship, which he proposed in 1653, with the consent of the court, but the parliament would not register the edict.* Three years after, he tried his project again, for building a stone bridge over the Seine, when it had both the favour of the court and the sanction of parliament, under the title of Banque Royale, but it failed again; for somebody having given it the unlucky name of Tontine, nobody in Paris would trust his money in a lottery that had an Italian title. The last attempt poor Tonti made, was to get his plan adopted by the clergy for the payment of their debts; but though they acknowledged the ingenuity of it, they rejected it as unfit for their purpose.

Such was the invention of the Tontine. If it is not trespassing too much upon you, I will now show when it first came into use. When Louis XIV. was distressed by the league of Augsburg, and granted money beyond what the revenues of the kingdom would furnish, for supplying his enormous expenses he had recourse to the plans of Tonti, which, though long laid aside, were not forgotten; and by an edict in 1689, created a Tontine Royale of 1,400,000 livres annual rent, divided into fourteen classes. The actions were 300 livres a-piece, and the proprietors were to receive L10 per cent., with bene-

* [By "survivorship," it is meant that the longest liver of the annuitants becomes ultimately the holder and proprietor of the whole stock. Each annuitant receives interest during life, and at the death of each, this ceases, the heirs of no annuitant but the survivor of all having any claim on the concern. Hence, when Tontine schemes are established, the subscribers usually settle the annuities on their youngest and healthiest children, to give the better chance of the survivorship. Inns and public buildings of different kinds are still sometimes built on the Tontine plan.]

fit of survivorship in every class. This scheme was executed but very imperfectly; for none of the classes rose to above 25,000 livres, instead of 100,000, according to the original institution, though the annuities were very regularly paid. A few years after, the people seeming in better humour for projects of this kind, another Tontine was erected upon nearly the same terms, but this was never above half full. They both subsisted in the year 1726, when the French king united the 13th class of the first Tontine with the 14th of the second; all the actions of which were possessed by Charlotte Bonnemay, widow of Louis Barbier, a surgeon of Paris, who died at the age of ninety-six.

This gentlewoman had ventured 300 livres in each Tontine; and in the last year of her life she had for her annuity 73,000 livres, or about L3600 a-year, for about L30.—*Gentleman's Magazine* for 1791.

SPIDER AND WASPS.

IN autumn 1838, a small party of friends paid a visit to Blair-Athol, and while sauntering through the pleasure-grounds, after visiting the Falls, and admiring the majestic windings of the Tay, one of them, on observing an unusually large spider's web, immediately called a halt and attention to the subject. This summons his companions obeyed, and after examining carefully a spider's web, larger by a half than any of them had ever seen before, great anxiety was expressed to obtain a peep of the giant spider himself. This, however, was a work of some difficulty; but at length, by dint of patient searching, they detected his hiding-place among the surrounding grass, and by means of a piece of paper, formed into a small twisted bag, succeeded in ensconcing him for future experiment. Arrived at Dunkeld, and dinner discussed, the conversation turned a good deal on entomology; each of the party had some anecdote to communicate, or remark to make; story in short followed story, and much, in particular, was said of the relative fighting powers of spiders and wasps. One man's experience was in favour of the superior prowess of the wasp; another's pointed to an opposite conclusion, and in this way discourse progressed, until bets were taken that the Blair-Athol prisoner would kill any wasp or wasps that could be found in the town of Dunkeld; and *vice versa*. As good luck would have it, a grocer situated near to the inn door had just staved a barrel of sugar, and as wasps are never far distant when such a windfall happens to be in the way, the backers of the bastard unproductive bee had an opportunity of picking and choosing at will. Three likely specimens were therefore selected, two of which were placed under a glass, and the third softly deposited at the bottom of a tumbler. The spider was then disenclosed, and placed on the rim of the same vessel; but he contented himself with trailing round and round, and seemed averse to descend. This, however, could not be permitted, and as it was necessary to bring the belligerents to close quarters, both were placed under a glass inverted. And then began the mêlée; both immediately bristled up for defence or attack—the spider a little above, and the wasp below. Watching an opportunity, the spider descended, and endeavoured to wound the wasp in the body; this attempt the other resisted, and in return paid his antagonist the compliment of biting off one of his legs. This throughout seemed the favourite mode of tactics, and as the spider on the other hand carefully avoided such accidents, the inference was that all insects he ventures to attack know instinctively that this is the only method by which he can be met, and, perchance, overcome. The battle lasted for some little time, but after the spider had inflicted a third bite, the enemy dropt, and instantly expired. A second wasp was then introduced, which also attempted to maim and lacerate the spider's legs; but it was less successful, and after receiving three or more bites, shared the fate of its predecessor. A third, therefore, was brought to the scratch, a small but very active wasp, and as the spider was now somewhat exhausted, the fortune of war seemed more varied than it had been before. In the end, however, the wasp received one severe wound, under the effects of which it reeled, and appeared to be dying; but after a little time it rallied, and appeared bent on renewing the combat. The spider, coiled up, watched its motions narrowly, and having by this time probably recruited its stock of poison, descended fiercely, and completed the work of death by a single bite or blow. It was then enlarged as the hero of the ring, and when last observed was wending its way cautiously adown the wall of the inn at Dunkeld.

On another occasion, one of the above party had occasion to send a fine specimen of the spider tribe to a medical friend in Dundee, who is exceedingly curious in such matters. As the readiest means of transit, he enclosed it in a common speil box, and dispatched by coach the tiny traveller. The box, however, was too roomy for the spider's wants, and as he seems to have disliked the jolting incident to coach travelling, he had recourse to a very ingenious remedy. Bees evince extraordinary sagacity in overcoming difficulties of form and situation, and spiders, it would appear, share to a great extent the same delicate and useful tact. Such, at least, is the inference we feel inclined to draw from the following fact:—When the spider reached Dundee, and the consignee opened the box, he was equally surprised and delighted to find that his insect charge had spun for himself a superb hammock, securely hung from the four corners of his prison-house, in which he had couched, in sailor fashion, as softly as he does in his native lair.—*Dumfries Courier*.

LONDON: Published with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

A DAY AT NORWOOD.

ON a beautiful day in last July, I had the pleasure of making an excursion from London to Norwood, for the purpose of inspecting a very remarkable public institution which has for some years been established there. A coach, starting from Charing Cross, soon whirled me a few miles down into the county of Surrey, and in little more than an hour I was at the end of my journey. The district in which I now found myself, is, unlike the most of English ground, agreeably varied by gentle eminences, presenting slopes in all directions, plentifully ornamented with copses, tufts of forest-trees, and hedge-rows; while in every part we discover villages and gentlemen's seats nestling in hollows, or scattered over the rising grounds. The salubrity arising from a varied surface, many years ago caused this fine region to be selected by the guardians of the London poor, for the rearing of the numerous destitute children who fell into their hands. These unfortunates were placed here at nurse in the cottages of the peasantry, where, as is well known, they were not in general treated in such a manner as to aid the effects of the healthful climate. Afterwards they were collected into a large establishment at Norwood, under the charge of one trustworthy individual, who contracted for their nurture *en masse*: it was this establishment, latterly under the care of the new poor-law commissioners, which I had come to see. Formerly it was little thought of and rarely visited; but since the change of management just stated, which has been attended with considerable alterations in the mode of rearing the children, it has become an object of much curiosity, and taken its place beside Westminster Abbey, St Paul's, the Tower, the Colosseum, the Adelaide Gallery, and other established "lions" of the Great Metropolis.

I found the Norwood School of Industry, as it is now called, to be composed of a series of large brick buildings, in the midst of enclosed areas, the whole occupying the top of one of the swelling eminences before alluded to, and thus presenting an aspect of cheerfulness rather uncommon in pauper institutions. The children, at present eleven hundred in number, and of various ages, from two or three to twelve or thirteen, are classed in two separate wards or divisions, according to their sex, and still further classified in their respective divisions according to age and capacity. The present contractor and superintendent is Mr Aubin—a middle-aged man, of that aspect which I am accustomed (being a stranger in the south) to regard as characteristic of the frank and upright Englishman. He undertakes to pay all expenses, in consideration of his receiving four shillings and sixpence a-week for the support of each inmate—a rate which must be considered sufficient, though not by any means extravagant, considering the excellence and copiousness of the diet, the comfortable clothing and lodging, and the extent of intellectual and moral instruction which is conferred. It delights me with the sense of something worthy of a great city, to find the young outcasts of the streets of London thus handsomely provided for—for though a sufficient expenditure does not, of course, insure a right mode of management, it is certainly the only thing which makes that possible. Satisfied that the allowance ought to do all that is desirable, let us now inspect the establishment, to ascertain if the application of the funds be as judicious as their amount is generous.

Before saying a single word respecting the appearance of things in this mighty nursery, it will be important to note what was the ordinary course of instruction in the workhouse schools during the "good

old times." It was then customary to consign the workhouse children to some superannuated pauper within the walls, to be taught a little reading and writing; and as this was considered sufficient in the way of education, it was no uncommon thing for these unfortunate beings to be sent out into the world totally ignorant of any moral or social obligations, and with an intellect almost a perfect blank. Confined from the earliest dawn of intelligence to the joyless (and generally vicious) scene which the walls and floors of their prison-house presented to their eyes, they knew next to nothing of external nature, and were in no shape prepared for depending on their own resources when the period came for their taking an active part in the multifarious concerns of life. The consequence was, that, in those good old times, the workhouse, as it was the first, continued to be the after, refuge of the pauper; it was his home in infancy, his home during any temporary misfortune, his home in old age, and in turn became the home of his children, and his children's children after him—the great patrimonial mansion to which he and his family clung with all the tenacity of an entail.*

To proceed with an account of the new order of things at Norwood. Mr Aubin being a benevolent man, willing to engraft any improvement in his system, the routine of the establishment was revised and remodelled a few years ago at the recommendation of Dr Kay, poor-law commissioner of the London district. It now serves as a pattern for the organisation of workhouse schools throughout the country. The great object held in view is to fit the children to engage with alacrity and ease in any species of useful employment to which they may be put on leaving school, and with minds so morally and religiously trained, that they stand as little chance as possible of finding their way either back to the workhouse or into the criminal jail—in short, to train them up not to be paupers, but active, intelligent, and good members of society. From what came under my notice, I should think there is little fear of the result.

The principal edifice consists of a very long school-room on the lower floor, fitted up with desks and forms, and divided partially by green cloth curtains, which can be raised at pleasure. At the end, nearest the door of entrance, is a gallery or flight of seats, one above another like the steps of a stair, and to these the infant-school, consisting of about 130 pupils, was immediately marched for instruction. No sooner had the little creatures, each in his clean linen blouse, taken their seats, than I was struck with their apparently healthy and robust appearance. There were

* Confined within the walls of the workhouse, where such a spirit reigns, it is difficult to conceive any thing more joyless and miserable than the life of these poor creatures. Surrounded by nothing which can elicit a spark of intelligence, it might be expected that their countenances should be characterised by vacancy, or passion, and such is the case. At Marylebone, about two years ago, the writer of these pages saw a lad of fifteen years of age, who had never but once been out of the house from the time of his birth; he was well-grown, but, as may be easily supposed, deficient in intelligence. It is not more than two years ago since the children were taken out of the workhouse for a walk for the first time; and a person who saw them (and who has been greatly instrumental in introducing an improved treatment of the children in that workhouse) stated that it was a most affecting sight to witness the delight and surprise with which they first beheld the green fields near Primrose Hill. They rolled upon the grass, and appeared incapable of being satiated, so great was their joy. The poor fellow before alluded to fell into every drain and ditch; he had never before experienced such holes in the earth, and a jump or a long step were motions unknown to him, for he had never walked upon any thing but the flags of the workhouse.—*Central Society of Education: third publication.*

not many intellectually good countenances or heads among them, but their rosy and chubby cheeks were an evidence of excellent and sufficient diet, and of a happy mental condition. An English visitor would not perhaps have noticed these appearances; but with me, as being something new, they could not pass unobserved. I could not help comparing the rows of well-fed and happy faces with the pale miserable countenances of the children in most of the pauper asylums of Edinburgh, where the comforts of food, raiment, and lodging, are decidedly too much narrowed. The children being duly seated, an intelligent young teacher, skilled in infant-training, exercised them on a simple branch of useful knowledge, employing the oral and simultaneous method of instruction, and testing the intelligence of individuals by subsequent cross examination. A class of about forty pupils of a more advanced age was next examined on the subject of Bible history, and the readiness of their replies to every question which could be asked in reference to facts in either the Old or New Testament, excited general surprise among the spectators present. The questioner was a clergyman of the established church, who had not previously seen the school, and who seemed highly pleased with the state of religious knowledge which was displayed. We passed from this to other classes, and finally were led out to the boys' courtyard, around which apartments for industrial training are situated.

The spectacle of human industry is always attractive. Even the idle like to look on while others are busy. But the interest of such scenes is greatly increased when the industry is exerted by youth, as it was on the present occasion. In the first room into which we were ushered, sat some twenty boys on low benches, making and mending shoes. This was the shoemaking school, and was under the charge of a young tradesman, who shaped the leather and instructed the pupils in the mysteries of the gentle craft. Divested of their jackets, and tucked in brown leather aprons, the little fellows sat hammering and sewing away as busily as if in a regular workshop; and, on the whole, the shoes which they made were as well executed as those generally in use among boys who are engaged in country labour. From the shoemaking apartment we were conducted into that in which tailoring is in a similar manner taught to a certain number of boys. The clothes on which these worked, were, like the shoes made by the young shoemakers, designed for the use of the establishment. Next we entered, in succession, the workshops devoted to instruction in the business of the blacksmith, and in that of the tinsmith. At both occupations, boys were suitably engaged under the direction of masters. Departments for joinery and gardening are, we were told, not as yet commenced, but about to be so. We were then conducted at once to a large enclosed area or court, in which there is an apparatus representing the deck, mast, and rigging of a ship, with a couple of guns on carriages, the whole being designed for instruction in seamanship. A class of thirty boys, dressed in blue jackets and white trousers, and directed by an under naval officer, went through a variety of manœuvres with astonishing dexterity; among other things, manning the yards aloft, and afterwards letting themselves down by the ropes to the ground. On making inquiry, I found that this and all the other industrial operations which I had seen, or which may henceforth be added, are not taught to only a few selected boys out of the mass, but all the boys in the school are designed to be instructed in every department, one after the other. Thus every boy, it will be observed, must ultimately be able to make and mend his

own shoes, clothes, and house furniture, to employ himself in iron and tin work, to cultivate a garden, and rear the more useful kind of herbs, and also to a certain extent to act the part of a sailor, should circumstances lead him to a life at sea. It is not the object of the commissioners in establishing this description of industrial training, to make the boys proficient in any line of occupation, but to prepare them for some particular handicraft or service by which they may gain an honest living, and at least be enabled to increase the comforts of their household without an expenditure of their earnings. Who can doubt that such benefits as these will be realised from the course of instruction just described; and who can doubt that England would have been a very different thing at the present day, had such instruction, with all its moral aids, been afforded to the poor half a century ago?

From the courtyards of the boys we were led into those of the girls. Here, after examining the classes in the school in which reading, writing, knitting, sewing, and other exercises, formed the appropriate business, we proceeded to the apartments devoted to industrial occupations. The first was a washing-house, in which a number of girls were engaged at troughs in washing the linens of the establishment, and the next a place where a similar number of girls, forming an advanced class, were learning the equally necessary duties of ironing and mangling. The neat tidy dresses of the girls, and their generally smart appearance, were very remarkable, and contrasted favourably in my mind with the plain aspect of the workhouse females in my own country. Besides being taught to wash and dress clothes so as to prepare them for being laundry-maids and for the duties of households, to which as wives they may be hereafter called, the girls are regularly instructed in sundry domestic offices, including a knowledge of plain cookery, serving of meals, nursing the sick or the very young children, milking cows, and the general management of a dairy. They are also accustomed to make inventories of clothes, to write out receipts for frugal cookery, to make out bills of articles sold in small shops, and to keep accounts of domestic expenditure. Their time is thus divided between instruction in school and industrial operations, while their attention throughout is directed to the duties and rewards of females generally in humble situations of life, and the caution, integrity, and perseverance requisite to secure their permanent well-being.

While inspecting this part of the establishment, I was introduced to the gentleman who acts as visiting physician, and by him politely conducted to the ward set apart as an infirmary or hospital. There were not, however, more than six or eight patients, and of these only three were confined to bed. The chief disease which makes its appearance, I was told, is scrofula; such being in many cases a result of the vicious lives led by the parents, for it need scarcely be mentioned that nearly the whole of the inmates are the children of the most depraved class of the population of London. Knowing the prevalence of ophthalmia in our Scotch workhouses—the inevitable result, and perhaps most unfailing mark, of inadequate food and comfort—I was anxious to make some inquiries on this point, and was glad to learn that, unless from the inherent effects of scrofula, ophthalmia was unknown, the wholesome and sufficient diet being apparently a complete preventive.* My medical friend further mentioned a very interesting fact concerning the Norwood school: he stated, that since the introduction of the industrial and mechanical operations, the health of the children had been greatly improved. There were now considerably fewer under medical treatment than formerly; in fact, the indulgence in manual labour in the workshops had wrought like a charm, and sufficiently proved that it had increased instead of diminishing the mental pleasures and resources of the pupils. Possibly the wide dissemination of this very interesting fact may be serviceable in stimulating guardians of the poor to annex schools of industry to the already established seminaries of juvenile paupers.

With respect to the moral and religious training of the Norwood children, it is impossible of course for any one after a single visit to say anything, as from his own observation. Here I shall content myself with quoting the language of Dr Kay, in his account of the establishment contained in the Fifth Annual Report of the Poor-Law Commissioners, to which the reader may be referred for much valuable matter on the training of pauper children. "The moral training (says he) pervades every hour of the day, from the period when the children are marched from their bedrooms to the wash-house in the morning, to that when they march back to their bedrooms at night. By the constant presence of some teacher as a companion during the hours of recreation, they are taught to amuse themselves without mutual encroachment; they are trained in the practice of mutual forbearance and kindness; they are taught to respect property not their own, to avoid faults of language and manner, to treat their superiors with respectful confidence; they are trained in the practice of their religious duties, in a reverential observance of the Sunday, and in deference to the instructions of their religious teachers. Propriety of demeanour in their bedrooms and at

meals is a matter of special anxiety." The schools are provided with a library, the books of which are anxiously perused by the more advanced pupils; and there is a gymnastic apparatus in the play-ground for developing their physical strength and activity. "The industrial training of the children has already had the effect of reducing the age at which they are received into service, and of rendering premiums for apprenticeship unnecessary; not, however, in consequence of their skill in a particular handicraft, but because the children have acquired industrious habits." A better testimony of the truth of all this could not be found, than in the simple fact, that both boys and girls are now eagerly sought for by masters and mistresses, so that no difficulty whatever exists in the way of their getting into an honest and regular means of employment.

With this I conclude my account of a visit to the Norwood School of Industry, hoping that, from what has been stated, the reader will not be surprised at my classifying it as one of the most interesting sights at present within the command of stranger or native in the neighbourhood of the metropolis.*

THE AMERICAN SLAVE-TRADE.

THE general government of the United States of America is now, as is pretty well known, the chief abettor of the odious traffic in slaves, both as respects importation from Africa and trading within the bounds of the Union. The Spanish, Portuguese, and some other flags, are no doubt still used in what we must call the piratical practices of the slavers, but the bulk of the trade is in the hands of American citizens, whose boast is to serve under "the star-spangled banner of liberty." If this revolting species of commerce cannot be prevented by Britain, except at the cost of a warlike contest, which every one must deprecate, the press can at least continue to agitate the question of abolishing slavery in the States, and thus, if possible, aid the cause of humanity and civilisation. We propose, therefore, to be humbly instrumental in turning attention to this deeply interesting subject; and in doing so, shall confine ourselves in the meanwhile to the following series of facts, gleaned from a work which has lately come into our hands, entitled, "View of the action of the Federal Government in behalf of Slavery, by William Jay," (New York, 1839.)

One of the most remarkable features in the internal branch of slave traffic in America, is the prevalence of a system of rearing negroes for market, on a principle as nearly as possible resembling that of rearing live stock, such as cattle, sheep, or pigs, for market in England. Maryland, Virginia, and North Carolina, also a part of Kentucky, are the principal slave-rearing districts for exportation. Mr Jay accounts for this peculiarity in the rural economy of these states as follows:—"The rapid extension of the cotton and sugar cultivation in the extreme south, together with the settlement of the new states of Alabama, Mississippi, Missouri, and Arkansas, occasioned a prodigious demand for slaves; and the agriculturists of Virginia, and the neighbouring states, discovered that their most lucrative occupation was that of raising live stock for the southern and western markets. In Georgia and South Carolina, it has also been found more advantageous to export their supernumeraries to Mobile, New Orleans, or Natchez, than to employ them on their already well-stocked plantations. Hence has grown up an almost incredible transfer of slaves from the north to the south; and recently a new market has been opened in Texas, giving an additional stimulus to the trade."

In Virginia and Maryland the trade is carried on by dealers in the large towns, who purchase the young slaves from those who have reared them from their birth, or collected them from remote parts of the country. "Dealing in slaves," says the Baltimore Register, "has become a large business; establishments are made in several places in Maryland and Virginia, at which they are sold like cattle; these places of deposit are strongly built, and well supplied with cow-skills and other whips."

The nature of the trade may be understood from the advertisements of the Baltimore merchants. The following are among those quoted by Mr Jay:—

"Cash for Negroes.—The subscribers are particularly anxious to make a shipment of negroes shortly. All persons who have slaves to part with, will do well to call as soon as possible.—OVERLY AND SAUNDERS."

"The subscriber being desirous of making another shipment by the brig Adelaide to New Orleans, on the 1st of March, will give a good market price for fifty negroes from ten to thirty years old.—HENRY DAVIS."

"The subscriber wishes to purchase one hundred slaves of both sexes, from the age of ten to thirty, for which he is disposed to give much higher prices than have heretofore been given. He will call on those living in the adjacent counties to see any property.—ANSLEY DAVIS."

"Notice.—This is to inform my former acquaintances, and the public generally, that I yet continue in the slave-trade, at Richmond, Virginia, and will at all times buy

and give a fair market price for young negroes. Persons in this state, Maryland, or North Carolina, wishing to sell lots of negroes, are particularly requested to forward their wishes to me at this place. Persons wishing to purchase lots of negroes are requested to give me a call, as I keep constantly on hand at this place a great many on sale, and have at this time the use of one hundred young negroes, consisting of boys, young men, and girls. I will sell at all times at a small advance on cost to suit purchasers. I have comfortable rooms, with a jail attached, for the reception of the negroes; and persons coming to this place to sell slaves, can be accommodated, and every attention necessary will be given to have them well attended to; and when it may be desired, the reception of the company of gentlemen dealing in slaves will conveniently and attentively be received. My situation is very healthy, and suitable for the business.—LEWIS A. COLLIER."

Joseph Wood, of Hamburg, South Carolina, "a gentleman dealing in slaves," advertises that he "has on hand a likely parcel of Virginia negroes, and receives new supplies every fifteen days."

In 1829, it was estimated that the annual revenue to Virginia from the export of human flesh, was one million and a half of dollars. From this period the traffic steadily advanced, and in 1832 it had arrived at so high a pitch, that Thomas Jefferson Randolph declared in the legislature of the state, that Virginia had been converted into "one grand menagerie, where men were reared for market like oxen for the shambles." An idea of the increase in 1836 may be obtained from an article in the Virginia Times on the importance of increasing the banking capital of the Commonwealth: the writer estimates the number of slaves exported for sale during "the last twelve months" at forty thousand; each slave averaging in value six hundred dollars, and thus yielding a capital of twenty-four millions of dollars, of which the writer thinks at least thirteen millions might be contributed for banking purposes.

We shall have a very incorrect idea of the traffic in slaves in Virginia and other places, if we imagine that by the term *negroes* black-skinned human beings only are meant. The following notices offering rewards for runaway slaves, afford a tolerably convincing proof that *white* men may be classed as negroes, and pass by that name, when they happen to be the descendants of an African ancestry:—

"One hundred dollars reward will be given for the apprehension of my negro Edmund Kenney. He has straight hair, and complexion so nearly white, that it is believed a stranger would suppose there was no African blood in him. He was with my boy Dick a short time since in Norfolk, and offered him for sale, and was apprehended, but escaped under pretence of being a white man.—ANDERSON BOWLES."

"Fifty dollars reward will be given for the apprehension and delivery to me of the following slaves: Samuel, and Judy his wife, with their four children, belonging to the estate of Sacker Dubberly, deceased."

I will give ten dollars for the apprehension of William Dubberly, a slave belonging to the estate. William is about 19 years old, quite white, and would not readily be mistaken for a slave.—JOHN T. LANE."

"One hundred dollars reward.—Run away from the subscriber, a bright mulatto man slave, named Sam. Light sandy hair, blue eyes, ruddy complexion; is so white as very easily to pass for a free white man. EDWIN PAXTON."

"Run away from the subscriber, working on the plantation of Colonel H. Tinker, a bright mulatto boy named Alfred. Alfred is about 18 years of age, pretty well grown, has blue eyes, light flaxen hair, skin disposed to freckle. He will try to pass as free-born. S.G. STEWART."

Mr Paxton, a Virginia writer, tells us in his work on slavery, that "the best blood in Virginia flows in the veins of the slaves."

Dr Torrey, in his work on Domestic Slavery in the United States, p. 14, says, "While at a public-house in Fredericktown, there came into the bar-room on Sunday, a decently dressed white man, of quite a light complexion, in company with one who was totally black. After they went away, the landlord observed that the white man was a slave. I asked him with some surprise, how that could be possible? To which he replied, that he was a descendant, by female ancestry, of an African slave. He also stated that not far from Fredericktown there was a slave estate, on which there were several white females, of as fair and elegant appearance as white ladies in general, held in legal bondage as slaves!"

A paper printed at Louisville, Kentucky, the 'Emporium,' relates a circumstance that occurred in that city, in the following terms:—"A laudable indignation was universally manifested among our citizens on Saturday last, by the exposure of a woman and two children for sale at public auction, at the front of our principal tavern. The woman and children were as white as any of our citizens; indeed, we scarcely ever saw a child with a fairer or clearer complexion than the younger one.—Niles's Register, June 1821."

The business of collecting and rearing slaves for the southern market, as we are told by Mr Jay, is carried on to no small extent in the district or small state of Columbia, as well as in Maryland and Virginia. This is the most disgraceful fact connected with the American slave-trade, for Columbia, in which Washington the capital is situated, is solely governed by the general Congress, which could hence abolish slavery in at least one district, without encroaching on the rights of any of the several states. A few advertisements culled by Mr Jay from the Washington newspapers, present the same points of character as those of Baltimore. The

* The breakfast of the children consists of hasty pudding made of flour and milk, also bread; three times a week the dinner is of meat either roast or boiled, with vegetables; and supper every evening consists of bread and butter, and a quantity of sweet milk and water.

* By the Croydon railway, which passes at a short distance from the place, there is now a ready means of communication betwixt London and Norwood; the Annerly station is the nearest stopping point. The school can be viewed only on Fridays at two o'clock, and by an order.

National Intelligencer of the 28th March 1836, contained the following announcements:—

"Cash for five hundred negroes, including both sexes, from ten to twenty-five years of age. Persons having likely servants to dispose of, will find it their interest to give us a call, as we will give higher prices in cash than any other purchaser who is now or may hereafter come into the market.—FRANKLIN AND AMFIELD, Alexandria."

"Cash for three hundred negroes.—The highest cash price will be given by the subscriber, for negroes of both sexes, from the ages of twelve to twenty-eight.—WILLIAM H. WILLIAMS, Washington."

"Cash for four hundred negroes, including both sexes, from twelve to twenty-five years of age.—JAMES H. BIRCH, Washington City."

"Cash for negroes.—We will at all times give the highest prices in cash for likely young negroes of both sexes, from ten to thirty years of age.—J. W. NEAL AND CO., Washington."

"Here," says Mr Jay, "we find three traders in the district advertising in one day for twelve hundred negroes, and a fourth offering to buy an indefinite number. In a later number of the Intelligencer we find the following:—

"Cash for negroes.—I will give the highest price for likely negroes from ten to twenty-five years of age.—GEORGE KEPHART."

"Cash for negroes.—I will give cash and liberal prices for any number of young and likely negroes, from eight to forty years of age. Persons having negroes to dispose of, will find it to their advantage to give me a call at my residence on the corner of Seventh Street and Maryland Avenue, and opposite Mr Williams's private jail.—WILLIAM H. RICHARDS."

"Cash for negroes.—The subscriber wishes to purchase a number of negroes for the Louisiana and Mississippi market. Himself or an agent at all times can be found at his jail, on Seventh Street.—WILLIAM H. WILLIAMS."

Fostered by Congress (continues the indignant abolitionist), these traders lose all sense of shame; and we have in the National Intelligencer the following announcement of the regular departure of three slaves, belonging to a single factory.

"Alexandria and New Orleans Packets.—Brig Tribune, Samuel C. Bush master, will sail as above on the 1st January—brig Isaac Franklin, William Smith master, on the 15th January—brig Uncas, Nath. Boush master, on the 1st February. They will continue to leave this port on the 1st and 15th of each month, throughout the shipping season. Servants that are intended to be shipped, will at any time be received for safe-keeping at twenty-five cents a day.—JOHN AMFIELD, Alexandria."

But the climax of infamy is still untold. This trade in blood; this buying, imprisoning, and exporting of boys and girls eight years old; this tearing asunder of husbands and wives, parents and children, is all legalized in virtue of authority delegated by Congress! The 249th page of the laws of the city of Washington is polluted by the following enactment, bearing date 28th July 1831:—"For a licence to trade or traffic in slaves for profit, four hundred dollars."

Such is the character and extent of the American slave-trade, impudently and wickedly called by the Senate 'the coasting trade'—a trade protected and regulated by the very government which, in the treaty of Ghent, with wonderful assurance, declared that 'the traffic in slaves is irreconcilable with the principles of justice and humanity.'

Of the extent of the export trade in slaves from Columbia, Maryland, Virginia, and other places, to the southern and western markets, no statement has ever been presented in the commercial statistics of the United States, nor could such well be made, for the transport takes place by land as well as by sea. Whole coffles or gangs of chained slaves are driven long and painful journeys in the interior, much in the same manner as in the wilds of Africa. "The Rev. Mr Dickey, in a published letter (we quote from the authority before us), thus describes a coffle he met on the road in Kentucky:—"I discovered about forty black men all chained together in the following manner: each of them was handcuffed, and they were arranged in rank and file; a chain, perhaps forty feet long, was stretched between two ranks, to which short chains were joined, which connected with the handcuffs. Behind them were, I suppose, thirty women in double rank, the couples tied hand to hand."

Mr Dickey's statement is confirmed by the following touching account given by J. K. Paulding, the present secretary of the United States navy, in his "Letters from the South," published a few years ago in New York. "The sun was shining out very hot, and in turning an angle of the road we encountered the following group: first, a little cart drawn by one horse, in which five or six half-naked black children were tumbled like pigs together. The cart had no covering, and they seemed to have been actually broiled to sleep. Behind the cart marched three black women, with head, neck, and breasts uncovered, and without shoes or stockings; next came three men, bareheaded, half naked, and chained together with an ox chain. Last of all came a white man on horseback, carrying pistols in his belt, and who, as we passed him, had the impudence to look us in the face without blushing. I should like to have seen him hunted by bloodhounds. At a house where we stopped a little farther on, we learned that he had bought these miserable beings in Maryland, and was marching them in this manner to some of the more southern states. Shame on the state of Maryland! I say—and shame on the state of Virginia! and every state through which this wretched

cavalcade was permitted to pass. Do they expect that such exhibitions will not dishonour them in the eyes of strangers, however they may be reconciled to them by education and habit?"

Mr Jay produces a number of other facts criminative of the general government of the United States in the matter of foreign and domestic slavery, and these we recommend to the attention of those parties who are now anxiously agitating the subject in this country.

LEGACY-HUNTERS AND LEGATEES.

BY MISS AGNES STRICKLAND.

THE first legacy-hunter I ever knew, was a girl in her teens, who lived next door to a wealthy misanthropic old gentleman, called Mistress Bridget Fenning. Mistress Bridget was an ancient spinster, of the most penurious habits and crabbed temper, bearing both in mind and person a strong resemblance to the description of one of those amiable creatures of fairy lore, yeleft an ogress.

Mistress Bridget Fenning, who had neither relations nor friends, lived all alone in a small house in one of the back streets of Scrapelston-west, a little market-town situated almost at the world's end. She was completely antisocial in her habits, and was never seen abroad, except on a Saturday evening, when she crept forth, basket in hand, to pick up a bargain or two among the refuse of the provisions that had been left unsold in the market, and this supply always lasted for the ensuing seven days.

As she was a person in extreme old age, and nearly bent double with rheumatism, she experienced some difficulty in hobbling home with her freight, light as it was, and was very anxious to impose her burden on any good-natured young person who happened to be going the same way. Now, Maria Wakefield, her neighbour's niece, being a damsel of a remarkably stayed and meek deportment, was generally honoured by Mistress Bridget with the office of porter-in-ordinary on these occasions. Maria took this as a very favourable symptom of the rich old spinster's regard, especially as Mistress Bridget had confidingly informed her aunt one day, "that she appeared a steady, well-disposed young person, who knew how to behave herself to her elders and betters, which would be the better for her, perhaps, one day."

Both Maria and her aunt forthwith conceived the most sanguine hopes from this intimation, especially as the old lady was destitute of heirs: it seemed to them the most natural thing in the world that Maria would be the fortunate legatee to whom her treasured hoards would be bequeathed, provided she only paid her sufficient attention.

From the moment the simple girl came to this conclusion, she surrendered her time, her pleasure, and her liberty, into the hands of the most unconscionable old wretch in Christendom, who made a favour of accepting her services, and vented all her splenetic humours on her in return for her exertions to please her. Mistress Bridget Fenning did not keep a domestic of any kind, not so much as a cat, in order to avoid the expense of feeding what she considered useless incumbrances in a house; as for wages, she would have died sooner than disburse a single shilling in that way to either servant or washerwoman.

In process of time Maria Wakefield took all these offices upon herself, without receiving the slightest acknowledgment in return, or indeed expecting it, except in the shape of a fat legacy, at which reward Mistress Bridget occasionally pointed when she required some extraordinary exertion on the part of her slave-voluntary.

After a diurnal apprenticeship of seven years to the whims of her rich neighbour, Maria Wakefield was given to understand that Mistress Bridget found the nights long and lonely, and would be glad of her company for a sleeping partner.

Hitherto Maria's evenings had been at her own disposal, but now, in compliance with Mistress Bridget's requisition, she patiently sacrificed this last precious remnant of her freedom into the hands of the encroaching old hag, who locked up her doors and went to bed at nine precisely in the summer, and eight in the winter. A farthing rushlight always lasted her a week, and if it were extinguished accidentally, she never permitted it to be relighted the same evening, but compelled Maria to undress her, and go to bed in the dark.

She neither bestowed supper nor breakfast on her obsequious attendant, but duly sent her home to her aunt for her meals, strictly charging her not to waste her time by staying longer than was absolutely necessary, for she had many things for her to do.

Maria was obediently attentive to all the instructions of Mistress Bridget, whose legal heiress she now considered herself; and, truth to tell, was in that light regarded by all the neighbourhood, and became an object of positive envy and ill-will on that account to all legacy-hunters who were not actively engaged in the pursuit of promising game of their own.

Every day the wealthy spinster grew more and more exacting and ill-tempered. Her infirmities increased, but there were no immediate hopes of her death. She assured Maria that she had made her will in her favour, and even offered her the satisfaction of perusing it; but it is rather a delicate matter for any one but a lawyer to avail themselves of such a permission in the testator's presence; so Maria modestly

declined the pleasure of ascertaining the precise amount of her future possessions.

The damsel's forbearance was so well pleasing to the rich woman, that she patted her on the back, told her she was a good girl, and would one day see what she had done for her in that same will.

It is, however, beyond the power of even the most subservient being in existence to retain the affection of such a whimsical and tyrannical personage as Mistress Bridget Fenning; generally, an irreparable breach sooner or later takes place in intimacies like that which is now described. The termination of Maria's period of service and sycophancy, which at length came to pass, may be taken as a warning by all who have the meanness to follow her example. One bitter cold night she was ordered by her mistress to heat a brick upon the hob for the purpose of placing it at her feet in bed. This she did with her usual complacency; but alas! alas! the brick proved over-hot—why disguise the fact?—red hot on one of its sides, and this being unperceived by the luckless Maria, the burning of certain integuments of Mistress Bridget was the consequence. "Get out of my house," cried the infuriated ogress, "get out, you good-for-nothing hussy, and never presume to set foot in it again. It would be of no use if you did, for I shan't leave you a farthing."

The old lady kept her word, and Maria Wakefield reaped no other reward for her seven years' slavery than the derision of all her acquaintances. Mistress Bridget Fenning bequeathed the vast sum of her wealth to a person who never expected it, and who scarcely knew her by sight; a rich old bachelor, whose habits were almost as penurious as her own. "I leave my money to Mr Timothy Crompton," said she, "because it is evident he knows the value of money, and will take care of it and prize it accordingly."

The said legatee, Mr Timothy Crompton, was a crusty curmudgeon, whose only comment on hearing of this unexpected bequest was an ungracious growl, intimating "that he should be compelled, he supposed, to put himself to the expense of a suit of mourning for a person who was not in any way related to him."

After this great accession to his property, Mr Timothy Crompton became in his turn an object of increased interest to all the legacy-hunters of Scrapelston-west, who had the honour of being of his acquaintance, and of speculation to many who were not. He afforded very little encouragement to persons of this description, for he rejected all presents, and returned civilities with insults; nevertheless, he was most closely and perseveringly besieged with the attentions of a legacy-hunting cousin-germain, who was bent on supplanting the heir-presumptive to the accumulated wealth of the rich man. The heir-at-law of Mr Timothy Crompton was a sister's orphan son, a wild, thoughtless, young fellow, with all the spendthrift propensities that, generally speaking, pertain to a miser's heir. There was of course no friendly feeling between these rival kinsmen of the wealthy Mr Timothy Crompton, though they had some remarkable points of similarity in accidental circumstances respecting them, which were sometimes productive of confusion and inconvenient mistakes. Both were named Henry Glasspoole, and both were lieutenants, serving in the same regiment; consequently it was not always easy to know which Lieutenant Henry Glasspoole was meant when one was mentioned, without a particular explanation was given. They were constantly opening each other's letters, and more than once the worldly-wise Henry Glasspoole was in danger of being arrested for the debts of his thoughtless cousin; but this he well knew how to turn to his own sinister purposes in representing the matter to Mr Timothy Crompton.

The two Glasspooles were brothers' sons, but the mother of the elder Henry Glasspoole was the aunt of Mr Timothy Crompton; that of the younger Henry (or Harry Glasspoole, as he was generally called) was the sister of that amiable person.

Harry Glasspoole was gay, good-humoured, rash, and extravagant. All his follies and foibles were duly related to his uncle, with malicious exaggeration, by his designing cousin, who had exchanged into the same regiment, in order to become a spy upon all his actions. Timothy Crompton would have regarded the violation of every article in the Decalogue as trivial offences on the part of his nephew, in comparison with the crime of extravagance; but when that sin was proved against him beyond the power of contradiction, he resolved on making a will for the purpose of disinheriting the graceless spendthrift. He did so, and bequeathed his thousands and tens of thousands to the greedy legacy-hunter, who had played the part of informer and supplanter. The rich man did not long survive the painful exertion of appointing a successor to his worshipped wealth. It appeared to him like signing his own death-warrant, and he would have committed the document to the flames, if the remembrance of the cost of the parchment had not deterred him. It went against his nature to waste anything, especially a thing so expensive.

He fell sick. The Scrapelston apothecary, who was also a legacy-hunter, paid him friendly visits, physicked him gratis, and supplied him with a nurse.

"Ah, nurse," sighed Mr Timothy Crompton, "I shall surely die."

"Die, sir!" ejaculated the nurse with great naïveté; "to be sure, sir, you don't mean to be so foolish as to die! Lauk, sir! you had better stay where you are, for you'll never be so well off any where else."

"I am of the same opinion, nurse," replied the rich man, and—gave up the ghost.

And now arose a difficulty for the executors of the last will and testament of Mr Timothy Crompton, which no one had foreseen.

In accordance with his usual system of small savings, Mr Timothy Crompton had made his own will, in which he bequeathed the whole of his property, real and personal, to his dearly beloved relative Henry Glasspoole, Esq. of his majesty's—regiment of light infantry, but which of his two relatives of that name serving in that regiment, was by no means indicated, unless the epithet "dearly beloved" was intended to denote the favoured individual. Each Henry Glasspoole contended that he, and he alone, was the "dearly beloved" named in the last will and testament of the late Mr Timothy Crompton, and claimed the benefit of his bequest.

Mutual friends advised a compromise, but neither of the claimants felt disposed to resign any portion of a property, to which each considered himself legally entitled; so it was agreed by all parties that there was no remedy but an appeal to Chancery. Fortunately, however, for Henry Glasspoole the no-legacy-hunting nephew, the cause was settled in his favour in a very unexpected manner, by a decree more immutable than was ever pronounced by a lord chancellor either of whig or tory principles; that decree summoned Henry Glasspoole, the legacy-hunter, to his last account in such a hurry, that he, who had spent all his life in thinking of another man's will, had not time to make his own, but died intestate, leaving his rival, who was his nearest of kin, the undisputed heir not only to the fortune of Mr Timothy Crompton, but to his own.

It is not always that affairs of this kind are disposed of with so satisfactory a measure of poetic justice, for Mammon being the prince of this world, we sometimes find his votaries in a more thriving condition than honest people could wish. Yet, with regard to the business of legacy-hunting, I think experience will sufficiently prove, that for one instance of success, there are at least five hundred failures in that honourable calling.

THE SOCIAL SYSTEM OF FOURIER.

BY GIBBONS MERLE.

It is not generally known that there is a sect of Socialists in France, who, although differing materially from Mr Owen in the details of their plan, have the same object in view, namely, the melioration of the general condition of society.

Charles Fourier, from whom the sect took its rise, was born at Besançon, in France, on the 7th of April 1772. His parents, who had followed a trading profession, intended him to pursue the same career, and gave him an education fitted to their views. His maternal uncle, who had made a large fortune in trade, was also desirous that Fourier should follow similar pursuits. In 1780, this uncle retired from business, and purchased letters of nobility. At his death he bequeathed two millions of francs to his heirs. Young Fourier evinced the possession of talent at an early age. At seven he wrote a poetical essay on the death of a pastry-cook, which astonished the professors of the college at which he was placed, and in 1785 he carried off the two chief prizes of his class for Latin poetry. His favourite study at this time was geography, and he passed whole nights over maps which he had purchased with his pocket-money. The culture of flowers was his favourite recreation. His room was a flower garden, in which he had collected plants of various countries, and for which he adopted various modes of culture. He was passionately fond of music, and at a subsequent period continued to cultivate the science, and made it, as it were, the natural algebra of his writings. The heart of Fourier was always in harmony with his professions. When at school, he shared for a long time his breakfast with a poor half-starved peasant, and this self-abnegation was not known until the individual in whose favour it was exercised, could, by the absence of Fourier, speak of it without wounding his delicacy. On quitting school, Fourier was sent to a commercial house at Lyons, and having distinguished himself by his judgment and good conduct, was chosen by the heads of the establishment to represent them in a commercial tour to their customers. In those days the competition among wholesale dealers had not risen to such a height as to render regular journeys necessary, and the commercial traveller was generally a young man of good family, who made his journey as much a tour of improvement as of business. In this way Fourier visited the greater part of France, Germany, Holland, and Belgium, and returned to Lyons with a mind enriched by observation. In 1793, Fourier entering into business on his own account, laid out the whole of his patrimonial property in colonial produce, and Lyons having been declared in a state of siege by the Convention, he was suddenly ruined. He was subsequently arrested several times by the agents of that reign of terror, and escaped with life almost by miracle. In the same year he was included in the grand requisition, and compelled to enter the army, in which he served six years. On his return to Lyons he devoted himself with ardour to his system of association, and contributed many articles of high interest to the *Bulletin de Lyon*. His first work, called *The Theory of the Four Great Movements*, was printed in

1808, but remained almost unknown until the year 1816, when it was accidentally seen by M. Juste Murion, who resolved to promulgate it. His next work, called *A Treatise on Domestic and Agricultural Association*, in two large volumes, was published through the pecuniary aid of M. Murion. In 1825, Fourier, who had paid a visit to Paris, where he made a fruitless attempt to propagate his doctrines, returned to Lyons in such a state of poverty, that he was glad to accept a situation as a clerk in a commercial house, with a salary of only 1200 francs per annum. His *New Industrious World* (*Nouveau Monde Industriel*) was published in 1829; and in 1831 he published a pamphlet called *Delusions and Quackery of the Sects of Owen and St Simon* (*Pièges et Charlatanisme des Sectes Owen et St Simon*), in which he indulged in a strain of abuse, for which he frequently afterwards expressed his deep regret. In 1832, he contributed some articles to the journal called *Le Phalanstère*, which was founded in that year, and in 1835 published two volumes entitled *False Industry* (*La Fausse Industrie*). On the 9th of October 1837, he died in a state of great moral discouragement at the ill success of his plans for the improvement of society.

It is only since the death of Fourier that his projects have met with public attention, and been in some manner carried into execution. A society or sect of Fourierists has been established, but although it has made many converts, it still may be considered in its infancy. Whether that infancy is to become manhood, or to attain merely its teens, must depend as much upon circumstances over which the society has no control, as upon its own conduct. Persecution and disdain have been alternately shown by the authorities, but under the reign of the present mild government in France, it has a fair chance of arriving at distinction, if its merits be such as its partisans proclaim them to be; at least neither persecution nor contempt will be resorted to for the purpose of preventing the promulgation of their doctrines. So little, indeed, is the government disposed to prevent their progress, that the law which in France prohibits the assembling of more than nineteen persons at one time without the special permission of the police and the presence of a police officer, is seldom if ever enforced on the occasion of their public meetings, although there is reason to believe that many violent young men of that turbulent class called *La Jeune France* are members of the society. The number of enrolled members is not very considerable, and the monthly banquet which takes place in Paris is seldom attended by more than fifty or sixty persons; but there are various branch societies in Paris and in the French provinces which adopt the social system of Fourier, although they do not profess to be governed by all the obligations of the parent institution. They all, however, profess to take for their motto the words of Fourier, *Neutrality in politics and religion*, and to seek to arrive at their object by the force of moral energy, and an open disavowal of physical violence. Until very recently, the society had only one public organ of their opinions, which appears once a month, and is called the *Phalange*; but as members have branched off and devoted themselves to special modes of working out the main principle, other publications have been started, amongst which the most prominent are the *Chronique du Mouvement Social*, and the *Nouveau Monde*, which are regular periodicals. The most influential writers in these papers are M. Reverchen, a Frenchman, M. Doherty, an Englishman many years resident in France, and M. Czynski, a Pole. The latter has lately distinguished himself by a little pamphlet in a cheap form called *Atteindre des Ouïers*, in which he points out the folly and criminality of acts of violence on the part of the labouring classes, and attempts to convince them that they can only obtain the melioration of their condition by the unwearied exercise of virtuous industry, and an enlightened system of association. The parent society has many partisans in Belgium, Spain, Portugal, Mexico, and the United States. At Lyons there is a division of Fourierists under the name of *l'Union Harmonieuse*, and which boasts of having corresponding societies in thirty-four towns in France and in Switzerland and Algeria. It would appear, also, that the system has been introduced into Texas by an enlightened German. This gentleman, after studying the social condition in France, proceeded to the United States for the same purpose; and there, although he found none of those old institutions of what the labouring classes in Europe have been accustomed to complain as the source of the evils of their condition, and saw all the democratic changes which have been here clamoured for by the mass as a panacea, in full force, he witnessed the same demoralisation and the same absence of what the Fourierists consider real knowledge, as amongst the same class of persons in Europe. Determined to try the effect of the social system on a practical scale, this gentleman has induced fifty German families of New York to emigrate to Texas, where they are to live in community under the direction of a Fourierist, and it is expected that another emigration of one hundred German families will take place in the autumn of the present year. This little colony is called the *Phalange*, and is to be governed by the following statutes:—

1. The property of each individual in furniture, utensils, instruments of labour, and money, is to be placed in the hands of a committee, in exchange for certificates of shares, which may be exchanged or sold amongst the colonists.

2. No new member is to be admitted without the approbation of two-thirds of the society.

3. Trading is prohibited, except by the medium of the committee, who are to make all sales and purchases.

4. Members are to be allowed to quit the society, which is to repay all their advances.

5. The labour is to be performed by *series*, which are to be subdivided in *groups*. The *groups* are to appoint chiefs, and the chiefs of the groups to appoint those of the series; the latter are to name the central committee, and the central committee are to appoint the director or manager.

6. The gains of the community are to be thus divided—labour, five-twelfths; talent, three-twelfths; capital, four-twelfths.

7. The society are to educate the children, and the sick are to be attended to in the same manner.

8. The infirm members unable to labour are to have a decent maintenance from the society.

9. All the officers are to be elected for one year only, but they may be re-elected.

10. In the first instance, the *Phalange* is to be composed exclusively of Germans, but this regulation may be subsequently modified.

11. The maintenance of order and regularity, and the moral government of the society, are to be left to the chiefs of the *groups* and *series*; daily reports are to be made to the director, and by him to the committee, who are to have power to inflict punishment for slight offences. For grave offences, expulsion may be pronounced, but in such case the society alone can give final judgment.

This is the first attempt to carry the doctrines of Fourier into practical operation, but the parent society is endeavouring to make arrangements for doing it on an extensive scale in France; and the *Nouveau Monde* announces that Mr Doherty has been invited by some capitalists in Ireland to get up a practical society in that country. It will be very curious, if this should be realised, to see the working of the two systems of Owen and Fourier, the one in Ireland, and the other in England. The public will therefore have an opportunity of ascertaining how much of real good there is in both or either of these systems, and whether the practical difficulties which were opposed as an argument against them really formed part of their essential character, or were the mere actions of human prejudice, which is so apt to regard as visionary what it cannot at once understand.

It will be seen from the rules laid down for the government of the colony at Texas, that the bases of the system are—an integral association for domestic agriculture and manufacturing labour; the equitable division of profits, according to the application of capital, talent, and labour. The objects aimed at are—a production quadruple that of the present system of society, the rendering of labour attractive and agreeable, the attainment of comfort and happiness by all the members of the society, and general harmony and unity throughout the civilised world. On this latter point many of the admirers of the system of Fourier, as far as the melioration of the condition of the labouring classes is concerned, differ from the founder of the society. They regard his plans for the regeneration of mankind as visionary, although they are very willing to adopt his spirit of association for all the practical purposes of life. Hence it is that whilst all the branch societies respect the principles and views of the amiable individual to whom they owe their existence, they confine themselves more or less to those portions of his system which may be at once tried without trenching upon the attributes of established governments, and the institutions which are immediately under their guidance and control. It must be observed, however, that in every case the Fourierists contend for an entire change in the mode of education, which, according to their plan, is to be public, in order that children may not be exposed to the chance of a neglected or perverted education by their parents.

Madame Gatti de Gamond, a Belgian lady, has recently published an account of Fourier and his system, which has gone rapidly through three editions, and which continues to attract great notice. As an instance of this, it is stated in the *Nouveau Monde*, that a French capitalist has offered to place at her disposal a sum of 50,000 francs towards the foundation of the first practical essay of which she may approve. Madame Gatti thus describes the nature of the association proposed by Fourier:—"The smallest number of which a Phalanstère can be composed, is 400 individuals, or 80 families; the largest to which it can extend, is 1800 persons, or 400 families. If there be more or less, the attainment of harmony will be impossible. In an essay of 400 persons, there should be a general aptitude for occupation; unequal fortunes as much graduated, however, as possible, each bringing his share of capital, skill, and labour, or one of these three. The dwellings should be of different dimensions, and their styles of living according to the different fortunes. He who brings only his labour, is at once to receive the minimum as relates to the food, lodging, and clothing; of another class, each labourer, being paid his share of its proceeds, will soon be in a condition to repay the advances which may have been made for him by the community, acquire talent, and thus participate in the retribution of that talent. The maintenance of the sick, the infirm, and children up to five years of age, is to be at the charge of the community. Transferable shares are to be given to those who bring capital or

property into the common stock; and capitalists, not otherwise members of the community, may be allowed to contribute, taking, at their option, either a fixed dividend of 8 per cent., or a dividend upon the portion of the profits to be set aside for capital. Children are to be entitled, after the age of five, to a proportion of the gains of the community, which are to be laid aside for them until they attain their majority." In another part she describes the arrangement of a *Phalanstère*:—"The centre is to be consecrated to dining-rooms, an exchange, committee-rooms, libraries, and school-rooms; here also are to be the place of worship, the telegraph, and the observatory. In one wing are to be the manufactories for labour attended with noise, and in the other the sleeping-rooms, ball-rooms, and reception-rooms. Near the public hall for dining, are to be smaller rooms for those groups or series who may prefer dining by themselves, and also rooms for private social meetings. The stabling and warehouses are to be opposite the main edifice. In addition to the grand courtyard, there is to be a courtyard for the winter, planted with evergreens. The whole building is to be so arranged that all the communications may be under cover, and heated so as to keep up a constant and genial temperature."

The mode of classing the Phalansterians for the purposes of labour, recreation, and education, is detailed in the condensed view of Fourier's system, which has been published by Madame Gatti. Much of this resembles the system proposed by Mr Owen, and could only interest the reader in connection with the development of the whole plan, of which this article is intended to be merely a general outline. Fourier, like Owen, proposes to make labour useful to all by its becoming the amusement of all, and, like Owen, he goes further than the mere organisation of families in one community for their own particular exigencies. He also would regenerate society in all its bases; but his disciples, less enthusiastic than himself, and more prudent, perhaps, inasmuch as they know that the deep-rooted prejudices of society must to a certain extent be indulged, if they cannot be respected, until they shall disappear under the influence of practical conviction, have confined themselves to such parts of the system as may be at once brought into operation without exciting the fears of any government, or of any class of persons. The greater part of the branch societies limited their views to the establishment of agricultural and commercial communities, governed by their own laws so far as may regard all their internal regulations, but demanding for themselves no greater degree of liberty, as regards the established institutions, than can be fairly conceded by any government and in any country. Hence it is that the modified Fourierists are gaining ground and receiving offers of capital, and even a certain degree of encouragement from the French government.

MANCHESTER AS IT IS.

THIS is the title of a little volume recently published by Messrs Love and Barton of Manchester, as a guide to what they well describe as the *manufacturing metropolis of England*. It contains a great quantity of useful information, condensed into small space, arranged with judgment, and written with neatness and propriety. Some of the references which it makes to business transactions of this extraordinary town, are of a very interesting nature, and we believe we shall be gratifying our readers, without injury to the publishers, by extracting them.

There are several mercantile firms, we are told, in Manchester, who each make sales to the extent of one million sterling per annum, and who employ nearly fifty salesmen and clerks. In walking the streets, it is remarked, "the bustle and activity, the loading and unloading of waggons, the carriers' carts waiting to receive packages, and the dyers' and bleachers' vans waiting to deliver pieces, the waggon-loads of cotton, the immense iron-hooped bales for exportation, drawn along the streets, which, at the most hasty glance, cannot fail to convey to the mind of a stranger an idea of the amazing amount of commerce that is daily transacted."

The mills are immense buildings, raised to the height of six, seven, and eight stories, erected at an expense of many thousands of pounds, and are filled with machinery, costing as many more. The capital sunk in a single mill will sometimes be £50,000, and frequently is as much as £100,000. Some of the mills contain nearly two thousand hands. A visit to one of the largest mills, if an introduction can be procured, is a gratifying treat. The rooms are kept in the most perfect state of cleanliness, and the strictest order and regularity prevail. Every operation is performed by rule, and the subdivision of labour is carried out in the most minute manner." As a specimen, that of Messrs Birley and Co. is described. Here several hundred thousand pounds have been sunk in buildings and machinery. "The number of hands employed by this firm is sixteen hundred, whose wages annually amount to the sum of £40,000. The amount of moving power is equivalent to the labour of 397 horses. The number of spindles in the mills is about 80,000. The annual consumption of raw cotton is about 4,000,000 pounds weight! The annual consumption of coal is 8000 tons. It will perhaps excite surprise in a person unacquainted with the nature of machinery,

when informed that the annual consumption of oil, for the purpose of oiling the machinery, is about 5000 gallons; and the consumption of tallow, for the same purpose, 50 hundred-weight. The annual cost of gas is £600. One room alone, belonging to this firm, contains upwards of 600 power-looms. The establishment in which the fabric is manufactured for waterproof clothing, such as 'Macintosh cloaks,' belongs to Messrs Birley and Co., and is a part of their concern. The number of hands employed in this business varies from two hundred to six hundred. The immense amount of 250,000 pounds weight of India-rubber is annually consumed in the process of manufacture, to dissolve which, 100,000 gallons of spirits are employed.

The method of paying the wages of the work-people in Messrs Birley and Co.'s establishment, is one that is worthy of imitation, and ought to be made known. By procuring a large amount of silver and copper every week, each individual receives his or her wages *separately* before leaving the premises, thus obviating the necessity of going to the public-house or beer-shop to seek change, a practice much too general on the Saturday evenings. To a stranger, the paying of so large a number of work-people would appear a work of some difficulty; but so excellent are the arrangements, that the whole amount is counted and distributed for payment by one individual in about two hours."

The making of machinery is now one of the most important departments of Manchester business. In steam-engine-making and engineering, one of the principal establishments is that of Mr Fairbairn, to which we some time ago made allusion in this work. Here "the *heartiest* description of machinery is manufactured, including steam-engines, water-wheels, locomotive-engines, and mill-gearing. There are from five hundred and fifty to six hundred hands employed in the various departments; and a walk through the extensive premises in which this great number of men are busily at work, affords a specimen of industry, and an example of practical science, which can scarcely be surpassed. In every direction of the works the utmost *system* prevails, and each mechanic appears to have his peculiar description of work assigned, with the utmost economical subdivision of labour. All is activity, yet without confusion. Smiths, strikers, moulders, millwrights, mechanics, boiler-makers, pattern-makers, appear to attend to their respective employments with as much regularity as the working of the machinery they assist to construct.

In one department mechanics are employed in building those mighty machines which have augmented so immensely the manufacturing interests of Great Britain, namely, steam-engines. All sizes and dimensions are frequently under hand, from the diminutive size of 8 horses' power, to the enormous magnitude of 400 horses' power. One of this latter size contains the vast amount of 200 tons or upwards of metal, and is worth, in round numbers, from £5000 to £6000.

The process of casting metal is conducted here on a very large scale. Castings of twelve tons weight are by no means uncommon: the beam of a 300 horses' power steam-engine weighs that amount. Fly-wheels for engines, and water-wheels, though not cast entire, are immense specimens of heavy castings. A fly-wheel for an engine of 100 horses' power, measures in diameter 26 feet, and weighs about 35 tons. In this establishment some of the largest water-wheels ever manufactured, and the heaviest mill-gearing, have been constructed; one water-wheel, for instance, measuring 62 feet in diameter. The average weekly consumption of metal in these works in the process of manufacturing, owing to the quantity of wrought-iron used, and the immense bulk of the castings, is 60 tons or upwards, or 3120 tons annually.

The preparation of patterns—wood fac-similes of the castings—is a very costly process. Every piece of machinery, before it can be cast, must be constructed in wood; and these *patterns*, as they are termed, are made to form, in sand, the mould into which the liquid ore is poured. Fifty men are daily employed in making patterns. The patterns, which are part of the proprietor's *stock in trade*, are worth many thousand pounds. After being used, the most important are painted and varnished, and laid carefully aside, in a dry room, to be ready for use when machines may accidentally get broken, or to aid in the construction of new ones. The patterns are made frequently of mahogany.

A most curious machine is employed for the purpose of *planing iron*, and by means of its aid, iron shavings are stripped off a solid mass of metal, with apparently as much ease as if it were wood, and with the greatest regularity and exactness. Not the least interesting department of these works is that appropriated to boiler-making. Boilers, for steam-engines, are composed of a number of plates of wrought-iron, about $\frac{3}{4}$ of an inch in thickness. They are riveted together with rivets about $\frac{1}{2}$ of an inch diameter, holes to receive which are punched through the plates by a powerful yet simple machine, with as much facility as if the resistance was mere air. The process of riveting was, on the *old method*, an extremely noisy one; but a new plan is adopted here, and by it the work is performed silently, and much more efficiently. Some time ago about fifty boiler-makers were employed by Mr Fairbairn. They 'struck,' as it is termed, because their employer infringed, as they considered, upon their privileges, by introducing a few labourers, not in 'the union,' to perform the drudgery connected with the work. On this occurring, Mr Fairbairn and Mr

Robert Smith invented a machine which superseded the labour of forty-five out of the fifty of his boiler-makers. The work is performed by the machine much quicker, more systematically, and, as before said, without noise.

This extensive concern forwards its manufactures to all parts of the world. The stranger is told, on inquiry, that *this* article is for Calcutta, *that* for the West Indies; this for St Petersburg, that for New South Wales: and there are, besides, men belonging to it located in various parts of Europe, who are employed, under the direction of Mr Fairbairn, in superintending the erection of work manufactured on these premises.

Many of the hands employed receive from £2 to £3 weekly wages, and scarcely any, except common labourers, receive less than 25s. per week. The total weekly wages amount to nearly one thousand pounds! From these facts, some idea of the capital necessary to conduct a concern of this description may be imagined."

THE FORTUNES OF THE GRENADIER MOREAU.

WONDERFUL enough in all points of view, the victories of the French under the Empire were in nothing so extraordinary, as with respect to the great and eventful changes which they produced in the condition and fortunes of individuals of all ranks and classes, from the conscript peasant to the possessor of a throne. No Arabian story-teller ever dreamt of inventing such things as were then seen to take place in real life, and of this truth the city of Tours, in the year 1829, witnessed one striking proof, in the history of the grenadier Moreau, whose name is prefixed to the present narrative. It was in the year 1806 that this individual, then a youth of twenty, was sent from the recruiting depot in his native town of Tours towards the Prussian frontier, where the Emperor Napoleon was at the time concentrating his forces, and preparing for the opening of a great campaign. Eugene Moreau was descended from a family which had once been of high provincial respectability, but had become latterly so much decayed that his immediate progenitors held the humble position of small farmers, or, to speak more plainly, of peasants. As regarded personal appearance, Eugene would have done honour to the noblest ancestry. To say that he was merely handsome, would be disparaging and unjust. His person was tall and beautifully formed; his features remarkably fine and regular, and his eye dark, sparkling, and animated; while his air and gait were at once pleasing and noble. In short, a sculptor would have had but to cover the youth's black and glossy locks with a Greek head-piece, to have in him a perfect model of the goddess-born Achilles, or the more graceful Antinous.

The eye of the emperor was too searching and discriminative not to alight soon on such a figure as that of Moreau. On reaching Bamberg, a Bavarian town where the first head-quarters of the grand army were established, the young recruit chanced to fall in Napoleon's way. After a momentary glance of admiration, the emperor turned to an inferior officer behind him, and, pointing with his finger to Moreau, exclaimed, "That stripling is for my guard." Moreau heard the words, and imagined at the moment that he felt in his grasp the baton of a marshal of France. For the time, his fanciful anticipation was no further gratified than in his finding a place among the private grenadiers of the third regiment of the imperial guard. But youth and hope kept his fancy still at work in drawing magnificent pictures of the future. More particularly was this the case, when, wrapped in his cloak and stretched on the ground by the side of the bivouac fire, he listened to the older soldiers going over their reminiscences of Egypt, and revelling in exaggerated descriptions of the riches which their eyes had there beheld, or perhaps their hands had touched, and of the dark-eyed sultanas, glittering with pearls and diamonds, who had smiled upon the soldier's path, and offered, it may be, to follow him over the world. Moreau had received but an ordinary education, and simplicity was a natural characteristic of his mind. He knew not yet what war really was, and his ear drank in such recitals, till he became accustomed to regard the hopes excited by them as certain to be realised in his own case.

The French army ran over a portion of Prussia, and came to the vast plain of Jena. There, as every one knows, was fought a mighty battle, which delivered over Berlin to the Emperor of France. This great conflict has nothing to do with the particular history of Moreau, but it is a matter of justice to say that he fought in it like a lion, and helped well to maintain the fame of the guard of which he was a member. Subsequently to the engagement, the main army marched upon the Prussian capital, while a small division to which Moreau was attached, was ordered to take station temporarily at Weimar.

In the distribution of billets at Weimar, our young soldier got one fixing him singly upon a little chateau about a mile distant from the town. As the light-hearted Eugene walked from the town to his destined abode, scarcely feeling the weight of his arms or his knapsack, his thoughts ran back over the changes which had taken place during the last six months of his life. In May, a peasant, labouring on his father's little field; in October, a soldier—a member of Napoleon's guard, and one of the conquerors of Jena; and who knew how grand the next change might be? His company had lost many men, and had performed prodigies of valour. The hour of reward was yet to come, and then his arm might be decorated by the corporal's or serjeant's stripes—the only honourable kind of them—and even the cross of honour might be planted on his breast. Such were Moreau's imaginings as he drew near to the chateau, pointed out to him as the place designed in his billet. He rang the gate bell, and the door opened instantly. Stepping forward into the court, he saw no human being, but two furious dogs met him in the face, and threatened to tear him to pieces. In fact, the servants, seeing the soldier approach, had thought this a fit way to receive and repulse an enemy. But Moreau was not one to beat a retreat on such grounds as these. Keeping the dogs at bay with his musket, he cried, "Hollo!—down, you vicious brutes! Hollo! you inside there! call off the dogs, else I shall be obliged to hurt them! Hollo!"

No one chose to hear the cry, however, and Moreau struck one of the dogs lifeless at his feet by a blow from the butt end of his piece. The other animal he dexterously contrived to seize by one of the hind legs, and, swinging it above his head with a powerful arm, dashed out its brains against the court wall. He then tranquilly advanced to the inner entrance of the chateau, which was half open. As he pushed this door to the wall, he saw a whole posse of domestics flying out at an opposite side of the lobby hall. Eugene thought to himself that a soldier of the emperor's guard had a right to better treatment than this, but he was patient and sweet-tempered; so he said nothing, but marched forward. Apartment after apartment showed him no living person, and he began to grow wearied of this style of reception, as well as a little irritated thereby, when all at once he heard the sound of a female voice. Following the direction, he soon found himself in a retired chamber, face to face with a young lady, who was seated with her harp by her side, and her fingers in the act of touching its chords.

"*Mein herr*," said the startled young lady, and then paused; for her eye had caught the tricoloured cockade in the soldier's cap, indicating that he belonged to the hostile army that had invaded her country. "*Monsieur*," said she, changing her address from her mother tongue to that of her visitor. But she carried her speech no further. Her fingers quitted her harp, and she remained motionless before the young soldier of France.

Often, often did Moreau in after years describe that first interview, and always with a degree of tenderness that affected the hearer, though circumstances might make him doubtful at the time of the truth of the narration. All Moreau's anger fled at the sight of the lady; his fusil trembled in his hand; and that fair-haired beauty of the north, with her blue eyes and her snow-like skin, appeared to him far to surpass all the pictures which his older comrades had drawn of Egyptian loveliness. Her eye was cast on him with an expression at once of entreaty and kindness, as if beseeching his protection and proffering a friendly reception. It would appear as if she had noticed his impatient look on entering the room. "My servants," said she, when, after a pause, she followed with her first word *monsieur*, "my servants have received you inhospitably, but they are grieved at late events, and grief does not reason." But poor Moreau was already so far from feeling anger, that he could almost have knelt down and asked pardon for having killed the lady's dogs, though, had he not done so, they would probably have torn him in pieces.

The Countess Diana de Drucken was the name of the lady in whose chateau Moreau now took up his residence. She was a widow, and still extremely young, having been married almost in childhood to a wealthy old noble, at the wish or rather command of her proud and ambitious brothers and kindred. Her husband soon died, leaving no child to inherit his wealth. The young countess lived alone at the time when fortune brought Moreau to the chateau. Whether from the lady's desire not to provoke an invading enemy, or from other motives personal to Moreau (whose ancestral respectability she soon learnt from conversation with himself), certain it is that he was entertained, during his stay of several weeks, like an honoured guest. He occupied the apartments of the late master of the mansion, and the same domestics who had lately received him so curiously, became his devoted slaves. In his simplicity, the young soldier was no whit astonished at all this; he found it quite natural to live in a beautiful chateau, to walk (not alone) every morning in a magnificent park, to mount the finest horses for an evening ride, to be served by lacqueys covered with embroidery, and to dine on three courses daily with a countess. Had not he heard at the bivouac fires, that such was the soldier's common fortune in Egypt? Moreover, he loved the countess, and, remembering the ancient honours of his family more than his present condition, he thought not of concealing his love.

On him the passion took its usual effect; it softened his manners, gave inspiration to his tongue, and threw a grace and delicacy over his every thought and every action. The sincerity of his love was too obvious to be doubted for an instant. He was young (in truth, almost a boy-soldier), beautiful, and a conqueror. The Countess Diana could not help herself. Though seeing their true relative position much more clearly than Moreau did, the passion of the soldier found an echo ere long in her bosom. She had none about her to keep her pride of rank awake. An old infirm chaplain, verging on the grave, was her only present friend and counsellor, and he was too much attached to her to make any annoying opposition to her wishes. The issue may be guessed.

The happy Moreau saw nothing in the future but visions of pleasure and joy. He loved too sincerely ever to cast a thought on the fortune of the countess, but he had other ambitious thoughts. "It is true," said he, "that I am only one of the humble soldiers of the emperor, but it is from among them that he chooses his captains, and I feel assured that I shall become one of them." The countess was less hopeful of the future, but she could not cast a damp over these anticipations. And when the period of Moreau's stay came to a close, when his detachment was ordered to join head-quarters, she did not express to the young soldier the fears that filled her own mind whenever the thought of her haughty relatives, and of her reunion with them, crossed her memory. The last words of Moreau were, "It is but necessary that I should speak to my major, and he will speak to the emperor, and all will be arranged." The countess swore to be ever faithful; and Moreau promised that he would be careful of his life, and return with the cross of honour, and the epaulettes of an officer. Bathed with the countess's tears, the young soldier then took his way from the chateau, but often cast back his eyes, and gazed, as long as he could see it, on the hand of the lady of his love waving a kerchief in token of reiterated farewells.

The soldier of the guard rejoined his regiment an altered being. A marshal's baton no longer glittered before his eyes; a parchment, sealed with the great seal of the empire, and authorising his legal union with the Countess Diana de Drucken, was the object to which all his thoughts tended. He forbore to speak of the lady of the chateau to his comrades, but to his major he took an opportunity of revealing all. That officer replied briefly, "Ah! well, my fine lad, all this may be true, but we can say and do nothing about it till we come to the emperor's head-quarters." Soon afterwards, Moreau's regiment entered Potsdam only some hours before the expected arrival of the emperor, and was drawn up beside the palace of Sans-Souci, to be reviewed by him as he passed. Napoleon's visage was bland and smiling as he moved slowly on his white battle-horse along the ranks which had so bravely fought at Jena. When he came before the spot where Moreau stood, the latter, who had made up his mind to plead his own cause, stood forward from the ranks, presented arms, and begged permission to say a word. "Speak," said the emperor, who encouraged these personal appeals. "I wish to marry, sire, if it be your good pleasure," said Moreau. "What! in the middle of a campaign?" replied Napoleon; "what suttler gipsy has deceived you to this?" "Sire!" said the simple-hearted Moreau, "it is no angel, but a lady near Jena, who is beautiful as an angel, and rich as the mayoress of Tours." The emperor smiled, and the young soldier continued—"She has sworn her faith to me; and, for me, I have promised to her to have one day the cross of honour and the epaulettes of a captain." "Her name?" said the emperor. "The Countess Diana of Drucken," was Moreau's answer.

At this name the emperor showed a degree of displeased surprise. In a second or two he exclaimed, "Fy! you a soldier of France, to forget yourself thus, and wish to degrade yourself and your comrades by an alliance with a stranger, an enemy of France! Think no more of it! Return to your place in the ranks." As he spoke, he gave the spur to his charger, and flew at full gallop to another regiment. The exact motives which led him thus to crush the hopes of poor Moreau, can scarcely even be guessed at with any certainty. It is possible that he doubted the statement of the soldier, and thought there could be no true desire for such a marriage on the part of the Countess of Drucken. Whatever was the emperor's impression, his decision was ruinous to Moreau's hopes. The emperor's sanction alone could have removed all obstacles from the way of the lovers. Even a simple discharge could not be got without it, and the soldier would have died sooner than desert.

The campaign went on, and Moreau fought bravely through it. Another and another campaign followed, and he was still in the guards of Napoleon. The fearful invasion of Russia found him in the same position, and he was with his master till the abdication at Fontainebleau. By this time Moreau had won the cross of the legion of honour, and had risen in the service, though not to a commission; but hard toil and wounds had done much of the usual work of time upon him. The remembrance of the Countess Diana, however, remained ever fresh on his memory. He had written to Weimar, to Madame the Countess of Drucken, but either the post or the lady was faithless. He received no reply—not a word—not a token of reminiscence. When the Bourbons finally brought with them a

general peace, Moreau revisited his aged father and his native Tours. There he found many old friends, and they would have had him to marry a young and pretty girl, and settle himself for life; but he was the chosen bridegroom of a countess, and he refused all proffers of this kind; waiting always, with undiminished anxiety, for the appearance of the coronetted carriage, which he confidently expected to come one day and carry him to his beloved. At length, weary of waiting in vain, he set aside four or five quarters of his pension, and, with a staff in his hand, took the road to Prussia. Very different was he in appearance from the tall, erect, and noble-looking guardsman, who had followed on his emperor's heels from victory to victory on the German plains. Moreau, though comparatively young in years, was in aspect a toil-worn veteran, with wrinkled brow and slightly stooping figure; but his heart was as simple as ever, and he had preserved all the bright hopes and illusions of youth, and *one*, in particular, in undying freshness. He reached Weimar, and, with beating heart, passed on to the chateau of the countess. Diana had disappeared; the chateau had long been possessed and inhabited by strangers, to whom nothing but the name of the former proprietors was known. About their abode and condition Moreau could learn nothing.

Tours saw our soldier return once more, poor and wearied, but hoping still. His relatives and friends, to whom he talked confidently and freely on the subject, considered his expectations as completely illusory, and resembling one of those curious instances of monomania which are not unusual in the world. All loved the veteran, nevertheless, for he was the most innocent of human beings.

In the year 1829, Moreau still remained at Tours, and still found the chief solace of life in the hopes which all who knew him considered vain and delusive. The summer of the year mentioned, however, was signalled by the arrival in Tours of a superb *berlin* (a particular species of German travelling-carriage), drawn by four horses. A young man was the sole occupant of this, and scarcely had he entered the town, when he left the carriage, and made inquiry "if Moreau, a grenadier of the old imperial guard, was still alive, and still resided in Tours?" The answer was in the affirmative, and the young man requested to be guided to his residence. A person readily offered to execute this task, and walked towards the veteran's dwelling, the carriage as well as its owner following. "Yonder is Moreau," said the guide, "seated on his stone bench." The young man moved forward alone to the side of the old soldier, who was indeed basking his still noble-looking head in the rays of the evening sun. "Are you Moreau of the old guard?" said the stranger, with a faltering voice.

The German accent of the youth was instantaneously caught by the veteran's ear. "Yes!" cried he, starting up, "I am Moreau, of the third regiment of the old guard, whom the emperor at Potsdam prevented from marrying. Does my bride call me at length? Does Diana send to seek me? I am here!—I am ready!" It was an affecting sight to see a white-haired old man thus warming at the remembrance of youthful love.

"It is you whom I seek," said the youth, clasping the old man's hand, and seemingly struggling to conceal his emotions from the public eye; "enter this carriage. I am come to conduct you to the chateau of Drucken." Half embraced by his conductor, Moreau ascended the vehicle, and the postillions, at a signal, drove rapidly away. Moreau, the grenadier of the old guard of Napoleon, was no more seen in Tours, or in his native France!

Diana Countess of Drucken was not unfaithful to the young soldier. But when rejoined by her family, after the terrors caused by the French visit had a little subsided, they threatened her even with death if she attempted to prosecute her engagement with Moreau. Effectually to mar her purpose, they strove to induce her to marry again, but this they could not effect. It was only, however, when the truth could not be longer concealed, that she dared to tell them that the ceremony of marriage had already passed between Moreau and herself, the old chaplain being the officiating minister, and also the sole witness, on the occasion. Bitterly as the kindred of the countess cursed this secret connexion, they agreed, on condition that she solemnly swore never to disgrace them by sending for Moreau, to torment her no more with schemes of re-marriage, and to permit herself to bring up the boy to whom she gave birth, under the character of her nephew and avowed heir. The very name of Moreau was sentenced to oblivion. The fear of endangering her son's welfare caused the countess to keep her engagement unbroken, though her unchanged affection for Moreau would often strongly tempt her to an opposite line of conduct. But, on her deathbed, the countess revealed for the first time to her son his true history and parentage, and laid her dying commands upon him to go to Tours, and to render comfortable the old age of his father, if he still lived. Her own heart, at that truth-displaying moment, was wrung with remorse at the reflection that she had permitted any engagements whatever to separate her from one to whom she had solemnly and lastingly bound herself.

Arrived at Drucken, Moreau could only weep over the tomb of her for whom he had yearned for twenty-four long years. But the tender cares of his son, who had taken him from Tours, rendered the veteran's

latter days happy. If he had not the object of his life's dream beside him, he had at least the satisfaction of knowing that she had not been unfaithful to him.

[This story is a version, with some slight changes, of a little piece which appeared recently in one of the French periodicals.]

JIM SOOLIVAN.

We find the following capital bit of Irish humour in a late number of the Dublin University Magazine, a periodical, by the way, which is rapidly improving both in the variety and piquancy of its articles.

JIM SOOLIVAN was a decent, honest boy as you'd find in the seven parishes, an' he was a beautiful singer, an' an illegant dancer intirely, an' a mighty pleasant boy in himself; but he had the devil's bad luck, for he married for love, an' av course he never had an asy minute after. Nell Gorman was the girl he fancied, an' a beautiful slip of a girl she was, just twinty to the minute when he married her. She was as round an' as complate in all her shapes as a firkin, you'd think, an' her two cheeks was as fat an' as red, it id open your heart to look at them. But beauty is not the thing all through, an' as beautiful as she was, she had the devil's tongue, an' the devil's timper, an' the devil's behaviour all out; an' it was impossible for him to be in the house with her, for while you'd count tin without havin' an argument, an' as sure as she riz an argument wid him, she'd hit him a wipe iv a skillet, or whatever lay next to her hand. Well, this wasn't at all plasin' to Jim Soolivan, you may be sure, an' there was scarce a week that his head wasn't plastered up, or his back bint double, or his nose swelled as big as a pittaty, with the violence iv her timper, an' his heart was scalded everlastinly wid her tongue; so he had no pace or quietness in body or soul at all at all with the way she was goin' an'. Well, your honour, one cowlid snowin' evenin', he kim in after his day's work regulatin' the men in the farm, an' he sat down very quite by the fire, for he had a scrimidge wid her in the mornin', an' all he wanted was an air iv the fire in pace; so divil a word he said, but dhrew a stool an' sat down close to the fire. Well, as soon as the woman saw him, "Move aff," says she, "an' don't be intrudin' an' the fire," says she. Well, he kept never mindin', an' didn't let an' to hear a word she was sayin', so she kim over, an' she had a spoon in her hand, an' she took jist the smallest taste in life iv the boilin' wather out iv the pot, an' she dhropped it down an' his shins, an' wid that he let a roar you'd think the roof id fly aff iv the house. "Hould your tongue, you barbarian," says she; "you'll waken the child," says she. "An' if I done right," says he, for the spoonful of boilin' wather riz him intirely, "I'd take yourself," says he, "an' I'd stuff you into the pot an' the fire, an' boil you," says he, "into castor oil," says he. "That's purty behaviour," says she; "it's fine usage you're givin' me, isn't it?" says she, gettin' wicked every minute; "but before I'm boiled," says she, "I'll try how you like that," says she; an', sure enough, before he had time to put up his guard, she hot him a rale terrible clink iv the iron spoon across the jaw. "Hould me, some iv ye, or I'll murder her," says he. "Will you?" says she, an' with that she hot him another tin times as good as the first. "By jabers," says he, slappin' himself behind, "that's the last salute you'll ever give me," says he; "so take my last blessin'," says he, "you ungodderable baste," says he; an' with that he pulled an' his hat an' walked out iv the door. Well, she never minded a word he said, for he used to say the same thing all as one every time she dhrew blood, an' she had no expectation at all but he'd come back by the time supper id be ready; but faix the story didn't go quite so simple this time, for while he was walkin', lonesome enough, down the borheen, with his heart almost broke with the pain, for his shins an' his jaw was mighty troublesome, av course, with the threathment he got, who did he see but Mick Hanlon, his uncle's sarvint iv, ridin' down, quite an' easy, an' the ould black horse, wid a halter as long as himself.

[To make a long story short, Jim gets on the horse along with the by (boy), and is carried to his uncle's house, where he is drifted up with snow for upwards of a week. Meanwhile the mutilated body of a man is found near Jim's home, and being taken for Jim, is waked and buried as such. His widow, "bad luck to her," marries Andy Curtis, and all is comfortable with the pair when Jim finds his way back to his own door one very cowlid night.]

So, one night (as the story proceeds), when Nell Gorman an' her new husband, Andy Curtis, was snug an' warm in bed, an' fast asleep, an' every thing quite, who should come to the door, sure enough, but Jim Soolivan himself, an' he began slakin' the door wid a big blak-thorn stick he had, an' roarin' out like the divil to open the door, for he had a dhrop taken. "What the devil's the matter?" says Andy Curtis, wakenin' out iv his sleep. "Who's batin' the door?" says Nell: "what's all the noise for?" says she. "Who's in it?" says Andy. "It's me," says Jim. "Who are you?" says Andy; "what's your name?" "Jim Soolivan," says he. "By jabers you lie," says Andy. "Wait till I get at you," says Jim, hittin' the door a lick iv the wattle you'd hear half a mile off. "It's him, sure enough," says Nell; "I know his speech; it's his wandherin' sowl that can't get rest, the crass o' Christ betune us an' harm." "Let me in," says Jim, "or I'll dhrove the door in a top iv yis." "Jim Soolivan, Jim Soolivan," says Nell, sittin' up in the bed, an' gropin' for a quart bottle iv holy wather she used to hang by the back iv the bed, "don't come in, darlin', there's holy wather here," says she; "but tell me from where you are is there any thing that's throublin' your poor sinful sowl?" says she. "An' tell me how many masses will make you asy, an' by this crass I'll bny you as many as you want," says she. "I don't know what the divil you mane," says Jim. "Go back," says she, "go back to glory, for God's sake," says she. "Divil's

cure to the bit iv me 'ill go back to glory, or any where else," says he, "this blessed night; so open the door at onst, an' let me in," says he. "The Lord forbid," says she. "By jabers you'd better," says he, "or it 'ill be worse for you," says he; an' wid that he fell to wallopin' the door till he was fairly tired, an' Andy an' his wife crassin' themselves an' sayin' their prayers for the bare life all the time. "Jim Soolivan," says she, as soon as he was done, "go back, for God's sake, an' don't be freakenin' me an' your poor fatherless children," says she. "Why, you bosthoon, you," says Jim, "won't you let your husband in," says he, "to his own house?" says he. "You wor my husband, sure enough," says she, "but it's well you know, Jim Soolivan, you're not my husband now," says she. "You're as drunk as can be consaved," says Jim. "Go back, in God's name, pacibly to your grave," says Nell. "By my sowl, it's to my grave you'll find me, sure enough," says he, "you hard-hearted bairn, for I am jist aff wid the cowlid," says he. "Jim Soolivan," says she, "it's in your decent coffin you should be, you unfortunate spirit," says she; "what is it's annoyin' your sowl, in the wide world, at all?" says she; "hadn't you every thing complete?" says she, "the oil, an' the wack, an' the berrin?" says she. "Och, by the hoky," says Jim, "it's too long I'm makin' a fool iv myself, gosterhin' wid you outside iv my own door," says he, "for it's plane to be seen," says he, "you don't know what you're sayin', an' no one else knows what you mane, you unfortunate fool," says he; "so, onst for all, open the door quietly," says he, "or, by my sowkins, I'll not have a splinter together," says he. "Well, whin Nell an' Andy seen he was gettin' vexed, they began to bawl out their prayers, with the fright, as if the life was lavin' them; an' the more he bate the door, the louder they prayed, until at last Jim was fairly tired out. "Bad luck to you," says he, "for a rale divil av a woman," says he. "I can't get any advantage av you, any way; but wait till I get hould iv you, that's all," says he. An' he turned aff from the door, an' wint round to the cow-house, an' settled himself as well as he could, in the athraw; an' he was tired enough wid the thravellin' he had in the day-time, an' a good dale bothered with what liquor he had taken; so he was purty sure of sleepin' wherever he thrun himself. But, by my sowl, it wasn't the same way with the man an' the woman in the house; for divil a wink iv sleep, good or bad, could they get at all, wid the fright iv the spirit, as they supposed; an' with the first light they sint a little goosoon, as fast as he could wag, straight off, like a shot, to the priest, an' to desire him, for the love o' God, to come to them an' the minute, an' to bring, if it was plasin' to his reverence, all the little things he had for sayin' mass, an' savin' sowls, an' banishin' spirits, an' freekenin' the divil, an' the likes iv that. An' it wasn't long till his reverence kem down, sure enough, on the ould gray mare, wid the little mass-boy behind him, an' the prayer-books an' bibles, an' all the other mysterious articles that was wantin', along wid him; an' as soon as he kem in, "God save all here," says he. "God save ye, kindly, your reverence," says they. "An' what's gone wrong wid ye?" says he; "ye must be very bad," says he, "intirely, to disturb my devotions," says he, "this way, jist at breakfast time," says he. "By my sowkins," says Nell, "it's bad enough we are, your reverence," says she, "for it's poor Jim's spirit," says she; "God rest his sowl, wherever it is," says she, "that was wandherin' up an' down, opposit the door all night," says she, "in the way it was no use at all, thryin' to get a wink iv sleep," says she. "It's to lay it, you want me, I suppose," says the priest. "If your reverence 'id do that same, it 'id be plasin' to us," says Andy. "It 'ill be rather expinsive," says the priest. "We'll not differ about the price, your reverence," says Andy. "Did the spirit stop long?" says the priest. "Most part iv the night," says Nell, "the Lord be merciful to us all!" says she. "That'll make it more costly than I thought," says he. "An' did it make much noise?" says he. "By my sowl, it's it that did," says Andy; "leatherin' the door wid sticks and stones," says he, "an' I fairly thought every minute," says he, "the ould boards id smash, an' the spirit id be in an' top iv us, God bless us," says he. "Phiew!" says the priest, "it'll cost a power iv money." "Well, your reverence," says Andy, "take whatever you like," says he; "only make sure it won't annoy us any more," says he. "Oh! by my sowkins," says the priest, "it'll be the quarest ghost in the seven parishes," says he, "if it has the courage to come back," says he, "after what I'll do this mornin', please God," says he; "so we'll say twelve pounds, an' God knows it's chape enough," says he, "considherin' all the circumstances," says he. Well, there wasn't a second word to the bargain; so they paid him the money down, an' he settled the table out like an althar, before the door, an' he settled it out wid all the things he had wid him; an' he lit a bit iv a holy candle, an' he scattered his holy wather right an' left, an' he took up a big book, an' he wint an' readin' for half an hour, good; an' whin he kem to the end, he tuck hould iv his little bell, and he began to ring it for the bare life; an' by my sowl he rang it so well, that he wakened Jim Soolivan in the cow-house, where he was sleepin', an' up he jumped, widout a minute's delay, an' med right for the house, where all the family, an' the priest, an' the little mass-boy, was assembled, layin' the ghost; an' as soon as his reverence seen him comin' in at the door, wid the fair fright, he flung the bell at his head, an' hot him sich a lick iv it in the forehead, that he stretched him an' the floor; but faix he didn't wait to ax any questions, but he cut round the table as if the divil was after him, an' out at the door, an' didn't stop even as much as to mount an' his mare, but leathared away down the borheen as fast as his legs could carry him, though the mud was up to his knees, savin' your presence. Well, by the time Jim kem to himself, the priest persaved the mistake, an' Andy wint home, lavin' Nell to make the explanation. An' as soon as Jim heard it all, he said he was quite contint to lave her to Andy, intirely; but the priest would not hear iv it; an' he jist med him marry his wife over again, an' a merry widdin' it was, an' a fino

collection for his reverence. An' Andy was there along wid the rest, an' the priest put a small pinnace upon him, for bein' in too great a hurry to marry a widdy. An' bad luck to the word he'd allow any one to say an' the business, ever after, at all at all, so, av course, no one offnded his reverence, by spakin' iv the twelve pounds he got for layin' the spirit. An' the neighbours wor all mighty well plased, to be sure, for gettin' all the divarsion of a wake, an' two weddin's for nothin'.

ENGLISH HAY-MAKERS OF THE DISTRICT AROUND LONDON.*

ONE of the most remarkable peculiarities of the land for a number of miles around London, is the large extent of ground kept in grass for producing hay for the metropolitan market. The hay is generally of a sweet and nourishing quality, very unlike the harsh kind of wiry grass and clover which prevail in the northern part of the United Kingdom, where it would be called by the name of meadow hay; and its preparation forms an important branch of rural economy. The hay-making season, which is the busiest in the year, draws labourers from places most remote from the scene of operations, in the same manner as the grain harvest attracts a throng of reapers in other quarters of the country. Those who mow or cut the grass, are almost to a man English labourers; but the other class of workers are a mixture of English and Irish, the former being about two to one of the latter. A Welshman is rarely to be seen among either class, and a Scotchman never.

The hay-making season is from about the middle of June to the third week of July. In the beginning of June, English labourers are to be seen on the different roads, travelling with their faces towards London, each bearing his scythe and a basket or small bundle, the edge of the scythe carefully protected against the action of the atmosphere. These precursors are mowers, men known to be good and trustworthy workmen, who, year by year, work on the same farm, and until the time of cutting are sure of other work. Day by day the numbers of the travelling labourers increase, and by the middle of June the roads are thronged with them. Some of the English bear scythes, and most of them a bundle or basket; now and then one has a fork, its points guarded with corks. A few of the Irish carry a bundle, but the majority bear no greater burthen than the clothes they wear. To persons not acquainted with the customs of these labourers, they are apparently wanderers in search of work, but, in reality, the greater part are not so. They are making their way to certain points, where they have worked in former years, or where they have been recommended to be employed. Some men do not leave home until they have received a message from their usual employers or some acquaintance, stating the time they will probably be wanted, and these messages (usually by word of mouth) are also a guide for others as to the right time of starting; a carrier or drover is generally the bearer of such a message, and the punctuality with which it is delivered, and the accuracy with which it is understood and acted upon, would surprise the lettered man, who can only imagine a correct correspondence to be carried on between parties at a distance by means of letters. These word-of-mouth messages are an ancient practice, and the continuance is owing probably to the cost of postage; but the saving is questionable. Master and man commonly meet the bearer at a road-side inn; so, what between treating him, and their own loss of time, a much greater expense is incurred than probably the postage of a letter would amount to. At home, and on the road, the English term their migration "going upwards for work." The English labourers commonly travel alone, or in parties of two, three, or four, and usually leave home with provision sufficient for the greater part or the whole of their journey, and money to pay for decent lodgings at night. On the other hand, the Irish, first congregated on board a vessel, when they reach England, commonly travel in droves, trusting mainly to chance for food and lodging during their travels.

The mowers are paid by the acre. A common price at the beginning of the season of 1839 was 4s. 6d. an acre without beer, but it afterwards rose to 5s. and 5s. 6d. an acre with beer. Each mower finds his own tools; the cost of a scythe complete is 12s. 6d., the price of a good blade by itself about 7s., and a mower in full work requires a new blade every season; such a man in a season will use a dozen whetting-stones of the price of about 4d. each. The edge only of a scythe blade is steel. A mower will cut from an acre to two acres a-day, but two acres is an extraordinary day's work, and to perform it a man must labour hard, early and late, beginning before sunrise and keeping on until sunset, and that during the longest days of the year. He also requires extraordinary food, and the profuse use of his perspirations would exhaust him, were he not supplied with great quantities of drink to keep it up: for this purpose small beer is the usual beverage, but sometimes water is used; strong beer being only taken at a meal, or after the work of the day is over. In fine weather, when not mowing, the mowers are

* The above paper is the composition of an individual, who, as the matter of it will amply prove, is intimately acquainted with the class whom it professes to describe. As a minute and apparently faithful picture of a section of the rural population of England, it cannot fail to have some interest, at a time when the attention of all classes is so eagerly directed to each other's condition.

employed at other work in hay-making, receiving the highest wages paid to daymen. The mowers do not calculate on being employed the whole time in mowing. Mowing is performed by parties of from three to six; the same man is always the leader, and is sometimes termed "the lord;" he is to his party what a stroke-man is to a boat's crew.

At the beginning of the season 1839, the pay of a hay-maker (in distinction to a mower) was 2s. and 2s. 6d. a-day, and afterwards rose to 3s. and 3s. 6d. a-day, with an allowance of beer, some of them finding their own forks. When the hay is spread, or is fit to carry, and rain is expected, the farmers urge all hands to increased exertions by extra allowances of beer, and promise of a supper. In this district, compared with others, the women employed in hay-making are few, and their pay is commonly 1s. a-day: this is not fair; for, although it is true that a woman cannot take every place in the work, she will, in the lighter portions, perform as much as a man. The boys employed are also few. In fact, very few women and boys are employed but those belonging to the resident agricultural population. The migratory hay-makers are paid, in full or on account, day by day; and if the weather will not allow the work to go on regularly, they are only paid according to the time they actually work, this time being on all farms reckoned down to an hour. Where payment on account is adopted, it is to prevent a labourer leaving, in the event of wages rising in the course of the season in other places.

In the beginning and at the height of the season, the public-houses and cottages in the district, where lodgers are taken, are crowded with the migratory labourers. Every chamber has as many beds as can be put into it, and the men sleep two, sometimes three, in a bed; in rooms of not greater dimensions than fifteen feet by twelve, from eight to ten, and even twelve men, pass the night. The price of lodging to a man who has a bed to himself, is sixpence a-night, but when more than one sleep in a bed, the charge for each is fourpence. If a man pays four nights consecutively, he pays no more that week; at least this is the practice in some places. The Englishmen usually sleep in beds, and the Irishmen in barns, stables, or outhouses, sometimes ensconcing themselves in a hay-cock. A prejudice exists against the Irish labourers, that they are not so clean in their persons as the English, and some publicans make a point of refusing them lodgings. When the Irish hay-makers have women and children with them, they often camp in the lanes, but without tents, there cooking their food, and taking their evening meals; such a case with an English party is very rare.

Beer is the hay-makers' usual drink. They very seldom have recourse to spirituous liquors, and, compared with the workmen on canals, railroads, and in brick-fields, they are generally of sober habits. The Irish are decidedly more sober than the English. When lodging either at a public or private house, each man buys his own food, the cooking being performed, and pepper and salt provided, gratis. The publicans usually keep bread, cheese, and bacon, and sometimes cooked meat, for sale; at some houses soup is supplied, for which the charge is twopence a basin. Tea and coffee are not commonly used.

Towards their employers and strangers, the hay-makers are civil in manner and language, but with each other practical jokes are not uncommon. The language of the English labourers among themselves, particularly of the young men, is mixed up with many oaths, and horrible imprecations. This species of language is at present dreadfully on the increase, and has not yet reached its climax; for these labourers are still behind the workmen on railroads and canals, inland boatmen, brickmakers, and the like, from whom the contagion has been caught.

Upon their way from home, and at their places of destination, anxious are the inquiries and the mutual talk of the men as to the probabilities of the weather, the state of the crops, the numbers of workmen likely to come up, the prices of labour, and the masters who have and who have not engaged their complement of men. The season fairly entered into, the merits and demerits of the different masters who give the best wages, whose beer is the best, who are most liberal in giving that and victuals, and who look most sharply after their people, are engaging subjects of conversation; but of these, "the beer" is the most frequent; and it is impossible for strangers to conceive the importance which hay-makers, in particular the English, attach to beer, either as a source of pleasure or a help to work. When elevated with this same beverage, their own capabilities are boasted of; and how much, in one day, a man can mow of grass, cut or thrash of corn, feats of strength and agility, and the like, supply matter for noisy but friendly debate. Sometimes the meaning of words and phrases locally used in the neighbourhoods of their respective homes, and local peculiarities in manners and customs, especially as regards labour, beguile their leisure hours. With them Saturday nights are times of carousal; but Monday is never Saint Monday, if the weather be fine. Sunday is a tiresome day, not one hay-maker in a hundred attending a place of worship; from singing, or any kind of play, they usually abstain on Sunday, but often get tipsy; and if their master required it (as is sometimes the case in wet weather), they would not hesitate to work. Tobacco, in smoking, is used in great quantities; a few chew it; but snuff is only taken in fun, when an

elderly mechanic or old woman offers a pinch. Tossing halfpence, to decide which man shall pay for beer, or a game of skittles, the stake very seldom exceeding a pint of beer, is almost the only gambling in which they indulge; cards are very seldom used. Over their jugs and pipes, a song is a favourite recreation; the music, however, is never, and the words not frequently, of a refined order. Occasionally a song is sung in praise of poaching, after the manner in which war or sea songs set forth the hardships, pleasures, glories, and honours, of war and the ocean. The way in which such songs are received, and the heartiness in which all join in the chorus, prove that with the English agricultural labourers, poaching is not considered a crime; though, in talking of poaching, they treat it as a misfortune for a man to have a propensity towards it, and call him a fool for indulging therein. Politics they never discuss. If any portion of a weekly newspaper be read aloud, it commonly is something which relates to a murder, a robbery, or dreadful accident. Quarrelling, likely to lead to fighting, is carefully avoided; and if a man in this respect lacks discretion, he is repressed by his fellow-workmen, particularly a mower by fellow-mowers, and reminded, that a fight will probably spoil him for work for a week; not a slight consideration with a labourer, miles away from home, depending upon his daily work for his daily bread.

In past times great jealousies and feuds have existed between the English and Irish hay-makers. These jealousies and feuds, however, are yearly diminishing in number, and will in time disappear. Already, the English labourers are rather pleased than otherwise to have an Irishman in their company, as his remarks are usually shrewd and witty, and tend to keep up the general harmony and mirthfulness, whether in the field or on the road.

Whether, upon the whole, these hay-making excursions are profitable to the English labourers, in a pecuniary point of view, is questionable. No doubt they are looked forward to with pleasure, are a time of pleasure in a fine season, and a pleasurable source of conversation on their return home. But the loss of time and expenses in travelling; the payments for lodgings; the higher price of their provisions, being less able to make the most of them than when at home; the inducements to spend money lavishly when they have any; extra wear and tear of clothes and payment for washing; the greater chance of illness, and then without the comforts of home; the families of those who have families living on credit, for which a high price is given and imposition practised; the risk of bad habits being acquired by the young; the dislike incurred from masters at home in being left at a busy and important time of the year, and this dislike acting prejudicially on a winter's employment or the price of winter's work; are serious drawbacks from the higher wages of five weeks' hay-making. It is true that some of them, in a fine season, take home sums of money varying from one to three pounds, but the greater part generally return as poor as they set out. The Irish labourers, on the contrary, by living in the poorest possible style, and resorting to begging when it can be accomplished, contrive to save money during the hay-making season; all which earnings are, as is well known, carried home as a sacred fund to pay the rent of the slip of land from which they draw the ordinary means of existence.

POETRY AT SIGHT.

A remarkably successful operation has just been performed on the eyes of an elderly lady, who had been blind and deaf from her birth. The following letter to her niece has been sent to us by her friends, to show the rapidity of her literary acquirements, immediately on her attainment of the power of vision; and such of our readers as can fancy themselves deaf, will certainly see it to consist of capital rhymes.

Dear Dolly, I'll thank you to send the cocoa,
And Susan, who brings it, shall take back your boe.
Pray tell Doctor Bleed'em I've got a sad cough;
I caught it while watching young Hodge at the plough;
I thought the day fine, and was simple enough
My umbrella to leave, so got wet through and through.
For it came down in torrents; your poor aunt was caught
In the rain, and I afterwards sat in a draught.
This made me much worse, but experience I bought,
And I'll never more trust to the sunshine and drought!
Well, I made myself dry, and I sat down to tea;
Of the good that it did me you'd form no idea.
But I quite hate the country, the weather's so rough,
So you'll see me, dear, soon in your little borough.
I hope, after all, that my cold will be trivial—
But still you may send me that stuff in the vial—
In the kitchen you'll find it, just over the trough,
Oh, my cough! oh, my cough! it all comes of the plough.
—From the Comic Almanack.

ELECTRICITY OF VEGETATION.

As plants, during vegetation, exert a chemical action on the atmosphere, sometimes converting its oxygen into carbonic acid gas, and at others decomposing the carbonic acid already existing in it, assimilating the carbon and disengaging the oxygen, it was conceived that electricity might be thus developed; and, from the very extensive operation of vegetation, the quantity might be sufficient to influence the atmosphere. The results of experiments confirm this anticipation. When seeds were sown in the earth, there were signs of electricity as soon as the germs appeared at the surface, and the electricity became more evident as vegetation advanced. So considerable was the evolution, that it was calculated that a powerful battery might be charged by the vegetation

from an area of one hundred square yards. Every green tree and every leaf of verdure is, therefore, continually supplying the atmosphere with electricity; and in hot and humid climates, as that of Brazil, the quantity derived from this source must be extraordinary, if we reflect on the vigour with which the growth of plants is carried on. According to the assertion of a respectable traveller, rain in the evening will, by sunrise, have given a greenish tinge to the earth; if the rain continue, there will be sprouts of grass an inch long on the second day; and on the third day, the grass will be strong enough for the pasturing of cattle.—*Companion to Almanack*, 1839.

ORIGINAL ANECDOTE OF THE BEGGARS OF MULLINGAR.

When the gallant 50th were removed to Mullingar, it was supposed that this town produced a greater number of beggars than any in the king's dominions. A swarm of paupers rendered the streets almost impassable, and ingress or egress to or from a shop was occasionally impracticable. Now, beggars were to the head major an abomination, and for two days he ensconced himself in his lodgings, rather than encounter the mendicants of Mullingar. Confinement will increase bile, and bile may induce gout; and at last, wearied of captivity, he sallied forth, and to every application for relief he replied by specifying an early day on which he wished the numerous supplicants to call upon him at a particular hour, and above all things to be punctual. His wish was faithfully attended to, and on the expected morning the street where he resided was completely blocked up. The major, under a volley of blessings, appeared at the hall door. "Are you all here?" he inquired, in accents of the tenderest compassion. "All, your honour—all, young and old!" responded a big beggarman. "We're all here, Colonel, avourneen!" exclaimed a red virago, "but my poor man Brieny Boccoh; and he, the cratur, fell into the fire on Sunday night, and him hearty, and sorrow stir he can make, good nor bad." "Ah, then," said the humane commander, "why should poor Brien be left out? Arrah! run yourself, and bring the cripple to us!" In a twinkling, off went the red virago, and after a short absence issued from a neighbouring lane, with Brieny on her shoulders. "Are ye all here now?" inquired the tender-hearted major. "Every single sowl of us!" said an old woman in reply. "Ogh! that the light of heaven may shine on his honour's dying hour, but it's he that's tender to the poor!" "Amen!" responded a hundred voices. "Silence!" said the major, as he produced a small book bound in red morocco. "Whisht, you sows!" cried the big beggarman. "Are ye listening?" "Shah, shah! Yes, yes!" was responded in English and Irish. "Then, by the contents of this blessed book, a rap I won't give one of ye, you vagabonds, if I remained a twelvemonth in Mullingar!"

"HOW TO GET ON."—THE APOTHECARY METHOD.

"Don't you see?" said Bob; "he goes up to a house, rings the area bell, pokes a packet of medicine without a direction into the servant's hand, and walks off. Servant takes it into the dining-parlour; master opens it and reads the label, 'Draught to be taken at bed-time—pills as before—lotion as usual—the powder. From Sawyer's, late Nockemoff's. Physicians' prescriptions carefully prepared: and all the rest of it. Shows it to his wife—she reads the label; it goes down to the servants—they read the label. Next day the boy calls: 'Very sorry—his mistake—immense business—great many parcels to deliver—Mr Sawyer's compliments—late Nockemoff.' The name gets known, and that's the thing, my boy, in the medical way; bless your heart, old fellow, it's better than all the advertising in the world. We have got one four-ounce bottle that's been to half the houses in Bristol, and hasn't done yet."—From the *Pickwick Papers*.

PARENTAL PARTIALITIES.

Parents can never too carefully avoid showing a distinction between children in the distribution of their affection. Parental love during infancy and youth should be the patrimony of all, and—so far as human infirmity will allow—like the kindly dews of heaven, which descend equally "on the just and on the unjust." The faults of early years should not be visited by a withdrawal of affection from the wayward child, nor should a naturally amiable disposition entitle its possessor to that interest in a parent's heart which excludes others who have the same claim of consanguinity. We of course only refer to the commencement of life; for the parental love of after-years assuredly is justly influenced by the conduct of our offspring. To the inexperienced in such ties, it may appear a task hard of fulfilment to guard against the froward behaviour of children influencing our bearing towards them; yet, strange to say, here is not the error that so often spreads jealousy and dissension in families. It is not the natural yearning of the heart towards the most amiable—no, it is the bestowal of our partial affection on one child in preference to another, from the accident of sex, or from being the youngest or the oldest born—from form or feature, or the early indications of intellect. Here the election is made by the father or mother, often to the ruin of the favourite child; and it may generally be remarked, that the favoured of a parent under such circumstances is the first to make that heart ache, the partiality of which was so unjustly engrossed.—From *John's Legend and Romance, African and European*.

In some recent numbers of the New York Mirror, we perceive the following articles or pieces—"Claude Duval," "Fortune's Frolics," "Augustus Broom," "Song of Peace, by Giffillan," and "Scene with a Pirate," all of which have been copied from Chambers's Edinburgh Journal, without any mark of quotation or acknowledgment. We make no complaint of this: the editors of the New York Mirror are at liberty to copy our entire paper weekly, if it shall suit their purpose to do so; but we beg to represent to them the impolicy of not marking the authority whence they draw their selected matter, as the practice throws a doubt over the originality of articles which are absolutely their own.

PRICE THREE HALFPENCE.

A CHAPTER FOR THE UNMARRIED.

WHEN we are visited by the evils of which every mortal must in this life expect to have a certain share, patience and resignation are called for. It is at the same time proper that every effort should be made to avoid evil: for this express end, we are endowed with the qualities of foresight and prudence. There is one class of evils which might be greatly reduced in number and severity, by the exercise of foresight and prudence—namely, those which arise from matrimonial alliances. We are well aware that this is the very department of human affairs in which maxims of wisdom are most liable to be disregarded; yet let us never despair of the effects of a few words of plain sense, plainly spoken. If unable in any degree to control the dictates of Passion, we may at least in some instances, where the danger chiefly lies in Ignorance, be able to rouse prudence and awaken conscientiousness.

Maxims as to the age, temper, and other qualities of the parties who are to be made wives and husbands, are perhaps sufficiently plenty. Nothing, we apprehend, that is strictly new, can be said on these points. We are more anxious, on the present occasion, to call attention to certain natural laws which greatly affect the happiness of the married state, not only of the immediate parties, but of their posterity, and often tell, again, by reflection, from posterity, back upon the immediate parties.

One of these laws bears reference to the consanguinity of the parties forming an alliance. All experience shows that an unsoundness of constitution is the unavoidable inheritance of those who derive their existence from parents nearly allied in blood. How or why this should be, is of no importance at present, though we may be very sure that, as with all the other laws of nature, a beneficial end is served by it. Certain it is, that the children of parents related in blood are in many more instances conspicuously unsound in body and mind, than those of parents who stand in no known relationship to each other. Often they are well enough to pass amidst the crowd of mankind; and such instances are apt to be adduced in defence of a marriage of the kind in question. But these are exceptions from a rule; or perhaps we should rather say that these are only instances, in which the unsoundness chances to be of small amount, or not sufficient to be observable in a community where so many are from other causes unsound. That there is a greater likelihood of conspicuously unsound children from such marriages than from others, which appears to be established beyond contradiction, is enough for our argument. Such marriages ought to be avoided, because, in them, a danger is incurred, without any of those good reasons or ends which alone can sanction the incurrence of any heavy risk. It is very unfortunate that cousins, from the attachment of relationship, the frequency of their intercourse, and other circumstances, should be so apt to entertain for each other the tender feelings which give the wish for a matrimonial union. But these are only reasons why the greater pains should be taken to warn all such persons against the dangers in question. Friends, instead of making it, as they often do, a matter of policy to bring cousins together, should exert all their eloquence to depict to them the terrible griefs which attend a progeny irremediably weak and liable to perish before their time. It would even be proper to make this a point in the education of all young persons; for what is of more importance than that persons entering into life should be biassed from a step which is likely to make that life a scene of continual misery? Delicacy, it may be said, dictates

silence on the subject; but surely it must be a false delicacy which can impose such a restraint—a restraint as to words, while conduct is left free to the most disastrous errors. Nor would we only call upon the young of both sexes to repress the feelings which are apt to lead them into alliance with their kindred, but we would have pointed out to them the important fact that there is a corresponding virtue in the remoteness of origin of those whom they may select for their partners. If not natives of the same town or parish, it is well; if not of the same county, we would say it is still better. If other circumstances made it possible or prudential for persons of different countries to marry, we would say that that were best of all. We see the force of this advice when we contemplate the little isolated communities which nestle in the recesses of mountainous countries—such as the Swiss Alps and the Highlands of Scotland—where idiots are always abundant; as also in the vigorous national character which invariably arises where races have been much mixed—for example, in our own island. The crossing of breeds of animals, and the importance in agriculture of sowing grain which has been raised from a different soil, are illustrative facts which need only be hinted at. On this point there seems to be one law throughout the whole of organic nature.

The soundness of constitution of those who are to become parents, is another matter of the highest importance. That a taint of constitution, in the mental as well as in all the other faculties, is likely to be inherited by offspring, is apparently as well established as the law we have above alluded to. Certain diseases, as epilepsy, consumption, and fatuity, are noted for reappearing in children; but it is probable that many kinds of unsoundness, which do not take any very recognisable form, are also transmitted from parent to child. Evil and grief are thus perpetuated from one generation to another. The first party, not satisfied with his own life of suffering, seeks to have it represented by other human beings in the next and future ages. He both feels the pains of his own maladies, and, if he survives so long, he experiences the still more exquisite distress of contemplating those of a set of creatures whom nature endears to his bosom, and for whose ease he would diligently sacrifice his own. A deterioration to that extent of the body of the future people of his country, is another point of view in which the evil may be regarded. Now, by what means might such evils be prevented? Obviously by the abstinence from marriage of those who are affected by incurable disease. It may be thought too much to expect from mankind that any individual of either sex should exercise so much self-restraint for such a reason; and we readily own that with many little is to be expected. Yet we have hopes from a few—and whatever may be the result, we may certainly assert the principle. We are not, then, for advocating the maxim that the sound should keep apart from the unsound. We do not like the selfishness of that form of the maxim. What we would say is this—that every human being who is sensible of possessing a hereditary taint of whatever kind, is bound in conscience to abstain from sending it into a new generation. No human being has a right to make others miserable; neither has any human being a right to call into existence beings who are sure from that very fact to be miserable. Men are every day of their lives preaching the propriety of avoiding giving each other unnecessary pain. Shall they do so—shall they be shocked when they see one inflict so much as a harsh word on another, and yet be reckless though they occasion to perhaps more than one a whole life of misery? Assuredly, as the conscientiousness of our race becomes clearer and of greater force, it must see

this in the right light, and set it down as one of the greatest of all offences to become a medium for the perpetuation of such great afflictions.

It is interesting to observe how exactly the interests of immediate parties, those of the other nearly concerned parties, and those of the world at large, harmonise in all these matters. By marrying one remote in blood, the health and strength of the next generation is most likely to be secured; the parents are thereby rendered happy; the community is advantaged by the addition of sound instead of unsound members. By the contrary course, all the benefits are reversed into evils. Again, when an unsound person abstains from marrying, the misfortunes of his state are confined to their original amount—he acquires no satellites to reflect back the light of his own pains in tenfold intensity upon himself—the race is spared the evil of new vitiation. By the contrary course, all these benefits are in like manner reversed into evils.

SONG-WRITERS.

BURNS, who of all men that ever lived appears to have possessed the greatest natural capabilities for song-writing, declares the art to be a difficult one, and desires those who think otherwise "to sit down and try their hand at it," when the truth of the matter is likely to dawn upon them. Such an opinion, coming from so high an authority, is entitled to great weight, and it is corroborated by the undeniable fact, that few persons have ever attained to real excellence in the practice of composing songs. The total number of first-rate songsters who have adorned literature since its origin to the present day, may be counted upon one's ten fingers, and not a tip be touched twice. Men of the highest poetical genius have attempted this department of composition in vain, and of the truth of this assertion we have many living evidences. Has either Wordsworth or Southey produced, in the long roll of their multifarious works, one single verse which is familiarly sung in the homes of their country, be they rich or be they poor? Not one; and this is not because the endeavour has never been made, but because these great poets have failed utterly in the instances where they have attempted the composition of songs. Byron, too, though his want of success was less decided, has left behind him, upon the whole, not one song that has been or ever will be popular among his countrymen.

While it is thus obvious that the possession of the highest poetical genius does not ensure success in song-writing, we find, on the other hand, that many of our best and most popular songs have been produced by persons who never, excepting in these individual instances, evinced the possession of any poetical talent whatever. In the annals of Scottish song, in particular, numerous cases occur where lasting reputations have been won by the composition of one single song—"The Flowers of the Forest," "Auld Robin Gray," and "Lucy's Flitting," will rise to the recollection of every one as having made famous the names of Miss Elliott, Lady Anne Lindsay, and William Laidlaw. The list might be largely extended, and would include the fine songs of "The Boatie Rows," "Roalin' Castle," "Were na my heart light, I wad die," and "The Broom o' the Cowdenknowes." The art of song-writing seems, in the one point of view, an art of surpassing difficulty, while on the other hand we might be tempted to think the very reverse, from its being excelled in by persons who never displayed poetical genius otherwise. The explanation is to be sought for in the peculiar nature of the song, its construction, and its uses.

In minutely examining the masterpieces of Burns, the feature which most forcibly presses on one's attention, is their extreme *simplicity of thought and language*. Another striking feature is the almost prosaic plainness of grammatical construction in the sentences or verses. No such thing is to be found in his best songs as an *inverted expression*, or any other complication of arrangement. A third characteristic is, the total absence of *parenthesis*, or even any thing resembling a parenthetical clause. Let the reader look, in the illustration of these remarks, at the song, "Of a' the airts the wind can blaw."

"Of a' the airts the wind can blaw,
I dearly like the west,
For there the bonnie lassie lives,
The lassie I luv best;
There wild woods grow, and rivers run,
And mony a hill between;
But day and night, my fancy's flight
Is ever wi' my Jean.
I see her in the dewy flowers,
I see her sweet and fair;
I hear her in the tuneful birds,
I hear her charm the air;
There's not a bonnie flower that springs
By fountain, shaw, or green,
There's not a bonnie bird that sings,
But minds me o' my Jean."

Every line here holds precisely the form and place which would be given to it, if the same thing had to be told in prose. The thoughts are peculiarly simple, and the meaning clear and obvious, while expressed, at the same time, in the fewest possible words. *Concentration* is a most marked characteristic, even *epithets* being avoided as far as practicable. If we turn to other songs of Burns, we find them presenting the same distinctive features. "John Anderson my jo," which, when sung well, moves the hearer even to tears, is almost transparently simple in thought and expression.

"John Anderson my jo, John,
We clamb the hill theither,
And mony a centy day, John,
We've had wi' ane anither;
Now we maun totter down, John,
But hand in hand we'll go,
And we'll sleep theither at the foot,
John Anderson my jo."

It is unnecessary to multiply examples. Let any one examine for himself, and he will find that the distinguishing features here pointed out pervade the whole of the best songs of Robert Burns. In no point, it may be further observed, is his care for the preservation of simplicity so obvious, as in his introduction of similitudes, which, in ordinary writing, are usually more or less parenthetical in their position and character. Burns seldom or never resorts to the use of, "As the," &c., or "So the," &c., or "Like the," &c.; his similes are managed in a very different way. Here is one fine specimen:—

"Wi' lightsome heart I pu'd a rose
Fu' sweet upon its thorny tree;
And my fause lover stole the same,
But ah! he left the thorn with me."

It is in this manner that he incorporates his similitudes with the song, without breaking its "even tenor," by giving them an abstracted form.

Reasons for all this may, we think, be easily found. It is the object, we apprehend, of a song, to represent or embody some of those trains of sentiment which rise spontaneously in the mind under the influence of peculiar circumstances, as love, regret for the absence of a mistress, joy for her consent—the social enjoyments—patriotism. When we are under these feelings, we do not naturally seek fine or involved language in which to express them: they come from us in an unpremeditated burst of exclamations, straight, clear, and continuous. If a song be of corresponding structure—and all successful songs could, we think, be shown to be of such a structure—the mass of mankind feel, without any critical prompting, that it is appropriate and suitable to express the sentiment professedly conveyed by it—they feel that, under the circumstances, they would speak in the same way; it therefore answers its end, and becomes, to use a sufficiently significant term, popular. On the contrary, when a song is composed, as poetry usually is, in an elaborate fashion, with all attainable literary graces of language and thought, it becomes a poem, but never is accepted as a song. It may be said, in opposition to this argument, that many of Mr Moore's songs are of the latter description, and yet are sung; to which we would answer, that the songs in question have, to a certain extent, by their very brilliancy, overcome the objection, and therefore form a sort of exception to the rule, though we should still doubt if their popularity will be permanent, while we have no doubt that some others by him, particularly a few of his patriotic songs, in which he always takes more direct and natural forms of expression, will last with the language. Another point of importance is to be noted—that involved and parenthetical phraseology is unsuitable for being conveyed in music. In prose recitation, a careful management of the voice will make out the most involved composition, but no such management is attainable in singing. It is, then, by inattention to these points that so many poets fail utterly in the production of songs. They write beautiful lyrics, and often have them united to beautiful music, but find, to their great mortification, that

the public will not take them into their mouths and make "household words" of them, although perhaps conferring that honour, at the same moment, upon verses far inferior in beauty of thought and expression. This is a matter of surprise to the poets so passed over, but we believe the whole to be capable of an easy explanation upon the principles stated above. Of course, the most successful writers of song are those who bring poetical genius of the highest order to the pursuit and practice of the rules necessary for success in that line of composition. Robert Burns was one so situated; and it was this that made him eminent among other followers of the art. The same rules hold good with regard to ballads, which are merely narrative songs; and we may illustrate our remarks by referring to two versions of the celebrated story of Helen of Kircornell, the one the composition of some old and unknown author, and the other the production of William Wordsworth. Every one remembers the older piece:—

"Gleniffer, I were where Helen lies—
Night and day on me she cries:
O that I were where Helen lies
On fair Kircornell's isle."

O Helen fair, beyond compare,
I'll make a garland of thy hair;
I'll bind my heart for evermore,
Until the day I die.

O think na ye my heart was sair,
When my love dropt and spoke nae mair,
She sunk and swooned wi' mickle care
On fair Kircornell's isle.

Curst be the hand that thought the thought,
And curst the hand that fired the shot,
When in my arms I dropt Helen dropt,
And died to succour me."

Here we have a most passionate yet most simple opening of the story of poor Helen, and which, when finely sung, might draw tears even from the eyes of an inquisitor. Wordsworth, also, aims at great simplicity in this version, but, alas! how different is it in general effect from the antique strain!

"Fair Ellen Irvine, when she sits
Upon the braes of Kirtle,
Was lovely as a Grecian maid
Adorned with wreaths of myrtle;
Young Adam Bruce beside her lay,
And there did they beguile the day
With love and gentle speeches,
Beneath the budding beeches.
From many knights and many squire
The Bruce had been selected,
And Gordon, fairest of them all,
By Ellen was rejected.
'Said tidings to that noble youth!
For it may be proclaimed with truth,
If Bruce hath loved sincerely,
The Gordon loves as dearly."

No one, we imagine, can compare these modern verses with the preceding, without being at once sensible that the old ones would have an immensely superior effect when sung. There every word tells, the poet's meaning being expressed in a brief and simple manner, and each thought having a plain and intensely passionate reference to the subject-matter of the song. On the other hand, Wordsworth departs at the very outset from the straight-forward construction necessary to give effect to the verses in singing, by describing parenthetically the locality adorned by the lady, "when she sate upon the braes of Kirtle." And then, supposing the piece to be set to fine pathetic music, corresponding with the melancholy tenor of the story, how awkward and ridiculous would be the effect of the singer expending his most mournful tones upon the very lively simile contained in the words "as lovely as a Grecian maid adorned with wreaths of myrtle," or upon the pretty and cheerful phrase of the "budding beeches." It is true that the modern poet does not speak, as in the case of the old song, in the character of the lamenting lover, and therefore is not bound to use language so profoundly sorrowful; but as it is evident that Wordsworth has aimed at giving the poem the style of a song, and of course of a sad one, these remarks are still applicable. This case shows very clearly the immense advantage which Burns possessed, in composing his verses to existing and known music. It enabled him to try every thought and line with the utmost critical severity, and to adapt his production to every turn of the music to which it was intended to be sung. Moore enjoyed a similar advantage in composing the words for the Irish melodies, and much of his brilliant success may be ascribed to it. Had Wordsworth, when he composed his song, been humming to himself a piece of sad music intended for it, he would at once have seen the incongruity of the simile alluded to.

Without pretending to say or believe that the individuals in question walked knowingly and purposely by the rules now adverted to as those proper for song-writing, we can scarcely err in assuming, that the success of those personages who produced excellent single songs is to be ascribed generally to the simplicity indispensable to such compositions. The tone wanted is something so extremely like the plain and simple language of real and every-day life, that it is scarcely to be wondered at, that persons possessed of no marked degree of poetical genius should occasionally have given a happy expression of natural feelings in song. Tannahill, certainly, does not rank in this class of incidental songsters, for he possessed the poetical endowment to a very considerable extent, and wrote many pieces of one kind and another; but he presents a fine instance of the all-effective power of simplicity in the composition of song. The "Braes

o' Gleniffer," the "Flower of Lavern Side," "Gloomy Winter's now awa," the "Harper of Mull," and many of his most popular songs, are so simple in thought and language, that one could scarcely believe, unless from experiencing it, how admirable their effect would be in singing. A specimen of Tannahill may be given in proof of these assertions:—

"While I there seek their evening sports,
I wander, dowie, a' my lane,
For when I join their glad recruits,
Their daffin' gleams meekle pahn.
Altho' it was nae shortytime,
When a' my nights were spent wi' glee;
But O! I'm feared that I may tane
The love that ye hae promised me.
Dear lassie, keep thy heart aune,
For I hae waired my winter's fee,
I've coft a bonnie silken gown,
To be a bridal gift for thee.
And sooner shall the hills fa' down,
And mountains-high shall crown the sea,
Ere I'd accept a golden crown,
To change that love I bear for thee."

The success of Thomas Campbell's songs depends upon the same distinguishing features which gave popularity to those of Burns and Tannahill. Wordsworth once said, that he had in vain endeavoured to discover any merit in Burns's noble war-song, "Scots wha hae." Doubtless he would also set down the "Wounded Hussar," and the "Exile of Erin," as quite unworthy of the author of "Gertrude of Wyoming," yet these songs are the most heart-rendingly effective that can be poured from human lips. The merit of the same poet's naval songs, also, lies mainly in the vigorous concentration of thought and straightforward brevity of expression which characterise them.

HENRY HUDSON—HIS LIFE AND ADVENTURES.

HENRY HUDSON was an Englishman by birth, but respecting his early history little or nothing is known. He was regularly trained to a seaman's life, and appears to have acquired considerable repute for professional skill previously to the year 1607, when he was in the prime of manhood. At that period, "certaine warshipfull merchants of London" appointed him to the conduct of an expedition undertaken at their charge, and which had for its object to explore the coast of Greenland, and to discover a passage by the North Pole to Japan and China.

Though the dangers attending such an undertaking were incomparably greater in those days than they can be now, this expedition under Hudson, as regards its complement of ships and men, presented a striking contrast to the exploratory parties of our own times. One vessel, with a crew of twelve persons in all, inclusive of the commander and his young son John, constituted the whole equipment for the enterprise, the perils of which cannot be fully appreciated unless by keeping in mind that Columbus and his immediate successors had scarcely yet examined more of North America than the shores of the Mexican Gulf, and that to the northward of this point all was mysterious, dark, and unknown. Henry Hudson, nevertheless, fearlessly set forth on his difficult course on the 1st of May 1607, after solemnly taking the sacrament, with all his crew, in the church of St Ethelburge in Bishopgate Street. His log, or journal, which was printed in the old work called "Purchas' Pilgrimage," relates that he reached the Shetland Isles in twenty-six days, and, continuing his route to the north-west, came on the 13th of June in sight of Greenland. For some time he coasted along its shores, hoping always to be able to round it, but impeded in his endeavours by the severity of the weather. In reference to this part of his voyage, he says, "Considering we found lands contrary to that which our cards make mention of, we accounted our labour so much the more worth." Finally, he found it advisable to strike to the eastward, where he touched at Spitzbergen, an island which he usually receives the credit of having discovered. But it had been in reality visited before by a Dutch mariner named Barentz, and Hudson knew its name and position ere he saw it in person. From the 27th of June to the 27th of July, our navigator struggled to pass to the northward of Spitzbergen, but, after encountering imminent risks of ice, he was compelled to turn to the southward, in the consciousness that nothing further could be done that season. He arrived at Tilbury Hope on the Thames, September 15th, after an absence of four and a half months.

The London Company of Worshipful Merchants were induced to fit out a new expedition in the following year, in the hope of discovering a north-east passage, or a route to the East Indies, by Nova Zembla and the north of Asia. The companions of Hudson amounted on this occasion to thirteen persons, himself and his son making the complement up to fifteen. On the 22d of April 1608, he left the Thames, and shaped his course to the north-east. After a tedious and difficult passage, he rounded the North Cape on the 3d of June, and soon after fell into the neighbourhood of great quantities of ice, which exposed the ship to constant peril, besides impeding his progress northward. The

head winds, also, obstructed his advance, and actually drove him southwards for many days. He knew at this time that he was near the west coast of Nova Zembla, and it was with the deepest reluctance that he gave up his cherished hope of passing it on the north side, where he could not get farther than the seventy-fifth degree. He then resolved to make an attempt to pass Nova Zembla to the south, by the Vaigatch Straits, known to divide it from Russia. Turning southwards, he soon saw the coast of Nova Zembla, and continued coasting about till the month of July was far advanced, making several excursions on land, and exploring sounds and rivers, in the vain endeavour to find an eastward passage. At length the scantiness of his stores compelled him to turn homewards once more. He reached England on the 26th of August.

Though Hudson's observations on Greenland, Spitzbergen, and Nova Zembla, were not without their value to mariners, his voyages had been unproductive of profit to merchants, and the Worshipful Company of London were discouraged. Our navigator was not so, and he immediately offered his services to the Dutch East India Company, who, having heard of him as a skilful and courageous explorer, gave him the command of a small vessel with a complement of twenty hands, Dutch and English, and sent him once more to seek a north-east passage thither to China and the Indies. Leaving Amsterdam on the 25th of March 1609, he again doubled the North Cape, but finding his way impassably obstructed by ice, fog, and head winds, he took it upon him to change his course to the west, and passed directly over to the coast of Newfoundland. Having heard from his friend, Captain John Smith, an intrepid contemporary navigator, that there existed an unexplored passage to the western Pacific Ocean by the south of Virginia, Hudson gave his crew the option of either sailing in quest of this passage, or of trying the north-west route by Davis' Straits. The men chose the Virginian enterprise, and, accordingly, the ship moved southward from Newfoundland, and about the middle of July ran into Penobscot Bay, on the coast of Maine (which names, of course, are of later origin). Traders had already visited these coasts at one or two points, and had begun to traffic with the natives, but very little of the internal country, or its rivers, had as yet been examined by civilised men. Hudson was soon visited by the natives, who came to sell furs and other articles. The journal from which we derive the particulars of this expedition was not drawn up by Hudson, but by his mate, Robert Juet, a man of good talents and seamanship, and who had been with the navigator in the previous voyage to Nova Zembla. This person being the author of the journal, we know not whether the leader of the expedition sanctioned a murderous and plundering descent which Juet describes himself and some companions to have made on the dwellings of the natives. "We manned our boat and scute with twelve men and muskets, and two stone pieces or murderers, and drave the salvages from their houses, and took the spoil of them, as they would have done of us." This presumption of the evil wishes of the natives seems to have been totally unsupported by any single overt act of injury on their part during their whole intercourse on this occasion with the voyagers.

From the coast of Maine, Hudson moved southwards, and after seeing and passing the northern and southern extremities of Cape Cod, he came to the entrance of Chesapeake Bay in the middle of August. Two years before, a colony of one hundred and five Englishmen had settled near this spot, but our navigator was prevented by adverse winds from visiting them. He went south as far as the latitude of 36 degrees, and then, despairing of finding that passage to the Pacific of which his friend Captain Smith had spoken, he turned once more to the north, resolving, seemingly, to render his voyage of some advantage by his examinations of the North American eastern coast, since he could not effect his purpose of finding a way to China. In retracing his steps accordingly, he discovered Delaware Bay, and afterwards entered Sandy Hook Bay. Happily for his fame, which can never perish so long as these regions continue to be the habitation of a great people, Hudson resolved to penetrate the waters which he had now entered upon. After sending a boat's crew forward to explore the way, he himself passed through the Narrows, and anchored in New York Bay. Previously to this, however, he had seen many of the natives, and had been under the necessity of seizing two of them as hostages, in consequence of his exploring boat being attacked by a party of them, and one man killed. There was some danger of his ship and his small crew being altogether overpowered by the savages, but this prospective peril could not move Hudson from his resolution of ascending the noble stream which now lay before him, and which at this day bears his name.

On the 12th of September, he commenced his memorable voyage up the Hudson. At first the wind impeded him much, and he spent the time in trading with the natives, who brought off furs, oysters, Indian corn, tobacco, and other vegetables, to be exchanged for beads, knives, and the like. On the evening of the 14th, he had only got about fifty miles up, and was among the fine scenery of the Highlands, as the region is now named. Next day, the two hostages made their escape through the port-holes—a circumstance regretted at the time, but more so afterwards. On the 16th, the vessel reached the spot which is now occupied by a flourishing city, that bears the name of Hudson.

Continuing his trading with the natives, yet always jealous of their intentions, and on his guard against treachery, Hudson advanced as far as the present site of Albany, about one hundred and forty miles up the river. Finding the waters here becoming shallow, and the soundings irregular, he resolved to turn about and descend, satisfied that his discovery and ascension of this great navigable stream would open the way for his employers to trading or colonial possessions of immense value. The country to which he had found the key, was fertile, he saw, to excess, its indigenous animals numerous and valuable, and its vegetables of a still richer kind, there being "great store of goodly oaks, and walnut-trees, ewe trees, and trees of sweet wood, in great abundance," while the climate was delightful, and the waters seemed stocked with the finest fish. All this was a source of gratification to Hudson, although the exploration of this river had thrown no light on the India passage, as he may at first have expected. By the 1st of October he had descended the river as far as Stony Point, and here commenced a series of attacks from the savages, to which they were apparently urged by the two hostages who had escaped. Hudson was under the necessity of using his fire-arms to a very deadly extent, before he could repel the natives and save his ship. Finally, he got away from them, and leaving the Hudson, made his way once more into the Atlantic. On the 4th of October he arrived at Dartmouth, in England.

It is asserted by Dutch authors, that, through the jealousy of the English, Hudson was not permitted after his landing to pass over to Holland, but was forced to send the vessel home without him. The navigator, however, seems to have contrived to transmit all his charts and papers to his employers, as they were over in the Hudson with trading ships in the course of the very next year, long before the English, or any other nation thought of going thither. Besides, a Dutch author published an account of the voyage in 1613, which was several years before the publication of Juet's Journal in Purchas' Pilgrims. The Dutch writer states that he drew up his account of the expedition from the papers of Hudson, then in his possession. This proves beyond a doubt that the jealousy of his sovereign and his countrymen could not induce the honest and manly navigator to yield up the fruits of his observations and toils to any but those who were entitled to them.

But he was willing and ready to give his native land the benefit of his future services. The Worshipful London Company were encouraged by his late successes to send him out once more in quest of that undiscoverable thing, the north-west passage. On the 17th of April, a vessel named the *Discovery*, manned by twenty-three persons, left London under the command of Hudson, and proceeded in a straight course for Iceland, which was seen, with its flaming mountains and smoking springs, by the middle of May. Near Iceland, the first symptoms appeared of an unhappy spirit, which rendered the sequel of this voyage ever to be deplored. Robert Juet, the mate, has been already mentioned; he was again with Hudson on this voyage. A young man named Henry Greene was also on board, a person who had been cast off by his family for his depraved habits, and whom the generous Hudson had taken with him out of mere pity. Another of the crew was Habbakuk Pricket, a person, like both Juet and Greene, of tolerable education, and from whose private journal the events of this voyage became chiefly known. "At Iceland (says this journal) the surgeon and he (Henry Greene) fell out, and he beat him ashore, which set all the company in a rage." Robert Juet seems to have taken this opportunity to excite the crew against the captain, who, he said, defended Greene, and made a spy and favourite of him. Juet, moreover, was heard to remark, that there would be "bloodshed before the voyage was over." These things came speedily to the ears of the captain, and he was on the eve of returning to Iceland and putting Juet ashore, to be taken home by some fishermen; but the persuasions of others caused him to change his purpose. In the early part of June, he made the coast of Greenland, and having rounded its southern extremity, pushed westward for nearly a month across Davis' Straits. He now came in sight of unknown land, and fell into a current to the south of it, which carried him farther west. Here his peril became great from the enormous masses of ice which were floating about in every direction. Hudson was forced to run the vessel among the larger and more fixed masses, and there let her lie for a time, although one mountain of ice had shortly before fallen over close by the vessel's side, and had given the crew a thrill of mortal alarm. As soon as it was practicable, the captain struggled to carry the ship through the ice, but in vain; it became at length so wedged in as to be immovable.

Fixed in the centre of a boundless waste of rugged mountains of ice, with a band around him of discontented if not mutinous men, Hudson might well have sunk into despondency. But he gave way to no such feelings. He summoned all the crew before him, showed them his charts, told them where he thought they were, and convinced them that they had no hope of extricating themselves but by active, persevering, and combined exertions. The love of life gained the mastery over other passions, and the crew set determinedly to work to clear away the ice around the ship. Ere long, they got her relieved, and brought into open sea. Hudson now pursued his course to the north-west, and passed more than a month in travers-

ing the straits which bear his name. In the beginning of September he reached the most westerly point of Hudson's Straits, and his mind was then filled with the most profound joy, as he believed himself to be just entering into the vast waters of the Pacific, and to have at length discovered the much-desired passage. His crew were anxious that he should stop for a time at Cape Digges, at the corner of the straits, where provisions might have been got; but the commander was eager to make his way into the open sea, and held on in a southerly direction till about the middle of September, when, to his bitter disappointment, he came to the bottom of Hudson's Bay, or of the large inland sea, rather, which is known by that name. Still hoping, however, to find an outlet in the desired direction, he spent the remaining part of September and all October in exploring the bay. In the beginning of November he was compelled to run into a small bay, to haul the ship aground, and take up a station for the winter.

This location was chosen as carefully as possible, but, under any circumstances, the crew of the *Discovery* had the prospect of a miserable winter before them. In ten days the ship was completely frozen in, and the party began to suffer the extremity of cold. The ship, moreover, had only been victualled for six months, and prudence required that the stores, which were falling short, should be dealt out sparingly. To remedy this misfortune as far as lay in his power, the captain offered a reward for every beast, fish, or fowl, that could be killed. All these evils were aggravated by the discontented spirit of those subjected to them. In the middle of September, Hudson had found it necessary to punish Juet the mate, and Francis Clement the boatswain, by depriving them of their posts, on account of various acts of insubordination. Some time after the winter station was taken up, the gunner died, and this event led to new disturbances. It was the custom in those days to sell by auction the clothes of dead seamen, and the gunner had left a strong cloth wrapper, which was coveted by all the crew. But Hudson would not permit it to be put up to auction, because Greene had set his heart upon possessing it. He did not obtain it, however, after all. Having backed the carpenter in his refusal to do a particular piece of work, Greene lost Hudson's countenance, was taunted by him for former discreditable conduct, and had the mortification of seeing the grey gown given to another. Greene was thus added to the number of the mutinous. Such is the account given in the journal of Pricket, who displays the "master" as having become soured in temper, hasty, and irritable. His recent disappointments may have made him so, but he certainly exhibited no such spirit on former occasions. We have, unfortunately, no authority but that of Pricket to follow in these matters. The navigator did not live to tell his own tale.

It was not till the winter had passed, and the ship was again at sea, that the spirit of mutiny reached its height. The men had suffered terribly from frost-bites and hunger, and on the day that the anchor was weighed, Hudson had divided the small remnant of provisions among them with tears in his eyes. This allowance was quickly and almost ravenously consumed, and then the commander proposed that every man's chest should be examined, lest any thing edible should have been concealed. He gave up his own chest for examination in the first instance, and, strange to say, a bag containing thirty cakes was there found. This extraordinary oversight on the part of Hudson exasperated the crew beyond measure, and produced the fatal crisis. Greene and Juet appear to have coalesced, and become friends, in their mutual desire to be revenged on the commander. They formed a cruel plot to seize Hudson and set him adrift in the boat, with all who were sick at the time, and all who were most friendly to him. It was about the middle of June, when the ship was lying at anchor, partially surrounded by ice, that the scheme was carried into effect. Pricket says that he himself was then so lame that he could scarcely move, but that he crawled on deck and besought the conspirators, on his bended knees, to "remember their duty for the love of God, and do as they would be done by." His words were of no avail. Hudson was seized, bound, and put into the boat, scarcely making any cry or act of resistance. Regarding those set adrift in the boat with him by the wretches, an American writer says, "To have killed their victims (the sick) outright would have been comparatively merciful; but a long lingering and painful death was chosen for them." The imagination turns with intense and fearful interest to the scene. The form of the commander is before us, bound hand and foot, condescending to no supplication to the mutineers, but calling in vain for assistance from those who would gladly have helped him, but who were overpowered by numbers, or disabled by sickness. The cry of the suffering and dying rings in our ears, as they are dragged from their beds, to be exposed to the inclemencies of the ice-covered sea in an open boat. Among them appears the young son of Hudson, whose tender years can wake no compassion in the cold-blooded murderers. We refrain from following the unhappy beings, even in fancy, through their sufferings after they are separated from the ship. Over these awful scenes the hand of God has hung a veil, which hides them from us for ever." Not one among them was heard of again.

It is remarkable that the only person who voluntarily chose to follow his commander's fortunes, was the carpenter, with whom Hudson had had the quarrel,

which made Greene his enemy. It is not less remarkable that Greene, Juet, and Wilson (who had been recently made boatswain), were the very men, of all the crew, who should have been the last to lay a finger on Hudson to his injury, in place of acting, as they did, as the leaders in this most inhuman affair. But they reaped, from another hand than that of man, the fitting retribution. Greene was appointed commander, and under his conduct the ship was carried to Digges' Cape, where, in the search for food on shore, the crew were attacked by savages, and Greene was killed on the spot. Wilson was also wounded mortally, and died soon after, with two other men, in great torture. Subsequently, the surviving voyagers passed through Hudson's Straits, killing occasionally some fowl and fish, and thus contriving to sustain life. When they at last got into the open sea, they were reduced to far greater extremities, and were glad to devour the tallow candles and every oleaginous substance they could get. Juet died of sheer want, just as the ship came near the coast of Ireland. Here a fishing vessel picked up the miserable voyagers, and they were afterwards taken safely to England by a pilot. They had been absent in all one year and five months.

Deeply lamenting the fate of Hudson, the London people sent out the *Discovery* in the year following, under the command of Captain Thomas Button, to ascertain if the navigators were yet alive. To this expedition, which proved fruitless, Prickett consented to act as guide, and this circumstance serves to confirm the truth of his narrative in its main points, as he must otherwise have dreaded the re-appearance of his old leader. There is little doubt, therefore, that Henry Hudson came to his end in the manner here related. He had previously done enough, happily, to give him an imperishable name among the explorers of the earth.

WALKS IN THE BRITISH MUSEUM.

EGYPTIAN ROOM—FOURTH ARTICLE.

AMONG the remaining relics of ancient Egypt are to be seen one or two specimens of the spindles used by the people of the country three thousand years ago. These are made of wood, and measure a little more than one foot in length. A ring of wood, or a plaited loop, served to secure the twisted materials on the spindle, and the whole spinning process appears to have been managed by the hands alone. Among other implements preserved in this part of the room, a netting-needle, brought home by Mr Salt, merits particular notice, from its being precisely the same in shape with those commonly used at the present day. It is of wood, and split open at both ends. The Egyptians seem also to have used the distaff, and to have possessed looms of tolerably perfect construction. This latter fact is made apparent by some portions of the Theban paintings, as well as by the remnants of cloths of various kinds which we find in the Egyptian room. The most noticeable point about these cloths, some of which are of close and regular texture, is the fringe attached to many of them, consisting of the twisted ends of the warp, which recalls to mind the directions of Moses to the Hebrews, delivered in times nearly coeval with those under consideration. In the book of Numbers, the children of Israel are bid to "make them fringes in the borders of their garments, throughout their generations," and to "put upon the fringe of the borders a ribbon of blue." The whole process of manufacturing linen or woollen cloths must certainly have been a tedious one, as conducted in ancient Egypt; though this was a matter of minor consequence in a country where labour seems to have been the cheapest of all imaginable things.

The cases of the Egyptian room display a vast variety of children's play-things, or small ornamental articles which we may conceive to have been of that description. Dolls are abundant—some of them bearing shapes recognisable as models of existing animals, and others constructed at the bidding of the most grotesque fancy. Several of these articles are moveable in part or parts, and appear to have been set in action by strings for the delectation of the juvenile Egyptians, in the same manner as our jumping-jacks are put in motion at this enlightened day. For the amusement of these children of old, mimic animals exhibited their powers in a hobbling gallop, and figurative bakers wrought lustily at their kneading-board at the touch of an infant's finger. A curious instance of the occasional utility of even the most trifling relics of antiquity in throwing light on subjects of greater and real interest, is afforded by one of these toys, which is in the Leyden Museum, and wears the form of a crocodile. Herodotus, notwithstanding his having visited Egypt in person, commits the blunder of supposing that the crocodile cannot move its lower jaw, and, upon his great authority, the notion has continued prevalent almost up to the present hour. The mobility of the lower jaw of the toy shows that the Egyptians at least did not share this error, or instil it into the mind of the old historian, but that they knew the under jaw to be the moving one in this creature, as it is in other members of the animal world.

Children's play-things naturally suggest the subject of adult games or sports in ancient Egypt. In the cases of the Egyptian room, we find several balls, formed of a variety of stuffs, and indicating the game of ball to have been common in Egypt. Some of these balls are covered with skin or leather, and stuffed with bran, while the interior of others is composed of plaited

rushes. Children used these articles, doubtless; but the paintings on the tombs show us that the game of ball was commonly practised also by grown-up people, and particularly by women. Sometimes one ball only was thrown into the air, as if for mere exercise of the arms; and in other cases, the player kept up three or four balls at one and the same time, like the modern eastern jugglers. The paintings exhibit another and more curious mode of ball-playing, where one person is seated upon another's back, and in that situation engages in a game with another party, holding precisely the same position at a short and fixed distance. When either of the players fails to catch the balls passing between them, the one so failing dismounts, and becomes the supporter in turn of the party on whose back she was placed: we say *she*, because the painting representing this game displays four women engaged in it. Another amusement, common in ancient Egypt, was that of throwing the dice, of which articles several specimens have been found. These are formed of ivory or bone, and have the usual number of sides (six), marked in the very same way as the ordinary ones now in use. We do not exactly know whether the Egyptians used these articles in connection with any other game, such as backgammon, but the dice are implements of such a nature, that, once possessed of them, no one can be at a loss for multiform varieties of gambling. In truth, mortals can make sufficiently exciting and perhaps ruinous trials of fortune or chance, without any such implements at all, as is satisfactorily displayed on some of these same Theban paintings. There we find parties obviously engaged in playing at "odds and evens," a game well known to children in this country, and performed by one person holding in his hand or hands a number of small objects, while another guesses whether the number be an even one or otherwise.

The magnificent work of the learned Italian professor, Rosellini, as well as the excellent production of Mr Wilkinson in this country, contain plates illustrative of various other Egyptian games depicted in the monumental paintings, and of which no record exists, or indeed could be expected to exist, among the preserved relics of the country. Among others, we find a representation of playing with the thimble, or thimble-rigging. Professor Rosellini's work exhibits (not thimbles, certainly, but) four small cups in the usual fashion, with the conjuror apparently haranguing away to an intended victim, and defying him to discover under which the ball (pea) lay. The meaning of the painting is not to be mistaken. The modern world of civilisation, therefore, which has so long had the vanity to regard the refined science of thimble-rigging exclusively a creation of its own, must yield the palm, in this as in so many other points, to the people of old Thebes. Tumblers, a class of performers who now-a-days exhibit on nearly the same scenes as the thimble-conjurors, were abundant in Egypt, if we may put faith in the same monumental paintings. Women, in tight dresses, seem to have been usually the performers, and some of their postures indicate them to have accomplished very difficult feats. For example, one tumbling feat appears to have consisted in the continued circumgyrations of two persons, who commenced their task in such a way that, when one was standing, the head of the second was downwards, and her feet or legs projected over each side of the first's neck. The first bent backwards till the projecting feet of her companion reached the ground, when the latter, standing firm, threw the first one's limbs over her head in turn. They contrived in this manner to go over and over like a revolving wheel. Other feats of agility, not less curious, are represented as having been performed by these Egyptian tumblers.

It is worthy of notice, also, that among other games, one resembling chess or draughts appears to have been known to the Egyptians. One or two upright pieces of wood, of small size, have been found about the tombs, and, from the sculptures or paintings representing the game, these have been concluded to be specimens of the pieces or men which the players moved on the board. The principles of the game, of course, cannot be ascertained from the delineations of it, which merely exhibit two persons seated opposite to each other, with a board (in profile) between them, on which appears a row of the upright pieces alluded to. From these and other facts relating to the Egyptian games, it may be concluded, on the whole, that the people of that country had abundant and varied means of enjoyment, both in-doors and out-of-doors, of the kind derivable from such sources. Wrestling, and other athletic sports, are shown by the tomb paintings to have been practised among them, and we regret to add, that the same unquestionable authority shows bull-fighting to have been also one of their common public amusements.

We have now glanced over the principal portion of the articles in the Egyptian room, which possess sufficient interest to justify a particular description. Yet, after all, but a small proportion of these relics has been here noticed. Whole shelves, for example, are covered with Egyptian deities, or household gods, formed of wood, metal, or stone, and moulded into an immensity of fantastic shapes. These, though almost indescribable on paper, will both interest and amuse the eye of the visitor to the room. The same may be said of the numerous sepulchral figures contained in these cases, of the human mummies and their elaborately ornamented receptacles, of the animal mummies, and of many other relics to be seen in this interesting

apartment. In our successive notices of the remains of ancient Egypt, however, it has been our object to confine our descriptions chiefly to such articles as illustrated the condition of the domestic arts among this remarkable people, and thus to afford room for a comparison between the state of civilisation which the world had attained three thousand years ago, and that which it displays at the present hour. The result will be felt, we believe, to be much more favourable in many respects to antiquity, than could have been believed without such infallible testimonies as these relics present. As regards domestic luxuries, the furnishings of dwellings, and various important arts of life, mankind seem actually to have advanced scarcely a step beyond the point which their predecessors had reached in Egypt, in the times under notice. The carpenter, the potter, and many other craftsmen, appear to have wrought with the very same tools now in use, and to have produced specimens of workmanship that lose nothing by contrast with aught of modern manufacture. There is something painful in the thought of all this, though the feeling is mitigated by the consciousness that, in some great and prominent particulars, we can boast of a vast superiority over our Egyptian predecessors on the stage of time. The press, steam, and gas, need only be mentioned in proof or explanation of this assertion. The first two, at least, of these mighty inventions, are alone calculated to change the face of a world, and, recently as their energies have been developed, it is to them that we really owe the superiority we possess over the ancient Egyptians, both as regards intellectual cultivation and the condition of the manufacturing arts—in short, as regards civilisation, in the most comprehensive sense of the term.

In any view of the question, what a long blank interval of non-improvement there has been in the annals of the world! Had our course of melioration been unchecked, from the palmy era of Thebes downwards, mankind would now have been, or ought to have been, far, far in advance of their present condition. War, the perpetual and self-inflicted scourge of blinded man, has been the great impediment in the way, and has caused what may be fairly termed a loss to the human race of all the benefits deducible from the experience of three thousand years.

OCCASIONAL NOTES.

"IT IS LOW."

WE scarcely know any error into which people are more ready to fall than the notion that certain things—for instance, certain lines of business—are *low*. "Oh, it would be looked upon as so *low*. I can't do such a thing as that." "I should think shame to be seen following such a *low* profession." And so on, with fifty excuses and stupidities equally ridiculous. What this thing is which is called low, we never have been rightly able to understand, for it varies in different places, and is never exactly the same any where. What is reckoned low in latitude fifty-five degrees fifty-four minutes, is not low in latitude forty-eight; what is low in the longitude of Greenwich is not low in the longitude of New York. It likewise varies according to times. A thing was low twenty years ago which is not low in the present day. We have a distinct remembrance of things being considered low, which are low no longer. The publication of our own poor little paper was, by most people, looked upon as low. The aristocracy of sixpence and half-a-crown viewed the affair as an excessively low thing, in the same manner, and from the same feeling, that the authors of folios and quartos in the reign of Queen Anne, viewed the paltry efforts of the daily press, of which Addison gives us a humorous account in his *Essays*. Whether we are still reckoned to be low, we do not pretend to say, but we are quite certain of the fact, that those who once called out low, have themselves yielded to the spirit of lowness, and now emulate the cheap press in its multifarious efforts. Thus a change is perpetually going on in notions of what is low. The idea is breaking down. The thing that is low in one year, is not low the next; and he who scruples to transact any honest piece of business from an idea that it is low, may rest assured of this, that he will soon see some one less fastidious step in and take the said business from him; and, what is more, he will see that very person thrive and be respected for doing that which he at one time foolishly rejected and was ashamed of. The truth is, there is nothing intrinsically low if it be consistent with what is just and reasonable. We are all, every one of us, living by ministering, some way or other, to each other's necessities and comforts. The nobleman who lets his land to a farmer, properly speaking, lives by the sale of turnips, grass, and cattle, the farmer being merely a convenient instrument for conducting the negotiations and gathering in the money; or he possesses coal-pits, and through the medium of a tacksman or lessee, supplies fuel to all and sundry who will buy of him. What great difference, then, is there, in one respect, between

the nobleman who possesses these sources of revenue, and the merchant or tradesman who keeps a shop! No one pretends there is any substantial difference. The whole world is but a great shop, in which all are sellers and buyers in turn, and in which each is expected to do something useful for the general well-being of the concern. Let us, for the sake of consistency and common sense, get rid of this preposterous notion of lowness, which, as we say, is ever shifting its ground, and gradually getting broken down. It is the bane of rational enterprise, and keeps hundreds from doing that which would be really honourable and lucrative. Honour and shame, as Pope has observed, arise from no particular condition in life; true merit consists in the correct performance of our part, whatever that may chance to be.

STORY FROM FORBES'S ORIENTAL MEMOIRS.

IN Forbes's Oriental Memoirs, a work published more than twenty years ago, and one of the very ablest productions on the subject of the East, we find the subjoined story related as having occurred in the history of an individual with whom the writer was well acquainted, and for whose respectability and veracity he could confidently vouch.

A lady, known to Mr Forbes, had been twice married in India. "Her first husband dying when she was very young, left two children, a son and a daughter: the latter remained with the mother; the boy was sent to England for education, and at the age of sixteen embarked to return to Bombay, with the appointment of a writer. All the ships of the season arrived in due time except that in which he sailed, and that was at length despaired of; but the mother still walked at evening upon the beach, looking towards that quarter where ships from Europe would first be seen. A brahmin, well known among the English for some extraordinary instances of second sight, noting her resort to this place, and her anxious looks, asked her the cause of her anxiety, and she in reply, believing in his power, inquired why a man so gifted should ask what he must needs know. The brahmin was affected, and said, 'I do know the cause of your sorrow; your son lives; the ship will soon arrive in safety; but you will never more behold him.' The conversation was immediately reported to her friends; the ship soon reached Bombay: and it was then learnt that the youth had changed his religion on the way at Rio de Janeiro, and entered as a novice among the Jesuits; in that order he professed, and wrote occasionally to his mother, till the Jesuits were suppressed, and banished from South America. After that, he was heard of no more.

The mother, having removed to England, lost her daughter there, and sank into a state of despondency, from which neither time, nor religion, nor the efforts of an affectionate husband, could rouse her. An intimate friend of the family having money remitted from India by bills on Portugal, went to Lisbon to receive it. Walking near a prison in that city, an Englishman, through the grate of a subterranean dungeon, asked charity; he stopped to relieve his countryman, and inquiring who he was, and how he came there, found it was the son of this lady. The intelligence was immediately conveyed to England, and communicated to her with all possible tenderness; she was told that money had been remitted to him, and such means taken for his deliverance that there could be no doubt of their success. The news did create a momentary joy, but it was succeeded by keener pangs of sorrow; and she continually exclaimed, 'Oh the brahmin! the brahmin! If the devil possessed the power of making us miserable, it would be by giving us this foreknowledge that he would most successfully exert it.' The brahmin had told her that her son lived, but that she should never see him more; the first part of the prediction had been fulfilled, and she could not doubt of the truth of the latter. And the prediction, after the lapse of thirty years, was accomplished in all its parts. The release of the ex-Jesuit was obtained—he heard of life and light, and joy and maternal love; the change was too great for human nature, and he died almost immediately after his deliverance."

In noticing the work of Mr Forbes, the Quarterly Review quotes this story, as it has been now given, and observes at the conclusion—"In the latter part of this very remarkable story we believe Mr Forbes to be incorrect; certain it is, that no Englishman could solicit charity from a dungeon, in Lisbon, without finding immediate assistance from his countrymen. The circumstances, as we heard them at Lisbon, were these:—The English Jesuit having been a man of eminence in his order, was one of Pombal's countless victims, and confined, not where he could call upon his countrymen for charity, but in one of the prisons at Belem, which at high water was under the bed of the river. There he remained, his existence being known only to those who had the charge of feeding him, neglected, and perhaps forgotten, by the unfeeling despotism which had cast him there, till Pombal was disgraced. All the living victims of that minister's policy being then delivered, this dungeon also was opened, and the Englishman, who for many years had never beheld the light of heaven, nor breathed the open air, was left to go where he would. He found his way to the *Praça*

di Commercio (the Exchange), where the English assemble, and there told his story. He was recognised by a friend of the family, and the result was as Mr Forbes relates it: he had lived, like a toad, in the bowels of the earth, and might long have continued to live in his dungeon; his nature had adapted itself to the situation. There was no consumption of life; it existed like the fabled lamps in a sepulchre, in its own atmosphere. But air and light became poison to one who had lived so long in darkness, and the change, in the course of a very few weeks, proved fatal."

We need hardly add, that the brahmin's assumption of the gift of foresight was nothing else than a pretence, and that his prediction was a mere hazard, which came true by chance; had it failed, there would have been no attention paid to the circumstance. Thus, the successful predictions of pretended prophets are always sure to be reported, while their failures are forgotten.

THE ART OF SELF-EXAMINATION.

MR WYSE, in his large and excellent work on Education, offers a suggestion which is exceedingly worthy of the attention of those who are charged with the instruction of youth: he recommends that, for the better moral training of pupils, each should be initiated and confirmed in the art of self-inquiry and self-examination. "This," he observes, "has been reduced to practice at Hofwyl. When a boy commits a fault, he is sent to write down a detailed account of what he has done, the motives and reasons which prompted him to its commission, &c. The effect of this, it is obvious, must be most powerful. Suppose a boy has told a falsehood to serve himself and implicate another, what is more likely to make him deeply sensible of the meanness of what he has done, than the retracing, step by step, the circumstances, reasons, feelings, &c., which urged him to the act? First of all comes the action which he has endeavoured to deny, falsehood; then the fear of discovery, cowardice; the seeking the means to avoid it, cunning; the implication of another, baseness, treachery, &c.: while all this continues a confused heap in his mind, self-love, taking advantage of the confusion, will attempt to disguise its enormity. But let it be thus analysed, and if he be not absolutely hardened, he must be covered with confusion. Such, indeed, conjoined to an affectionate attachment to all above them, has been the result. So far now from seeking to disguise or excuse their errors, in order to avoid this confusion, they are usually the first to report them themselves."

"Make the pupil (continues this intelligent author) observe, examine, account, not for the circumstances only, but for the motives of his fault; and not with rebuke and harshness, but with that sympathy and paternal love, which, if he be the child which such a discipline should form, depend upon it will be punishment and correction enough. The dread of this confession, the necessary consequence of every error, enhanced, as it will always be, by the kindness and judgment of a good teacher, will soon be transferred to self-examination, to the confession of his own heart, in the solitude of his own chamber. He will blush to meet himself as he did his teacher, after an act of duplicity, or selfishness, or passion. The censure of the teacher's eye will be weak compared to his own, for conscience will be the court, and God the judge, and he himself will be his own accuser. When once this habit is formed (and how easily may it be formed!) the master has indeed achieved his work. He has surrounded these young and undefiled spirits with omnipresence and omniscience; he has introduced the severest and surest of all police (a preventive power, in comparison to which all corrective is weak) into the innermost foldings of the young heart. There is nothing now necessary but punctuality and perseverance. No evening should be allowed to pass without this inquest; and in order that it may be conducted in the most effective manner, even mechanical aid should not be despised. Various have been proposed: that suggested by Franklin, and developed, in an article in the Journal of Education, under the name of the 'Regulator,' is excellently adapted to this evening examination."

The following is the plan pursued by Franklin, which is recommended in an especial manner to young men. "Finding that bad habits usually crept in from want of attention, and that his propensities were often too strong for his reason, he adopted a method framed for the purpose of breaking up these habits and controlling these propensities with something like certainty, and forming and strengthening the opposite dispositions and qualities. Observing that very vague ideas were attached to the names of virtues in general, he specified more minutely those he was desirous of acquiring, and ranged them under the thirteen following heads:—1. Sobriety. 2. Silence. 3. Order. 4. Resolution. 5. Economy. 6. Application. 7. Sincerity. 8. Justice. 9. Moderation. 10. Cleanliness. 11. Tranquillity. 12. Chastity. 13. Humility. Resolved to acquire each, he did not attempt the task in gross. He took each of the thirteen in succession, beginning with *Sobriety*. He accompanied this, conformably, as he says, to the advice of Pythagoras, with a *Daily Evening Examination*; and in order to conduct it with effect, he adopted the following plan:—He assigned in a small book, for each of the virtues just mentioned, a page ruled with red ink, in seven columns, one for each day in the week; these columns were crossed by thirteen horizontal lines, at the beginning of each of which was the initial letter of one of the virtues. On this line, and in the appropriate column, he marked the violations committed during the day against that particular virtue. He paid strict attention for a whole week to each in succession, leaving the others to take their chance. In case he succeeded during an entire week in keeping clear his line marked, for instance, '*Sobriety*,' he considered the habit of that virtue to have been sufficiently formed, and extended his attention to the next, with the view of obtaining in the next week another line equally exempt

from marks. In this manner he hoped to be enabled to make a course in thirteen weeks, and four courses in the year.

This plan was continued for some time without any interruption. He was surprised, at first, to find that he had many more defects than he had imagined; but he had soon the satisfaction to see them gradually diminish. After a little time, he made only one course during the year; later, one only in many years; at last none, in consequence of the diversity and multiplicity of his avocations, journeys, &c., but he always carried his little book with him. The resolution of Order he found the most difficult of all others to observe; for though practicable as long as he was a journeyman printer, the moment he became master, his time was no longer at his disposal. He found also, from early habits of disorder, and too much reliance on an excellent memory, extreme difficulty in keeping in proper arrangement his papers, books, &c.; for a time he almost despaired of ever acquiring punctuality, and very painfully experienced, even in his latter days, the disadvantages resulting from its want. Yet with all this, and though he did not attain the full perfection at which he aimed, his efforts rendered him better, and much happier, than he would have been had he never formed this plan. He states, for the information of posterity, that to it, with the assistance of God, he was mainly indebted for the constant happiness he enjoyed to the seventy-ninth year of his life. He attributes to his Sobriety his long and uninterrupted health; to his Industry and Economy the independence which he early attained, and the acquisition not only of wealth but of knowledge, which enabled him to perform the duties of a good citizen, and acquire the consideration which he enjoyed amongst the literary characters of his day; to his Sincerity and Justice the confidence and distinctions with which he had been honoured by his fellow-countrymen. In fine, to the union of these several virtues, however imperfectly attained, he was indebted for that equality of temper and good humour which rendered his company an object of delight even to the youngest. He hopes, therefore, that the process he has recommended, will be as eagerly, and he doubts not as successfully, applied by his descendants."

AN INCIDENT A LA CALEB BALDERSTONE.

SOME of our readers have doubtless perused "Stephens's Incidents of Travel in Egypt, &c.," of which we lately published a cheap edition for popular use, but many others in all probability have not. The work is exceedingly amusing, both for the liveliness of the author's style—he is an American—and the graphic accounts which he presents of eastern manners, and the remarkable places he visited. The following scrap affords a tolerably fair specimen of his free-and-easy way of reciting his adventures in sailing up the Nile in quest of pyramids:—

Returning from one of his excursions on the banks of the river, in company with two Englishmen, whose well-replenished boat he was so fortunate as to overtake, "I was glad (he says) to get back to my rascally donkey. If a man were oppressed and borne down with mental anxiety, if he were mourning and melancholy, either from the loss of a friend or an undigested dinner, I would engage to cure him. I would put him on a donkey without saddle or halter, and if he did not find himself by degrees drawn from the sense of his misery, and worked up into a towering passion, getting off and belabouring his brute with his stick, and forgetting every thing in this world but the obstinacy of the ass, and his own folly in attempting to ride one, man is a more quiet animal than I take him to be.

As I intended going the next day up the Cataracts with my companions, and expected to spend the day on board their boat, I had asked them to dine with me in the evening. After giving the invitation, I held a council with Paul, who told me that the thing was impossible, and, with a prudence worthy of Caleb Balderstone, expressed his wonder that I had not worked an invitation out of them. I told him, however, that the thing was settled, and dine with me they must. My housekeeping had never been very extravagant, and macaroni, rice, and fowl, had been my standing dishes. Paul was pertinacious in raising objections, but I told him peremptorily there was no escape; that he must buy a cow or a camel, if necessary, and left him scratching his head and pondering over the task before him.

In the hurried business of the day, I had entirely forgotten my servant Paul and his perplexities. Once only, I remember, with a commendable prudence, I tried to get my companions to expend some of their force upon dried dates and Nubian bread, which they as maliciously declined, that they might do justice to me. Returning now, at the end of nine hours' hard work, crossing rivers and rambling among ruins, the sharp exercise, and the grating of my teeth at the stubborn movements of my donkey, gave me an extraordinary voracity; and dinner—the all-important, never-to-be-forgotten business of the day, the delight alike of the ploughman and philosopher—dinner, with its uncertain goodness, began to press upon the most tender sensibilities of my nature. My companions felt the vibrations of the same chord, and with an unnecessary degree of circumstance talked of the effect of air and exercise in sharpening the appetite, and the glorious satisfaction, after a day's work, of sitting down to a good dinner. I had perfect confidence in Paul's zeal and ability, but I began to have some misgivings. I felt a hungry devil within me, that roared as if he would never be satisfied. I looked at my com-

panions, and heard them talk; and as I followed their humour with an hysteric laugh, I thought the genius of famine was at his heels in the shape of two hungry Englishmen. I trembled for Paul, but the first glimpse I caught of him reassured me. He sat on the deck of the boat, with his arms folded, coolly, though with an air of conscious importance, looking out for us. Slowly and with dignity he came to assist us from our cursed donkeys; neither a smile nor frown was on his face, but there reigned an expression that you could not mistake. Reader, you have seen the countenance of a good man lighted up with the consciousness of having done a good action; even so was Paul's. I could read in his face a consciousness of having acted well his part. One might almost have dined on it. It said, as plainly as face could speak, one, two, three, four, five courses and a dessert, or, as they say at the two-franc restaurants in Paris, 'Quatre plats, une demi-bouteille de vin, et pain à discrétion.'

In fact, the worthy butler of Havenswood could not have stood in the hall of his master in the days of its glory, before thunder broke china and soured buttermilk, with more sober and conscious dignity than did Paul stand on the deck of my boat to receive us. A load was removed from my heart. I knew that my credit was saved, and I led the way with a proud step to my little cabin. Still I asked no questions, and made no apologies. I simply told my companions we were

Paul's hands, and he would do with us as seemed to him good. Another board had been added to my table, and my towel had been washed and dried during the day, and now lay, clean and of a rather reddish white, doing the duty of a table-cloth. I noticed, too, tumblers, knives and forks, and plates, which were strangers to me, but I said nothing; we seated ourselves and waited, nor did we wait long; soon we saw Paul coming towards us, staggering under the weight of his burden, the savoury odour of which preceded him. He entered, and laid before us an Irish stew. Reader, did you ever eat an Irish stew? Gracious Heaven! I shall never forget that paragon of dishes; how often in the Desert, among the mountains of Sinai, in the Holy Land, rambling along the Valley of Jehoshaphat, or on the shores of the Dead Sea—how often has that Irish stew risen before me to tease and tantalise me, and haunt me with the memory of departed joys! The potato is a vegetable that does not grow in Egypt. I had not tasted one for more than a month, and was almost startled out of my propriety at seeing them; but I held my peace, and was as solemn and dignified as Paul himself. Without much ceremony, we threw ourselves with one accord upon the stew. I think I only do our party justice, when I say that few of those famished gentlemen from whose emerald isle it takes its name, could have shown more affection for the national dish. For my own part, as I did not know what was coming next, if any thing, I felt loath to part with it. My companions were knowing ones, and seemed to be of the same way of thinking; and without any consultation, all appeared to be approaching the same end, to wit, the end of the stew. With the empty dish before him, demonstrative to Paul that so far we were perfectly satisfied with what he had done, that worthy purveyor came forward with an increase of dignity to change our plates. I now saw that something more was coming. I had suspected from the beginning that Paul was in the mutton line, and involuntarily murmured, 'This day a sheep has died;' and presently on came another cut of the murdered innocent, in cutlets, accompanied by fried potatoes. Then came boiled mutton and boiled potatoes, and then roast mutton and roast potatoes, and then came a macaroni paté. I thought this was going to spoil the whole; until this I had considered the dinner as something extraordinary and recherché. But the macaroni, the thing of at least six days in the week, utterly disconcerted me. I tried to give Paul a wink to keep it back, but on he came; if he had followed with a chicken, I verily believe I should have thrown it at his head. But my friends were unflinching and uncompromising. They were determined to stand by Paul to the last; and we laid in the macaroni paté with as much vigour as if we had not already eaten a sheep. Paul wound us up and packed us down with pancakes. I never knew a man that did not like pancakes, or who could not eat them even at the end of a mighty dinner. And now, feeling that happy sensation of fullness which puts a man above kings, princes, or pachas, we lighted our long pipes and smoked. Our stomachs were full, and our hearts were open. Talk of mutual sympathy, of congenial spirits, of similarity of tastes, and all that; 'tis the dinner which unlocks the heart; you feel yourself warming towards the man that has dined with you. It was in this happy spirit that we lay like warriors, resting on our arms, and talked over the particulars of our battles.

And now, all dignity put aside and all restraint removed, and thinking my friends might have recognised acquaintances among the things at the table which were strangers to me, and thinking, too, that I stood on a pinnacle, and, come what might, I could not fall, I led the way in speculating upon the manner in which Paul had served us. The ice once broken, my friends solved many of the mysteries, by claiming this, that, and the other, as part of their furniture and stores. In fact, they were going on most unscrupulously, making it somewhat doubtful whether I had furnished any thing for my own dinner; and I called in Paul. But that functionary had no desire to be questioned; he hemmed, and haved, and dodged about; but I told him to make a clean heart of it, and then it

came out, but it was like drawing teeth, that he had been on a regular foraging expedition among their stores. The potatoes with which he had made such a flourish were part of a very small stock furnished them by a friend, as a luxury not to be had on the Nile; and instead of the acknowledgments which I expected to receive on account of my dinner, my friends congratulated me rather ironically upon possessing such a treasure of a steward. We sat together till a late hour: were grave, gay, laughing, and lachrymose, by turns, and when we began to doze over our pipes, betook ourselves to slumber."

MACHINERY—A DIALOGUE.*

In the month of October 1830, there was a great stir among the Belgian workmen. The streets of the city where I dwelt were crowded with them at leisure hours. They ran from spot to spot, gesticulated, and harangued incessantly. On one occasion, a large body of them assembled just under my window, by leaning over which I could not only recognise many of them individually, but could also hear distinctly all that was said among them. Their discourse interested me so much, that I think it worthy of preservation and repetition.

A Cotton-Spinner.—My friends, I tell you that all machines are abominable things. If we do not bring them to an end, they will soon bring us. The spinning machine which I manage does more work by itself than a hundred persons could. Only think what a lot of bread there would be here for poor workmen if it were not for such an invention!

A Spinning-Weaver.—There cannot be a doubt of that; these machines are invented to enrich manufacturers, and nobody thinks of the wrong which they do to the like of us. My master, who has twenty power-looms going, gives work enough to me; but if it were not for the machinery, my wife and my girls, and my boys too, might all be employed in the business.

A Shoemaker.—They are even making shoes now by machinery. Save us! what will this poor world come to, and the poor folks in it! Shoemakers will soon scarcely find enough of work to keep themselves in old slippers.

A Printer.—There is perhaps no need of machines, my friend, to prove the truth of the proverb that "the shoemaker's son is always worst shod." But printers, my friends, will be worse off than any of you; these steam-presses will, by and bye, take away our whole work.

A Field-labourer.—We who toil in the country are far more unfortunately placed. During the whole winter we have no way of living but by thrashing grain to the farmers, and now there are new thrashing machines spreading like wildfire over the whole country.

A Baker.—Fsha! you have much reason, truly, to complain, when, during the whole summer, you can get as much work as you like. It is but in winter that you can suffer; but what do you think of us, who find kneading-machines and such like articles destroying the value of our arms every day in the year; and taking away our bread!

A Carding-machine-maker.—Gentlemen, you complain of machines. Ah, machines were not such bad things when it required men's hands to make them, and when men got bread by the work. But now, what think you of their setting machines to make machines!

All the workmen.—Oh, it is horrible; we can't stand it much longer.

The Printer.—Ah! Bonhomme Richard,† you who are one of the very best workmen living, are not you of our opinion about these machines!

Richard (shaking his head).—No, my friends, I am of quite an opposite opinion. I think that machines are productive of very great good to the country, and even to the workmen themselves.

All.—Impossible! Do you really think as you say?

Richard.—You know well that I always speak what I believe to be the truth. Listen to me, and you will soon think as I do in this matter. Don't you [addressing the printer]; when you buy bread, like better to pay fivepence for it than temperance!

The Printer.—There is no doubt about that.

Richard.—Then the kneading-machine, the thrashing-machine, the ploughing-machine, and all sorts of mill machinery, are as useful to you as they are to others. When you [addressing the baker] find it necessary to buy some yards of cotton; you prefer paying sixpence a yard for the article to paying half-a-crown!

The Baker.—I naturally do.

* The above piece, which places in a simple and clear light the question of competition between manual and machinal labour, is translated from the Belgian Almanack for 1837. Many of the arguments have been repeatedly urged before, but as the operatives are yet far from having arrived at conviction on this important point, the truth cannot be the worse of repetition.

† Bonhomme Richard, being translated, signifies Goodman Richard. The name is familiarly used to designate a sort of emblematic character—the best ideal of a good, worthy man, possessed of a deal of shrewd common sense. The Poor Richard of Franklin gives a pretty correct illustration of the character.

Richard.—Then the cards and the jennies are advantageous things to you. When you [to the field-labourer] want a pair of hose for Sunday, do you find it most pleasant to pay sixteen or eighteen pence for them, or to pay a couple of shillings or more? When you want an almanack to look at the months, whether do you like best to get it for threepence or for temperance!

The Field-labourer.—Ah, you are joking now! Sure enough I like the cheap way best.

Richard.—Then the stocking-loom and the steam-press are advantageous to you. In short, all of you may see, when the point comes to undergo a little examination from you, that the machines of which you complain are useful to each of you individually; and even if they could be shown to prejudice you a little in the exercise of your particular trades (which is not the case, however, as I shall yet prove to you), do they not in the aggregate procure you a host of comforts, which you could never have without them? Suppose for a moment that each of you would gain more if there were no machines. Would this make you richer, if you were obliged to pay dearer for every article of life! No; assuredly not. For, as one of our writers says, "Every diminution in expenditure is equivalent to an increase in gain."

If we examine the question with more care, you will see by and bye why machines must be useful to all the world. Listen.

When any thing exists in sufficient quantity for consumption, the want or utility of it is not what fixes its value; that depends on the amount of trouble and labour necessary to procure the article. Stones are articles in great request; and yet they cost very little. Wood is also a very necessary article, and yet wood, in the greater part of Belgium, is by no means expensive, because the care and labour laid out on the raising of trees, and cutting down of them, are comparatively trifling, and the land is not high in price. Iron, too, is cheap, because easily extracted from the earth, and found in it in abundance. But gold, again, which is far less useful than iron, is very dear, and this is to be ascribed to the difficulty of discovering any great quantity of it in the earth, and of extracting it therefrom. The difficulty and trouble of production, my friends, fix the value upon every article; and if we could discover the means of producing, without trouble, all the things that are now expensive, we should have them cheap enough in the market. Now, machinery affords these very means, and by it alone are all the necessities of life to be made cheap.

A Workman.—But, Richard, when there were no machines, people were happier than they are now.

Richard.—Happier! Ah, my friends, this is nothing but a too oft repeated falsehood. The lower classes, in particular, have little reason to regret the changes which time has effected. Formerly, they were slaves, dependents even for life on those above them, ill clad, ill fed, ill housed, exposed to destructive epidemics, often suffering through famines, and in every respect, as is easily demonstrable from history, subject to wretchedness of which they have now no idea. The good old times were very bad times for the poor.

But suppose that all machines were destroyed, and every thing brought back to the state of a former period. What would be the result? We have now a working population in Belgium of about twelve hundred thousand persons. This number of workers, deprived of mills and all agricultural machinery, would be totally unable to cultivate the lands of the country. A great proportion of the soil would of necessity lie untilled, and in the first year a large section of the population would die from sheer famine. No more arts, no more manufactures; all the available human arms would be forced to till the earth, and, for the price of their toil, would barely raise enough of food to keep themselves alive.

A Workman.—Well, Richard, we believe what you say, as far as regards the necessity for ploughs and other agricultural machines. We should be furnished without their aid in raising food. But this is not the case with other machines; we should not die of hunger, if there was no printing machinery, no power-looms, no paper-machines, and engines like these.

Richard.—You are in error: It is impossible that machinery can be useful in one department and destructive in another. The same cause, in the same circumstances, ought always to produce the same effects. But let us leave agriculture, then, as we find it at this day: it is plain that with its machines, moved by animals, wind, or water, it no longer requires the labour of the whole population, and that the unoccupied individuals will occupy themselves in fabricating all the articles in request among a cultivated people. Supposing that these workmen interdict the use of machines, what would ensue? It is obvious that a great diminution of the quantity of produce would be the first and instantaneous result. Society would then be deprived of a large proportion of the articles now spread among them for their comfort and enjoyment. The scarcity would cause articles to rise to an exorbitant price. The workman would scarcely be able to purchase the article on which his own labour was expended; but if he had even some little advantage with regard to this single article, he would be, as regards all others, a mere common purchaser, and the dearth would be felt by him as much as by the rest of the world. Work, besides, would be executed in an inferior way without machines, and thus the first result

of the diuse of machines would plainly be to make all articles and necessities of life at once scarce, costly, and bad. Machines—

A Workman (interrupting).—But what use is it to workmen that such a state of things is changed by machinery, and that articles are produced cheap, good, and in abundance, if that very machinery deprives workmen of employment, and prevents their having means to buy and enjoy either cheap or dear things?

Another Workman.—Ah! yes, that is well said. What say you to that, Richard? We complain of machines, because, while they make some rich, they throw others into the greatest misery, by taking from them their employment.

Richard.—My friends, it is not difficult to answer this assertion. I will prove to you that machines, the more they are multiplied, give only the greater chances of employment to workmen. Listen to this statement. We inhabit a city of twenty thousand inhabitants. Well; suppose that the art of manufacturing woollen cloth was yet imperfect, and that this cloth (touching his coat) cost 60 francs (L2, 10s.) the yard. How many people do you think there are in your city, rich enough, and extravagant enough, to buy cloth at 60 francs per yard? Not above ten, I should imagine. Suppose, now, that a clever manufacturer invents a machine, which, by economising time, and enabling one man to do twice his previous work, permits the inventor to sell his cloth at 30 francs. At this price, a hundred persons will be found to purchase the goods, in place of ten. Thus, you see, if an invention diminishes the amount of manual labour by one-half, the consumption, on the other hand, is increased ten-fold, and five times the previous number of workmen will be employed. This is the certain consequence of the increased demand. If the manual labour suffers another diminution of one-half, through some new mechanical invention, the manufacturer will sell his goods at 15 francs, and, at a fair enough computation, a thousand purchasers will now be found in the city. The consequence again is, that the number of workmen employed will be twenty-five times greater than when the cloth sold at 60 francs. If by further inventions the price can still be decreased, the augmented consumption will cause the augmentation of the workmen to proceed in the same ratio. The consumption can never fail under natural circumstances, for when the city is supplied, there are still ample markets elsewhere.

The case is still more striking in the matter of printing. A few copyists long occupied the whole trade of multiplying books, and produced them at such prices as to throw an impassable barrier in the way of the spread of knowledge. The discovery of printing, though one of the most direct imaginable savings of manual labour, increased the workmen in the trade to a most wonderful extent. A printer does more work than two hundred copyists; and if we add the press-makers, the type-founders, the ink-makers, the paper-makers, the booksellers, and various other classes of workmen—all dependent on this trade—we shall find that the employment of machinery in the manufacture of books, is and has been the means of giving work to thousands upon thousands, who would never have found it under the manual or copying system.

Look at things which have taken place under your own eyes. Many can remember since all the cotton in Belgium was spun without machinery; let them look at the trade now-a-days, and they will see that the numbers of workmen have vastly increased since the use of machinery, and that all of these men, in clothing, housing, and feeding, are much better off than the few engaged in the trade were formerly. These are facts, and the opponents of machinery should blush for making so senseless an outcry in the face of them.

A Workman.—But every thing should have its bounds. Don't you think machinery may be carried too far?

Richard.—There is but one natural limit to the multiplication of machinery, and that limit is the want of arms to construct and manage it.

The Printer.—Yes; but is there not inconvenience at the moment when machines are introduced? They do the work of many men, and throw those necessarily out of employment. The hundred copyists, for example, whose duty was taken up by one press?

Richard.—Even there, inconvenience is seldom really felt. No new invention comes immediately into use; it has to struggle against prejudice and existing interests; and, in short, before it operates fully on the manufacture with which it is connected, no one can sustain much injury. There were copyists a hundred years after the discovery of printing. Have we not seen how long hand-spinning struggled against machine-spinning in our own day? In a thousand instances we see machinery not yet employed where it will certainly be in time. No; no; excepting in a few rare instances, old things and old ways receive ample warning of coming change, and it is only those who obstinately stand in its way that are crushed by its irresistible impulse.

Yes, my friends, machinery is so far from being an enemy to you, or to any one, that it is the great agent for insuring ease and comforts of every description to mankind. Low prices and abundance follow in its train.

The Peasant.—Well, well, I now see that, after all, Master Richard is in the right. Hurrah! Machines for ever!

All.—Machines for ever!

The crowd now dispersed, reiterating this cry enthusiastically. For my part, I was so struck by the good sense and shrewdness of Richard Bonhomme, that I could not help lending my voice to swell his triumph, and bowed, as I closed my window, 'Machines for ever!'

THE HORTICULTURIST.

We have long been possessed with an indistinct sort of notion that we should write a sketch of these incomprehensible beings, tulip and violet fanciers—persons who go half crazed about the cultivation of such things as heart's-eases, roses, and ranunculuses, but we are luckily spared the pains of doing so: a Parisian author, Alphonse Karr, has hit them off to a tee. His sketch, entitled the Horticulturist, translated and published in that very clever serial (a new word for books coming out in parts or in a series), "Pictures of the French drawn by Themselves," is well worthy of personal, as may be judged by the following extract:—

"Certain tastes brighten and fill up so completely a man's existence, that we can easily understand how all feel the want of a hobby to indulge according to their fancy.

Thus, sometimes we see very superior men devote their lives to a few flowers, or a few insects, and not uncommonly to a single flower, or a single insect: an admirable instinct, or perhaps a wise philosophy, has taught them to present the least possible target to the shafts of fortune, contenting themselves with a humble lot, and enjoying a simple happiness apart from the busy world.

The intensity and violence of a passion are not to be measured by its object. The horticulturists, who, like the bees, live among the flowers, have also, like them, a dangerous sting. The softer passions protect themselves by an outward ferocity, like rare plantations surrounded by brambles and thistles, to preserve them from the encroachments of cattle.

This reminds us how we became acquainted with the naturally bad disposition of sheep, which we had always regarded as emblems of gentleness and kindness. 'Sir,' said a shepherd to us, as we walked side by side along the road to Eperray, 'there is no animal so wicked as the sheep: only look at mine; they care no more for the pasture of that enclosed field than for this on the common, where they may range at will, and yet there they are in the field. They must do it, to have me taken up for trespassing, and fined. Brrr—brrr—seize him there, Medor—brrr—It is the black one yonder that is teasing my dog: it takes a delight in irritating him. The malicious animal is trying to provoke the dog to worry him, knowing that when a dog kills a sheep, it is the poor shepherd who pays. Here, boy, Medor! Medor! Down, sir, down. Behind—fall back!'

A discussion once arose in the presence of the author of this sketch, concerning a stock, asserted to be *blue*, of which the blossoms were a most beautiful yellow; and the writer's life was actually put in jeopardy by his asking of what use it could possibly be to have blue stocks to produce yellow flowers.

It will be remembered with what enthusiasm tulips were cultivated all over Europe, particularly in France and in Holland, about thirty years ago. One root, the *Semper Augustus*, was sold for 12,000 francs. Another, the *Yellow Crown*, for 1123 francs, and a carriage and two bay horses. A third, not very fine, the *Viceroy*, fetched no less than the following articles in exchange:—Four tons of wheat, eight of rye, four oken, eight pigs, twelve sheep, two casks of wine, four barrels of beer, two firkins of butter, a thousand pounds' weight of cheese, a bed, bedstead, and bedding, a chest of clothes, and a silver goblet.

At that time it was quite usual to see in the newspapers such a paragraph as the following, under the head of foreign news:—'AMSTERDAM.—The Admiral Liefers is flowering beautifully at M. Berghem's.'

But to return to our story. Horticulturists took it into their heads one fine day, that yellow tulips were no longer beautiful, and were unworthy the admiration they had hitherto received; that the only tulips worth looking at, or cultivating, were those with white grounds. Henceforth, yellow tulips were to be banished, and their seeds scattered to the winds. Amateurs were not, however, undivided on the subject. Letters, pamphlets, songs, and even thick quavies, were written on the subject. The yellow-tulip party were called obstinate, prejudiced, illiterate, enemies to all improvement, and Jesuits; while the partisans of white tulips were pronounced to be innovators, revolutionists, democrats, and sans-culottes. Friends quarrelled, husbands and wives separated, and families were disunited.

As M. Müller was one evening playing at dominoes with one of his oldest friends, tulips chanced to be mentioned. M. Müller was a yellow tulipist, while his friend sided with the reformed partisans of the white ones. The celebrated composer, Mehul, himself a distinguished amateur, had just gone over to the white party. Being both well-bred men, M. Müller and his friend spoke with the greatest moderation, and appeared to avoid, with extreme care, the most distant approach to a dispute.

'Nature,' said M. Müller, 'as she has made nothing in vain, so has she produced nothing out of place. There is some beauty in every one of her productions. Why should amateurs rigidly exclude from their gardens certain flowers? There are, undoubtedly, some white tulips that I would willingly admit into my collection, were my garden large enough.'

'I, also,' replied his friend, not wishing to be behind in politeness and concessions, 'I am ready to allow that the *Erymanta*, all yellow as it is, is a very presentable flower.'

'I do not condemn the *Unique de Delphes*, white as it is,' said M. Müller.

'But it is not very white,' observed the Friend: 'it keeps, for three or four days, the yellow tint that distinguishes it when its petals first open, and for this reason we do not esteem it much.'

'Yet I have one of all your collection that I should prefer.'

The friends were on these excellent terms when Madame Müller left them to make tea. It would be difficult to ascertain by what imperceptible transitions the discussion warmed into a serious quarrel, until insults were exchanged. It is certain, that when Madame Müller returned to the room, the table was overturned, the dominoes scattered over the carpet, while M. Müller and his friend, having seized each other by the hair, were engaged in a desperate struggle.

It will be readily imagined with what feelings of shame the two antagonists were overwhelmed, after their anger had a little cooled. On the morrow, M. Müller wrote the following note to his friend:—

'I am a brute, really worse than a bear. Pray receive my apologies, and for the sake of our old friendship let us forget this foolish affair. My wife begs of you to come and dine with us to-day. There will be a favourite dish of yours. Your friend, MULLER.'

P.S.—Will you oblige me, my dear friend, by putting aside for me a few of your beautiful white tulips? I have reserved for them one of my best beds. I am particularly anxious for the *Palmeade* and the *Agnes Regale*. Shortly after dispatching the above, he received the following answer:—'I shall be with you at a quarter before five. You will permit me, my dear friend, to introduce to you a horticulturist who desires to see your magnificent tulips, especially your *Tombereuse*, your *Jacobus*, and your delicate *Lisa*.'

Out of compliment to his friend, M. Müller expressed his admiration for the whitest amongst the white tulips, while his friend was no less warm in his praise of the yellow specimens. However, this sudden change could only proceed from generous feeling between the two friends. M. Walter's concession passed away with the sentiment and impulse of the first moment; M. Müller's did not long survive his momentary enthusiasm. The poor white tulips were not half so well tended and cared for as the yellow. The second year, M. Müller thought they encumbered his garden; the third, they were placed near a waterspout, where they flowered badly; and M. Müller, after showing his visitors his fine collection of yellow tulips, in all their brilliancy and splendour of full bloom, would say, 'These are the only samples of white tulips we keep: they were given to me by my friend Walter, and I prize them highly for his sake.' And when, ten minutes afterwards, he added, 'I am at a loss to understand why horticulturists cultivate white tulips,' no wonder that M. Müller's visitors agreed with him.

There were, in the reign of Louis XIV., only four sorts of roses known. At the present day, the reasonable horticulturists—those who are not so blinded by their love of new discoveries as to give five or six different names to the same plant—reckon forty different species, and more than eighteen hundred varieties.

Certain amateurs, led astray by the ambition of being the exclusive possessors of a particular variety, seek for defects in roses with as much eagerness as others would look for beauties. 'If a rose be but rare, that is beauty sufficient; and it is prized on that account, more than those rich in form, colour, or perfume. Rose-fanciers have been seeking, these last fifty years, for a green, blue, or black rose, and for the double-capuchin rose.

Madame de Genlis, who pretends to have originated the moss-rose, gives in one of her works a receipt to procure a green and a black rose; the process, which is exceedingly simple, is only to graft a rose on a *cane* or a *holly tree*. We have tried on both; the holly produced its green and prickly leaves, and the *cane* bore its accustomed fruit.

Every year, towards the end of May, a never-failing report goes the round of the newspapers that the double-capuchin rose is at last discovered. We have journeyed far and wide to see it, but till now we have neither found it double nor capuchin. To produce the blue rose, horticulturists have filled every nook of their gardens with every description of blue flower, in the vain hope that the bees, by carrying the pollen from their stamens to a rose-tree, might give birth to the wished-for flower. We have on this subject an idea of our own, which we shall put in practice some one of these days. The roses designated by the bluest names, such as the 'Negress,' the 'Ourika,' &c., are all violet.

Amateurs are constantly on the watch to observe the most minute differences. One rose is remarkable for its stem, another for its thorns. This is precious on account of its total want of beauty; that is admired in consequence of its having no perfume; and another would not be nearly so valuable, did it not possess an odour peculiarly disagreeable. In fact, the more extraordinary they are, and the farther removed from what

all the world can have, the more highly they are prized.

Happy the man who could possess a rose which would become a vine, that he might make wine from his roses! We have seen a rose-bush which the happy possessor triumphantly assured us had not flowered for five years. Lucky man! but still more lucky would he be if next year it would bear no leaves!"

MANCHESTER SCHOOL OF DESIGN.

We are glad to find from Messrs Love and Barton's lately published work, "Manchester as it is," that in that flourishing and improving town, a School of Design was planted with success in 1838, and promises to be well supported. "The objects of the society are to give instruction to students, by means of competent masters, in design—including ornamental drawing, flower-drawing, drawing the human figure, perspective, geometry, civil engineering, architecture, modelling, light, shade, and colour, pattern-drawing for calico printing, fancy weaving, &c.; delivery of lectures on painting, sculpture, anatomy, zoology, botany, &c.; the formation of a museum for the exhibition of casts, models, paintings, designs, mechanical inventions, and other works of art; and of a library of books and engravings. Persons who pay L.10, or subscribe L.1 per annum, have free personal access for themselves; and persons paying L.20 or upwards, or subscribing L.2 per annum, have free access for themselves and all the members of their families (except males above twenty years of age), to the drawing-school, library, museum, meetings, exhibitions, and all other public parts of the Institution, subject to the regulations of the council. The following is an extract from the first report of the Institution, published in February 1839:—"The school was opened on the 1st of October last, and thirty-six pupils have been admitted, consisting of 12 Pattern Designers, 9 Artists, 5 Architects, 1 Engineer, 1 Glass Stainer, 1 Coach Painter, 1 Cabinet Maker, 1 Printer, 5 Miscellaneous Occupations, 36 total, attending chiefly in the evening, regularly. Of these students, 12 are qualified to draw from the round, either statues or busts; 13 are good copyists; and 11 are elementary students; and the Council have every reason to be satisfied with the general progress of the pupils." The receipts up to the date of the report were L.369; Mr Bell is the master."

TEMPERANCE A THING OF OLD DATE.

KING LOUIS IX. (named St Louis) mixed his wine with water, by measure, according to the strength of it, and what it would bear. "He once asked me," says the Lord of Joinville, when at Cyprus, "why I did not mix water with my wine." I answered, what the physicians and surgeons had told me, that "I had a large head, and a cold stomach, which would not bear it." But the good king replied, that "they had deceived me, and advised me to add water; for that, if I did not learn to do so when young, and was to attempt it in the decline of life, the gout, and other disorders which I might have in my stomach, would greatly increase; or, perhaps, by drinking pure wine in old age, I should frequently intoxicate myself; and that it was a beastly thing for an honourable man to make himself drunk."—*Memoirs of Lord de Joinville, written in the thirteenth century.*

Touching the harm which cometh from the excess of meat and drink, I observe that the excess thereof hath so far alienated the affections of our countrymen from the ancient English worth and valour, that if you compare them which now live, with those who died forty years ago, you would not believe that they are of the same offspring. To the end that no man (who hath coin, and is addicted to the vanity thereof) may be abridged of his humour, alehouses are so plentiful at this day, that almost the one-half of every town is nothing but alehouses (to omit those which are in hamlets, and upon commons and other unnecessary places). Great pity it is that our worthy justices of the peace will not root out a great part of them, considering how many sweet, hopeful, and virtuous young gentlemen, and others, have spilt their whole estates, and shipwrecked their best fortunes, upon the rocks of drunkenness, and brought themselves to untimely deaths. (It hath been a cause of mine own utter impoverishment, and brought so great a mass of miseries and disgraces upon myself, that if the mercies of God had not wonderfully preserved me, I had undoubtedly perished therein). Yet if one or two honest poor men, which have no trade, were permitted to sell ale and beer, and sworn to sell the same according to the statute, this were very well. The abundance of pot-companions would decrease, drink would not be so strong to betray the weakness of men's brains, the price of corn would be abated, and the plenty thereof would abound; sins would be more weakened, God better served, and our commonwealth (by little and little) would recover her ancient lustre. But now, every one, both honest and vicious, if they can procure money to pay for their licences, are permitted to keep tippling houses, and sell their liquor at what rates they please. So that, in my judgment (and I have cause to know more in this than is for my credit), there is no commodity of this kingdom sold, wherein more extortion is used (to the inexplicable detriment of the poor).—*Certain Observations touching the estate of the Commonwealth, composed principally for the benefit of the Gentry of the County of Durham, 1634.*

The Fifth Law.—Thou shalt not drink strong liquors.

COMMENTARY.

This law commands us not to drink any intoxicating liquor. There are many sorts in the western frontier countries, as liquors made of sugar-cane, of grapes, and of many other plants; in this country (China) it is the general custom to make a strong liquor from rice—of all these thou shalt not drink; with this exception, when thou art sick, and nothing else can restore thy health, and then it must be known by all that thou drink strong

liquors. If there be no reason for it, thou shalt not touch any liquor with thy lips, thou shalt not bring it to thy nose to smell at, nor shalt thou sit in a tavern, or together with people who drink spirits.

There was once a certain Yew-po-han, who, by breaking this law, violated also all others, and committed the thirty-six sins; you can see by this that it is no small sin to drink wine (strong drink). There is a particular department in hell filled with mire and dirt for the transgressors of this law, and they will be born again as stupid and mad people, wanting wisdom and intelligence. There are bewildering demons and maddening herbs, but spirits disorder the mind more than any poison. The Scripture moveth us, therefore, to drink melted copper, sooner than to violate this law and drink spirits. Ah, how watchful should we be over ourselves!—*From the Catechism of the Shamans, or, the Laws and Regulations of the Priesthood of Buddha, in China.*

A TYNESIDE ANECDOTE.

Upon the occasion of the visit paid by the allied sovereigns of Russia and Prussia to London, after the overthrow of the man to whom they had so long cringed, a distinguished individual, in the suite of the Emperor Alexander, proceeded to the north of England, for the purpose of having ocular proof of the subterranean wonders of the far-famed collieries of the Tyne. Being provided with letters to the head viewer of the Wallsend colliery, a gentleman of the name of Buddle, who had instructions to take the necessary measures to ensure the prince's object being safely and satisfactorily accomplished, the illustrious stranger was conducted to the residence of the viewer, situated in the immediate vicinity of the principal pit. Before descending to the coal seams in the bowels of the earth, it is necessary to throw off every article of usual dress, and to put on, instead, the attire worn by the pitmen or miners, consisting of thick flannel trousers and jacket. This metamorphosis the Russian prince underwent, and casting aside his glittering uniform and orders, he appeared in the uncouth and soiled garments of a common collier. In this garb he was escorted to the mouth of the pit, down which he was to be lowered, followed by a considerable number of the sooty denizens of the place.

It will be known to almost all of our readers, that pits are round holes, of about ten feet in diameter, sunk into the earth to the depth in some cases of three hundred fathoms, nearly one-third of a mile, and divided by a wooden partition the whole way down, so as to form two shafts. The mode of descending a shaft is either by entering a large basket used for hauling up the coals, or by putting one leg through a large iron hook at the end of the rope, and clinging by the hands to the chain to which it is appended. The latter mode, contrary to what might be imagined, is the best and safest, and for this reason, that the basket is liable to catch the sides of the pit, and be thus turned upside down. Each person is provided with a short stick to keep himself from grazing the black and dripping walls as he proceeds downwards, and the rapidity of the descent is such as to render this precaution highly expedient. To a person who views this dark hole, and the rough apparatus for a dive down it, for the first time, nothing can be perhaps more frightful; and when, to the contemplation of the actual horrors, is added the recollection of all the disasters of which pits have been so frequently the scene, the whole is doubtless sufficient to appal a very stout heart. So much so indeed is this the case, that hundreds of the inhabitants of the coal districts, with that daily exhibition before them which renders the mind careless and indifferent to danger, have never summoned up the requisite quantity of courage to encounter the perils of a coal mine, or if piqued by shame or curiosity to advance to the margin of the gloomy cavern, and cast an eye down its grim jaws, they have recoiled with a shudder from prosecuting their design of entering.

The pit to which the Russian magnate was led at Wallsend, was one of the deepest and narrowest on the Tyne. It was at that period in the full enjoyment of its fame as sending up the finest coals in the world, and offered certainly good cause of astonishment, that out of such a small black hole an individual was reaping an income of L.50,000 a-year. On this account the Wallsend colliery was generally visited by the curious, although the mode of working the mine was not at all different from the one adopted in all the other collieries. What idea the prince had formed in his own mind of a coal-pit, it is impossible to say, but it is to be presumed that he had either thought little about the matter, or been very wrongly informed upon the subject. When Mr Buddle, the viewer, conducted him up the ladder leading to the platform of the pit mouth, and introduced him to the scene of operations, he stopped suddenly short, and asked with alarm whether that was really the place to which he had been recommended to come. Upon being assured that such was actually the case, he went forward to the very edge of the pit, at sight of which, however, he stepped precipitately back, and holding up his hands, exclaimed in French, "Ah! my God, it is the mouth of hell!—none but a madman would venture into it!" Upon uttering these words, he hastily retreated, and, slipping out of his flannels as quickly as he could, again assumed his splendid uniform of a Russian general, and soon left the Wallsend colliery far behind him.

The person who thus displayed so infirm a purpose, or a mind so easily cowed at sight of an unexpected hazard, was one upon whose impulses for good or bad it pleased providence at this present moment to rest the destinies of a large proportion of the whole human race. It was Nicholas the First, Autocrat of all the Russias.

A WITTY AUCTIONEER AND AN OLD CLOCK.

THE Christian Register of Boston publishes, with just commendation, the annexed speech of an auctioneer unnamed, who had the selling of the clock of the "old brick meeting-house" in Boston. To be sure, the Courier of that city throws some doubt upon the authenticity of this speech, in which case we have only to apply the Italian saying, *Si non e vero e ben trovato*.

"The clock which for many years hung in the interior of the 'old brick meeting-house' in this city, after various fortunes, lately fell into the hands of the auctioneer. At the time of the sale, the auctioneer actually delivered the following speech, which we have been permitted to publish. We venture to affirm, that a more appropriate and witty speech never fell from the lips of the most celebrated orators at vendues:—

'Here is the relic of the early days of our country's annals, a remnant saved; antique of its kind, and venerable for every association connected with its history—the old church clock—bearing a mark of patriarchal longevity in the date, that speaks it one hundred and eighteen years of age. Yet, while it has ticked and struck off the thousands and tens of thousands who have looked on its calm face into eternity, it is still in good time, and going! going! Though its existence was begun in the land of kings, moved by the spirit of our pious fathers, it followed them to the land of pilgrims, and was consecrated to serve in the house of God, whom they came hither to worship as the children of his kingdom, and not as spiritual slaves to earthly despotism. This sober, ever-going clock came over in the days of caution and sanity. It came when a sea voyage was a serious thing, and religion a serious thing, and a church clock a serious thing. It counted the moments, while the minister of God was preaching, and his hearers listening, of eternity. It echoed his text, "Take heed how ye hear." Then was there real clockwork and order in men's minds and principles. Vanity did not then stare this venerable monitor in the face, and study the while how to display its plumage. Avarice did not dare, under its measured "click," to be planning in the temple how to lay up goods for many years. Nor was pride then puffed up by the breath of its own nostrils, while this minute-hand was showing its duration cut shorter at the beat of every pulse. Now, who will let this venerable memento of those days be desecrated? Who will not wish to possess himself of it, as a relic of the age of simplicity and godly sincerity? Look at its aged but unwrinkled face. It is calm: for it has not to answer for the sermons it has heard. Look at it, ye degenerate sons of New-England! Do ye not seem to see the shade go back on the dial-plate to the days of your fathers, and to hear the voices of those aged servants of God, who went from their preaching to their reward? I would speak more, but the hour is come. To whom shall it be sold?"—*New York Mirror.*

THEMISTOCLES AND THE LACEDÆMONIAN FLEET.

Themistocles, the leader of the Athenian armies, was a great soldier, but not a conscientious man. From an undue love of his own country, he was anxious to ruin its neighbour and rival, the state of Lacedæmon. One day, in a public assembly, he informed the Athenians that he had formed a design for raising them permanently above the Lacedæmonians, but he could not communicate it to them, because its success required that it should be carried on with the greatest secrecy. He desired them to appoint a person to whom he might explain the design, and who should judge whether they were to allow it to be executed. For this purpose, they unanimously pitched upon Aristides, the individual of their number in whose honesty and prudence they had the greatest confidence. Themistocles then took Aristides aside, and told him that the design he had conceived was to burn the fleet belonging to Lacedæmon and the rest of the Grecian states, which then lay in a neighbouring port. By this means, he said, Athens could not fail to become the undisputed mistress of all Greece. Aristides now returned to the assembly, and merely told them that nothing could be more advantageous for the interests of Athens than the scheme of Themistocles, but that nothing could be more unjust. The people immediately, without hearing another word, ordained that Themistocles should desist from his project.

Rollin, the historian, says of this decree of the Athenians:—"I do not know whether all history can afford us a fact more worthy of admiration. It is not a company of philosophers (to whom it costs nothing to establish fine maxims of morality) who determine on this occasion that the consideration of profit and advantage ought never to prevail in preference to what is honest and just. It is an entire people, who are highly interested in the proposal made to them, who are convinced that it is of the greatest importance to the welfare of the state, and who, nevertheless, reject it with unanimous consent, and without a moment's hesitation, and that for this only reason, that it is contrary to justice."

AN IMPROVEMENT IN HUSBANDRY.

On the farm of Shireff, at Barnyard, near Beaulieu, in Inverness-shire, is a machine for making holes to deposit bone dust, instead of sowing it broadcast along the drills, in the usual way. This economises the bone so steadily and effectually, that Mr Shireff says he can raise as good a crop on ten bushels of bone dust as he would have in the ordinary way with twenty bushels an acre. The machine is simple and cheap, and seems to work admirably. It is drawn by a horse, two women following putting in bones with their hands, other two following putting in the turnip-seed, and two more follow covering up the holes. The turnip-roller then comes, with the coulter out, and the drills are levelled in the usual way. Eight acres of turnips are sown in a day with the above six women, a man, and a horse.—*Newspaper paragraph.*

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

REDDY RYLAND;

SHOWING HOW "THE SHINE" WAS TAKEN OUT OF HIM.

LAUGHING, loving, rollicking, rousing, fighting, tearing, dancing, singing, good-natured Reddy! of all the kind-hearted, light-hearted, gay-hearted fellows that ever whirled a shillala at a fight (*when he could not help it*, for Reddy declared that otherwise he never fought), or covered the buckle* at a fair Reddy Ryland was the king! His very face was a jest-book. His eyes, though wild and blue, were not as mischievous as mirthful; his full, flexible mouth was surrounded by folds and dimples, where wit and humour rested at all times and all seasons. His hat sat in a most knowing manner upon the full rich curls of his brown hair; his gay-coloured silk neckerchief was tied so loosely round his throat, that if it were possible he had ever seen a picture of Byron, folk would have said he was imitating the lordly poet; his figure was that of a lithe and graceful mountaineer—his voice the very echo of mirth and joy; and his name for ten miles round his mother's dwelling (Reddy was resolved it should not be considered his until after her death) was sure to excite either a smile or a blessing, perhaps both. With all this, Reddy was careful of the main chance—a good farmer in a small way, and a prosperous one; read Martin Doyle and Captain Blackyer; understood green crops, and stall-fed his cow; had really brewed his own beer twice, and it only turned sour *once*; talked of joining the Temperance Society—though I need not add, that if Reddy had been fond of "the drop," he would not have been the prosperous fellow he was. Here, then, was an Irish peasant free from the common faults of his countrymen; he seldom procrastinated; was sober, honest, truthful, diligent, and, to use the phrase which his mother applied to him at least ten times a-day, "was as good a son as ever raised his head beneath the canopy of heaven." What, then, can I have to say about Reddy Ryland, more than to give honour due to his good qualities? If this be all, my task is nearly done; for the language of praise, I am told, is used sparingly by the prudent; people in an ordinary way tire amazingly over the record of their neighbours' virtues. It is very delightful to feel their good effects—to enjoy the advantages arising therefrom; but we do not like to hear them lauded what we call too highly; it is a sort of implied censure on our own imperfections, that we do not relish; consequently, we are by many degrees too anxious to pick out faults, and thrust our tongues therein, as children do their fingers into small rents, to make them larger. The rent, the faulty spot in Reddy's character, was unfortunately large enough for all the tongues in the country to wag through: and let no one suppose that his popularity prevented many a bitter animadversion upon his imperfection; his particular friends never praised him without exclaiming, "Ah, thin, sure he is a darlint; sorra a one like him in the country; and sure it's an angel he'd be all out, but for that fault he has." It certainly is marvellous how our intimates discover and publish our faults, oiling their observations with "what a pity!" Reddy's fault was, in a word, a superabundance of conceit—real personal vanity. When he was a little boy, he used to dress his hair in every tub of water that came in his way; and when he grew up "a slip of a boy," his first pocket-money purchased—a looking-glass.

Reddy was intolerably vain; he thought himself the handsomest "boy" in the barony; and more than that, he had the impudence to declare that no woman could refuse him! I must confess that the country girls had, if not sown, cultivated this vanity to a very considerable extent; they paid him a great deal too much attention, which is any thing but good for men in general; and the consequence was, that Reddy considered himself very much as a sort of Irish grand sultan, who had nothing to do but throw his handkerchief upon the favoured fair one; and be she who she might, she would rejoice to become his bride!

"Ah, thin, Reddy dear!" exclaimed his mother one Sunday morning, when Reddy had, even in her opinion, taken a very long time to dress for mass—"Ah, thin, Reddy dear, what ails the shoes?"

"Mother dear, it's boots that's in it; and I'm thinking they'll wrinkle on the instep."

"Well, dear, why are you faulting them so? Sure they're mighty slim and purty to look at; and the only wonder I have, is how ye ever got yer feet into them. Oh, thin, what would yer father say to see ye turning out on the road in single soles, without so much as a sparable in the heel. Oh, my! why, thin, Reddy, you have a mighty purty fut, God bless it!"

"Well, mother, it's nate, I don't deny it," he answered, elevating his foot and viewing it in every position; "I never go out on the floor* without seeing the notice that's taken of it, especially in heel and toe; that's the step to show the shape to advantage—whoop!"

And Reddy cut a caper, while his mother said, "Aisy, Reddy; it's time enough to begin that sort of *discurshin* after mass. That's a mighty purty handkerchief ye've got about yer neck, dear; they do be saying you don't close up yer throat because it's so handsome; ye always had a mighty clanc† skin."

Reddy showed his teeth at the compliment.

"Darling boy, yer hair is a thrifle too long; I'll cut it the morrow morning if you like."

"Mother," answered Reddy, somewhat indignantly, "ye may dock all the children in the parish, but ye shan't *masacree* my curls any more. Ye spoilt me intirely last fair-day."

"Well, dear," answered the mother, who was perfectly conscious of her son's weakness, though she encouraged it, "there's the bowl dish I always put on yer father's head when I cut his hair, that I might trim it all round, even; one would have thought the dish made on his head, it fitted so beautiful: that was when first we war married; but, bedad! after a fair or a faction fight, the knocks would grow up, and grow out, and push it up—I always allowed for them in the cutting—and he never said—not he (the heavens be his bed!) 'Nell, it's not to my liking.' He was as handsome to the full as you, Reddy, *arick!* but never took as much pride out of himself as you do. Now, don't put a frown upon *your joy of a face* to your ould mother, my son. The times are changed now, and the young men think more of themselves than they used—times and fashions do change, *agra!* Sure I mind the mistress at the big house riding to church on a pillion behind the coachman, in a green joseph, a goold watch as big as your fist, and a beautiful beaver and feathers—jog jump! jog jump! all along the road. And then of a week day, my darlint! to see her up before the maids in the morning at day-break, and rowling out the pasthry for company, and clearing jelly!—that was her glory. And now, why, the ladies rides in coaches, and leaves word with the maids to get up, and orders the pasthry, and faults the jelly,

arick machree! There's not the heartiness in the counthry of the good ould times; we're fading from sun-bames into moonbames: *that's* what ails us!"

"Am I a moonbame, mother?" inquired the son, with an insinuating look.

"A moonbame, *arick!* Ah, thin, no; that you aint. You're a flash-o'-lightning-boy—oh! that's what you are. And if you do take a taste of pride out of yerself, *who* has a better right, and all the counthry putting it into you?"

Reddy perfectly agreed with his mother, and after giving her a hearty kiss, as it was yet too early for second and too late for first prayers, he thought he would open his heart to her, as he had long intended to do.

"Ah, thin, mother darlint, will ye listen to us for a few minutes, and give us yer advice, which we want at this present time intirely, ye see."

"Why, thin, I will, to be sure, and pray the Lord to put sense into me for that same; for a mother's counsel comes oftener from the heart than from the head. What is it, *arick?*"

"How ould was my father whin he married?"

"Why, thin, not all out twenty-one."

"And I'm twenty-five next Martinmas, please God. Mother, that's a shame."

"That the Lord has given ye so many years, is it?" said the widow, with great *naireté*.

"Dear! how innocent ye are all of a sudden, mother! No, but that I didn't do as my father did before me."

"Ah, thin, no one can reproach ye with that same, *arounneen*; not many a fair in the country but knows the face and the figure of Reddy Ryland to be the same as his father's—and sorra a purty girl that ye havn't made love to, ever since ye counted—Oh, my grief! why, Reddy, you made love to purty Peggy Garvey before you war turned thirteen—that was kind father for ye, any way."

"Mother, now lave off make-believing *innocence*; sure ye know very well what I mane—is it time I was—married?"

His mother gave a very admirable start of astonishment, and, after a pause, said, "Well! it's only natural, and so—why!—sure my darling boy has only to ax and have, only to pick the counthry! Ah, thin, Reddy, why don't ye make up yer mind to Ellen Rossiter! It's her people, every one of them, that has the warm house and the warm heart."

"Mother, I've nothing to say against the girl, only I'd be affard her head would set the house on fire. Now, mother, that's enough. I never could abide red hair."

"It's only auburn, my son; and, sure, after a few years it will be the colour of mine, white like the first snow; beauty's but skin deep, though its memory is pleasant when it does fade. Well, there, I'm done; I'll say no more about her. What do ye think of Miss Kitty Blackney?"

"She's short, mother, all out too short, mother."

"Let her stand on her *purse*, Reddy dear," replied the mother; "let her stand on *that*, and she'll be even with Squire Baine's tall poplar tree! Maybe Miss Kitty hasn't a *purse*! Oh, thin, it's yerself that's hard to be plased; I'll say no more about her, though it's yellow goold she'd give ye to ate, if she had ye. Well, maybe, Mary Murphy is long enough to plase ye?"

"The *stalking coragah!* She is long enough, but her family's not long. I must have *blood, bone, and beauty*, and that's the thruth, and I'll never marry without it, never throw myself away—that's what I wont do. I'll show the counthry what a wife ought to

* A favourite Irish step (not known in quadrilles).

* Dance.

† Fair.

be. I'll not marry a girl to be ashamed of her people. I'll not marry a poplar nor a furze bush. I'll not marry for money, nor all out pride, nor all out love, only a little of both. I'd like a girl, ye see, that would be proud of her husband, particularly when we'd be both in our Sunday clothes. I'll never marry a girl that hasn't sunshine in every bit of her face."

"And in her temper, too, I hope; a good temper is a cordial to a man's heart. It's the nurse of sorrow—the medicine of sickness—the *vine at a poor man's table*. Whatever ye do, *arick*, watch the temper."

"I don't think," said Reddy, looking at himself in the glass that hung from a nail in the dresser; "I don't think any woman could be ill tempered with me."

"The heavens never shone on a better boy, that's thrue; but for all that, some women is mighty ingenuous. But, Reddy, don't marry a girl that's altogether without money; it's a mighty *surety* thing in a house; but don't marry altogether for it."

"Trust me, mother dear; but is there no one else you could think of?"

"Sorra one; unless it be the Flower of Loughgully, and —"

"Don't name *her*, mother dear, if you please," said Reddy, turning away his face. "I'll not deny that I thought on't a dale of Kathleen O'Brien, a great dale; but nobody ever thought as much of her as she did of herself, and so —"

"She didn't dare refuse *you*?" observed Mrs Ryland indignantly.

"No, no, not *that*; but *she* laughed at *me*; and I wonder at *ye*, mother, to name the Flower of Loughgully to *me*. Ye just did it to get a rize out of *me*, that's all; but don't do it again, mother. I'll show *her*, before a month is over her raven hair, that she bands so neat; before another month has made us all nearer to eternity, I'll show *her* the sort of wife Reddy Ryland can get. I'll —," he paused, overcome by contending feelings to which his mother had no clue; and then, while she thought over his words, he added, with his usual gaiety of manner, "I've made up my mind to go to Kilkenny next week, where I've heard of one from my cousin to suit *me*; and, maybe, I won't bring *ye* a daughter, mother. There's not a girl in this country fit for *that*, mother," and he looked, not at his mother, but at himself; "not one. And now God be with *ye*! I've made up my mind to be married, and now I've told *you*. I'll punish the hearts of the girls—of the girl, any way, that — But God be with *ye*, mother; I must not lose mass," and off he bounded, leaving his mother to recall, and cogitate, over the old adage of the more haste the worse speed.

"If," said she, "after all, he should marry out of spite to the Flower of Loughgully, what might come of it? I named *her* last, to see if he would speak of *her*, but he did not; and yet I'm sure his heart turned to *her* above all others, though he'd never *give in* to *her*, nor *she* to him—*she* has such a spirit! And sometimes, I think, I make too much of my boy, but I can't help it. His face, so handsome, so like his father's; and his voice, when he calls me in the morning, or blesses me at night, I often think my own darling is with me again! Pray the Almighty," said the widow, after a long pause, and clasping her hands, "pray the Almighty, that, after having had the pick of the country, *he* don't take the crooked stick at last!"

Now, it so happened that the widow Ryland did every thing in her power to prevent her son's visit to Kilkenny; but she had not accustomed him to contradiction, and he would go, and he did go; and the neighbours said Reddy Ryland was gone to Kilkenny to bring home a wife; and when Kathleen O'Brien, the Flower of Loughgully, heard that, she wept bitterly, for she had calculated on the influence of her own beauty over the heart of her lover, having altogether forgotten how completely Reddy was absorbed in the contemplation of his own perfections. A woman never can have much power over a vain man.

Three weeks elapsed, and Reddy returned to his home, and his foot and eye were both heavy; the elasticity had departed from the one, and the brightness from the other. His mother pressed him to her bosom, and his neighbours crowded to welcome his arrival. Many a hand was extended; and "sure we'll have some fun now ye're come back," said one. "Ah, thin, it was a quare wake Andy Magaveney had, poor man; the pipes weren't half smoked, and the dancing not worth a farthing, 'cause *ye* warn't in it," said another. "Sure ye never saw a gayer boy than *yourself*, Reddy, since ye left it," exclaimed a third. "Well, he's with us again, any how. But, Reddy, *where's* the Kilkenny lady *you* was to bring to show us the fashions?" inquired a fourth.

Reddy laughed, and turned off the question, and called for some whisky to treat his friends. His mother observed he made his punch double its usual strength; and, as she said afterwards, an "impression" came over her heart "like the hand o' death," for she saw something was wrong, and she sat looking at her son with tears in her eyes; even when their friends were gone, she had not courage to ask him if he was married; but Reddy walked to the table after he had shut the door, and, filling out a great glass of whisky, drank it off, and then said,

"Mother, wish me joy. Joy, joy, mother! I'm married!"

"Oh, Reddy, it isn't possible that's thrue—without ever consulting *yer* mother, or letting *her* see *yer* choice!"

"It's as thrue, mother—as bad luck."

"Oh, Reddy, my own son, has *she* 'the blood' *you* talked about? Is *she* of an ancient family all out?"

"Mother," answered Reddy, after a pause, "it's not aisy to get every thing."

"Oh, wisha! if ye'd thought of that before, ye need not have gone to Kilkenny for a wife. Well, I dare say *she's* a fine figure of a woman. *She* has *bone*, any how?"

"None to spare," said the hard-to-be-pleased-gentleman; "however, *she's* my wife."

"And a beauty?" added the mother; "I'm sure, sartin sure, *she* has beauty?"

"The devil as much as would fit on the top of a grasshopper's toe," replied her son impetuously.

"Not blood, nor bone, nor beauty! Well, maybe *she* has better materials than any of them to make a good wife. *She* was your cousin's recommending, and he knew how much *you* wanted a girl to set a pattern to the country."

"*She* was *not* my cousin's recommending, mother; but somehow *she's* a very town-bred woman, and took a wonderful liking to *me*."

"A good education's a fine thing," said Mrs Ryland, almost weeping, for, like all the Irish, she laid great value on the qualities Reddy had confessed *she* did not possess; but *she* was a gentle-hearted woman, and desired, in her simple wisdom, to make the best of every thing—no bad wisdom either.

"It is, mother," sighed the bridegroom.

"But what has *she* besides the education, Reddy?" inquired his mother, seeing that her beloved son sat moodily with his hands clasped resting on the table, and his chin fixed upon them. "What has *she* besides the education?"

"Two small children," was Reddy's reply.

"Oh, Reddy, Reddy, is that the end of *ye*!" exclaimed his distracted mother; "you, the pride of the county—the beauty of the parish, that might have had the pick of the whole county for a wife!—you who was thought so much of, and who thought so much of *yourself*!"

"You're right, mother!" interrupted Reddy; "*that* last did it. If it hadn't been for that, I might have been content with — But no matter—it's all over now. *She* was a widow, mother; and *I* was so sure *not* to be caught by a widow, that I took no heed. I persuaded *her* to stop half way, and that I'd take the car for *her*."

"And the children?" added his mother. "And the same car can take *me* out of this; two widows are too much for any man's house. Oh, Reddy, Reddy, to think of this! to think of this! how *you* war taken in! How was it?"

But Reddy would not tell; the affair was a mystery. His old mother was broken-hearted; she refused to remain in his house, though somewhat comforted by the information that the bride was rich, though red haired; and at last, unable to withstand the strong entreaties of her son, she agreed to receive her before *she* departed. The next day was one of mingled curiosity and lamentation amongst the female population of the neighbourhood, while the men agreed, with something like satisfaction, that "the shine" was now taken out of handsome, loving, rousing, fighting, dancing, singing, good-natured Reddy Ryland. If "the shine," as they called it, was taken out of Reddy by the mere "report," how much more was he either to be pitied or exulted over when the bride made her appearance! His poor mother could not support it. Of all the crooked sticks, *she* was the most crooked that had ever been seen. How the married men laughed and talked of bachelors' wives, and how the young men tittered, and the young girls peeped from under their hoods at the broad, bold, ruddy-faced—was that his choice, indeed! No sunshine in her face; and such a tongue! In less than two months every body sympathized with the young farmer: his vanity was punished. He was fading into a shadow, and certainly his feelings were not soothed by an incident, which is nothing to tell, but a great deal to feel. He met Kathleen O'Brien one morning at the turn of a particular lane, where he had often met her before. *She* did not recognise him at first, but his voice. "Kathleen, we may be friends, Kathleen—you *will* not laugh at *me* now—it was that did it, Kathleen—that: my pride could not bear it; but I'm punished. I've had the fall which they say follows pride. Went you spake! Sure the whole country sees 'the shine' is taken out of Reddy Ryland." Went ye bid God bless *me*? I've need of a blessing, Kathleen. I own I did it to vex *ye*. Went ye forgive *me*?"

Kathleen, the Flower of Loughgully, could not speak the forgiveness that came to her lips, but turned away from her old lover to hide her tears.

Unvirtuous love—if love it may be called—is almost unknown in Irish peasant life. Reddy was glad no one had seen him speak to Kathleen; he loved her fame quite as much as he had once loved herself.

Mrs Reddy was, every one knew, a regular virago. What *she* had been, people only guessed; but *she* said her husband had been drowned at sea.

No wealth had been added to Reddy's store; that was very evident: and things appeared going to ruin—the old story where there is no affection—when suddenly a stranger stood at the threshold of Reddy Ryland's house, and inquired for his wife.

"*She's* within, honest man," said the young farmer.

"But you're not Reddy Ryland?" said the traveller.

"I was," was the reply.

"But I heard he was a fine, slashing, handsome, rollicking boy," persisted the stranger, who looked and spoke like a sailor.

"I wish to God I had never heard it," observed Reddy.

"Well, certainly Poll would take the shine out of any thing, from a new shilling upwards, if *you* are the Reddy Ryland I heard tell of," persisted the man, looking at him from head to foot.

"And who are *you*?" inquired Reddy.

"Who am I? Why, I'm Poll's husband; and don't be afraid—all I want is my children. I'll make *you* a present of *her*, and welcome. *She* thought me dead; and, by the powers! such a lass as that deserves credit!"

"For what?" inquired the delighted Reddy.

"For having the art, *d'ye* see, to catch two such beautiful boys as our two selves."

Reddy Ryland was in no degree disposed to accept the present so liberally offered. He was both laughed at and congratulated by his neighbours. His mother returned, but he never allowed her to utter a word in his praise. "I'll never heed a flattering tongue again," he would say; "I've had enough of *that*." A little longer, and Kathleen herself took pity on him. And again he returned to his former self: in every respect but one he was exactly the same. He confessed that "the widow," as he always called her, had got at his weak side, flattered his vanity, and thus accomplished her purpose. "The shine," in truth, was "taken out of him," but the substance remained; and Reddy Ryland, a handsome Irish peasant, is at this moment a *rara avis*—a vain man cured!

BEET-ROOT SUGAR.

BEET (*beta vulgaris* of the botanists) has been long known as a valuable esculent root. It grows wild in several of the warmer districts of the European continent, and, in other quarters, is procured only by cultivation in gardens. There are two principal varieties of it, one possessing a root of a deep red or purplish colour, which pervades its whole substance, while the other variety, though covered with a red skin, is white in the interior. The red beet is so familiar as a culinary vegetable, that its appearance scarcely requires to be described. Varying in length from two or three inches to a foot, and in diameter from one to three inches, the root is full of a purplish juice, which it yields freely on being cut. Though rather insipid to the taste, the red beet is often eaten pickled at table, and contains a very considerable quantity of saccharine matter, amounting, according to Sir Humphry Davy, to about twelve per cent. of its whole weight.

The white beet, again, is a coarser variety of the plant, and is seldom or never directly used as an article of human food; yet its hardy character, and the comparative ease attending its cultivation, have elevated it into a degree of importance far exceeding that which has any where fallen to the share of the red variety. The existence of a certain portion of sugar in the white beet seems originally to have been discovered by a Prussian chemist, named Margraff, in the year 1747, but although the discovery was published, no practical application of it was attempted till forty years later. At that time another Prussian chemist entered on a new set of experiments, and arrived at such satisfactory results, in his own estimation, that he proclaimed the beet to be the "best and greatest gift of heaven to man," and declared it capable of yielding, not sugar alone, but rum, vinegar, and even tobacco, in abundance. The assertions of this visionary philosopher attracted some attention, and the Institute of France, instigated by peculiar circumstances in the political condition of their country, appointed a committee of their body, in 1800, for the special purpose of inquiring into the subject. The result was in discordance with the conclusions of the Prussian. It was determined by the committee that there appeared no good reason for anticipating any advantage from the establishment of a sugar-manufacture from beet. Nine years later, however, the attention of the French men of science was again called to the matter, by political considerations of a still more pressing character. Napoleon issued at that period his famous Milan decrees, by certain articles of which his subjects were prevented from purchasing the West Indian produce. Quite aware, at the same time, of the necessity of procuring supplies of so important an article as sugar from some quarter or another, he instituted a new inquiry into the practicability of making it from beet-root. It was the imperial will on this occasion that the thing should appear possible, and the subservient *scarcely* determined it to be so. The active genius of the emperor accordingly set manufactories of beet-root sugar at work, in a very short time, over the whole kingdom. The consequence was, that the French were supplied with sugar, but only in limited quantities, and at very high prices. There was no competition, and no impost, so that the manufacturers took to themselves very large profits. This state of things came suddenly to a close in the year 1814, when the restoration of peace opened the markets once more to foreign sugars. But on the plea of protecting the French colonial sugars against the dangerous rivalry of those from British colonies, which could be brought

in at a cheaper rate, a high protecting and equalising duty was imposed in 1816 on all foreign sugars, and in 1822 this duty was largely increased. These impositions caused the immediate revival of the beet-root trade, which had been almost stopped by the changes of 1814. From 1822, nearly to the present time, the trade in question has been allowed to continue in this position, and has prospered, although only, it is too obvious, in consequence of the protecting duties, and with the effect of entailing a high price on the sugars used in France.

Before alluding to the amount of beet-root sugar now manufactured in France, it may be proper to expend a few words on the mode in which the manufacture is conducted. The roots are boiled as soon as they are taken from the earth, and, when cold, are sliced, and the juice pressed out. The whole of the juice is then evaporated to the consistence of syrup, from which the sugar is subsequently obtained by crystallisation. From 110 pounds of the roots, it is understood, about 41½ pounds of juice are procured, and this again yields 4½ pounds of brown sugar, or, by renewed crystallisation, 4 pounds of white or refined sugar. These points, however, will vary considerably with the quality of the beet-crop, and other circumstances.

We have now before us a number of documents relating to the state of the beet-root sugar manufacture in the year 1837, at which period the subject excited great interest in France. In 1836, it would appear that the beet-root, cultivated for manufacturing purposes, occupied a pretty large proportion of the arable lands of the country, and amounted in all to about 1,012,770,589 kilogrammes in weight—roots only, of course, being taken into account. (A kilogramme is equal to 2 pounds, 2 ounces, 4 drachms, and 16 grains, English avoirdupois.) The amount of sugar extracted from this quantity of roots was 30,349,340 kilogrammes. This was an amount of produce exceeding that of the preceding year by not less than 17,119,129 kilogrammes, the whole produce of 1835 being 13,230,211. The produce of 1835 showed an increase, in turn, to the amount of nearly 6,000,000 of kilogrammes over that of the year 1834. In the mean time, the importation of foreign sugars into France, whether from its own colonies, or from those of other countries, was sustaining a regular declension.

The following numbers give a proportionate view of the sugar-consumption for the years 1834, 1835, and 1836.

	1834.	1835.	1836.
French colonial sugars . . .	854	798	632
Foreign do. do.	55	40	11
Beet-root or indigenous sugars . .	91	162	337

Had this increase in the produce of the indigenous sugar been of a natural and advantageous description, the result would have been the reduction of price to the consumers. But this was not the case. While, in consequence of the high duty laid on imported sugars, the beet-root manufacture was enabled so far to occupy and fill the market as deeply to injure the external trading, the expenses attending its production were too great to enable it ever to be the source of a full supply of cheap sugar to the country. By comparing the consumption of sugar in France with that of other countries, it will be seen how imperfect is the supply of the article in the existing state of the trade. In Britain, each individual consumes about 12½ kilogrammes of sugar. In France, the consumption by each person does not (or did not in 1836) exceed 3 kilogrammes. The people of the United States use 9½ kilogrammes to each individual, and even Spain exceeds France in this respect, having 3½ kilogrammes for every inhabitant of its territories. In short, with the exception, we believe, of Ireland, France is worse supplied with sugar than any country in Europe.

The attention of the government and people of France was strongly turned to these circumstances in the course of the year 1837. It appeared but too obvious that the duties on colonial sugar, while they acted as a direct bounty upon the beet-root manufacture, were gradually injuring the colonies of the country in a vital branch of their trade, without counterbalancing the evil by lowering the price of sugar, or increasing materially the supply. The Chambers took the subject into consideration, and the result was, that, after a degree of opposition which showed the trade to be a most profitable one to the parties concerned in it, a law was passed in June 1837, by which certain duties were imposed on the beet-root manufacture, by way of bringing it to a footing of greater equality with the colonial trade. The principal items in this imposition of taxes were the following:—A fifty franc licence (about £2) to be paid by every manufacturer, as in the case of wine and spirit selling; a tax of fifteen francs on every 100 kilogrammes of sugar, brown or white; and of eighteen francs on every 100 kilogrammes of the highly refined sugar. The party supporting the indigenous sugar-trade in the Chambers, on the plea that time would be required to permit agriculturists to withdraw safely from the cultivation of the beet-root (for such, they said, would be the consequence of the new decrees), got an amendment passed, fixing July 1838 as the period when the law was to come into force, and decreeing that only two-thirds of the impost should be levied during the first year.

In July, therefore, of the present year (1839), the full weight of the impost will have been felt for the first time by the beet-root manufacturers. Though the taxes are by no means very heavy, there can be little

doubt that a check will be given to the trade, which had never hitherto stood a fair trial, enjoying, as it did, a total and most unnatural exemption from all burdens, while the avenues to competition were perfectly closed up by duties. The country seems to be opening its eyes to the folly of forcing a trade by such means, at the expense of the whole community, and to the direct injury of other interests. One would have thought, however, that a better way of improving the condition of the French sugar-trade would have been to lower the duties on imported sugar; but this mode might not be compatible with the financial requirements of the country. The duties in question, as already stated, are enormously high, ninety-five francs being levied, by the terms of the law of 1822, on every 100 kilogrammes. If the beet-root trade, with a corresponding tax of only fifteen or eighteen francs, cannot compete with the colonial manufacture, the French cannot surely persist much longer in their cultivation of this plant for the making of sugar. Such conduct might justly be termed a direct contravention of the designs of nature, which has to all appearance allotted the task of producing sugar to warmer climes, and on these has bestowed for the purpose certain vegetables, from which the desired substance exudes abundantly.

We have no intention here of entering on the subject of political economy, but we may be permitted to express a general opinion on the absurdity and folly of endeavouring in any case, by conventional laws, to cause a cold district of the earth to serve the assigned end of a warm one, and to compel one vegetable to answer a purpose inconsistent with the qualities specially implanted in it. Being unnatural, all such endeavours must ultimately fail in their object, and the prosecution of them must be attended with continual and great disadvantages.

In Prussia, the beet-root sugar manufacture has been tried, and with similar results. It appears, from the experiments made there, that the establishments for making it could barely extract from the business enough of revenue to pay the expenses of manufacture; and there, at least, the government was not foolish enough to bolster up the trade by duties and protections. In conclusion, it may be safely re-asserted that all past experience goes to prove the beet-root totally unsuited, under ordinary circumstances, for the production of sugar in Europe, and we hope that in Britain the attempt to establish such a manufacture, which has sometimes been thought of, will never be made.

MOCHA DICK,

OR THE WHITE WHALE OF THE PACIFIC.

[Abridged from the Knickerbocker, or New York Monthly Magazine, where it appeared in May 1838. Mocha, from which the whale takes its name, is a small island off the coast of Chili, in latitude 38 degrees 28 minutes south. The story of the conquest of Mocha Dick is narrated by an intrepid American "whaler," on board a whale vessel in the Pacific; but before entering into the particulars of this triumph, the author gives a preliminary account of this famed monster of the deep.]

MOCHA DICK, who had come off victorious in a hundred fights with his pursuers, was an old bull whale, of prodigious size and strength. From the effect of age, or more probably from a freak of nature, as exhibited in the case of the Ethiopian Albino, a singular consequence had resulted—he was white as wool! Instead of projecting his spout obliquely forward, and puffing with a short convulsive effort, accompanied by a snorting noise, as usual with his species, he flung the water from his nose in a lofty perpendicular expanded volume, at regular and somewhat distant intervals; its expulsion producing a continuous roar, like that of vapour struggling from the safety-valve of a powerful steam-engine. Viewed from a distance, the practised eye of the sailor only could decide, that the moving mass which constituted this enormous animal, was not a white cloud sailing along the horizon. On the spermaceti whale, barnacles are rarely discovered; but upon the head of this *lusus nature* they had clustered, until it became absolutely rugged with the shells. In short, regard him as you would, he was a most extraordinary fish; or, in the vernacular of Nantucket, "a genuine old sog" of the first water.

Opinions differ as to the time of his discovery. It is settled, however, that previous to the year 1810, he had been seen and attacked near the island of Mocha. Numerous boats are known to have been shattered by his immense flukes, or ground to pieces in the crush of his powerful jaws; and it is said that on one occasion he came off victorious from a conflict with the crews of three English whalers, striking fiercely at the last of the retreating boats, at the moment it was rising from the water, in its hoist up to the ship's davits. It must not be supposed, however, that through all this desperate warfare our leviathan passed scathless. A back serried with irons, and from fifty to a hundred yards of line trailing in his wake, sufficiently attested, that though unconquered, he had not proved invulnerable. From the period of Dick's first appearance, his celebrity continued to increase, until his name seemed naturally to mingle with the salutations which whalemens were in the habit of exchanging, in their encounters upon the broad Pacific; the customary interrogatories almost always closing with, "Any news from Mocha Dick?" Indeed, nearly every whaling captain who rounded Cape Horn, if he possessed any professional ambition, or valued himself on his

skill in subduing the monarch of the seas, would lay his vessel along the coast, in the hope of having an opportunity to try the muscle of this doughty champion, who was never known to shun his assailants. It was remarked, nevertheless, that the old fellow seemed particularly careful as to the portion of his body which he exposed to the approach of the boat-steerer; generally presenting, by some well-timed manœuvre, his back to the harpooner, and dexterously evading every attempt to plant an iron under his fin, or a spade on his "small." Though naturally fierce, it was not customary with Dick, while unmolested, to betray a malicious disposition. On the contrary, he would sometimes pass quietly round a vessel, and occasionally swim lazily and harmlessly among the boats, when armed with full craft for the destruction of his race. But this forbearance gained him little credit; for if no other cause of accusation remained to them, his foes would swear they saw a lurking devilry in the long careless sweep of his flukes. Be this as it may, nothing is more certain than that all indifference vanished with the first prick of the harpoon; while cutting the line, and a hasty retreat to their vessel, were frequently the only means of escape from destruction left to his discomfited assailants.

"I will not weary you," said the whaler, "with the uninteresting particulars of a voyage to Cape Horn. Our vessel, as capital a ship as ever left the little island of Nantucket, was finely manned and commanded, as well as thoroughly provided with every requisite for the peculiar service in which she was engaged. I may here observe, for the information of such among you as are not familiar with these things, that soon after a whale-ship from the United States is fairly at sea, the men are summoned aft; then boats' crews are selected by the captain and first mate, and a ship-keeper, at the same time, is usually chosen. The place to be filled by this individual is an important one, and the person designated should be a careful and sagacious man. His duty is, more particularly, to superintend the vessel while the boats are away in chase of fish; and at these times the cook and steward are perhaps his only crew. His station, on these occasions, is at the mast-head, except when he is wanted below to assist in working the ship. While aloft, he is to look out for whales, and also to keep a strict and tireless eye upon the absentees, in order to render them immediate assistance should emergency require it. Should the game rise to windward of their pursuers, and they be too distant to observe personal signs, he must run down the jib. If they rise to leeward, he should haul up the spanker; continuing the little black signal-flag at the mast so long as they remain on the surface. When the 'school' turn flukes, and go down, the flag is to be struck, and again displayed when they are seen to ascend. When circumstances occur which require the return of the captain on board, the colours are to be hoisted at the mizen peak. A ship-keeper must further be sure that provisions are ready for the men on their return from the chase, and that drink be amply furnished, in the form of a bucket of 'switchel'."

I have already said that little of interest occurred, until after we had doubled Cape Horn. We were now standing in upon the coast of Chili, before a gentle breeze from the south, that bore us along almost imperceptibly. It was a quiet and beautiful evening, and the sea glanced and glistened in the level rays of the descending sun, with a surface of waving gold. The western sky was flooded with amber light, in the midst of which, like so many islands, floated immense clouds, of every conceivable brilliant dye; while far to the north-east, looming darkly against a paler heaven, rose the conical peak of Mocha. The men were busily employed in sharpening their harpoons, spades, and lances, for the expected fight. The look-out at the mast-head, with cheek on his shoulder, was dreaming of the dangers he had passed, instead of keeping watch for those which were to come; while the captain paced the quarter-deck with long and hasty stride, scanning the ocean in every direction, with a keen, expectant eye. All at once he stopped, fixed his gaze intently for an instant on some object to leeward, that seemed to attract it, and then, in no very conciliating tone, hailed the mast-head: "Both ports shut!" he exclaimed, looking aloft, and pointing backward, where a long white bushy spout was rising, about a mile off the larboard bow, against the glowing horizon. "Both ports shut," I say, "you leaden-eyed lubber! Nice lazy son of a sea-cook you are, for a look-out! Come down, sir!"

"There she blows!—sperm whale—old sog, sir," said the man, in a deprecatory tone, as he descended from his nest in the air. It was at once seen that the creature was companionless; but as a lone whale is generally an old bull, and of unusual size and ferocity, more than ordinary sport was anticipated, while unquestionably more than ordinary honour was to be won from its successful issue.

The second mate and I were ordered to make ready for pursuit; and now commenced a scene of emulation and excitement, of which the most vivid description would convey but an imperfect outline, unless you have been a spectator or an actor on a similar occasion. Line-tubs, water-kegs, and wade-poles, were thrown hurriedly into the boats; the irons were placed in the racks, and the necessary evolutions of the ship gone through, with a quickness almost magical; and this, too, amidst what to a landsman would have seemed inextricable confusion, with perfect regularity and precision; the commands of the officers being all but forestalled by the enthusiastic eagerness of the men. In a short time we were as near the object of our chase as it was considered prudent to approach.

"Back the main-top-s'l!" shouted the captain. "There she blows! there she blows! there she blows!" cried the look-out, who had taken the place of his sleepy shipmate, raising the pitch of his voice with each announcement, until it amounted to a downright yell. "Right ahead, sir!—spout as long an 's thick as the main-yard!" "Stand by to lower!" exclaimed the captain; "all

hands, cook, steward, cooper, every one of ye, stand by to lower!"

An instantaneous rush from all quarters of the vessel answered this appeal, and every man was at his station almost before the last word had passed the lips of the skipper.

"Lower away!" and in a moment the keels splashed in the water. "Follow down the crews: jump in, my boys; ship the crotch; line your oars; now pull as if the d—l was in your wake!" were the successive orders as the men slipped down the ship's side, took their places in the boats, and began to give way.

The second mate had a little the advantage of me in starting. The stern of his boat grated against the bows of mine at the instant I grasped my steering-oar and gave the word to shove off. One sweep of my arm, and we sprang foaming in his track. Now came the tug of war. To become a first-rate oarsman, you must understand, requires a natural gift. My crew were not wanting in the proper qualification; every mother's son of them pulled as if he had been born with an oar in his hand; and as they stretched every sinew for the glory of darting the first iron, it did my heart good to see the boys spring. At every stroke the tough blades bent like willow wands, and quivered like tempered steel in the warm sunlight, as they sprang forward from the retreating wave. At the distance of half a mile, and directly before us, lay the object of our emulation and ambition, heaving his huge bulk in unwieldy gambols, as though totally unconscious of our approach.

"There he blows!" An old bull, by Jupiter! Eighty barrels, boys, waiting to be towed alongside! Long and quick—shoot ahead! Now she feels it; waist-boat never could beat us; now she feels the touch! now she walks through it! Again—now! Such were the broken exclamations and adjurations with which I cheered my rowers to their toil, as, with renewed vigour, I plied my long steering-oar. In another moment we were alongside our competitor. The shivering blades flashed forward and backward, like sparks of light. The waters boiled under our prow, and the trenched waves closed, hissing and whirling in our wake, as we swept, I might almost say were *lifted*, onward in our arrowy course.

We were coming down upon our fish, and could hear the roar of his spouting above the rush of the sea, when my boat began to take the lead.

"Now, my fine fellows," I exclaimed, in triumph, "now we'll show them our stern—only spring! Stand ready, harpooner, but don't dart, till I give the word."

"Carry me on, and his name's Dennis!" cried the boat-steerer, in a confident tone. We were perhaps a hundred feet in advance of the waist-boat, and within fifty of the whale, about an inch of whose hump only was to be seen above the water, when, heaving slowly into view a pair of flukes some eighteen feet in width, he went down. The men lay on their oars. "There he blows again!" cried the tub-oarsman, as a lofty perpendicular spout sprang into the air, a few furlongs away on the starboard side. Presuming, from his previous movement, that the old fellow had been 'gallied' by other boats, and might probably be jealous of our purpose, I was about ordering the men to pull away as softly and silently as possible, when we received fearful intimation that he had no intention of baulking our inclination, or even yielding us the honour of the first attack. Lashing the sea with his enormous tail, until he threw about him a cloud of surf and spray, he came down, at full speed, 'jaws on,' with the determination, apparently, of doing battle in earnest. As he drew near, with his long curved back looming occasionally above the surface of the billows, we perceived that it was *white as the surf around him*; and the men stared aghast at each other, as they uttered, in a suppressed tone, the terrible name of MOCHA DICK!

"Mocha Dick!" said I; "this boat never sheers off from any thing that wears the shape of a whale. Pull easy; just give her way enough to steer." As the creature approached, he somewhat abated his frenzied speed, and, at the distance of a cable's length, changed his course to a sharp angle with our own.

"Here he comes!" I exclaimed. "Stand up, harpooner! Don't be hasty—don't be hurried. Hold your iron higher, firmer. Now!" I shouted, as I brought our bows within a boat's length of the immense mass which was wallowing heavily by. "Now!—give it to him solid!"

But the leviathan plunged on, unharmed. The young harpooner, though ordinarily as fearless as a lion, had imbibed a sort of superstitious dread of Mocha Dick, from the exaggerated stories of that prodigy, which he had heard from his comrades. He regarded him, as he had heard him described in many a tough yarn during the middle watch, rather as some ferocious fiend of the deep, than a regular built, legitimate whale! Judge then of his trepidation, on beholding a creature, answering the wildest dreams of his fancy, and sufficiently formidable, without any superadded terrors, bearing down upon him with thrashing flukes and distended jaws! He stood crest, it cannot be denied. He planted his foot—he grasped the coil—he poised his weapon. But his knee shook, and his sinewy arm wavered. The shaft was hurled, but with unsteady aim. It just grazed the back of the monster, glanced off, and darted into the sea beyond. A second, still more abortive, fell short of the mark. The giant animal swept on for a few rods, and then, as if in contempt of our fruitless and childish attempt to injure him, flapped a storm of spray in our faces with his broad tail, and dashed far down into the depths of the ocean, leaving our little skiff among the waters where he sank, to spin and duck in the whirlpool.

Night being now at hand, the captain's signal was set for our return to the vessel, and we were soon assembled on her deck, discussing the mischances of the day, and speculating on the prospect of better luck on the morrow.

We were at breakfast next morning, when the watch at the fore-top-gallant head sang out merrily, "There she breaches!" In an instant every one was on his feet. "Where away?" cried the skipper, rushing from the cabin,

and upsetting in his course the steward, who was returning from the caboose with a replenished biggin of hot coffee. 'Not loud but deep' were the grumbings and groans of that functionary, as he rubbed his scalded shins, and danced about in agony; but had they been far louder, they would have been drowned in the tumult of vociferation which answered the announcement from the mast-head.

"Where away?" repeated the captain, as he gained the deck. "Three points off the leeward bow." "How far?" "About a league, sir; heads same as we do. There she blows!" added the man, as he came slowly down the shrouds, with his eyes fixed intently upon the spouting herd. "Keep her off two points! Steady! steady, as she goes!" "Steady it is, sir," answered the helmsman. "Weather braces, a small pull. Loose to—gallant-s'l's! Bear a hand, my boys! Who knows but we may tickle their ribs at this rising?"

The captain had gone aloft, and was giving these orders from the main-to—gallant-cross-trees. "There she top-tails! there she blows!" added he, as, after taking a long look at the sporting shoal, he glided down the back stay. "Sperm whale, and a thundering big school of 'em!" was his reply to the rapid and eager inquiries of the men. "See the lines in the boats," he continued; "get in the craft; swing the cranes!"

By this time the fish had gone down, and every eye was strained to catch the first intimation of their re-appearance.

"There she spouts!" screamed a young greenhorn in the main chains, "close by; a mighty big whale, sir!" "We'll know that better at the trying out, my son," said the third mate, drily. "Back the main-top-s'l!" was now the command. The ship had little headway at the time, and in a few minutes we were as motionless as if lying at anchor.

"Lower away, all hands!" And in a twinkling, and together, the starboard, larboard, and waist-boats, struck the water. Each officer leaped into his own; the crews arranged themselves at their respective stations; the boat-steerers began to adjust their 'craft,' and we left the ship's side in company; the captain, in laconic phrase, bidding us to 'get up and get fast' as quickly as possible.

Away we dashed in the direction of our prey, who were frolicking, if such a term can be applied to their unwieldy motions, on the surface of the waves. Occasionally a huge shapeless body would flounce out of its proper element and fall back with a heavy splash; the effort forming about as ludicrous a caricature of agility, as would the attempt of some overfed alderman to execute the Highland fling.

We were within a hundred rods of the herd, when, as if from a common impulse, or upon some preconcerted signal, they all suddenly disappeared. "Follow me!" I shouted, waving my hand to the men in the other boats; "I see their track under water; they swim fast, but we'll be among them when they rise. Lay back," I continued, addressing myself to my own crew, "back to the thwarts! Spring *hard*! We'll be in the thick of 'em when they come up; only *pull*!"

And they did pull, manfully. After rowing for about a mile, I ordered them to 'lie.' The oars were peaked, and we rose to look out for the first 'noddle-head' that should break water. It was at this time a dead calm. Not a single cloud was passing over the deep blue of the heavens, to vary their boundless transparency, or shadow for a moment the gleaming ocean which they spanned. Within a short distance lay our noble ship, with her idle canvass hanging in drooping festoons from her yards; while she seemed resting on her inverted image, which, distinct and beautiful as its original, was glassed in the smooth expanse beneath. No sound disturbed the general silence, save our own heavy breathings, the low gurgle of the water against the side of the boat, or the noise of flapping wings, as the albatross wheeled sleepily along through the stagnant atmosphere. We had remained quiet for about five minutes, when some dark object was descried ahead, moving on the surface of the sea. It proved to be a small 'calf,' playing in the sunshine.

"Pull up and strike it," said I to the third mate; "it may bring up the old one—perhaps the whole school."

And so it did with a vengeance! The sucker was transpierced, after a short pursuit; but hardly had it made its first agonised plunge, when an enormous cow-whale rose close beside her wounded offspring. Her first endeavour was to take it under her fin, in order to bear it away; and nothing could be more striking than the maternal tenderness she manifested in her exertions to accomplish this object. But the poor thing was dying; and while she vainly tried to induce it to accompany her, it rolled over, and floated dead at her side. Perceiving it to be beyond the reach of her caresses, she turned to wreak her vengeance on its slayers, and made directly for the boat, crashing her vast jaws the while in a paroxysm of rage. Ordering his boat-steerer aft, the mate sprang forward, cut the line loose from the calf, and then snatched from the crotch the remaining iron, which he plunged with his gathered strength into the body of the mother as the boat sheered off to avoid her onset. I saw that the work was well done, but had no time to mark the issue, for at that instant a whale 'breached' at the distance of about a mile from us, on the starboard quarter. The glimpse I caught of the animal in his descent, convinced me that I once more beheld my old acquaintance, Mocha Dick. That falling mass was white as a snow-drift!

One might have supposed the recognition mutual, for no sooner was his vast square head lifted from the sea, than he charged down upon us, scattering the water into spray as he advanced, and leaving a wake of foam a rod in width, from the violent lashing of his flukes.

"He's making for the bloody water!" cried the men, as he cleft his way towards the very spot where the calf had been killed. "Here, harpooner, steer the boat, and let me dart!" I exclaimed, as I leaped into the bows. "May the 'Goneys' eat me if he dodges us *this* time, though he were Beelzebub himself! Pull for the red water!"

As I spoke, the fury of the animal seemed suddenly to die away. He paused in his career, and lay passive on the waves, with his arching back thrown up like the ridge of a mountain. "The old sog's lying to!" I cried, exultingly. "Spring, boys! spring *now*, and we have him! All my clothes, tobacco, every thing I've got, shall be yours, only lay me 'longside that whale before another boat comes up! My *grimky*! what a hump! Only look at the irons in his back! No, don't look—*PULL*! Now, boys, if you care about seeing your sweethearts and wives in old Nantuck!—if you love Yankee-land—if you love me—pull ahead, *wont* ye? Now, then, to the thwarts! Lay back, my boys! I feel ye, my hearties! Give her the touch! Only five seas off! *Not* five seas off! One minute—half a minute more! Softly—no noise! Softly with your oars! That will do."

And as the words were uttered, I raised the harpoon above my head, took a rapid but no less certain aim, and sent it, hissing, deep into his thick white side!

"Stern all! for your lives!" I shouted; for at the instant the steel quivered in his body, the wounded leviathan plunged his head beneath the surface, and, whirling around with great velocity, smote the sea violently, with fin and fluke, in a convulsion of rage and pain.

Our little boat flew dancing back from the seething vortex around him, just in season to escape being overwhelmed or crushed. He now started to run. For a short time, the line rasped, smoking, through the chocks. A few turns round the loggerhead then secured it; and with oars a-peak, and bows tilted to the sea, we went leaping onward in the wake of the tethered monster. Vain were all his struggles to break from our hold. The strands were too strong, the barbed iron too deeply fleshed, to give way; so that whether he essayed to dive or breach, or dash madly forward, the frantic creature still felt that he was held in check. At one moment, in impotent rage, he reared his immense blunt head, covered with barnacles, high above the surge; while his jaws fell together with a crash that almost made me shiver; then the upper outline of his vast form was dimly seen, gliding amidst showers of sparkling spray; while streaks of crimson on the white surf that boiled in his track, told that the shaft had been driven home.

By this time the whole 'school' was about us; and spouts from a hundred spiracles, with a roar that almost deafened us, were raining on every side; while in the midst of a vast surface of chafing sea, might be seen the black shapes of the rampant herd, tossing and plunging, like a legion of maddened demons. The second and third mates were in the very centre of this appalling commotion.

At length Dick began to lessen his impetuous speed. "Now, my boys," cried I, "haul me on; wet the line, you second oarsman, as it comes in. Haul away, shipmates! why don't you haul? Leeward side—*leeward*! I tell you! Don't you know how to approach a whale?"

The boat brought fairly up upon his broadside as I spoke, and I gave him the lance just under the shoulder blade. With the exception of a slight shudder, which once or twice shook his ponderous frame, Dick lay perfectly quiet upon the water. But suddenly, as though goaded into exertion by some fiercer pang, he started from his lethargy. Making a leap towards the boat, he darted perpendicularly downward, hurling the after oarsman, who was helmsman at the time, ten feet over the quarter, as he struck the long steering-oar in his descent. The unfortunate seaman fell, with his head forward, just upon the flukes of the whale, as he vanished, and was drawn down by the suction of the closing waters, as if he had been a feather. After being carried to a great depth, as we inferred from the time he remained below the surface, he came up, panting and exhausted, and was dragged on board, amidst the hearty congratulations of his comrades.

By this time two hundred fathoms of line had been carried spinning through the chocks, with an impetus that gave back in steam the water cast upon it. Still the gigantic creature bored his way downward, with undiminished speed. Coil after coil went over, and was swallowed up. There remained but three flakes in the tub!

"Cut!" I shouted; "cut quick, or he'll take us down!" But as I spoke, the hissing line flew with trebled velocity through the smoking wood, jerking the knife he was in the act of applying to the heated strands out of the hand of the boat-steerer. The boat rose on end, and her bows were buried in an instant; a hurried ejaculation, at once shriek and prayer, rose to the lips of the bravest, when, unexpected mercy! the whizzing cord lost its tension, and our light bark, half filled with water, fell heavily back on her keel. A tear was in every eye, and I believe every heart bounded with gratitude at this unlooked-for deliverance.

Overpowered by his wounds, and exhausted by his exertions and the enormous pressure of the water above him, the immense creature was compelled to turn once more upward for a fresh supply of air. And upward he came, indeed; shooting twenty feet of his gigantic length above the waves by the impulse of his ascent. He was not disposed to be idle. Hardly had we succeeded in baling out our swamping boat, when he again darted away, as it seemed to me, with renewed energy. For a quarter of a mile we parted the opposing waters as though they had offered no more resistance than air. Our game then abruptly brought to, and lay as if paralysed, his massy frame quivering and twitching as if under the influence of galvanism. I gave the word to haul on; and seizing a boat-spade, as we came near him, drove it twice into his 'small,' no doubt partially disabling him by the vigour and certainty of the blows. Wheeling furiously around, he answered this salutation by making a desperate dash at the boat's quarter. We were so near him, that to escape the shock of his onset by any practicable manœuvre, was impossible. But at the critical moment when we expected to be crushed by the collision, his powers seemed to give way. The fatal lance had reached the seat of life. His strength failed him in his career, and sinking quietly beneath our keel, grazing it as he wallowed along, he rose again a few rods from us, on the side opposite that where he went down.

* A whale's name is "Dennis," when he spouts blood.

'Lay around, my boys, and let us set on him!' I cried, for I saw his spirit was broken at last. But the lance and spade were needless now. The work was done. The dying animal was struggling in a whirlpool of bloody foam, and the ocean far around was tinted with crimson. 'Stern all!' I shouted, as he commenced running impetuously in a circle, beating the water alternately with his head and flukes, and smiting his teeth ferociously into their sockets, with a crashing sound, in the strong spasms of dissolution. 'Stern all! or we shall be stove!'

As I gave the command, a stream of black clotted gore rose in a thick spout above the expiring animal, and fell in a shower around, bedewing, or rather drenching us, with a spray of blood.

'There's the flag!' I exclaimed; 'there! thick as tar! Stern! every soul of ye! He's going in his flurry!' And the monster, under the convulsive influence of his final paroxysm, flung his huge tail into the air, and then, for the space of a minute, thrashed the waters on either side of him with quick and powerful blows; the sound of the concussion resembling that of the rapid discharge of artillery. He then turned slowly and heavily on his side, and lay a dead mass upon the sea, through which he had so long ranged a conqueror.

'He's fin up at last!' I screamed, at the very top of my voice. 'Hurrah! hurrah! hurrah!' And snatching off my cap, I sent it spinning aloft, jumping at the same time from thwart to thwart, like a madman.

We now drew alongside our floating spoil; and I seriously question if the brave commodore who first and so nobly broke the charm of British invincibility, by the capture of the *Guerriere*, felt a warmer rush of delight, as he beheld our national flag waving over the British ensign, in assurance of his victory, than I did, as I leaped upon the quarter-deck of Dick's back, planted my wafepole in the midst, and saw the little canvass flag, that tells so important and satisfactory a tale to the whaleman, fluttering above my hard-earned prize.

The captain and second mate, each of whom had been fortunate enough to kill his fish, soon after pulled up, and congratulated me on my capture. To get the harness on Dick, was the work of an instant; and as the ship, taking every advantage of a light breeze which had sprung up within the last hour, had stood after us, and was now but a few rods distant, we were soon under her stern. The other fish, both of which were heavy fellows, lay floating near; and the tackle being affixed to one of them without delay, all hands were soon busily engaged in cutting in. Mocha Dick was the longest whale I ever looked upon. He measured more than seventy feet from his noddle to the tips of his flukes, and yielded one hundred barrels of clear oil, with a proportionate quantity of 'head-matter.' It may emphatically be said, that 'the scars of his old wounds were near his new,' for not less than twenty harpoons did we draw from his back—the rusted mementos of many a desperate encounter."

THE EGG-HATCHING EXHIBITION.

A SHORT time ago, while in London, I went to see, among other "sights," the much-talked-of egg-hatching apparatus, or, as it is called by its proprietor, the *ECCALEOBION*—a word from the Greek, signifying to bring to life. The establishment is situated in Pall-Mall, opposite the Italian Opera-House, and consists of a large handsome back apartment, entered by a passage from the street. The first feeling on entering the room is that of rather a warm atmosphere, along with the slight smell of a poultry-yard—which the place literally is. On one side, on your left, is a huge oblong case against the wall, elevated three or four feet from the floor, and used as a hatching oven; on the opposite side, running nearly the length of the room, is an enclosure formed of paling, separated in distinct divisions for different sizes of birds, and containing, close to the wall, a row of coops or houses for the little creatures to run into. At the farther end of the room is a glass-case on a table, in which the birds of one day old are kept and nursed; and in the centre of the room is a table with a number of saucers, in which lie the yolks of eggs at different stages of advancement towards maturity, but which being broken are of course useless for hatching; they only exhibit the progress of the chick. Such is the general outline of the establishment, which is fitted up with iron steam-pipes running round the room to preserve a certain temperature; and with a man, who attends the oven, and a woman to look after the poultry-yard or enclosure, the whole is before the eye of the visitor.

The first thing we do is to take a peep into the oven, where the process of incubation is performed. This oven executes the office of the parent hen, and in a remarkably perfect manner; in fact, much better than most hens could perform the operation. Every body who has any thing to do with hatching poultry knows that the great difficulty consists in keeping the hen upon her eggs. Some hens are better hatchers than others, but, generally speaking, they are too apt to leave their eggs to get cool; and this, by checking the incubation, at once destroys the unborn chick. By the *Eccaleobion* process, this chance of loss is entirely avoided. If the egg be a fresh good egg, it must give up its chick; nothing can keep it from being hatched. The oven or case, as we have said, is

a large oblong box projecting from the wall. It is divided into eight compartments, like the floors of a house, and each exposed to view by means of a glass door. To satisfy our curiosity, the door of one of the compartments was opened, and on looking in we perceived that the interior is a sort of shallow box lined with cloth, heated with steam-pipes, and the bottom covered with eggs lying at an easy distance from each other. A jug of water is placed among the eggs, for the purpose of supplying the air of the box with a necessary degree of moisture. Thus, each compartment or box is a distinct oven with its own eggs, and in each the eggs are at a particular stage of advancement. In one box they may be but newly put in, and in another they may be in the act of being hatched. The meaning of having eight boxes is to insure a batch of chicks every two or three days. Each box holds from two to three hundred eggs, or the whole upwards of two thousand.

An egg requires from twenty to twenty-three days to hatch, according to its quality and other circumstances; the exact time is allowed to be twenty-one days; but such is the variety of eggs, that a batch will require three days in entirely chipping. The progressive series of phenomena during incubation, as exhibited in the broken eggs on the table of the room, are exceedingly interesting, particularly that in which the heart is seen beginning to beat on the surface of the yolk, and are as follow. I quote from a pamphlet handed to visitors:—

"1st day. In a few hours after exposure to the proper temperature, the microscope discovers that a humid matter has formed within the lineaments of the embryo: and at the expiration of twelve or fourteen hours, this matter evidently bears some resemblance to the shape of a little head; a number of new vesicles also successively appear, rudimentary of different parts of the future body of the chick; those first formed, and most easily distinguishable, may afterwards be recognised as assuming the shape of the vertebral bones of the back.—2d day. The eyes begin to make their appearance about the thirtieth hour, and additional vessels, closely joined together, indicate the situation of the navel. The brain and spinal marrow, some rudiments of the wings and principal muscles, become observable. The formation of the heart is also evidently proceeding.—3d day. At the commencement of the third day, the beating of the heart is perceptible, although no blood is visible; a few hours, however, elapse, and two vesicles, containing blood, make their appearance; one forming the left ventricle, the other the great artery. The auricle of the heart is next seen, and in the whole of these, pulsation is evident.—4th day. The wings now assume a more defined shape, and the increased size of the head renders the globules, containing the brain, the beak, and the front and hind part of the head, distinctly visible.—5th day. On the fifth day the liver makes its appearance, and both auricles, now plainly seen, approach nearer the heart than they were before. That beautiful phenomenon, the circulation of the blood, is evident.—6th day. The lungs and stomach are distinguishable, and the full gush of blood from the heart distinctly apparent.—7th day. During this day, the intestines, veins, and upper mandible, become visible, and the brain begins to assume a consistent form.—8th day. The beak, for the first time, opens, and the formation of flesh commences upon the breast.—9th day. The deposition of matter, forming the ribs, takes place, and the gall-bladder is perceptible.—10th day. The bile is now formed, or at least distinguishable by its green colour; and the first voluntary motion of the body of the chick is seen, if separated from its integuments.—11th day. The matter forming the skull now becomes cartilaginous, and the protrusion of feathers evident.—12th day. The orbits of sight are now apparent, and the ribs are perfected.—13th day. The spleen gradually approaches to its proper position in the abdomen.—14th day. The lungs become inclosed within the breast.—15th, 16th, and 17th days. During these days, the infinity of phenomena in this wonderful piece of vital mechanism elaborate it into more perfect form, and it presents an appearance closely approaching the mature state. The yolk of the egg, however, from which it derives its nourishment, is still outside the body.—18th day. On the eighteenth day, the outward and audible sign of developed life is apparent, by the faint piping of the chick being, for the first time, heard.—19th, 20th, and 21st days. Continually increasing in size and strength, the remainder of the yolk gradually becomes inclosed within its body; then, with uncommon power for so small and frail a being, it liberates itself from its prison in a peculiar and curious manner, by repeated efforts made with its bill, seconded by muscular exertion with its limbs, and emerges into a new existence.

The position of the chicken in the shell is such as to occupy the least possible space. The head, which is large and heavy in proportion to the rest of the body, is placed in front of the belly with its beak under the right wing; the feet are gathered up like a bird trussed for the spit; yet in this singular manner, and apparently uncomfortable position, it is by no means cramped or confined, but performs all the

necessary motions and efforts required for its liberation, with the most perfect ease, and that consummate skill which instinct renders almost infallible. The chicken, at the time it breaks the shell, is heavier than the whole egg was at first."

The superintendent of the oven politely exhibited a compartment in which the eggs were chipping. Some had chipped the day before, others that day, and some would not be chipped till the morrow; in a few cases we observed the beak of the chick boring its way through the shell, and getting itself emancipated. When the little creatures are ushered into the world, they are not immediately removed out of the oven, but are allowed to remain for a few hours till they become dry; they are then removed and put into the glass-case, on the table at the end of the room. This case is very shallow, and the glass cover can be easily pushed aside to permit the superintendent handling them if required. They are here for the first time fed, though not for twenty-four hours after being hatched; the material scattered among them is small bruised grits, or particles little larger than meal; these they eagerly pick up without any teaching, their instinctive desire for food being a sufficient monitor. After the brood has been kept in the glass-case (which is partially open) for two or three days, and been thus gradually accustomed to the atmosphere, they are removed to one of the divisions in the railed enclosure on the floor. Here hundreds are seen running about, uttering peep cries, picking up grits, or otherwise amusing themselves, all being apparently in as lively and thriving a condition as if trotting about in a barn-yard. At six in the evening they are put to bed for the night in the coops, twelve together in a coop; these coops are small wooden boxes, lined with flannel, and furnished with a flannel curtain in front, to seclude and keep the inmates as warm and comfortable as if under the wing of a mother. At six or seven in the morning they are again allowed to come forth into their court-yard, which being strewn with sand, and provided with food and water, affords them all the advantages of a run in an open ground.

I made some inquiries respecting the failures in hatching, and deaths, and received the following information:—The eggs are usually purchased from Leadenhall market, and, consequently, not being altogether fresh, or otherwise suitable, one half of them fail in hatching. Once hatched, they are safe, for not more than one dies out of fifty which are brought into existence. If good and suitable eggs could be procured in all seasons, the failures in hatching would be comparatively trifling. Bad eggs, therefore, are the weak point in the establishment, and I should recommend the proprietor to complete his arrangements, by adding an egg-laying department to those which he has for hatching. This might be done by keeping a regular poultry-yard, either in connection with the place or in the country. The apparatus for hatching is capable of producing forty thousand chickens in a year, and, making allowance for failures, the actual produce cannot fall far short of half of that number. When three weeks old, as I was informed, the chickens are taken to market, and sold for a shilling each. Thus, we should suppose, the *Eccaleobion* turns out at least a thousand pounds worth of chickens annually—no bad revenue, it will be said, after paying expenses, but not greater than the ingenious contriver and proprietor, Mr William Bucknell, deserves.

This thing, trifling as it may appear to some, is highly deserving of public attention. Attempts to hatch eggs in ovens are of old date, but have never succeeded on a permanent or large scale in this country. In Egypt the practice has been more successful; yet even there, with the advantages of a superior climate, one in five of the hatched birds dies, and many are deformed, doubtless from the unequal application of the heat. It has only been by the *Eccaleobion*, as far as I can learn, that the birds have been brought out with certainty, or been reared successfully after being hatched; every bird is perfect, and will grow to its full size. The distinguishing characteristic of this invention is exact regulation of temperature at different stages of advancement, for eggs, as is well known, develop heat naturally in the course of hatching, and consequently the artificial heat requires to be judiciously diminished as the natural heat increases. By employing steam or hot-water pipes, the temperature is not only capable of being exactly regulated, but is diffused generally and equally throughout the oven, and acts upon all sides of the egg alike. Hence, the eggs in the *Eccaleobion* require no handling or turning during the process—there is no fear of their being either roasted on one side or cooled on the other. Provided all is as fair and above board as the proprietor of the *Eccaleobion* describes, or the superintendents inform the visitors, there can be no difficulty in multiplying egg-hatching and chicken-rearing establishments all over the country. Poultry is at present a dear article, on account of the very limited and imperfect manner of its production; but this need not

be the case any longer. There is nothing to prevent every town in the kingdom having its chicken manufactory as well as any other branch of business. Wherever there are establishments with steam-engines having a small redundancy of steam, it would be the easiest thing in the world to erect a fowl-producing apparatus in connection with the works. And if this did not in some degree improve the resources of the country and the condition of its people, I do not know what would.

BIOGRAPHIC SKETCHES.

MADAME DACIER.

ANNE LEFEVRE was born at the town of Saumur, in the north of France, in the year 1631. Her father, Tanneguy-Lefevre, a famed and excellent scholar, had originally no idea of making his daughter a scholar also, nor indeed of bestowing on her any further training than usually falls to the share of her sex; but accident revealed to him such extraordinary capabilities in his child, as to lead to a total change in her destiny. Being present one day, according to custom, while her father gave instructions in the classics to her young brother, she pursued her wonted task of sewing, and appeared to pay little or no attention to what was passing by her side, until she perceived that the pupil replied very lamely to the questions of his instructor. Without raising her eyes from her work, she suggested in a low voice to her brother the true answers which he ought to make. Monsieur Lefevre heard the whisperings of his daughter, and was equally charmed and surprised by the discovery of the knowledge which she had acquired, simply through her taste having led her to listen to her father while he taught others. From this time forward Lefevre divided his instructions between his son and daughter, and under so competent a master the latter of these pupils speedily made so rapid a progress as to astonish her tutor and guide.

Anne Lefevre was soon mistress of the Greek and Latin tongues, in so far as regarded the power of reading the extant writings in either language. But with this mere acquisition of the key to ancient knowledge, the young scholar did not content herself. She plunged deeply into the study of the classical writers, and her natural tastes and dispositions in this respect were in due time seconded by motives of emulation. Her father gave her a rival and companion in her labours in the person of André Dacier, then a youth about her own age, and the connection, which thus commenced through a conformity of pursuits and tastes, was afterwards strengthened into a lasting union, cemented by esteem and mutual affection. Though young Dacier proved himself no common scholar, the sex of his associate in study rendered her classical acquisitions the subject of greater surprise, and her repute, even at a very youthful period of life, spread far and wide among the learned and literary circles of France.

This was in a measure fortunate for Mademoiselle Lefevre. Her father died in the year 1672, and the daughter was under the necessity of removing to Paris, the great national field for the display of every species of talent. Her scholarly abilities had been heard of in the capital, and she gave ample proof of them, soon after her arrival within its walls, by publishing an edition of the works of Callimachus, one of the later and unjustly neglected Greek poets. This first display on the part of the subject of our memoir, as an editor and commentator on the classics, greatly increased her repute, and excited the most lively wonder in the mind of the whole lettered republic, coming, as it did, from a quarter so unusual. A short time afterwards, the Duke de Montausier, a nobleman intimately connected with the court, proposed to Mademoiselle Lefevre to undertake the task of editing some of the Latin authors destined to form a part of the great classical collection for the use of the Dauphin; but she at first declined to accept of this honourable charge, regarding the task as above her powers. New proofs, however, having been given by her of her qualifications, the same employment was again pressed on her, and she consented to become one of the labourers on the famous Delphin edition. The writers whose works she thus undertook to edit, with the ample notes, explanations, and commentaries required by the general plan of the collection, were among the minor classics, and were the more difficult from having been the object of comparatively little previous inquiry. *Aurelius Victor, Florus, and Eutropius*, the historians, with the less known authors *Dares the Phrygian* and *Dictys the Cretan*, were

the five writers whom Mademoiselle Lefevre edited, and most ably edited, for the "use of the Dauphin."

The marriage of our heroine with her old companion M. Dacier, who had also commenced a distinguished career of scholarship in Paris, occurred in the midst of these learned labours, in the beginning of the year 1683. This union was pleasantly called "the marriage of Greek and Latin," but which of the pair stood for the Greek, and which for the Latin, it would be hard to say, seeing that each was alike skilled in both tongues. However this may be, the alliance was certainly a happy one for the parties, and a happy one for the cause of learning. Their extraordinary congeniality of tastes and talents rendered their thirty-seven years' union one of rare mutual felicity, and although they did not for many years bend their minds upon any common tasks, the encouragement which the counsel, applause, and society of the one afforded to the other, had an important stimulating influence on the isolated exertions of both in the field of classical literature. Besides the works mentioned as having been produced for the Delphin collection, Madame Dacier had published, two years before her nuptials, an edition of the "Poems of Anacreon and Sappho," with notes, and a French prose translation. Of this prose translation, the noted writer Despreaux observed, that "it ought to make the pen fall from the hand of any one who undertook to render these poems into *verse*," alluding, by this expression, to the superior fidelity and force of the prose of Madame Dacier. In the year of her marriage, our authoress gave to the public three of the most noted comedies of the Roman dramatist, Plautus, accompanying them with translations and critical remarks of a high order of excellence; and in the following year, 1684, she issued, with the like accompaniments, two of the most famous comedies of Aristophanes, the Grecian, entitled "Plutus," and "The Clouds." The remarkable merit of these editions cannot be fully appreciated without keeping in mind that the Grecian and Roman comedies, from the frequency of their allusions to things of the hour, and which passed away with the hour, are the most difficult and least comprehensible portions of classical literature. Yet Madame Dacier's success was complete, and most succeeding translators have followed her versions, or at least acknowledged themselves deeply indebted to her elucidations and commentaries. The same remarks apply in all respects to her edition of the whole comedies of Terence, which was published in 1688, next in succession after the plays of Aristophanes. Subsequent translators of the latter writer were not more indebted to the learned Frenchwoman's expositions than was Colman the elder, and others who produced versions of the dramatic pieces of Terence.

At this point of our memoir we are called upon to turn our attention to some particulars of Madame Dacier's private life. And, in the first place, it will be but just to allude to a charge which has been brought against herself and her husband of having meanly permitted fear or favour to cause them to change their religious persuasion shortly after their marriage. It is true that Monsieur and Madame Dacier were both brought up Protestants, and that they solemnly passed into the Catholic body in 1685; an act which was not then uncommon, and which would probably have called down upon them no reprobative notice, had not the revocation of the edict of Nantes taken place a short time afterwards. But the calumniated pair cleared themselves from the odium of an unconscientiousness in faith, by showing that the revocation of the edict had not been hinted at or surmised by any one when their religious renunciation took place, and, also, that they had retired to the country to perform the act with all possible privacy, instead of publishing it, as those would have done who sought to gain court favour. They had in truth retired at the period to Castres, the native place of Monsieur Dacier, and here they staid as long as circumstances would permit. An order from the king was found necessary to draw them back to the capital to resume their yet unfinished Delphin labours. The chief cause of Madame Dacier's desire for seclusion, lay in her anxiety to superintend the education of her two daughters, and, more particularly, of her only son. This boy showed such precociousness of intellect as to excite general wonder. He repaid his mother's classical instructions so well, that, at the age of seven and eight, his mind was largely imbued with ancient learning. At ten years old he was so thorough a proficient in Greek that he stole for his own perusal, from his mother's repositories, such of the more recondite authors as she interdicted him from reading, on the ground of their being yet too difficult for him. But he died on reaching the age of eleven, to the lasting regret of all who knew him, but more especially of his mother. Of her two daughters, one likewise died on entering the spring of womanhood. Her remaining daughter, and sole surviving child, entered a convent for life, by her own wish and choice.

The labours of the subject of our memoir, for the ten years succeeding the appearance of Terence in 1688, were chiefly confined to assisting her husband in preparing editions of "Marcus Antoninus's Reflections," and of "Plutarch's Lives." Otherwise, her attention appears to have been chiefly engaged, and in some respects sorrowfully so, by her children. At the same time, such a mind as hers could not be altogether idle, and she was continually making progress with at least one great work, an edition and translation of *The Iliad*

of Homer. This appeared in the year 1699, and was determined, by common consent, to be the most valuable of all her works. Her original and profound emendations of the text, and her erudite illustrations of its meaning, rendered her *Iliad* the chief guide to Pope, and every later translator. The world universally said of the work, "This would have been a noble and gigantic feat for a man, were he the best scholar that ever lived; for a woman, it is altogether marvellous." It had been a labour of love to Madame Dacier, in some measure, to illustrate Homer, whom she venerated as the prince of poets, and she therefore felt the more pain on seeing the old Greek severely treated soon afterwards by M. Lamotte, a clever writer of the day, in the preface to a poetical abridgement of the *Iliad*. The ire of the learned Dacier was aroused, and she defended her ancient favourite, or rather attacked his detractors, in a treatise "On the Causes of the Decline of Taste," published in 1714. Lamotte replied, and reply followed reply, until a great contest was originated, in which all the leading literary characters in France took one side or another. In her rejoinders to Lamotte, it was admitted that Madame Dacier showed much more acerbity of feeling than her opponent permitted himself to display; and hence it was pointedly observed, that the lady had written and argued with the virulence of a scholarly partisan, and Lamotte with the mildness and grace of a woman of letters and genius. It is consoling to know that after this dispute had been maintained for a number of years, the two leaders in the fight agreed to bring their dissensions to a close, and solemnised the re-establishment of peace by a grand and harmonious festival. A work published during the Homeric war, and entitled, "Homer defended against the Apology of Hardouin," and the "Odyssey of Homer," with notes and a translation, complete the list of Madame Dacier's difficult and laborious literary enterprises, with the exception of several elegant Latin Epistles, and some minor pieces of a similar character.

It may be thought by those who are not familiar with the subject and nature of classical editing, that in all these productions of the erudite Frenchwoman there was little scope or necessity for original thought and writing. This, however, is an error. The lengthened prefaces, copious notes, and numerous critical dissertations requisite to elucidate fully such authors as Madame Dacier edited, would constitute, if collected, a large amount of original writing, and as to the thought expended thereon, the extent of it would be truly incalculable. In our own country, many instances could be pointed out of men attaining the repute of great scholars, by effecting but one such classical edition as those of Madame Dacier. Let none of our readers, therefore, through want of acquaintance with such matters, imagine that this learned lady won her fame as much on account of her sex, as of her actual achievements. She merited all the praise which she received. Yet, in spite of her man-like renown, and in spite, too, of the bitterness which she certainly displayed in the Homeric disputation, Madame Dacier never overstepped the bounds of feminine delicacy in private life, and seemed always more anxious to be viewed as the woman than as the scholar. She avoided learned discussions in company, and could scarcely be prevailed upon to utter literary opinions there. Many traits of her modesty of character have been recorded. The inscription of autographs in albums was a custom of those days as well as of ours, and Madame Dacier was sometimes bored to death by such requests. Overcome one day by the unflinching perseverance of a German autographist, she did consent to put down her name, but accompanied it with a characteristic maxim (from Sophocles), the influence of which might counteract, she thought, the seeming vanity of the act to which she had been forced. The saying bore, that "Reserve is the ornament of woman."

But it was as a wife that this celebrated lady was especially admirable. The affection existing between her and her husband was of the most enduring nature, being based on a mental assimilation of the most rare and exalted kind. A number of epistles, written to Monsieur Dacier from the country, whither she had gone to settle for him the affairs of his patrimonial estate, are still preserved, and are equally remarkable for the business-like acuteness and the conjugal tenderness which pervade them, as well as for the learned comments on the books perused at her leisure hours, which she also introduced. Madame Dacier's scholarship procured for her various honours from foreign and home societies; but of all the compliments of this kind bestowed on her, none equalled that which came from Louis XIV., when he made her the colleague of her husband in the office of royal librarian, and assigned to her the reversion of the same important post. A woman never before attained to such an honour, and the like may never happen again. But the wife of the royal librarian was not destined to be her husband's successor. She died of a paralytic attack on the 17th of August 1720, at the age of sixty-nine, having suffered much during the last two years of her life, though without any impairment of her faculties. Monsieur Dacier survived her but two years, having languished, rather than lived out that period, in a state of inconsolable grief for the loss of his companion. The parents were survived by their daughter and sole remaining child.

The services of this illustrious female to ancient literature can never pass into oblivion. She is well calculated to be an object of proud remembrance to her sex,

being a striking proof of the capability of the female intellect to grapple with even the most recondite subjects. Her doing so, also, it is of consequence to remember, did not render her less amiable as a woman, a wife, and a mother. While those at a distance thought her chiefly admirable in her scholarly character, those who had the happiness to share her society considered that her virtue, her firmness, her benevolence, and her equanimity, were her principal titles to the honour and esteem of the world.

HOW WE ENCOURAGE THE FINE ARTS.

IN the "ART-UNION, a monthly Journal of the Fine Arts," lately established in London, and containing much useful information on the subjects of which it treats, we find the following tolerably hard hits against us as a nation, in regard to our encouragement of artists and their productions:—

"Neither was the taste of the nobility, nor the patronage of the people [a hundred and twenty years since], a whit better than it is in our own time; Hogarth had to sell his pictures by raffle, and Wilson was obliged to retire into Wales from its affording a cheaper living; so much for the discernment and patronage of the period. It was but the other day the committee of the British Institution purchased a picture of Gainsborough's for eleven hundred guineas, and presented it to the National Gallery as an example of excellence, and yet this very picture hung for years in the artist's painting-room without a purchaser, though the price was only fifty pounds. But while we censure the ignorance of former times, we cannot praise the taste or knowledge 'of our own generation.' Let us take the case of Sir David Wilkie as an example—an artist who has founded a school of art unknown before in this or in any other country, a combination of the invention of Hogarth with the pictorial excellences of Ostade and Teniers; yet this artist's works, on his coming to London in 1804, were exposed in a shop window, at Charing Cross, for a few pounds; and a work for which he could only receive fifteen guineas, was sold the other day for eight hundred. Do transactions such as these show the taste or discernment of the public? Sir George Beaumont, as a kind act of patronage, gave him a commission to paint the picture of the 'Blind Fiddler,' and paid him fifty guineas for what would now bring a thousand at a public sale. It seems, therefore, a fair inference that a discerning public, or a patronising nobility, are only shown when an artist's reputation makes it safe to encourage him; then also come out the laudations of the public press with their astute display of critical lore. The besetting sin of this country is politics—a subject which excludes every other, in a great degree, from consideration and acquirement; from the cradle to the coffin, the whole energies of life are employed in the struggle between the aristocracy and democracy for an extension of power, to the total exclusion of those refinements which tend to humanise the mind and embellish society. How often have we heard the amiable and eloquent president of the Royal Academy draw the attention of the public to the 'still small voice' of painting, unheeded amidst the bustle of political warfare."

While the provincial towns are striving with each other in establishing schools of design, we see no reason to despair, even in our day, of seeing professors of painting established in both universities: it seems derogatory to common sense, that a science which opens up so large a field of gratification, both at home and abroad, should be allowed to lie dormant. Until something of the kind is acted upon, it is in vain to expect that the higher branches of art will either be appreciated or encouraged; neither can the public taste be properly directed to any useful or ornamental termination. What, for example, can be more ridiculous than the result of the deliberations of the committee collected to decide upon the Nelson testimonial? In the first place, the very appointing of such persons precluded every artist of spirit from competing, or submitting his works to such a tribunal; yet the public press joined in reprobating the talent of the country for standing aloof. Did it never strike any of those noblemen or gentlemen that they were accepting a trust for which they were totally incompetent? Had they not the modesty to say, 'We have been brought up in the army and navy, and can know nothing of the subject of sculpture or architecture.' Well may artists complain that the government has never done any thing for the profession. There is not a single situation connected with art that is filled by an artist; there has not been a purchase by the government of a single work of art; nor have artists been consulted as to what would be of advantage, either to themselves as a body, or to the general taste of the country; and when artists see the very reverse of all this abroad, and the respect paid to the fine arts, they have just cause of complaint; and they not only suffer all this neglect, but are abused by the press for not having established an English School of Painting, and for debasing the taste, in humouring the meretricious eye of an ignorant public."

We beg to subjoin one or two ideas on the subject. The true way, as it appears to us, to encourage the fine arts and artists, should consist in elevating the standard of taste throughout all classes of the community. To do this effectually, we must begin by educating more generally, and in a better manner

than at present, the mass of the people; and also open public exhibitions and pleasure grounds as on the Continent, so as to introduce the habit of seeking refined pleasures in place of those of a gross nature. At present, during holidays and hours of relaxation, Sundays included, no places of recreation are opened for the people but the public houses and gin-shops—and the consequences are such as need not be described.

TRAVELS IN THE BURMAN EMPIRE.

It is gratifying to observe that the Christian Missionaries of the present day, while neglecting no part of the duties more especially incumbent upon them, are taking advantage of the favourable opportunities afforded by their character and position to collect much valuable information of a general kind respecting the countries which form the scene of their labours. A work which gives a favourable idea of these their services to general knowledge, now lies before us, being a narrative of "Travels in South-Eastern Asia, by the Rev. Howard Malcolm," a missionary from Boston in the United States. Though embracing notices of "Hindustan, Malaya, Siam, and China," this book is devoted in a more particular manner to an account of the Burman Empire.

The Burman Empire is situated on the east and north-east shores of the Bay of Bengal, and is bounded by the territory of Siam on the south, by China on the east, and by Tibet on the north. The extreme length of the kingdom is seven hundred and twenty miles, and its extreme breadth about four hundred. In 1836, which was the period of Mr Malcolm's visit, the population, according to the most rational computation, amounted to nearly eight millions, reckoning in this sum the subsidiary tribes connected with the empire. Not many years back, its bounds were much more extensive, but in 1826 the British took away a large slice of country on the borders of the Bengal Bay, and similar losses of territory were sustained from other causes. Ava, situated in the interior of the country, on a large river called the Irrawaddy, is the present Burman capital, and contains about 100,000 inhabitants, according to Mr Malcolm's calculation, which is lower, however, than that made by others. The city is surrounded by a wall twenty feet high and seven miles in circuit, and within this space are two other walls, the outermost enclosing the dwellings of the great, and some of the best streets, while the inner one encompasses the palace and various public buildings. Some of the latter edifices, and particularly the pagodas, which are of the ordinary pyramidal form, are (to use our author's words) "truly noble," and many of the ordinary street houses, which are built of wood with bamboo roofs, are such as to present a very handsome appearance. The details of common Burman architecture are given in the following passage. "Dwellings are constructed of timber, or bamboos set in the earth, with lighter pieces fastened transversely. When good posts are used, they are set seven feet apart; lighter ones and bamboos are placed closer. A frame set on stone or brick pillars is never seen. The sides are covered, some with mats, more or less substantial and costly; or with thatch, fastened with split ratans. The roof is usually of thatch (except in the city of Ava), even in the best houses. It is very ingeniously made and fastened on, and is a perfect security against wind or rain. The floor is of split cane, elevated a few feet from the earth, which secures ventilation and cleanliness, and makes them far more comfortable and tidy than the houses of Bengal. The open crevices between the eaves, however, too often invite carelessness, by suffering offal and dirty fluids to pass through, and not unfrequently, among the lower ranks, the space under the house is a nasty mud hole, alive with vermin. The doors and windows are of mat, strengthened with a frame of bamboo, and tied fast at the top. When opened, they are propped up with a bamboo, and form a shade. Of course there are no chimneys. Cooking is done on a shallow box, a yard square, filled with earth."

The people of the Burman country are low in stature, the average height of the men being five feet two inches, and that of the women four feet ten inches. The standard of beauty, as regards complexion, seems to be a delicate yellow, which is the natural hue of the race till deepened by long exposure to the sun. But for a little prominence of the cheek-bones, squareness of the jaw, flatness of the nose, and thickness of the lips, the Burmans would be tolerably good-looking. A delicate yellow powder is used, by ladies chiefly, to give the face the favourite tint, and also to impart to it a fragrant odour. This last point is of more importance among the Burmans than any where else, as they have a curious mode of kissing. "Instead of a slight touch (says our author) of the lips, as with us, they apply the mouth and nose closely to the person's cheek, and draw in the breath strongly, as if smelling a delightful perfume. Hence, instead of saying 'Give me a kiss,' they say 'Give me a smell.' There is no word in the language which translates the word kiss." This people have also a custom of giving an indelible black tinge to their teeth, by means of lamp-black and oil applied with a hot iron. When asked the reason of this fashion, they gave uniformly for answer, "What! should we have white teeth, like a dog or a monkey?" Where the teeth are not blackened in this manner, they are usually tinted red, in consequence of another custom nearly universal

among them, of chewing a mixture called *coon*, which is composed of a kind of nut, with tobacco and other ingredients, smeared over with a little tempered quicklime. This colours the whole mouth a deep red. "Smoking tobacco is still more prevalent among both sexes, and is commenced by children almost as soon as they are weaned. I have seen little creatures of two or three years, stark naked, tottering about with a lighted cigar in their mouth. It is not uncommon for them to become smokers, even before they are weaned, the mother often taking the cheroot from her mouth and putting it into that of the infant! The cheroot is seldom wholly made of tobacco. The wrapper is the leaf of the then-nat tree; fragrant wood rasped fine, the dried root of the tobacco, and some of the proper leaf, make the contents."

Food is wonderfully cheap and abundant in the Burman Empire. Mr Malcolm saw plenty of rice, the chief article of food in the country, sold at about 6d. sterling a bushel; and wheat, as good as he had ever beheld elsewhere, at 4s. 4d. sterling per hundred bushels! But the government will not allow of their exportation, although a most lucrative trade might be driven in these articles, without at all distressing the natives. "In the upper districts (says the work before us), where rice is dearer than below, wheat, maize, sweet potatoes, onions, peas, beans, and plantains, enter largely into the common diet. Indeed, a Burman seems almost literally omnivorous. A hundred sorts of leaves, suckers, blossoms, and roots, are daily gathered in the jungle, and a famine seems almost impossible. Snakes, lizards, grubs, ants' eggs, &c., are eaten without hesitation, and many are deemed delicacies. An animal which has died of itself, or the swollen carcass of game killed with poisoned arrows, is just as acceptable as other meat. Like the ancient Romans, the Burmans are very fond of certain wood-worms, particularly a very large species, found in the trunks of plantain-trees. I have seen several foreigners who had adopted it as one of their delicacies. Though the law forbids the taking of life, no one scruples to eat what is already dead; and there are always sinners enough to keep the sanctimonious ones supplied with animal food. Indeed, very few scruple to take game or fish. Thousands of the natives are fishermen by profession. I asked some of these what they thought would become of them in the next state. They admitted that they must suffer myriads of years, for taking so many lives; but would generally add, 'What can we do? our wives and children must eat.'"

The Burmans, like the Chinese and other eastern Asiatics, can by no means be called an uncivilised people, although their civilisation, like that also of their neighbours, is unfortunately of a non-progressive kind. To use the apt language of our American missionary, in their political, social, and moral system "no elements exist for the improvement of posterity, and successive generations pass like the crops upon their fields." They have many commendable points in their character, and, amongst others, that of temperance. "Temperance is universal. The use of all wines, spirits, opium, &c., is not only strictly forbidden, both by religion and the civil law, but is entirely against public opinion. I have seen thousands together for hours, on public occasions, rejoicing in all ardour, without observing an act of violence or a case of intoxication. During a residence of seven months amongst them, I never saw but one intoxicated; though the example, alas! is not wanting on the part of foreigners. It is greatly to be deplored that foreigners, particularly Moguls and Jews, tempt their boatmen and labourers to drink ardent spirits, and have taught a few to hanker after it." It may perhaps be thought that these temperate habits arise from some accidental want of acquaintance with the proper mode of manufacturing intoxicating liquors, but, in reality, the Burman territory has been gifted by nature with peculiar facilities in this respect. A ready-made liquor, of very considerable strength, is procurable from a species of palm-tree, called the *palmyra* by botanists, and by the British residents the *toddy-tree*, from the *toddy* which it yields. "To these trees slight perpendicular ladders are fastened, by which the owner ascends every morning to obtain the sap from a cut made for the purpose. But the regular climbers want no such aid. They tie their feet together, about six inches apart, and thus can apply the sole of each foot to the tree. Locking their fingers together, they clasp the trunk with their arms, and thus ascend with rapidity and ease. The sap or *toddy* is generally drunk immediately, when it is sweet and wholesome, or made into sugar, which resembles that obtained with us from the maple. When suffered to stand four or five hours, it ferments, and becomes more intoxicating than wine, but is rarely used in this state by the Burmans, and almost never to the point of intoxication. From Paghan to Ava this species of palm is very abundant, and produces a large amount of molasses, which sells for one-third of a penny per pound."

Nor is the Burman character devoid of even more important virtues; and it is but justice to mention these, seeing that we are too much accustomed to conjoin this people in our minds with races savage, ignorant, and unpollished. "During my whole residence in the country (says Mr Malcolm), I never saw an immodest act or gesture in man or woman." As in other warm latitudes, the dress of the lower classes is sometimes more scanty than is exactly consistent with our notions of propriety, but there is no gross offence given to the eye even in this respect.

Parents are extremely kind to children, and on the other hand, "children are almost as reverent to parents as among the Chinese. They continue to be greatly controlled by them, even to middle life; and the aged, when sick, are maintained with great care and tenderness. Old people are always treated with marked deference, and in all assemblies occupy the best seats among those of their own rank." Another favourable trait in the social character of the Burmans, is the comparatively honourable place which the female sex holds among them. Polygamy, indeed, is allowed in the country, but is exceedingly rare, except among the great. Hospitality is also a common virtue of this people.

The other side of the picture shows the Burmans to us in the light of inveterate liars. "Thieving and pilfering are common, but perhaps not more so than in other countries," says Mr Malcolm; but we fear that this view of the matter is too favourable to the Burmans. In passing up and down the rivers of the country, he was in continual danger of attacks from the natives. The authority of the government is not so well sustained as to afford adequate protection to life and property; and to this cause, perhaps, as much as to the evil dispositions of the people, is to be ascribed the prevalence of pilfering in the Burman territory. The pride of the Burmans is so rank and offensive, as almost to deserve enrolment among the vices of their character. "From the monarch, who adopts the most grandiloquent titles he can invent, to the pettiest officer, every man seems bloated with self-conceit. The meanest citizen seems to feel himself superior to the Peguans, Karens, Tongthoos, &c., around him. Gradations of rank are most minutely and tenaciously maintained, and are signified in every thing. Houses, dress, betel box, water-goblet, cap, umbrella, horse-equipments, &c., are all adjusted by rule. To ride on an elephant is the privilege only of royalty and high office, though often granted as an indulgence to others. The king alone, and his immediate family, use a white umbrella; the next have those gilded, the next red or fringed, next green, &c. Subdivisions of these grades are marked by the number of umbrellas of each particular colour. Thus one has twenty, another ten, another eight, and so downward.

The very language in which common actions are mentioned, is made to minister to this nicety. Thus there are three or four ways to speak of every thing, such as eating rice, walking out, sleeping, speaking, dying, one of which is always used of the king, another of priests, another of rulers, another of common persons. It would be an insult to use a lower phrase than the person is strictly entitled to, though a higher one is sometimes used as a sign of special respect. The same difference is made in the words for walking abroad, and many more."

It has been mentioned that food is exceedingly cheap in the Burman Empire. In fact, no country on the face of the earth seems to possess so rich an assortment of vegetables, calculated to supply the wants of man. Besides all the common grains and spices, tobacco, the tea-plant, and the sugar-cane, grow abundantly in a natural state. The same may be said of cotton, indigo, and other dye-stuffs. The great superfluity of edible vegetables gave rise, it is probable, to the laws (frequently evaded) that prohibit the use of animal food. The mineral riches of the country are equal to its vegetable wealth. Gold, silver, iron, tin, lead, arsenic, precious stones, sulphur, &c. are all known to abound, although their sources have as yet been but imperfectly drawn upon. The Burmans are not unacquainted with the art of making metallic alloys, and they have become particularly famous for casting bells. "These bells are disproportionately thick (says Mr Malcolm), but of delightful tone. The raised inscriptions and figures are as beautiful as on any bells I have seen. They do not flare open at the mouth, like a trumpet; but are precisely the shape of old-fashioned globular wine-glasses, or semi-spheroidal. Several in the empire are of enormous size. That at Mengoon, near Ava, weighs, as the prime minister informed me, eighty-eight thousand viss—more than three hundred and thirty thousand pounds! It seems almost incredible; but if any of my readers, interested in such matters, will make a computation for themselves, they will find it true. The bell, by actual measurement, is twenty inches thick, twenty feet high, including the ear, and thirteen feet six inches in diameter. A friend, distinguished as a civil engineer, computed the weight, from this measurement, to exceed five hundred thousand pounds, supposing the bell-metal to consist of three parts copper and one part tin. The weight was ascertained by the Burmans before casting, and its bulk in cubic inches proves them to be correct. It is suspended a few inches from the ground, and, like their other great bells, is without a tongue. That at Rangoon is not much smaller. It will be recollected that the largest bell in the United States does not exceed five thousand pounds. The Great Tom, at Oxford, in England, is seventeen thousand pounds, and the famous but useless bell at Moscow, is four hundred and forty-four thousand pounds."

Another mineral product of the country, worthy of notice, is the earth oil, or Petroleum, which is chiefly obtained at one spot on the banks of the Irrawaddy, from wells two or three hundred feet deep. "The wells are about four hundred in number, and occupy a space of about twelve square miles. Men do not go down these wells, but an earthen pot is lowered in, and drawn up over a beam across the mouth, by two

men running off with the rope. The pot is emptied into a little pool, where the water with which it is largely mixed subsides, and the oil is drawn off pure. Each well produces a daily average of one hundred and fifty gallons of oil, which sells on the spot for about 1s. 8d. per cwt. The gross annual produce is about eighty millions of pounds; it is carried to every part of the kingdom accessible by water, and is used for lights, paying boats, and various other purposes. It has the valuable quality of securing wood from the attacks of insects. A boat's bottom, kept properly in order with it, is about as safe as if coppered. It is thought to be a defence even from white ants."

Having already exceeded the proper limits, we must conclude our notice of Mr Malcolm's work by assuring our readers that a perusal of it will give them a very complete idea of the social condition and natural features of the countries visited by the author. As regards the more direct object of his journeyings, also, there is much gratifying information presented in these volumes. A map, and numerous pictorial illustrations taken from sketches by the author himself, add greatly to the interest of this work.

THE SEASONS.

The Seasons are my friends, companions dear:—
Hail Winter with I tend with constant feet,
When over world, and desert, lake and mere,
He sails triumphant in a rack of sleet,
With his rude joy the russet earth to greet,
Pinching the tiny brook, and infant ferry;
And I will hear him on his mountain-seat
Shouting his boisterous carol, free and merry,
Crown'd with a Christmas wreath of crimson hollyberry.

Young Spring will I encounter, coy and arch!
When in her humid scarf she leaves the hills,
Her dewy cheek dried by the winds of March,
To set the pebbly music of the rills.
As yet scarce freed from stubborn icicles;
And Summer shall entice me once again,
Ere yet the light her golden dew distils,
To intercept the morning on the plain,
And see Dan Phœbus slowly tend his drowsy wain.

But, pensive Autumn! most with thee I love,
When the wrung peasant's anxious toll is done,
Among thy bound and golden sheaves to rove,
And glean the harvest of a setting sun;
From the pure mellowing fields of ether won;
And in some sloping meadow musing sit,
Till vesper rising slowly, widow'd nun,
Reads whisperingly, her radiant lamp new lit,
The gospel of the stars, great Nature's holy writ.
—Thomson.

IMPROVEMENT IN THE MANUFACTURE OF PAPER HANGINGS.

We were favoured a few days since with an opportunity of visiting the extensive paper-works of Messrs J. Evans and Co., at Alder Mills, near Tamworth, where we had the pleasure of witnessing the application of an ingenious and very beautiful piece of mechanism, the invention of the Messrs Evans, to the printing of paper hangings, which cannot fail to produce a complete change in this department of our manufactures, from its superiority over the ordinary method of block printing. The Messrs Evans would have brought their invention into practical operation many years ago, had it not been for the heavy duties imposed on the manufacture of stained papers, which, by limiting the consumption, rendered their invention comparatively useless; a fact which supplies another argument against the imposition of heavy duties upon the manufacturing skill and industry of the country. In connection with the present invention, we may here state that the Messrs Evans took out a patent in February last for an important improvement in the manufacture of paper, by the application of a pneumatic pump in the compression of the moisture from the pulp, by which means the substance is almost instantaneously converted into paper. By this invention they are, we understand, enabled to manufacture a continuous sheet of paper six feet in width, and nearly two thousand yards in length, every hour. This paper, as it is taken off the reel, is in every respect fit for immediate use, and is conveyed on rollers to another part of the mill, in which the printing machinery is erected, through which it is passed with great rapidity, and receives the impression of the pattern intended to be produced, with all the precision and beauty of finish which machinery can alone effect. In order to connect the operations of the paper-making and printing machines, the Messrs Evans are at present engaged enlarging their premises; and when this alteration is completed, they will be enabled to print, glaze, and emboss the most complicated and delicate patterns in paper hangings, in every variety of shade or colour, as rapidly as the paper can be manufactured. Some idea may be formed of the power of the machinery, and the importance of the invention, when we state that during our visit to the mill, the machinery was working at a rate which would produce sixteen hundred and eighty yards of paper per hour, consisting of two very beautiful patterns, the only hand labour employed being that of one man, who superintended the machinery, and four girls employed in rolling up the paper in pieces of the required length. The whole process of manufacturing the paper from the pulp, and impressing it with the most complicated patterns, is carried on within a comparatively small space, and with a precision and rapidity which affords another instance of the progress and triumph of science and mechanical skill in supplying the necessities and comforts of civilised life.—*Birmingham General Advertiser.*

TREATMENT OF ABORIGINES.

A spot was pointed out to me, a few years ago, in Van Dieman's Land, where seventeen of the natives had been shot, at one time, in cold blood. They had been bathing in the heat of the day, in the deep pool of a river, in a sequestered and romantic glen, when they were suddenly surprised by a party of armed colonists, who had secured

the passes, and, I believe, not one of them was left to tell the tale. Nay, a convict bush-ranger in Van Dieman's Land, who was hanged a few years ago for crimes committed against the European inhabitants of the country, confessed, when under sentence of death, that he had actually been in the habit of shooting the black natives to feed his dogs.—*Dr Lang.*

SUCCESSFUL METHOD OF CURING DEAFNESS.

A short time since, in conjunction with our contemporaries, the Times, the Standard, the Courier, the Record, and other journals, we referred to a very extraordinary discovery which Dr Turnbull, of Russell Square, has recently made in the mode of curing deafness; the efficacy of which mode was tested, in the case of from thirty to forty patients, in the presence of noblemen, members of the House of Commons, physicians and surgeons, and a number of literary and scientific gentlemen. Dr Turnbull has now so far matured his discovery as to be able not only to cure ordinary cases of deafness, but to cure persons who have been deaf and dumb from their infancy except where there is an organic malformation of the ear. We were yesterday present at another exhibition of the kind alluded to, when we were again furnished with ocular demonstration of the singular efficacy of Dr Turnbull's new mode of treatment of deaf persons. A number of persons, of all ages, and from various parts of the country, who had been deaf and dumb from their infancy, and others who had been deaf for six, eight, ten, twelve, and even twenty years, and who have had their hearing entirely restored, or are in a fair way of its being so, were brought forward and rigidly examined. The cases of cure were, in several instances, of so extraordinary a character, that the spectators could hardly believe the evidence of their own eyes. What adds to the wonderful nature of these cures, is the fact, that neither what is called blowing, nor any operation of any kind, is resorted to by Dr Turnbull—the simple application to the ear, of a liquid preparation, which does not cause the slightest pain, being all that is necessary. In many instances the cures are almost instantaneous, and it is only in a few cases that more than five or six applications of the liniment, at intervals of a few days between each, are needed. It is to the simplicity and instantaneous nature of the cures, and the circumstance of any thing in the shape of operation being dispensed with, that we are to ascribe the fact of Dr Turnbull being able to attend (which he has of late repeatedly had to do) to the cases of from 150 to 200 patients in one day. In several instances, which we ourselves witnessed, the cure of deaf and dumb persons, and of others who were deaf only, was so perfect, that the parties could actually hear the ticking of a watch at a greater distance than those persons who had never had any impediment in their hearing. An exceedingly interesting part of the exhibition was that of witnessing individuals who had been born deaf and dumb, attempting to speak. Several of them had made such progress in the course of a few weeks, as to be able to articulate some of the more common words with a wonderful distinctness.—*London paper.*

TALE OF A TUB.

The following droll story appears in the St Joseph's Times:—On the passage of the ship Alexander from New Orleans to New York, a young lad, of about fourteen, from a naturally frolicsome disposition, became so troublesome, that he was threatened by the captain that he would confine him in a water-cask. Our youngster took no heed, and at his next offence was put into the cask, which was headed up, leaving a large bung-hole for the admission of air. The ship encountered a violent storm, and in a sudden lurch the cask containing the boy rolled into the sea. The circumstance was not noticed by those on board. Fortunately the cask struck bung up, and floated about thirty hours, when it was thrown upon the beach of Cape St Blas. Here the boy made efforts to extricate himself from his prison without success, and in despair gave up to die. Some cows strolling on the beach were attracted to the cask, and one of the number, it being fly time, switched her tail into the bung-hole, which the boy grasped with a desperate resolution. The cow bellowed, and set off for life; and after running some two hundred yards with the cask, struck it against a log on the beach, and knocked it, as we may say, into a cocked hat. The boy, thus providentially released, was discovered by some fishermen on the Point, and taken into Apalachicola, where a small collection being made for him, he was enabled to proceed north, by the way of Columbus.

OLD AND NEW TIMES.

An inhabitant of Horsham, in Sussex, now living, remembers, when a boy, to have heard from a person whose father carried on the trade of a butcher in that town, that in his time the only means of reaching the metropolis was either by going on foot or riding on horseback, the latter of which undertakings was not practicable at all periods of the year, nor in every state of the weather; that the roads were not at any time in such a condition as to admit of sheep or cattle to be driven upon them to London markets, and that for this reason the farmers were prevented sending thither the produce of their land, the immediate neighbourhood being, in fact, their only market. Under these circumstances, a quarter of a fat ox was commonly sold for about fifteen shillings, and the price of mutton throughout the year was only five farthings the pound. Horsham is thirty-six miles from London, and the journey between the two places now occupies less than four hours; more than thirty stage-coaches, travelling at this rate, pass through Horsham every day, on their way from and to the metropolis, in addition to numerous private carriages and post-chaises. The traffic of goods—principally coal and agricultural produce—carried on in the district of which Horsham is the centre, exceeds 40,000 tons a-year, besides which, the road is constantly covered with droves of cattle and flocks of sheep.—*Porter's Progress of the Nation.*

IGNORANT SUSPICIONS.

THE common people often make grievous errors in their notions with respect to the motives which animate public men. They generally err both as to the nature and amount of the motive. They are very much disposed to suspect that a direct and large bribe has been the cause of a certain piece of conduct, where any one acquainted with the two parties in the case would know at once that nothing of that kind was in the least likely to have ever been thought of by either. All the French generals in the early years of the Revolution who lost battles, were suspected of having been bribed by the enemy to allow themselves to be beaten. Even in our own day and country, each of the opposing political factions always presumes of each other, that lucre is the predominating motive of their respective opponents. The literary reviews are supposed by many to take douceurs from opulent authors, in consideration of panegyric criticism: we have seen, in one, a serious notice disclaiming the practice, in reply to an individual who had actually applied to know *how much* was generally expected. We ourselves have more than once had to repel the suspicion that we were hired by the colonial land-companies to advocate emigration. These are all of them most absurd errors—little superior, in fact, to the notions of our ancestors as to magic and witchcraft. Direct bribing is not now among the causes which actuate the conduct of educated men. To suppose that it is, is not only to attribute the wrong motive, but to hide the real one. The conduct of many public men is still very far from being animated by the right motives; but it is of importance that the community should thoroughly see and know by what motives they really are animated. When we see, then, in political personages, conduct which we think bad, we should probably now-a-days be much nearer the mark if we were to inquire how far it has been brought about by the flatteries of coteries, by spite at some peculiarity in personal position, by jealousy of some compeer to whom higher honours were awarded. A vast amount of such conduct is also the result of defective judgment, prejudice, and erroneous impressions. There may be absolute purity of moral intention, but deplorable infirmity of understanding. Upon the whole, it may be pretty safely assumed that love of approbation now goes farther with public men than the love of money. The courtesy of a glass of wine is more ruinous to contemporary honesty than the glitter of gold. As to generals suspected of selling their armies, the usual fact is, that the man was simply defeated, as one of the two contending parties always must be. Such a thing has happened, we believe, as the selling of a post by a general—witness the case of Arnold; and Pichegru made some advances in a sale of his army to the Bourbons; but the great rarity of authenticated instances of this tremendous treachery, compared with the frequency of the suspicion, shows the latter in a most ridiculous light. Again, editors of literary reviews are capable, we well believe, of allowing both spite and good nature to operate in criticism, and may even be actuated, consciously or unconsciously, by a regard to the interests of parties connected with their publications; but that any one above the very lowest literary, moral, and social rank, would receive a direct bribe, is what we cannot believe; and this simply, because, from what we know of the class, we are sure that such is not amongst the means by which their conduct is to be swayed. With regard to the charge brought against ourselves, we will allow that we may be wrong in entertaining the opinions which we do on the general subject of emigration, and we may have been misled respecting various

countries which we have endeavoured to describe; but, like our compeers, we live a hundred years too late to be accessible to a bribe.

An amusing instance of wild popular suspicion occurred a few years ago to a gentleman who occasionally, for benevolent reasons, gives lectures on popular science in the provinces. He had commenced a series of lectures on one of the physical sciences in a large manufacturing village near Glasgow. It was at the time when Earl Grey, having carried the Reform Bill, was thought to be anxious to restrain the agitation into which the country had been thrown by his great measure. The two first lectures were attended by a large audience, and passed off very satisfactorily to both parties; but when the lecturer appeared for the third time, he found a mere handful of people on the forms. He made no remark at the time; but, on the fourth occasion, finding still fewer in attendance, he asked a member of the managing committee to what he was to ascribe this miserable falling-off. The man hesitated greatly, and for some time could not be induced to give an explanation; but he at length mentioned that the people had contracted a suspicion respecting their lecturer. They had become convinced that he was an emissary sent by the prime minister to beguile them, by means of scientific trifling, from that salutary watch over public affairs which they had long held. If we could describe the village where this occurred, and the humble employments of its inhabitants, the reader would have a good laugh at the idea of the venerable premier taking so much trouble about them. But this is not the only instance we have known of working-men of strong political opinions viewing with jealousy the efforts made by an enlightened philanthropy to improve their intellectual condition. Nor is it the only instance of a minister being suspected of very deep designs for working on popular feeling. We have heard the missionary cause seriously spoken of as a thing got up by Mr Pitt to divert public attention from his mode of carrying on the national affairs. The ludicrous thing here, to all who know what public men really are, is the credit it gives them for a profound policy. The honest folk who suspect such things, little think by how little wisdom, foresight, or reflection of any kind, the world is governed.

These ignorant suspicions are not always of an innocent or ludicrous nature. It must be well remembered with what gallant zeal the medical profession every where exerted themselves, on the occasion of the pestilence of 1831-2, first to soften the violence of the coming blow by precautionary measures, and afterwards to relieve the afflicted. We would say that, if the members of this benevolent profession had never in any other way distinguished themselves by their kindness towards their fellow-creatures, their exertions on that occasion ought to have fixed their character for ever. Yet, what was the feeling with which the lower populace in many places beheld their succourers? A suspicion of the grossest kind. It was believed that the physicians had poisoned the wells for the purpose of creating the disease. This was believed in many villages throughout Russia and Germany—afterwards in Britain—and finally in Spain and Italy; and in all those countries there were violent riots against the medical men, who had often to fly for their lives to places of concealment, while engaged in the very business of relieving the sick. Those men who of all others were doing and suffering most for the people in that hour of their calamity, were in several places hunted like noxious animals, and all this from the suspicion of a kind and degree of guilt such as has never perhaps been proved against any class of men even in the most barbarous times.

Much of this suspicion was probably owing to the mystery in which the medical profession is enveloped. It is a profession which seems to walk in the dark, as far as the common people are concerned. Its language is not the language of common life. The education required for it takes place under circumstances involving a good deal of the horrible. Between medical causes and effects, no relation can be discerned by common eyes. Thus "the doctors" unavoidably become objects of much wild surmise amongst the humbler classes. In particular, no expedients are thought too revolting for them to resort to, in order to obtain subjects for the dissecting-room. A few years ago, on the occasion of the celebrated Burke murders, we had a striking illustration of this tendency to impute all sorts of atrocities to the medical profession. While it was generally acknowledged that the guilt of the two principals was almost too much to have been supposed possible in men even of their wretched class, it was with the same breath more than surmised that the lecturing anatomists who purchased the bodies, had been all along aware of the way in which these were come by, and had thus virtually been the chief cause of the murders. For some time this notion held possession of the minds not only of the humbler classes, but of many others, while more than one journalist used every endeavour to give it plausibility. There was, no doubt, some appearance of a likelihood that the proceedings of the two murderers should have become matter of suspicion to the anatomists; yet how much more likely was it that these gentlemen never did conceive suspicion, than that they, men of good education and respectable position in society, would have been capable of encouraging a system of murder for the mere purpose of obtaining a thing which was not unattainable by innocent means!

If we seek for the causes of these popular suspicions, we shall find the first element in ignorance. Where the mind has no knowledge of other things by which to measure new phenomena, it is almost certain to make great mistakes. Thus, on the occurrence of the cholera morbus, the popular mind, knowing nothing of the natural causes for such a wide-spreading malady, readily ascribed it to one which they could understand, but which was just the most improbable in the world. Thus, also, when the conduct of some person much above their own station is under consideration, the populace, ignorant of the moral standards which exist in the superior class, readily attribute a motive, which, though it might operate in the low sphere, is quite inapplicable in the high one. Other elementary causes are to be found in the common disposition to think the worst where we feel no kind interest for the parties, and in the freaks of imagination when it is let loose without guide or data. There is, however, a peculiar class of cases, where another cause operates. In these, some simple circumstances, such as take place every hour of our lives without any thing coming of them, chance to lead to some great results. A light word, we shall suppose, spoken without any special intention in the private circle of a personage of importance, has a great effect on the face of public affairs. When such a thing happens, the thinking public seems quite unable to imagine or admit that so great a matter can have had a slight cause. There is a disposition to suppose a cause as great and onerous as the result. We then hear of "foul plot" and "base conspiracy," where there was nothing perhaps but the most simple, trivial, and innocent conduct. Many of our readers must have known such circumstances in their own lives, and felt how extremely difficult it was to act under them, as any explanation tracing back the mighty

turmoil to so atomic a cause, was sure to appear ridiculous, and had no chance of being listened to. On such an occasion, it is difficult for one's self to maintain a consciousness of pure intention. One almost feels disposed, like poor Strap when found in an equivocal situation at the road-side inn, to admit that, appearances being so much against us, we must have really been prompted by base motives, although totally unconscious of them at the time.

It may appear scarcely worth while to pay so much attention to this class of popular errors. Truth, however, appears to us of such importance, that we cannot imagine any kind of error unworthy of correction. If our remarks shall have the effect of checking, in but one man, in one instance, the propensity to suspect worse motives than the real ones, or of undeceiving him in any erroneous impressions as to classes of society remote from himself, we shall not consider our labour as thrown away.

GENERAL ACCOUNT OF SAGO.

MANY must have seen sago brought forward as an article of dessert, and more recently seen it used as a component of common bread, without being aware of its natural character, and the peculiar circumstances attending its growth and preparation. The general impression of those who have seen it in its uncooked state, is, that it is a seed. We propose to rectify the common errors, and give some information respecting this article of food.

Sago is derived from the soft interior of a species of palm, which grows in various parts of the East Indies and neighbouring islands. The family of palms, it may be necessary for the bulk of our readers to premise, belongs to a class of trees, of which the fern is a familiar example in this country, which grow, not by concentric circles regularly added every year on the outside, as British trees mostly do, but by additions within, and which are therefore called *endogenous plants*, others being distinguished as *exogenous*. The sugar-cane is a notable example of the endogenous plants, many of which, like that well-known vegetable, have a soft pulpy interior or pith, forming a large proportion of the bulk of the tree. It is a curious circumstance relating to the trees which grow by internal additions, that the seeds of all of them have but one lobe, the seeds of exogenous plants on the contrary having two.

The particular tree from which sago is derived, is denominated, by the natives of the region of its birth, *Sagu*: hence our name for the article, and hence the appellation of *Sagus*, applied by naturalists to a genus of the palm family, to which the sago-bearing tree belongs. There are at least five species, if not a good many more, of the genus *Sagus*, growing in Sumatra, Java, the Moluccas, and the neighbouring continent; but most of these yield the farina in comparatively small quantities, and are not of any importance in that respect. The grand source of sago is the *Sagus genuina*, so named by Labillardiere, the naturalist who accompanied the expedition of La Perouse. He examined it in the Moluccas, where it abounds, and took drawings of it, from which it appears as a handsome but by no means elevated palm, the trunk being about ten feet in height, and the diameter two. The fruit is about the size of a pullet's egg, covered, like our fir-cones, with imbricated scales, reversed—their fixed points being at the top of the fruit. Throughout the Indian Archipelago, the sago-tree is an object of the greatest importance, being the chief source of the food of the people. From that region it has latterly been introduced into our East Indian possessions, where it now grows extensively, particularly in Malabar. It is also reared in Madagascar and the Isle of France, and has even been transplanted to America. Probably there is no tropical country of little elevation in which it could not with care and attention be cultivated. It commonly grows in moist and marshy grounds. There it springs up naturally; its growth is rapid, under the direct rays of the scorching sun, and it speedily attains goodly dimensions. It propagates itself by offsets or shoots, from the roots, which for a time appear only like bushes at the foot of the full-grown trunk; ere long, however, these extend wide, and their stems shoot up like arrows, forming a thick forest. These, on arriving at maturity, are felled; plants soon again spring up, and proceed rapidly through their different stages, until they are again subjected to the axe, and made to yield their alimentary store for the service of man.

Though the fruit, especially its pulpy kernel, and not less the *cabbage*, as it is familiarly called, that is to say, the germ of the foliage at the top of the tree, are very generally esteemed as articles of luxury, yet these do not constitute the richness of the tree. This consists in the farinaceous (mealy) and glutinous pith which constitutes the greatest proportion of the trunk,

and which, as in the bamboo, or the common reed, is arranged in separate sections, and surrounded with a harder encasement. When the palm is ripe, as we have already said, it is felled, and cut as near to the root as possible, that none of the nutritious portion may be lost. All the pith is removed, and by very simple processes is rendered fit for food. When the interior of the trunk is examined, it appears formed of a spongy cellular substance, penetrated by a number of tubes, which in time become tough threads, and consequently differ from the nutritive substance of the spongy cells. When viewed through the magnifier, the small cavities of the cellular tissue are found to be filled with very minute globules of different shapes and sizes, which apparently go to compose the sago; and as our potato, by undergoing the process of being converted into farina or starch, exhibits a fibrous portion as well as the pure starch, so is it with the sago: One portion is nearly pure farina or sago; and the other, the fibrous filaments or thready parts, distinguished by the natives by the name of *da*, is of inferior value, and appropriated to subordinate uses. The former is used by man; the latter is given to pigs, poultry, and inferior animals. When laid aside and left to ferment, it is apt to breed a particular kind of larva, or worm, which is esteemed as a first-rate delicacy in the Moluccas; and also to produce a peculiar species of mushroom, which, according to Sir Thomas Raffles and Mr Craufurd, is very much prized.

The process of manufacture to which the pith is subjected, is somewhat different, as it is intended for native consumption, or meant to be exported to Europe and other temperate and civilised countries. So thoroughly, however, is it prepared by nature for the use of man, that frequently the inhabitants of the islands where it grows do nothing more than cut as many slices as they require from the pith, and roast it, as we do our potatoes, previous to use. And so great is the purity of the fecula, that it will remain for a twelvemonth in the felled tree without spoiling, or undergoing any deterioration. Sometimes it is, much in the same way, preserved in a hollow bamboo. Far more frequently, however, the natives subject it to a process precisely similar in principle, and very much in practice, to that whereby our invaluable potato is converted into farina or starch. The details of the process vary somewhat in the different islands. The following is the account supplied by our countryman Forrest. "The tree, after being cut down, is divided into lengths of five or six feet. A part of the hard wood is then sliced off; and the workman, coming to the pith, cuts across the longitudinal fibres and the pith together, leaving a part at each end uncut, so that when it is excavated there remains a trough, into which the pulp is again put, mixed with water, and beaten with a piece of wood. Then the fibres, separated from the pulp, float at top, and the flour subsides. After being cleared in this way by several waters, the pulp is put into cylindrical baskets made of the leaves of the tree; and if it is to be kept some time, those baskets are generally sunk in fresh water, to keep it moist." When prepared in a larger way, more effective and expeditious methods readily suggest themselves. The trunk being divided into convenient portions, and split asunder by the application of wedges, the sago is scooped out with an instrument resembling an adze. After being reduced to the appearance of saw-dust, water is copiously added in troughs, whereby the meal is separated from the thready filaments, and after resting for a time apart, subsides. The wet meal is now laid on flat wicker baskets to dry; it is then kneaded together, and formed into little cakes, some very small, like our finger biscuits, and others of larger dimensions. These cakes are lastly put into moulds of corresponding size, and baked in the fire. One tree will yield about three or four hundred-weight of this aliment.

The Indian islanders use it in a variety of methods, as we employ our corn, or cereal grains. It is sometimes simply prepared with water as a pottage, or with milk; and sometimes it is made into broth or soup with meat and vegetables. It is sometimes again converted into richer stews, and frequently mingled with their delicious spices and aromatics, as rice with curry. Upon the whole, it is found a most agreeable, as it is a varied and universally used nourishment.

The sago intended for European commerce, though treated on the same principle, is generally, if not always, differently prepared, and this by being *pearled*, as it is called, by methods of which we believe we have no very precise knowledge. So uniformly and beautifully is this process executed, that the art was long taken for nature's work, and the product in this part of the world was universally regarded as the minute seed of some unknown plant. Suspicion was aroused concerning the accuracy of this opinion, on observing that these grains were of different sizes, sometimes as large as a coriander seed, and sometimes, and especially lately, not half the size. Our additional acquaintance with these distant regions has now dissipated the error on this point. As to the details of the process, we still remain in considerable uncertainty. "To bring it to this state," says Mr Forrest, "it must be first moistened, and then passed through a sieve into an iron pot, which enables it to assume a globular form; so that all our grained sago is half baked, and will keep long." Sir Thomas Raffles and Mr Craufurd, again, inform us that it is introduced

into a mill similar to those with which, in France, they *pearl* barley. The account which we have obtained, not from authors, but from private and respectable individuals, is, that the *pearling* is performed chiefly on the sago which is grown in our own Indian possessions; that for accomplishing the purpose it must be sent in its ruder state into China, where the art is alone understood; that thence a large proportion finds its way to the great free port of Singapore, where it is shipped for Europe. That the substantial qualities of sago are in any degree modified or improved by this process, remains to be established. It is possible the farina may be subjected to some additional process of refinement, but little is probably to be effected in this way; and the principal effect, besides the slight baking, appears to be produced in its appearance, rendering it more pleasant to the eye.

The sago of commerce consists of very small, smooth, round grains, of a dull white, or pale rosy hue; it is inodorous, very hard, insipid to the taste, dissolving imperfectly in the mouth, breaking with difficulty, or rather flattening only, under the teeth: it swells and softens in cold water, and in boiling, and always maintains its globular form. It thus differs from most fecule in its consistence, its insolubility, the difficulty of again reducing it to powder, its colour, and tendency to granulate. Like potato starch, it may be preserved for an indefinite period, if kept dry; but if allowed to get damp or wet, it spoils, so that it does not always reach these countries equally pure.

A SIMPLE STORY.

THE following little story derives no interest from any surprising entanglements in the plot, or peculiar romance in the situations. It will, however, we trust, be found somewhat striking as a series of actual and recent occurrences in the life of an individual, while, as it chances, there is not wanting in its conclusion a pretty strong inference in favour of prudent and virtuous conduct.

In a small town, in a certain part of Scotland, there lived some time since a respectable writer or law-agent, whom we shall call Brydon, a widower, with a family of two daughters and one son, all of them grown up. Mr Brydon, like many of his profession, kept up a respectable appearance in society, but in reality had nothing to depend upon except the current proceeds of his business. At his death, which took place rather unexpectedly, he left his daughters entirely dependent on the exertions of their brother, who had been trained to the pursuit of his parent's profession. But the son was not long in following the father to the grave, and the two girls were then without a friend or guide in the world. Necessity compelled them immediately to make an endeavour to support themselves by the use of their needles, and, to do them justice, they set about it actively and ungrudgingly. The elder Miss Brydon, however, was of weakly constitution, and subject to frequent attacks of severe illness, so that the whole burden, almost, of their maintenance, fell on the younger sister, Margaret. She toiled incessantly; yet, let her do what she might, she was barely able to earn enough to procure the mere necessities of life, where its comforts were almost indispensable to the poor invalid. Whether the issue would have been otherwise or not under happier circumstances, it is impossible to say; but, as it was, the elder of the sisters continued to decline until she died.

Alone in the world, friendless and penniless, with a heart weighed down by these successive calamities in her once happy family, Margaret Brydon, then only eighteen years of age, struggled for some time longer to maintain herself in her native place. But she found it a difficult task to live upon sympathy, of which she received a sufficiency, although extremely little real assistance came her way. At length she bethought her of a female relative in England, a cousin of her late father, and a person usually reported to be in wealthy circumstances. With this individual, it is true, Mr Brydon had never kept up any correspondence, and had never mentioned her to his family but as a woman of rude manners and hard heart. Poor Margaret, nevertheless, thought that her destitute condition might awake pity even in the breast of such a being, supposing her to prove to be all that she had been represented. A journey to Nottingham, where this relative resided, was therefore resolved upon, and it was soon accomplished, as Margaret was not burdened with any great effects to render removal difficult.

For three months after her arrival in Nottingham, did Miss Brydon reside with her relative, whom she found to be all and more than her father had said. The old lady, if such a name should be given to her, had started in life as a house-maid, coarse and uneducated, and had ended her career of service as the housekeeper of a

* Forrest's Voyage to the Moluccas.

nobleman, who at his death left her a considerable annuity to subsist upon in her latter days. Her original rudeness of character had only been aggravated by after-habits of petty domestic rule; and although she had asked Margaret to stay with her, she behaved subsequently with such unkindness, as to make life almost insupportable to the poor girl. Finally, a proposal made by the old woman, who added a keen love of money to her other qualities, that Miss Brydon should take upon herself the duties of house-servant at the coming term, brought matters to a point. "Heaven knows," said Margaret to herself, "that I am not unwilling to work! But if I am to maintain myself, I shall at least do it where I may have peace." The result was, that another vicissitude took place in our heroine's condition. She sought one of the great manufacturing establishments of the town, and was fortunate enough to be employed in executing a particular kind of needle-work. She would fain have had it in her power to work in private, but this could not be allowed in the circumstances. A considerable number of other girls were engaged in the same occupation in the establishment, and to their number Margaret joined herself. Happily, the remuneration for that variety of work was respectable in amount, and she was enabled to take a little lodging, and to keep herself above all fear of want.

For some time Miss Brydon pursued her humble occupation without having her fate chequered by any new incident of importance. At length some circumstances occurred, which gave her at first a considerable degree of uneasiness. One of the numerous partners of the establishment, a gentleman in the prime of life, and who chanced frequently to come on business errands to the room where Margaret wrought, began to take particular and unpleasant notice of her. She bore it in silence for a time, trusting that the fancy would be a passing one; but when, on one occasion, he began to praise her in a way which females in good society are not accustomed to, she gently but firmly told him that "such language was disagreeable and painful to her," and begged "him, as he was a gentleman, to desist." Mr Middleton, for such was the merchant's name, started, and stammered out an apology. He had never before heard the sound of Miss Brydon's voice, except in mere monosyllables, and he was surprised at the grace and breeding apparent in her manner and expression. "I—I beg pardon," he stuttered for the third or fourth time, as he retired. Margaret made no other reply than by a gentle inclination of her head.

Mr Middleton did not, however, give up his visits to the work-room of Margaret and her companions. On the contrary, he came thither more frequently than ever, and it was still to the young Scotswoman that he directed his attention, though in a very different style from that used on former occasions. Still he found it very difficult to induce Miss Brydon to enter into conversation, or lay aside the retiring coldness which she had assumed at the first. But his respectful manner and address prevailed ultimately to a certain extent, and so far broke down the barrier of honourable and maidenly reserve as to make him aware that she was of good parentage, and well educated, as well as sensible and intelligent. Things were in this state when Mr Middleton became suddenly ill. He was subject to inflammatory attacks in the chest, and the recurrence of that complaint on this occasion made his friends alarmed lest consumption should follow. On this account he was ordered off, as soon as he could be moved, to Devonshire. Before he went thither, however, he showed how deep was the impression which Miss Brydon had made on his mind, by sending a note to her in the following terms:—"Dear Miss Brydon, you will be aware that I have been ill. I should be the last person to desire that sorrow of any kind should fall to your lot, yet I confess that it would give me pleasure to know that you were sorry for me. I am advised to go for a time to the south of England. Will you permit me to write to you while I am absent? Grant me but this; I do not ask you at present to write to me again. I am," &c. Margaret returned an answer consenting to his request, and briefly expressing her regret for his illness.

While in Devonshire, Mr Middleton wrote once or twice according to his proposition. He described the beautiful scenery of the Devon in his letters, spoke of the excellent effect produced on his health, and expressed a warm wish to be home again, hinting plainly at his resolution then to "ask a peculiar favour" from the reader of his epistles. But foreknowledge is a thing unknown to man. Before Mr Middleton returned to Nottingham, Margaret had left it. Her close application to work had injured her health, and she found it absolutely necessary to allow herself some temporary relaxation. Fortunately, an invitation came to her about this time from one of the few friends with whom she maintained a correspondence in her native place. Margaret took advantage of the opportunity, and was in Scotland when Mr Middleton arrived in Nottingham. He resolved to follow her, and assigning a desire for change of scene as the cause, took upon himself the commercial journey to the north, which had usually been performed for the house by a traveller.

In the course of this route he came to the native town of Miss Brydon. But he knew not the name of the friend with whom she resided, nor could the people of the inn answer his inquiries on the point. He could only hope that chance might cast her in

his way. An hour had scarcely elapsed, when, as he sat at the inn-parlour window, he saw Miss Brydon pass. He sprang up, and followed her. She was greatly surprised to see him. He walked with her a little way, and then entreated her to enter the inn with him, as he could not communicate to her on the street all that he wished to do. Margaret demurred. "My dear Miss Brydon," said the gentleman, "do not refuse me this. I will ask the landlady to be present with us. Your delicacy of feeling is too precious to me to be treasured upon by any act of mine." The young lady at length consented, and in the course of a few minutes longer she had given her promise to become the wife of Mr Middleton.

The accepted lover of our heroine had to complete his commercial rounds, and it was settled that, immediately after his return to Nottingham, he should send for his bride and present her to his friends. But Mr Middleton only reached Nottingham to suffer another attack of his former complaint, and the first tidings which poor Margaret received from him were dated from Devonshire, whither he had again been sent. Instead of being summoned to a happy marriage, Miss Brydon was called upon by her betrothed to come instantly to England, that he might see her *once again* before he died. "Take any conveyance—four horses if necessary; think not of expenses, but come—come with speed." Such was the close of the letter. Margaret hesitated not a moment to comply with its demands. But the journey, however speedily performed, was a long one, and she did not arrive there until two hours after Mr Middleton had breathed his last!

This was a serious trial for the poor girl. She was a being alone in the world; and just as the hope was held out to her of having a strong support to lean upon—a strong arm to guide her for life—her prospects were at once and most painfully blighted. Her affection for Mr Middleton had been of the temperate kind founded upon friendly and grateful esteem, but her regret was not the less sincere. She was, however, of that gentle and patient temperament, which makes no violent display of feeling, and, by bending, perhaps escapes in part the force of the blast. Her deceased lover had left a small sum to be delivered to her—all that his hurried illness left at his command—under the plea of paying her expenses in coming to him, and she received also an open letter, which it was his wish that she should present in person to his mother. This paper described the situation in which Margaret and he had stood, and requested Mrs Middleton to be kind to her. After wetting with a tear her lover's new-made grave, Margaret slowly returned to Nottingham, ill at ease both in mind and body. The old lady *did* speak kindly to her when she called with the letter, and wished to see her again. But Miss Brydon had resolved to go back for a time to her native place, and there remain in quiet, till her mind had recovered from the late shock, and her frame had renewed its exhausted strength.

She fulfilled her intention, and staid in Scotland for several months. Both her strength and spirits were gradually recruited; and well it was that the case stood so, as she saw no course before her but that of returning to daily toil. She was just hesitating in what field to resume her honest endeavours, when she met accidentally, at a friend's house, a lady from Nottingham, who, on learning her wish to get employment for her needle, pressed her anxiously to return to that town. "I know various establishments where I am sure I can procure you good employment at once." Margaret told the lady of her having been there before, but disclosed nothing further, as well from sensitiveness of feeling as from prudence. The issue was, that she accompanied the lady soon after to England. "I am certain," thought Margaret, "of making there a peaceable living. Few can know my story; nor could they extract from it, if they did, any thing to my disadvantage." With these thoughts Margaret again entered Nottingham, and her friend immediately set about getting an engagement for her. It has just been mentioned that she did not relate the particulars of her former stay in the town to the lady, nor had she told the names of her former employers. Strange to say, these were the very parties to whom the lady went, and from whom she obtained a promise of ample employment for the young Scotswoman. When she came to Miss Brydon, and told her that she would have for her masters the house of Boyle, Middletons, and Co., our poor heroine was startled and stunned. But she soon regained her composure. "Why should I be unwilling to go there again?" she reasoned internally; "to be sure I might have borne a very different place—but it is silly to recall such thoughts. These people can know nothing of which I have reason to be ashamed. They will perhaps even be kinder to me than others might be. Yes, it would be weakness to refuse the offer." By exerting this quiet firmness of mind, Margaret gained the victory over the feelings at first awakened in her breast. She returned to work in the place where she had formerly been. In doing so, she was little aware of the happy consequences which were to follow therefrom.

The lady who brought Margaret to England did not rest satisfied with merely procuring work for her. She introduced her young protégée to all her friends, and, among others, caused her to meet the Middletons, the mother and brothers of the late Mr Middleton. Previously to this, Margaret had seen the necessity of informing the kind lady of her whole history, or rather gratitude had prompted the disclosure. The Middletons were very kind to the object

of their late relative's affection. They even pressed her to come and reside with them, but Margaret preferred her honourable independence; and the only request she preferred to them was, that she should be allowed to work in private. Her conduct did not go unrewarded. It was the cause of attracting to her the especial notice of the younger Mr Boyle, a junior partner of the house. He met her occasionally in the evenings, when her toil was done, at the house of her friend, and ultimately he made her an offer of his hand and fortune. It was accepted.

We are not now speaking of things of a musty date. Margaret Brydon's marriage was seen by us in the columns of a newspaper but a few days ago. We earnestly trust that her future career will be as happy as its commencement has been discreet, modest, and honourable.

IMPROVEMENTS IN THE FRENCH SYSTEM OF POSTAGE.

FROM A CORRESPONDENT IN PARIS.

THERE is no department of public business in France, in which more improvements have taken place within a few years, than the Post-Office, and certainly none in which the national pride which opposes itself to copying the improvements of other countries, has been so little allowed to prevail. Ten years ago, the communication by post with many parts of the south and west of France was only on three or four days of the week; it is now every day. The communication with England was only four days weekly, and letters were sixty hours on the road, whereas the communication is now daily, with the exception of one day, arising from there being no receipt or departure of letters from London on the Sunday; and instead of sixty hours, letters are only thirty-six hours on the road. On nearly all the roads leading to great commercial towns, such as Bordeaux, Marseilles, Rouen, and Havre, the former speed by *Malle Poste*, of little more than six English miles per hour, has been exchanged for the *Estafette* speed of ten miles, and occasionally more. A letter dispatched from Paris, at 6 o'clock in the evening, arrives at either Boulogne or Havre on the following morning at 8 or 9 o'clock, whereas a few years ago it did not reach in time for an answer to be sent on the same day. In what is called the rural post, the melioration has been equally great. In many villages of considerable size there was no delivery at all, and the inhabitants were compelled to send for their letters to the next post-town; and in others the letter-carrier arrived only twice or three times a week. Now, almost every village has its daily delivery. In Paris, the delivery of letters, which was frequently at as late an hour of the day as 2 o'clock in the afternoon, now takes place, owing to the better regulated arrival of the mails, and the use of omnibuses for the carriers, similar to those of the English General Post-Office, at 8 or 9 o'clock in the morning, and it was even earlier, but as many of the porters were not up when the distribution took place, as it did at 7 o'clock in the morning in the summer season, the hour was changed. In the departure of letters there has also been great melioration, although it falls short of the perfection of the delivery. A few years ago, no letter could be sent to England unless the postage was paid, and 2 o'clock in the afternoon was the latest hour at which they could be received. Now they need not be paid beforehand, and paid letters are received until 4 o'clock, and unpaid letters until 5 o'clock. The latter hour is, however, too early for the receipt of letters, as merchants do not leave the *Bourse* until nearly 5 o'clock, when they have not time to prepare their letters for the same day. For the accommodation of commercial men, the hour of departure for the mails ought to be changed from 6 o'clock to 7, and letters ought to be received at the General Post-Office, as in London, up to within half an hour of the making up of the bags. Looking, however, at what was formerly the case, the improvement is very great.

The changes which have taken place have not been accomplished without difficulty, particularly as regarded the intercourse with England. The first serious attempt to improve the Post-Office communication between the two countries, was during the postmastership of the Duke of Richmond. The noble duke was not well seconded by the chiefs of his department, and he had also to struggle against the influence of the late Mr Rothschild, whose system of expresses and exclusive information was to be destroyed by the projected change. Under the old mode of communication, Mr Rothschild received expresses from Paris a day earlier than the arrival of letters by post; and persons who could not, like him, bear an expense of thirty pounds for an express, were compelled to leave

him in possession of the field for twenty-four hours, whilst on two days of the week he had not even the Post-Office delivery to fear, so that a single express would sometimes give him an advantage of two days. The resistance of Mr Rothschild, therefore, was very natural; for by the proposed improvement, any person receiving a letter by the post would be on a footing with him, and he could no longer act upon the funds with intelligence which others could not receive until his purpose had been served. Whether the influence of this great capitalist in Paris was one of money or credit, I will not attempt to determine; but having been engaged in two missions with a view to bring about the desired change, I know that some influence was strongly exercised, and that it required all the energy of the Duke of Richmond to contend against interested motives abroad, and indifference at home. It was not until the merchants generally in London and Paris exerted themselves strenuously, that the object could be attained.

The great melioration of the roads in France, many of which have been macadamised, the substitution in some of them of light four-wheeled carriages, carrying no passengers except the courier,* and on others of new Malle-Postes constructed for speed, for the old Malle-Postes, have effected wonders in the Post-Office service as to time; and although this might still be shortened, there are no complaints respecting it. This is not the case, however, as to the charge for postage, which is very high. The inland postage will not indeed appear enormous to the English reader, when informed that for a letter from Rouen to Paris, a distance of 80 miles, only eight sous, or 4d. English, is charged; and from Boulogne to Paris, a distance of 130 miles, only ten sous, or 5d. English; but as the postage is here charged by weight, and as the simple postage, as it is called, is only applicable to a small and thin sheet of paper, and rapidly increases if there be an enclosure or two, the tax becomes very heavy in France when compared with the gains of persons in trade. From London to Paris, the postage of a letter on thin paper and without enclosures, is forty sous, or 1s. 8d. English; a single sheet of common Bath post costs fifty sous, or 2s.; and a sheet of superior thick post paper is charged three francs, or half-a-crown. Even at the lowest rate of charge, a father writing to his son in Paris once a-week, and receiving an answer weekly, incurs an annual charge of L.7. In former days, when the postage was even higher than it is now, and the Post-Office authorities were less delicate than they now are as to the sacredness of correspondence, an English gentleman published the following caution, and which was more valuable for its moral than its poetry, in an English newspaper:—

When sending to France, it is better and safer
To write on thin paper and seal with a wafer.
If you write on thick paper, there's the d—l to pay,
And wax can be melted to learn what you say.

The *Bureau Noir*, in which letters were opened by means of an ingenious process, by first copying the impressions and melting the wax, then resealing, and causing the letter to appear as if it had not been opened, for the purpose of political persecution, or amusing the court with the secrets of correspondents, is now, much to the honour of the government, abolished; consequently, the advice contained in the foregoing lines as to the mode of fastening letters, is superfluous; but it is still good as to the paper on which English correspondents should write.

There are many other meliorations of the French Post-Office, which can only be appreciated by persons residing in France. The letter-carriers, though they receive but small salaries, are now selected with much greater care than formerly, and allowed to retain many legitimate perquisites, by which the remuneration is so increased that there is no temptation to dishonesty. Amongst their perquisites is the supply of almanacks to the houses in their delivery; the price is left to the generosity of the purchaser, and is proportioned to the civility of the carrier. There are some carriers who realise as much as a thousand francs a-year from this source. The rapidity with which an ill-directed letter finds its way, is not the least admirable of the arrange-

* These carriages are called *Estafettes*. Within the last four months, another improvement has taken place by the introduction of a new description of mail coaches carrying passengers, but which are much lighter than the old *Malle Poste*. The new carriages are already running on the roads to Bordeaux, Caen, Strasbourg, and Lyons. They are drawn by four horses, and driven by a coachman as in England, many serious accidents having occurred by the postilion system. On the three first named roads, the carriages are in the form of a *coupe*, to contain three passengers, the courier sitting behind in a covered seat; the number of persons conveyed, therefore, including the driver, is five. On the Lyons road, the shape of the *Malle Poste* resembles the berlin, and four passengers are accommodated. The weight of the dispatches, and the luggage of the passengers, with that allowed for merchandise as a gratuity to the courier, varies from 800 to 1400 pounds. The relays are supplied by the postmasters, who receive a slight addition to the sum formerly paid, in order that they may provide a lighter and faster description of horses than those used for the ordinary posting. The rate of speed is regulated, according to circumstances, at from eight to ten miles per hour.

ments of the French Post-Office. I have seen a letter which had been handed from district to district for inquiries, until it had been through at least ten districts, and travelled over as many miles, reach its destination within four or five hours of the time at which it would have been delivered if there had been no error in the address. Other points worthy of praise might be noticed, but all the improvements and advantages are thrown into the background by one great evil—the high rate of postage, in which no change has taken place, but which we have now reason to believe will be immediately lowered to an uniform low charge as soon as the working of the new system in England shall have brought forth its results.

The important question of a uniform rate of postage was brought under consideration here, almost immediately after the appearance of Mr Rowland Hill's plan in England, and at once found favour with the authorities, who are only waiting for some experience as to the machinery, and an accurate idea of the real amount of postage which would defray the expenditure, to introduce a change in France. M. Piron, the sub-director of the General Post-Office, has published a pamphlet, in which he proposes that the tax upon single letters (letters within the prescribed weight) should be uniformly one *decime* (a penny), within the limits of the department in which they are forwarded; and two *decimes* for any other distance in France, however great; and that there should be stamped covers, the weight of which is not to be charged; and that, in the first instance, the use of these covers, although to be strongly recommended, shall not be compulsory; it is to become so, however, after a certain time. He also proposes that there shall be a double service for the large towns, the interests of which would be promoted by a day post. It is a curious fact that the idea of stamped covers, which has been regarded as new in England, was adopted in France as long ago as the year 1653. In that year a M. Velayer obtained from the government the privilege of placing letter-boxes in various parts of Paris, into which letters were dropped, which were taken out three times a-day by his agents, and delivered without charge to the persons to whom they were addressed. In order to secure the delivery of these letters, they were put under stamped covers or bands, purchased at the rate of one sous each, at an office established for that purpose by M. Velayer. In those early days of correspondence by letter, when the number of letter-writers was comparatively small, the plan of M. Velayer did not succeed, and it was not until the year 1759 that the Paris *petite poste* was regularly established. Nothing, however, could be more absurd than to argue unfavourably of the plan now proposed in these days of increased population and multiplied intercourse, because it was not successful nearly two hundred years ago. The omnibus is not a new invention; and there are persons who, when it was revived a few years ago, predicted its failure, because it had been abandoned by our ancestors: yet it is now become almost as great a necessity as our daily food.

One of the objections to a low uniform postage in France—and the same was said in England—is, that the receipts will not be in proportion to the increased expenditure. The same was said, however, of the proposal to establish a daily communication in France with those towns which had previously received letters only three or four times a-week. Let us see what the result has been. The increased expense of this service was 3,000,000 francs annually; in a single year, 1828, there was an increase of 2,500,000 francs in the receipts, leaving a deficiency of only 500,000 francs; in 1830 there was a further increase of 3,000,000 francs for the two years, an additional increase of 1,000,000 francs from 1830 to the end of 1832, and a still further increase of 4,557,000 francs for the four years ending in 1836. On the rural service, which for many reasons presented less chance of success, the result has been equally favourable. In less than nine months from its commencement in 1829, the receipts had increased 3,000,000 francs. These are very encouraging facts for the advocates of the proposed change in other countries, and we may corroborate them by referring to what has taken place in the establishment of the omnibus communication in the French capital; for the increase of epistolary correspondence, like that of persons, must depend upon the reduced rate at which it can be obtained. On a single line of omnibus in Paris, between four and five thousand persons are conveyed daily at an expense of six sous each, and there are ten or twelve other lines, averaging each, at least, from twelve to fifteen hundred persons per day, and yet the number of hackney coaches and cabriolets has not decreased. All this, therefore, is an addition to the former circulation, arising from diminished expense.

M. Piron, whose long experience renders him a competent authority, considers that the number of letters would be increased to an almost incredible extent if the rate of postage were reduced, and he takes a similar line of argument to that which I have attempted above. He states that in twenty years, from 1816 to 1836, the tax of one-tenth upon the proprietors of diligences, and other carriages conveying passengers, increased from 1,669,367 francs to 4,305,369 francs, being nearly triple, although there had been no reduction in the charge, thus showing the growth of communication, whilst in the same period the net revenue of the Post-Office had only risen from 19,825,800 francs to 35,600,000 francs.

The advantages which may be expected to arrive

from a low uniform rate of postage, and the introduction of stamped covers, in France, are thus summed up by a French journal:—

"A great boon to the commercial public, and, in particular, to the poorer classes, who have now no means of communication except by a pecuniary sacrifice which their means will ill afford.

A pecuniary advantage even to the revenue, the receipts of which would be augmented in the end, although, for a short time, they might not be in proportion with the increase of expenditure.

An increase of rapidity in the Post-Office department, by the use of stamped covers, and a diminution of error on the part of the employes.

A great diminution in the number of rejected letters, prospectuses, &c., now refused, the postage not having been paid, and which are generally called *lettres d'attrappe*.

A cessation of the demoralising temptation which presents itself to clerks and porters, who, instead of paying the postage of the letters which they are charged to pay for at the Post-Office, put the money into their pockets, and throw the letters into the box."

A CONVERSATION WITH AN ENGLISH PEASANT.

In a paper on the state of the peasantry in the county of Kent, contained in the third volume issued by the Central Society of Education, and to which we lately referred in our articles "the Kent Disturbances," the writer reports a conversation which he had with a peasant of that district, very remarkable in its nature, and calculated to be of some service at the present time:—

"To show how great is the ignorance existing regarding the rights of property, and of the advantages accruing to all from a sacred observance of those rights—and, at the same time, by how simple a process that ignorance, as well as the ill feeling towards the wealthy classes resulting from it, may be in great part removed—I subjoin the following anecdote. Talking one day with some men in the ville of Dunkirk in Kent, I observed, it was a pity there were no gentry in the neighbourhood. 'Well,' said one fellow, 'for my part I see no good they are to us; all they do is to make hard laws to grind us down. There was my poor brother clapt into prison, and his wife and family left to starve, all because he had killed a few hares.' 'Well,' said I, 'what right had he to kill other persons' hares?' 'Other persons, indeed! why weren't they as much his as another's?' 'Because he had no property in the land which fed them.' 'Ay, that's just it, but he ought to have had though.' 'How! do you mean to say that every body ought to have land?' 'Yes, to be sure I do. Look here now: didn't God give the land to all?' 'Well, what of that?' 'Why, then, a few can't have a right to the whole of it?' 'But I say they may.' 'Then how do you make out that?' 'Suppose every man had had his share, I suppose you'll allow he had a right to do what he liked with it?' 'Why, yes; I can't say no to that.' 'Well, then, suppose one man wishes to sell his share, and another wishes to buy it, they would have a right to do so.' 'Why, yes; no doubt of that.' 'Well, suppose, after that, the buyer saves up more money, and sets up a shop, and clears a good deal, and other men see what he is doing and want to do the same, but they have no money, and they offer their land to him, and he buys it; has he not a right to do so?' 'Yes, to be sure, if he gives them the money for it.' 'Well, then, you see here is a man who has got a good deal of land, and others have lost theirs, and you own it's all right?' 'Ay, ay, that's all well enough; but our squires didn't all get their land in that way.' 'Perhaps not, but then those they got it from did.' 'But if a man makes money and buys land, hasn't he a right to leave it to his children, or to any body else he chooses?' 'Why, I can't say but what he has.' 'So, my friend, you see one man may have half a county, and another not half an acre, and yet the last has no fair right to complain.' 'Why, sir, to be sure you do make it out somehow, there's no denying that; but then it's a hard case one man's good should be another man's harm.' 'But it is not: suppose a rich man were to come and build a cotton-mill in your neighbourhood, and your children could earn 10s. a-week each in it, you wouldn't think there was much harm in that?' 'Harm! no, indeed; it would be the best thing ever happened to us; for you see, sir, we are often puzzled to get work here.' 'Well, but how much would it take to build such a mill and fit it up with machinery?' 'Why, I can't tell; but I suppose a good deal.' 'Then I can tell you a very moderate sized one would cost L.20,000.' 'Indeed! that's a main sum!' 'Do you think the poor people in any place could ever club such a sum together?' 'Never, sir; not if they lived to the age of Adam, and tasted nothing stronger than water.' 'So, then, if the rich man didn't come and build the mill, the poor people never could do it.' 'No, that's certain.' 'Then you see the wealth of the rich man in this case is a real advantage to the poor?' 'To be sure it is, sir; and I was quite a fool like not to see it before.' 'But did you never read of such things?' 'No, never, sir.' 'Did you ever see the Penny Magazine?' 'No, can't say as I ever did.' 'But you read the newspaper?' 'No, I can't say as I can undertake for that; but I read a little in the Testament.' 'But you talk of these things with your neighbours?' 'No, sir, not much of that; you see, sir, though some of us are 'cute enough in some things, we aren't quite up to what you have been talking of, and there ain't no one here as can talk of these things to us.'"

The author, after producing various instances of the prevalence of superstition among the peasantry (such as belief in witchcraft and supernatural influences), concludes by observing—"And yet some persons are alarmed at what they term the over-education of the people! They may be perfectly easy on that score! If ever the rights of property shall be violated, and the progress of

civilisation checked by a servile war in this country, the disaster will come, not from the education of the lower classes, but their want of it; not from their knowledge, but their ignorance; an ignorance mainly chargeable, and therefore righteously visited, upon those who, called upon by the station they hold in the country to forward the cause of education amongst the people, have selfishly in some instances, ignorantly in others, and in all unwisely, shrunk from the performance of their noblest duties."

HARRY LORREQUER.

"CONFESSIONS OF HARRY LORREQUER" is the title given to a series of papers at present in course of publication, in monthly numbers, after the *Pickwick* fashion, and illustrated, in like manner, by engravings from the burin of the artist whose pleasure it is to be known by the name of Phiz.* The Confessions, as their title indicates, profess to give a narrative of the personal adventures of the writer, though it is pretty obvious that this form of composition has been adopted merely as a convenient one for stringing together a succession of sketches of a very varied kind, the scene of which shifts hither and thither, with great and enlivening rapidity. Ireland is the locality, however, in which the chief incidents of the earlier numbers are supposed to take place, and in this portion of the work the author has displayed much graphic humour, of that strong and salient kind which was unknown in our literature from the days of Smollett till those of Boz. The vein of Lorrequer, though not original in any marked degree, is vigorous, rich, and racy, and the general effect is admirably aided by the illustrations. We select the following coach adventures as a specimen of the work, principally because they chance to be readily comprehensible in a detached form.

Harry Lorrequer, Esq., subaltern in the —th regiment of foot, is about to start from Dublin for Kilkenny, in order to rejoin his regiment after leave of absence. His friend Tom O'Flaherty presses him much to stay in Dublin a few days longer; "but (says Lorrequer) I mentioned the necessity of my at once proceeding to head-quarters, and all other reasons for my precipitancy failing, concluded with that really knock-down argument, 'I have taken my place.' This, I need scarcely add, finished the matter—at least I have never known it fail in such cases. Tell your friends that your favourite child is in the measles—your best friend waiting your aid in an awkward scrape—your one vote only wanting to turn the scale in an election. Tell them, I say, each or all of these, or a hundred more like them, and to any one you so speak, the answer is—'Pooh, pooh, my dear fellow, never fear—don't fuss yourself—take it easy—to-morrow will do just as well.' If, on the other hand, however, you reject such flimsy excuses, and simply say, 'I'm booked in the mail,' the opposition at once falls to the ground, and your quondam antagonist, who was ready to quarrel with you, is at once prepared to assist in packing your portmanteau.

Having soon satisfied my friend Tom that resistance was in vain, I took an early dinner with him at Morrisson's, and we chatted away over old times and old friends, forgetting all else but the topics we talked of, till the timepiece over the chimney first apprised me that two whole hours had gone by, and that it was now seven o'clock, the very hour the coach was to start. I started up at once, and, notwithstanding all Tom's representations of the impossibility of my being in time, had dispatched waiters in different directions for a jarvey, more than ever determined upon going; so often is it that when real reasons for our conduct are wanting, any casual or chance opposition confirms us in an intention which before was but uncertain. Seeing me so resolved, Tom at length gave way, and advised my pursuing the mail, which must be now gone at least ten minutes, and which, with smart driving, I should probably overtake before getting free of the city, as they have usually many delays in so doing. I at once ordered out the 'yellow post-chaise,' and before many minutes had elapsed, I started in pursuit of his majesty's Cork and Kilkenny mail-coach.

"Which way now, your honour?" said a shrill voice from the dark—for such the night had already become, and threatened, with a few heavy drops of straight rain, the fall of a tremendous shower.

"The Naas road," said I; "and, harkye, my fine fellow, if you overtake the coach in half an hour, I'll double your fare."

"Ay, ay, I'll do my endayavour," said the youth; at the same instant dashing in both spurs, we rattled down Nassau Street at a very respectable pace for harriers. Street after street we passed, and at last I perceived we had got clear of the city, and were leaving the long line of lamp-lights behind us. The night was now pitch dark. I could not see any thing whatever. The quick clattering of the wheels, the sharp crack of the postilion's whip, or the still sharper tone of his 'gee hup,' showed me we were going at a tremendous pace, had I not even had the experience afforded by the frequent visits my head paid to the roof of the chaise, so often as we bounded over a stone, or splashed through a hollow. Dark and gloomy as it was, I constantly let down the

window, and with half my body protruded, endeavoured to catch a glimpse of the 'chaise,' but nothing could I see. The rain now fell in actual torrents; and a more miserable night it is impossible to conceive.

After about an hour so spent, he at last came to a check, so sudden and unexpected on my part, that I was nearly precipitated, harlequin fashion, through the front window. Perceiving that we no longer moved, and suspecting that some part of our tackle had given way, I let down the sash, and cried out, 'Well now, my lad, any thing wrong?' My question was, however, unheard; and although, amid the steam arising from the wet and smoking horses, I could perceive several figures indistinctly moving about, I could not distinguish what they were doing, nor what they said. A laugh I certainly did hear, and heartily abused the unfeeling wretch, as I supposed him to be, who was enjoying himself at my disappointment. I again endeavoured to find out what had happened, and called out still louder than before.

"We are at Ra'coole, your honour," said the boy, approaching the door of the chaise, 'and she's only beat us by half a mile.'

"Who the deuce is she?" said I.

"The mail, your honour, is always a female in Ireland."

"Then why do you stop now? You're not going to feed, I suppose?"

"Of course not, your honour, it's little feeding troubles these bastes, any how, but they tell me the road is so heavy we'll never take the chaise over the next stage without leaders."

"Without leaders!" said I. "Pooh! my good fellow, no humbugging, four horses for a light post-chaise and no luggage; come get up, and no nonsense." At this moment a man approached the window with a lantern in his hand, and so strongly represented the dreadful state of the roads from the late rains—the length of the stage—the frequency of accidents, latterly from under-horsing, &c. &c., that I yielded a reluctant assent, and ordered out the leaders, comforting myself the while, that considering the inside fare of the coach I made such efforts to overtake, was under a pound, and that time was no object to me, I certainly was paying somewhat dearly for my character for resolution."

After a long journey farther, "At last the altered sound of the wheels gave notice of our approach to a town, and after about twenty minutes' rattling over the pavement, we entered what I supposed, correctly, to be Naas. Here I had long since determined my pursuit should cease. The arrival of a chaise and four at a small country town inn, suggests to the various employes therein any thing rather than the traveller in pursuit of the mail; and so the moment I arrived, I was assailed with innumerable proffers of horses, supper, bed, &c. My anxious query was thrice repeated in vain, 'When did the coach pass?'

"The mail," replied the landlord at length. 'Is it the down mail?'

Not understanding the technical, I answered, 'Of course not the Down—the Kilkenny and Cork mail.'

"From Dublin, sir?"

"Yes, from Dublin."

"Not arrived yet, sir, nor will it for three quarters of an hour; they never leave Dublin till a quarter past seven; that is, in fact, half-past, and their time here is twenty minutes to eleven."

"Why, you stupid son of a boot-top, we have been posting on all night like the wind, and all this time the coach has been ten miles behind us."

"Well, we've cotch them any how," said the urchin."

One would have thought it enough of mischance for once in the coaching way, to have been laughed at by a rascal of a post-boy, and compelled, for his benefit and that of his confederates on the road, to post on with four horses, in the vain hope of overtaking what was all the time behind; but Mr Lorrequer's misadventures were not yet over, and we only stop the course of the narrative to inform the reader, that the Dr Finucane, afterwards mentioned, was a mighty pleasant, jolly, fighting Irishman, once on a time surgeon to the North Cork Militia, with whom it had been our hero's fortune formerly to get acquainted. This being premised, our readers are to suppose the mail at length come up, and Lorrequer safely lodged inside of it, secure from the storm of the night, and with one unknown person for a companion, about whom the guard could tell nothing save that he was "a real queer chap," who would fain have had the whole inside seats to himself, and had two paper parcels with him, over which he seemed to watch like a hawk. After getting into the coach, where all was pitch dark, Lorrequer made the remark that "the night was severe."

"Mighty severe," briefly and half crustily replied the unknown, with a richness of brogue that might have stood for a certificate of baptism in Cork or its vicinity.

"And a bad road too, sir," said I, remembering my lately accomplished stage.

"That's the reason I always go armed," said the unknown, clinking at the same moment something like the barrel of a pistol.

Wondering somewhat at his readiness to mistake my meaning, I felt disposed to drop any further effort to draw him out, and was about to address myself to sleep, as comfortably as I could.

"I'll just trouble ye to lean aff that little parcel there, sir," said he, as he displaced from its position beneath my elbow, one of the paper packages the guard had already alluded to.

In complying with this rather gruff demand, one of my pocket pistols, which I carried in my breast pocket,

fell out upon his knee, upon which he immediately started, and asked hurriedly, 'And are you armed too?'

"Why, yes," said I, laughingly; 'men of my trade seldom go without something of this kind.'

"I was just thinking that same," said the traveller, with a half sigh to himself.

Why he should or should not have thought so, I never troubled myself to canvass, and was once more settling myself in my corner, when I was startled by a very melancholy groan, which seemed to come from the bottom of my companion's heart.

"Are you ill, sir?" said I, in a voice of some anxiety.

"You may say that," replied he, 'if you knew who you were talking to—although may be you've heard enough of me, though you never saw me till now.'

"Without having that pleasure even yet," said I, 'it would grieve me to think you should be ill in the coach.'

"May be it might," briefly replied the unknown, with a species of meaning in his words I could not then understand. 'Did ye never hear tell of Barney Doyle?' said he.

"Not to my recollection."

"Then I'm Barney," said he, 'that's in all the newspapers in the metropolis; I'm seventeen weeks in Jervis-street hospital, and four in the Lunatic, and the devil a better after all. You must be a stranger, I'm thinking, or you'd know me now.'

"Why, I do confess I've only been a few hours in Ireland for the last six months."

"Ay, that's the reason; I knew you would not be fond of travelling with me, if you knew who it was."

"Why, really," said I, beginning at the moment to fathom some of the hints of my companion, 'I did not anticipate the pleasure of meeting you.'

"It's pleasure ye call it; then there's no accountin' for tastes, as Dr Colles said, when he saw me bite Cusack Rooney's thumb off."

"Bite a man's thumb off!" said I, in a horror.

"Ay," said he with a kind of fiendish animation, 'in one chop; I wish you'd see how I scattered the consultation; begad, they didn't wait to ax for a fee.'

Upon my soul, a very pleasant vicinity, thought I. 'And may I ask, sir,' said I, in a very mild and soothing tone of voice, 'may I ask the reason for this singular propensity of yours?'

"There it is now, my dear," said he, laying his hand upon my knee familiarly, 'that's just the very thing they can't make out; Colles says it's all the cerebellum, ye see, that's inflamed and combusted, and some of the others think it's the spine; and more, the muscles; but my real impression is, the devil a bit they know about it at all.'

"And have they no name for the malady?" said I.

"Oh sure enough they have a name for it."

"And, may I ask —"

"Why, I think you'd better not, because ye see, maybe I might be troublesome to ye in the night, though I'll not, if I can help it; and it might be uncomfortable to you to be here, if I was to get one of the fits."

"One of the fits! Why, it's not possible, sir," said I, 'you would travel in a public conveyance in the state you mention; your friends surely would not permit it?'

"Why, if they knew, perhaps," slyly responded the interesting invalid, 'if they knew, they might not exactly like it; but, ye see, I escaped only last night, and there'll be a fine hubbub in the morning, when they find I'm off; though I'm thinking Rooney's barking by this time.'

"Rooney barking, why, what does that mean?"

"They always bark for a day or two after they're bit, if the infection comes first from the dog."

"You are surely not speaking of hydrophobia?" said I, my hair actually bristling with horror and consternation.

"Ayn't I?" replied he; 'may be you've guessed it though.'

"And have you the malady on you at present?" said I, trembling for the answer.

"This is the ninth day since I took to biting," said he gravely, perfectly unconscious, as it appeared, of the terror such information was calculated to convey.

"And with such a propensity, sir, do you think yourself warranted in traveling in a public coach, exposing others —"

"You'd better not raise your voice that way," quietly responded he; 'if I'm roused, it'll be worse for ye, that's all.'

"Well but," said I, moderating my zeal, 'is it exactly prudent, in your present delicate state, to undertake a journey?'

"Ah," said he, with a sigh, 'I've been longing to see the fox-hounds throw off, near Kilkenny; these three weeks I've been thinking of nothing else; but I'm not sure how my nerves will stand the cry; I might be troublesome.'

"Upon my soul," thought I, 'I shall not select that morning for my debut in the field.'

"I hope, sir, there's no river or water-course on this road—any thing else I can, I hope, control myself against; but water—running water particularly—makes me troublesome."

Well knowing what he meant by the latter phrase, I felt the cold perspiration settling on my forehead, as I remembered that we must be within about ten or twelve miles of Leighlin Bridge, where we should have to pass a very wide river. I strictly concealed this fact from him, however, and gave him to understand that there was not a well, brook, or rivulet, for forty miles on either side of us. He now sank into a kind of moody

silence, broken occasionally by a low muttering noise, as if speaking to himself. What this might portend, I knew not—but thought it better, under all circumstances, not to disturb him. How comfortable my present condition was, I need scarcely remark—sitting opposite to a lunatic, with a pair of pistols in his possession—who had already avowed his consciousness of his tendency to do mischief, and his inability to master it; all this in the dark, and in the narrow limits of a mail-coach, where there was scarcely room for defence, and no possibility of escape. How heartily I wished myself back in the coffee-room at Morrison's, with my poor friend Tom!—ay, even the outside of the coach, if I could only reach it, would, under present circumstances, be a glorious alternative to my existing misfortune. What were rain and storm, thunder and lightning, compared with the chances that awaited me here?—wet through I should inevitably be, but then I had not yet contracted the horror of moisture my friend opposite laboured under. 'Ha! what is that—is it possible he can be asleep—is it really a snore? Heaven grant that little snore be not what the medical people call a premonitory symptom—if so, he'll be in upon me now in no time. Ah, there it is again; he must be asleep surely; now then is my time or never.' With these words, muttered to myself, and a heart throbbing almost audibly at the risk of his awakening, I slowly let down the window of the coach, and stretching forth my hand, turned the handle cautiously and slowly; I next disengaged my legs, and by a long continuous effort of creeping—which I had learned perfectly once, when practising to go as a boa constrictor to a fancy ball—I withdrew myself from the seat, and reached the step, when I muttered something very like a thanks-giving to providence for my rescue. With little difficulty I now climbed up beside the guard, whose astonishment at my appearance was indeed considerable—that any man should prefer the out to the inside of a coach, in such a night, was rather remarkable; but that the person so doing should be totally unprovided with a box-coat, or other similar protection, argued something so strange, that I doubt not, if he were to decide upon the applicability of the statute of lunacy to a traveller in the mail, the palm would certainly have been awarded to me, and not to my late companion. Well, on we rolled; and heavily as the rain poured down, so relieved did I feel at my change of position, that I soon fell fast asleep, and never awoke till the coach was driving up Patrick Street. Whatever solace to my feelings reaching the outside of the coach might have been attended with at night, the pleasure I experienced on awaking was really not unalloyed. More dead than alive, I sat a mass of wet clothes, like nothing under heaven except it be that morsel of black and spongy wet cotton at the bottom of a school-boy's ink bottle, saturated with rain, and the black dye of my coat. My hat, too, had contributed its share of colouring matter, and several long black streaks coursed down my 'wrinkled front,' giving me very much the air of an Indian warrior, who had got the first priming of his war paint. I certainly must have been a rueful object, were I only to judge from the faces of the waiters as they gazed on me when the coach drew up at Rice and Walsh's hotel. Cold, wet, and weary as I was, my curiosity to learn more of my late agreeable companion was strong as ever within me—perhaps stronger, from the sacrifices his acquaintance had exacted from me. Before, however, I had disengaged myself from the pile of trunks and carpet bags I had surrounded myself with, he had got out of the coach, and all I could catch a glimpse of was the back of a little short man, in a kind of grey upper coat, and long galligaskins on his legs. He carried his two bundles under his arm, and stepped nimbly up the steps of the hotel, without ever turning his head to either side.

'Don't fancy you shall escape me now, my good friend,' I cried out, as I sprang from the roof to the ground with one jump, and hurried after the great unknown into the coffee-room. By the time I reached it he had approached the fire, on the table near which, having deposited the mysterious paper parcels, he was now busily engaged in divesting himself of his greatcoat; his face was still turned from me, so that I had time to appear employed in divesting myself of my wet drapery before he perceived me; at last the coat was unbuttoned, the gaiters followed, and throwing them carelessly on a chair, he tucked up the skirts of his coat, and spreading himself comfortably, a l'Anglais, before the fire, displayed to my wondering and stupefied gaze the pleasant features of Doctor Finucane.

'Why, Doctor—Doctor Finucane,' cried I, 'is this possible! Were you then really the inside in the mail last night?'

'Not a doubt of it, Mr Lorrequer; and may I make bold to ask, were you the outside?'

'Then what, may I beg to know, did you mean by your confounded story about Barney Doyle, and the hydrophobia, and Cusack Rooney's thumb—eh?'

'Oh, by the pigs,' said Finucane, 'this will be the death of me; and it was you that I drove outside in all the rain last night! Oh, it will kill Father Malachi outright with laughing, when I tell him; and he burst out into a fit of merriment that nearly induced me to break his head with the poker.'

'Am I to understand, then, Mr Finucane, that this practical joke of yours was contrived for my benefit, and for the purpose of holding me up to the ridicule of your confounded acquaintances?'

'Nothing of the kind, upon my conscience,' said Fin, drying his eyes, and endeavouring to look sorry

and sentimental. 'If I had had only the least suspicion in life that it was you, upon my oath I'd not have had the hydrophobia at all, and, to tell you the truth, you were not the only one frightened—you alarmed me quite as much.'

'I alarmed you! Why, how can that be?'

'Why, the real affair is this: I was bringing these two packages of notes down to my cousin Callaghan's bank in Cork—fifteen thousand pounds—no less; and when you came into the coach at Naas, after driving there with your four horses, I thought it was all up with me. The guard just whispered in my ear, that he saw you look at the priming of your pistols before getting in; and faith I said four paters, and a hail Mary, before you'd count five. Well, when you got seated, the thought came into my mind that maybe, highwayman as you were, you would not like dying a natural death, more particularly if you were an Irishman; and so I trumped up that long story about the hydrophobia, and the gentleman's thumb, and devil knows what besides; and while I was telling it, the cold perspiration was running down my head and face, for every time you stirred, I said to myself, now he'll do it. Two or three times, do you know, I was going to offer you ten shillings in the pound, and spare my life; and once, heaven forgive me, I thought it would not be a bad plan to shoot you 'by mistake,' do you perceive?'

'Why, upon my word, I am very much obliged to you for your excessively kind intentions; but really I feel you have done quite enough for me on the present occasion. But, come now, doctor, I must get to bed, and before I go, promise me two things: to dine with us to-day at the mess, and not to mention a syllable of what occurred last night—it tells, believe me, very badly for both; so, keep the secret, for if these fellows of ours ever get hold of it, I may sell out, or quit the army; I'll never hear the end of it.'

'Never fear, my boy, trust me. I'll dine with you, and you're as safe as a church-mouse.'

But the merry Doctor did not keep his word, and Lorrequer was laughed at consumedly. Of such incidents as these the Confessions are full, and it may well be believed, therefore, that they are very entertaining as a whole.

SPIDER SILK.

SOME years ago, the Society of Arts conferred one of their honorary medals on a gentleman of the name of Rolt, for obtaining silk from the garden spider, *aranea diadema*. This is the insect whose webs in autumn are so conspicuous on the surface of shrubs, and in other situations. On allowing one of these animals to crawl over his hand, Mr Rolt found that it drew a thread with it wherever it went. He likewise, without any difficulty, wound some of this thread over his hand, finding that the spider continued spinning while the thread was winding up. On this hint he connected a small reel with the steam-engine of the factory in which he was occupied, and, putting it in motion, at the rate of 150 feet per minute, found that the spider would thus continue to afford an unbroken thread during from three to five minutes. The specimen of this silk which Mr Rolt presented to the society, was wound off from twenty-four spiders in about two hours. Its length was estimated at 18,000 feet; its colour was white, and its lustre of metallic brilliancy, owing, probably, to its great opacity. He did not attempt to combine two or more filaments into one winding, nor to form it into thread by throwing. The thread of the garden spider is so much finer than that of the silk-worm, that the united strength of five of the former is, according to Mr Rolt, equal only to one of the latter; and assuming that the weight is in proportion to the strength, and that a spider will yield twice a-year a thread 750 feet in length, while that produced by a single silk-worm is 1900 feet, it follows that the produce of one silk-worm is equal to that of 6.3 spiders. "Now," says the Report in the society's Transactions, "as on an average it takes about 3500 silk-worms to produce a pound of silk, it would take about 22,000 spiders to produce an equal quantity. Besides, spiders are not so easily confined as silk-worms, and whenever two come in contact, a battle ensues, which ends in the destruction of the weaker one. Spiders kept for silk must therefore be each in separate dens or cells; and the apparatus contrived by Mr Rolt for this purpose, although very ingenious and well adapted to carry on a course of experiments with a hundred or two, would manifestly be wholly inapplicable to any purpose of commercial utility."

But a gentleman of Languedoc went a great deal farther than the English experimenter, for he established a manufacture of spider silk, and so far succeeded that he made gloves and stockings from the fibres of the web. The great impediment, however, to his complete success, was the implacable hostility of these insects to each other. Reaumur placed 5000 in fifty different cells, and the larger destroyed the smaller, till only one or two were left in each cell. But there is a species of spider noticed by Dr Walsh in his travels in Brazil, to which this objection does

not apply. Here the insect was not solitary but gregarious; and colonies of more than 100 occupied the same web. The doctor's account of it is as follows:—"Among the insects is an enormous spider, which I did not observe elsewhere. In passing through an opening between some trees, I felt my head entangled in some obstructions, and on withdrawing it, my light straw hat remained behind. When I looked up, I saw it suspended in the air, entangled in the meshes of an immense cobweb, which was drawn like a veil of thick gauze across the opening, and was expanded from branch to branch of the opposite trees, as large as a sheet, ten or twelve feet in diameter. The whole of this space was covered with spiders of the same species (*aranea maculata*) but different sizes; some of them, when their legs were expanded, forming a circle of six or seven inches in circumference. They were particularly distinguished by bright spots. The cords composing the web were of a glossy yellow, like the fibres of silk-worms, and equally strong. I wound off several on a card, and they extended to the length of three or four yards." There is here a fair field for the Brazilian speculator. The spider's web, which, in single threads, could support a straw hat, must be much stronger and tougher than the frail tissues of our own country, and might certainly be manufactured into articles of wearing apparel, if a proper quantity of it could be obtained. As these gigantic spiders of Brazil are not eaters of their own species, large colonies of them might be maintained with ease, and, we doubt not, advantage, to the experimenter.

We may here conveniently introduce some particulars, by an attentive observer, of the domestic spider, and its great enemy, another spider of a larger size:—One of the latter genus not being able to spin any more web, came to invade the property of his smaller neighbour; a terrible conflict immediately ensued, in which victory seemed to incline to the side of the usurper, for the industrious spider was obliged to take refuge in his hole. After this the conqueror employed every method it could use to draw the other from its retreat: at one time it appeared to go away, but at another returned again quickly, until, at length, seeing that all its artifices were vain, it began to destroy the web of the vanquished. This occasioned another battle, in which the honest and industrious spider had the good fortune to slay its antagonist. Thus placed in peaceable possession of what was no more than its own property, it spent three days in repairing the breaches of its web, without taking any nourishment. Some time afterwards a large blue fly fell into the web, and began struggling violently to escape from its meshes. The spider at first let it alone, but finding that it was too strong for the snare, it came out of its hole, and in less than a minute so completely enveloped the fly in the coils of a new net, that its escape became impossible. This was like the downfall of a gigantic whale to the Esquimaux; and it continued to subsist the spider for a whole week. One day a wasp was thrown into the web; according to custom the spider ran towards the object which had disturbed it, but on observing the terrible enemy which it had to deal with (for spiders never catch Tartars, if they can avoid it), it soon broke all the strings that confined the wasp, and so set it at liberty. But in doing this the web had become irreparably injured; it was abandoned like an old house that is no longer tenable with safety to the possessor, and a new one was commenced, and finished in the usual time. To see how many webs a spider is capable of furnishing, this new web was destroyed; it made another, which was likewise demolished: it now seemed exhausted, for it span no more. The artifices which it then used, although deprived of its chief protection, were surprising. It drew up its claws like a ball, and remained for four hours immovable, yet always on its guard: but when a fly approached near enough, it instantaneously darted on it, and seldom missed its prey. At length, as if disgusted with this sort of life, it determined to invade the possessions of another spider. Accordingly, it advanced to the attack of a neighbouring fortification, but meeting with a vigorous resistance, it was repulsed. Far from being discouraged by this disappointment, it invested another, as military men say, and continued a close siege for three days, at the end of which time the beleaguered insect was slain, and its fortress taken possession of by the enemy. This spider lived for three years, and annually changed its skin like the snake. By way of experiment (it was a cruel one, however), one of its claws was repeatedly removed from the leg, and as often replaced by a new one in two or three days.

But it appears that insects not only yield the material of which cloth is manufactured, but, under certain circumstances, can manufacture it themselves. Some years ago there were exhibited to the Academy of Sciences at Paris, specimens of a very peculiar species of cloth fabricated by insects. Mr Habensbrecht of Munich, having observed the larvae of a butterfly called *tinea punctata*, or *tinea padilla*, to be in the habit of constructing over themselves a tent of great strength, conceived the idea of setting them to work on models prepared by himself. The models were of paper suspended from the ceiling, and lines were drawn on them with oil, to which the insects have a natural antipathy, to regulate the form of the tissue, and limit the operations of the tiny manufacturers. An air balloon, four feet high, weighing only five grains, and yet impervious to air, was constructed in this manner; also a shawl, an ell square, which, when spread out, was blown into the air by a puff of the breath, and had the appearance

of a thin vapour floating on the breeze. Such gossamer texture would afford but a poor protection in this country; but the experiment is extremely interesting. We know not, however, whether any thing has come of it, as Johnson would say.

BOWRING'S MINOR MORALS—MAHOMET ALI.

Dr BOWRING some years ago published two small volumes, under the title of "Minor Morals," in which, through the medium of conversations with his children, he illustrated a number of the familiar virtues by stories and anecdotes, chiefly picked up by himself from observations of real life, in the course of his travels. He has now added a *third volume*,* in which, taking as before the name of Howard, he gives his children conversational sketches of many things which he observed in his recent travels in Egypt and the countries around the Levant. With respect to this new volume, the title strikes us as inapplicable, seeing that very few of the sketches illustrate morals larger or smaller, but are simply very pleasant recollections of an intelligent traveller. Not to quarrel, however, with so external a matter as the name, let us give the author his due praise for the solid merits of his work, which is not only calculated to impress our British youth with some lively general notions of the East, but contains much matter that will be new to more grave inquirers, particularly with reference to the superstitions of the Orientals. The notices which Dr Bowring here gives respecting the *Djins*, or wicked genii of the east, the *Peris*, the vampires, and the belief in magic, are, we fairly confess, in a great measure new to us, and extremely interesting. We prefer, nevertheless, as a specimen of Dr Bowring's book, a portion of his conversation respecting the present viceroy, or perhaps we ought rather now to say sovereign, of Egypt, with whom the author has had the benefit of much familiar intercourse:—

"Papa! you have seen much of Mahomet Ali Pacha; will you tell us something about him? Where was he born?" was Arthur's request to Mr Howard when next they all met together.

"He was born at Cavalla in Roumelia," was his father's answer, "and he told me he was the youngest of sixteen children. He was much indulged by his father and mother, and was a great favourite of his brothers and sisters. He once said to me, 'Do not wonder if I am sometimes impatient and want to have my own way. I was never used to contradiction. I have scarcely ever known misfortune. I was born under a smiling star, and that star has smiled upon me all my life through.'"

"But has not Mahomet Ali committed a great many cruel deeds—did he not invite all the Mamelukes to a festival, and cause them to be murdered?" inquired George.

"And I have heard," added Arthur, "that one of them sprang, with his fine Arab horse, over the battlements of the high citadel of Cairo, and so saved his life."

"What you have heard is true," said Mr Howard, "and all that Mahomet Ali or his friends urge for his justification, is, that the Mamelukes were plotting against him, and would have destroyed him had he not destroyed them. * * I should tell you that Mahomet Ali was forty-six years old before he had learned either to read or to write. This he told me himself. I have heard that he was taught by his favourite wife. But he is fond of reading now; and one day, when I entered his divan unannounced, I found him quite alone, with his spectacles on, reading a Turkish volume, which he was much enjoying, while a considerable pile of books were by his side. "It is a pleasant relief," he said, "from public business; I was reading some amusing Turkish stories" (probably the Arabian Nights); "and now let us talk—what have you to tell me?" There is a great deal of sagacity in Mahomet Ali's conversation, particularly when he knows or discovers, as he usually does, the sort of information which his visitor is most able to give. He discourses with engineers, about mechanical improvements—with military men, on the art of war—with sea-officers, on ship-building and naval manœuvres—with travellers, on the countries they have visited—with politicians, on public affairs. He very willingly talks of foreign countries, and princes and statesmen, and is in the habit of mingling in the conversation all sorts of anecdotes about himself, and the events connected with his history. His phrases are often poetical, and he, like most Orientals, frequently introduces proverbs and imagery. I heard him once say, speaking of the agriculture of Egypt, "When I came to this country, I only scratched it with a pin; I have now succeeded in cultivating it with a hoe; but soon I will have a plough passing over the whole land." You asked me, George, if he were not a cruel prince? and that he certainly is not, for many a generous deed has he done, and seldom will it be found that the reign of a Turkish sovereign is so little stained with blood."

"We like to hear of acts of clemency," said one of the children; "tell us of Mahomet Ali's."

"When I was at Cairo, a number of Levantine merchants had got deeply, and I fear dishonestly, in debt to the pacha. Payment had been urged in every possible way, but in vain. At last the pacha got impatient, for the amount was large (exceeding £100,000 sterling), and he directed them to be seized, sent to the galleys for life, and all their property to be confiscated. It happened that an Englishman of distinction and myself were applied to by their distressed families to intercede with the pacha, and to implore mercy, less on account of the imprudent debtors than of their numerous families. We urged the excess of punishment, with reference to the offence, falling upon the innocent more heavily than on the guilty. We talked of the gentle quality of mercy—blessing the giver as much as the receiver—and the old man's heart was touched, and he forgave the debtors."

"I have heard you say that Mahomet Ali is a very interesting person in his own family; now let us all know something of his private character," said Mrs Howard.

"I do not deny," answered Mr Howard, "that I feel a great interest in Mahomet Ali, and the more so because I have had the advantage of seeing him with his children and grandchildren around him, and of talking with him about domestic matters. In the East it is very difficult to learn much about the private concerns of any Turk, and still less of those of men of high station. Mahomet Ali's great pride is Ibrahim Pacha; a victorious leader is always an object of admiration among Mussulmans, and Ibrahim Pacha's career has been one of brilliant military success. His father is fond of talking of his first-born son and intended successor. "I did not know him," he said; "I had not an unbounded confidence in him for many, many years; no, not till his beard was almost as long as my own, and even changing its colour," said the pacha to me, "but now I can thoroughly trust him." On the part of Ibrahim Pacha, though in rank above his father (for the Pacha of the Holy Cities is the first Pacha of the Ottoman Empire), there is always the utmost deference to Mahomet Ali's will. In the most difficult circumstances of his life he has always referred to his renowned sire for advice; and whenever he has been pressed by the representatives of the great powers of Europe, he has invariably answered, that he should abide by the instructions he received from his father. Of the sons of Mahomet Ali, Toussoun, the second, was long the favourite. He was a prince of a generous, not to say extravagant disposition; and when on one occasion he was reproached by his father for his prodigality, he answered, "It may be well for you to be economical, who were not born what you are, but I am the son of Mahomet Ali Pacha, and the son of a pacha must be liberal." His father smiled, the answer flattered his sense of dignity, and he upbraided Toussoun no more. Not long after, Toussoun died of the plague. A third son, Ismail, was murdered by the blacks in Sennar, the hut in which he was being surrounded by brushwood, set on fire, and he perished in the flames."

"Had they no motive—the blacks—had he done nothing to deserve so cruel a fate?" inquired Edith.

"He had invaded their country, and awakened their animosity, and, looking on him as an intruder, they thus satiated their revenge."

"And what happened in consequence?" asked George.

"The sheikh, or leader, at Shendy, where the deed was committed, was afterwards seized, and all the inhabitants who were supposed to have taken any part in the assassination, were put to death."

"How shocking!" exclaimed Edith.

"I have been very happy in my children," Mahomet Ali said to me one day; "there is not one of them who does not treat me with the utmost deference and respect; except," he added, laughing outright, "that little fellow, the last and the least of all, Mahomet Ali."

He was then a boy of five or six years old, called by his father's name—the son of his old age—his Benjamin—his best beloved.

"I see how it is," I said; "your highness spoils the boy. You encourage the little rogue." Mahomet Ali laughed again—it was an acknowledgment of a little paternal weakness.

Not long after, I was in the palace of Shoubra; it was on a Friday, the Mussulman Sabbath, when the pacha is in the habit of receiving all his family.

I found him in his divan. He was surrounded by all his sons and grandsons who were then residing at Cairo. He had been listening to the accounts of their studies—of their amusements and their employments. Abbas Pacha, the eldest son of Toussoun Pacha, sat next his grandfather, and the rest of the family were seated on chairs, according to their ranks and ages. After some conversation, Mahomet Ali told his descendants that they might now withdraw. One after another they rose, knelt before him, kissed the hem of his garment, and retired. Little Mahomet Ali came last; he was dressed in military costume, with a small golden-encased scimitar dangling at his side. He advanced towards his father—looked in his face; he saw the accustomed, the involuntary smile; and when he was about a yard from the pacha, instead of bending or saluting him, he turned on his heels, and laughingly scampered away, like a young colt.

"I see how it is," said I to Mahomet Ali.

The old man shook his head—looked grave for a moment—another smile passed over his countenance; "Peki, peki!" said he, in a low tone, "well, well!" But I certainly did not like his highness the worse for what I had just witnessed."

DIFFICULTIES IN THE WAY OF MISSIONARY ENTERPRISE.

Few persons who have not minutely investigated the subject possess any adequate notion of the difficulties encountered by missionaries in their endeavour to Christianise heathen countries, particularly India; and ignorance in this respect has produced no little injury to the missionary cause. Among other difficulties in the way, the following are given by Mr Malcom in his "Travels in Burmah," recently published:—

"The bigotry, superstition, and sensuality of the heathen, their want of early training in the proper theory of religion, the absence of a correct moral sense, and similar disadvantages of great magnitude, not felt by ministers in a Christian land, will not be insisted upon, because they equally impeded the apostles, who nevertheless had great success. I intend only to name those which are peculiar to modern missionaries."

1. An imperfect knowledge of the language of the people.

Scarcely one missionary in twenty has become able to preach with entire fluency, and probably never one had such a knowledge of the language as inspiration gave. A great amount of preaching has been done through interpreters, and these often unconverted heathen, who could not give full force to themes they did not comprehend. Few can acquire such mastery of a foreign tongue as to express their thoughts with the glow and intensity of a native, even when the idiom and structure of the language is thoroughly understood.

An experienced missionary in Bengal assured me that on an average not one half of the sermons of missionaries who undertake to preach is understood. Dr Carey, in a letter of August 1809, states, that after, by years of study, he thought he had fully mastered the Bengalee, and had then preached it two full years, he discovered that he was not understood! Yet Dr C.'s teachers flattered him that he was understood perfectly. This is a very common deception of pundits and moonshoes. In the opinion of one of the most experienced missionaries in the Madras presidency, not one missionary in ten, out of those who live the longest, ever gets the language so as to be generally understood, except when declaring the simplest truths. This is a difficulty not to be removed. Merchants and traders may easily acquire the vocabulary of traffic and social life, and so do missionaries. They may go farther, and be able to read or understand literary and historical subjects. But to have the ready command of words, on abstract theological subjects, and all the nice shades of meaning requisite to discuss accurately mental and moral subjects, can only be the work of many years, of intense study, and great practice.

2. There is a still greater difficulty, in the poverty of the languages themselves.

For terms which are of primary importance in religious discourse, words must often be used which are either unmeaning, or foreign to the purpose, or inaccurate. It is not easy to exhibit this difficulty in its true magnitude to such as have not mixed with heathen. A few examples may, however, make the argument intelligible. Words equivalent to God, Lord, &c., must, in various languages, be those which the heathen apply to their idols; for there are no others. In Tamil, the word *pámm* (sin) signifies only 'exposure to evil,' or simply 'evil,' whether natural or moral, and may be applied to a beast as well as a man. The word *padestiam* (holiness) means 'clearness.' *Re-generation* is understood by a Hindu or Buddhist to mean 'another birth' in this world, or 'transmigration.' The purposes of God they understand to be 'fate.' The word used in Bengalee for *holy* (*dharma*), sometimes means 'merit' acquired by acts of religious worship, and sometimes 'that which is agreeable to rule or custom.' When the compound word *Holy Ghost* is translated, it becomes 'Spirit of rule,' or some phrase not more intelligible. In the Episcopal Liturgy in Bengalee, it is rendered 'Spirit of existence' (*snadama*); and Mr Yates, in his new version of the Scriptures, uses the word *pubitru*, 'clean.' This last, while it avoids the hazard of conveying a wrong idea, and seems to be the best rendering, is yet evidently imperfect. In Siamese, the word most used for *sin* (*tót*) means either 'guilt,' or the 'punishment of guilt,' or simply 'exposure to punishment.' The best word the missionaries can get for *holy*, is *boreant*, 'purified,' when people are spoken of; and *sakut*, or 'Spirit having power because of sanctity,' when the Holy Ghost is meant. There is no Siamese word equivalent to *repent*; and a phrase is used signifying 'to establish the mind anew,' or 'make new resolves.' In Burmah, there is no term equivalent to our *heaven*, and a word meaning 'sky,' or more properly 'space,' is used; nor any word for *angel*, and the rendering of that term has to be 'sky-messenger,' nor any word for *condemn*, except the circumlocution 'decide according to demerit, or sin;' nor any word for *conscience*, *thank*, &c. &c. I might add scores of such cases, given me by missionaries. There is scarcely a theological term not subject to this difficulty.

For a multitude of our terms there is no word at all. Among these are not only theological terms, such as sanctification, gospel, evangelist, church, atonement, devil, &c., but the names of implements, animals, customs, clothing, and many other things, of which ignorant and remote tribes have never heard, and for which entirely new terms must be coined.

Let a man imagine how he would be embarrassed in reading a book, or hearing a discourse, in which he constantly met with Greek or Arabic terms, and words used in a sense differing more or less from that in which he understands them, and these often the principal terms in

* William Tait, Edinburgh; Simpkin, Marshall, and Co., London.

the sentence, and he may form some conception of this difficulty. Even the native assistant, preaching in his mother tongue, is not properly understood; for he must use these terms.

3. Want of familiarity with the system and sacred books to be encountered, and with national prejudices and modes of thinking.

For exposing with freedom, and attacking with power, a popular belief, these are eminent advantages. Hence, in part, the superior success of native preachers. The apostles were native preachers, almost wherever they went; and we see how largely they used their intimate knowledge of the national religion and habits of thinking, not only in disputations, but in formal discourses and epistles. Many years must elapse before a missionary can attain this power, and then only by the wearisome perusal of many volumes of disgusting legends, as well as contact with natives in many ways, and for a long period."

INFANT EDUCATION.

THE following copy of a letter from Dr Andrew Combe has been handed to us by the gentleman in this town to whom it was addressed. It was obtained, of course, for a special purpose, but its purport is of general interest:—

"In reply to the queries contained in your letter, I have no hesitation in stating my conviction, that the confinement of children for several consecutive hours in crowded class-rooms is highly injurious to their health, and often lays the foundation for a delicacy of constitution, especially in girls, which no subsequent care can entirely remove. To state why this result follows, would be to recapitulate the expositions already given in my works on physiology and dietetics, and is therefore unnecessary.

The only plan by which this evil can be obviated, is by admitting only one limited class at a time, to which the teacher's attention should be wholly devoted for one hour or thereabouts, and having the room thoroughly ventilated before another class is admitted.

As the result of much attention to the subject, I may here express my decided conviction, that the progress made by pupils thus treated will be greater, and far more pleasing to themselves, than where they are confined double the time, as in ordinary schools; and I have the direct testimony of several teachers and parents to the same effect.

As you have asked my opinion on these points, I may be allowed to refer to another, which is also of great importance to bodily health and mental activity. I allude to the injury done at present by sending children to school for so many consecutive hours, that they are deprived of the nourishment which their growing organisation imperatively requires, till frequently three or four hours beyond the time at which nature demands it. In several instances I have seen health restored in infirm children, merely by allowing them an hour for an early dinner, instead of obliging them to wait till four or five o'clock, when their school hours are over. Another great disadvantage of the present system of long confinement, is the impossibility, especially in winter, of getting that ample exercise in the open air, without which neither mind nor body can thrive. There will be difficulties on the part of parents as well as of teachers in obviating these errors, but I mention them as eminently deserving of attention in every improved plan of elementary education." The most eminent of the faculty in Glasgow have expressed their concurrence in Dr Combe's opinion.—*Scottish Pilot*.

A POTTEEN SMUGGLER'S WIFE.

A man who was known to have a large mountain farm and extensive homestead in these hills, was observed very frequently to ride into the town of B—; and he never made his appearance without a woman, supposed to be his wife, jogging steadily and uprightly on a pillion behind him. He was tall and gaunt in look; she large and rotund, and encumbered, as is the mode of all country wives, with a multitude of petticoats: they always rode into the yard of a man who kept a public-house; and before they alighted off their horse, the gate was carefully shut. It was known, moreover, that this publican acted as factor for this farmer in the sale of his butter; and so for a length of time things went on in a quiet and easy way, until one day it so happened (as indeed it is very common for idlers in a very idle country town to stand making remarks on the people as they come by) that the guager, the innkeeper, and a squireen, were lounging away their day, when the farmer slowly paced by, with his everlasting wife behind him. "Well," says the squireen, "of all the women I ever saw bumping on a pillion, that lump of a woman sits the awkwarddest; she don't sit like a natural born crutcher at all; and do you see how modest she is, what with her flapped-down beaver hat, and all the frills and fallals about her, not an inch of her sweet face is to be seen, no more than an owl from out the ivy. I have a great mind to run up alongside of her, and give her a pinch in the toe, to make old buckram look about her for once." "Oh, let her alone," says the innkeeper; "they're a decent couple from Joyce country. I'll be bound, what makes her sit so stiff is all the eggs she is bringin' in to Mrs O'Mealey, who factors the butter for them." There was, while he said this, a cunning leer about the innkeeper's mouth, as much as to denote that there was, to his knowledge, however he came by it, something mysterious about this said couple; this was not lost on the subtle guager, and he thought it no harm just to try more about the matter; and so he says in a frolicsome way, "Why, then, for curiosity sake, I will just run up to them, and give the mistress a pinch—somewhere; she won't notice me at all in the crowd, and maybe then she'll look up, and we'll see her own purty face." Accordingly, no sooner said than done: he ran over to where the farmer was getting on slowly through the market crowd; and on the side of the pillion to which the woman's back was turned, attempted to give a sly pinch, but he might as well have pinched a pitcher; nor did the woman even lift up her head, or ask "Who is it

that's hurting me?" This emboldened him to give another knock with his knuckles; and this assault he found not opposed, as it should be, by petticoats and flesh, but by what he felt to be petticoats and metal. This is queer, thought the guager: he now was more bold, and with the butt-end of his walking-stick he hit what was so hard, a bang which sounded as if he had struck a tin pot. "Stop here, honest man," cried the guager. "Let my wife alone, will you, before the people?" cried the farmer. "Not till I see what this honest woman is made of," roared the guager. So he pulled, and the farmer dug his heels into his colt to get on; but all would not do: in the struggle down came the wife into the street; and as she fell on the pavement, the whole street rang with the squash, and in a moment there is a gurgling as from a burst barrel, and a strong smelling water comes flowing all about; and flat poor Norah lies, there being an eruption of all her intestines, which flowed down the gutter as like potteen whisky as eggs are like eggs. The fact was, that our friend from the land of Joyce had got made, by some tinker, a tin vessel with head and body the shape of a woman, and dressed it out as a proper country dame; in this way he carried his darlint behind him, and made much of her.—*Otway's Tour in Connaught*.

POETRY.

[BY JAMES G. PERCIVAL.]

The world is full of Poetry—the air
Is living with its spirit; and the waves
Dance to the music of its melodies,
And sparkle in its brightness. Earth is veiled
And mantled with its beauty; and the walls,
That close the universe with crystal in,
Are eloquent with voices, that proclaim
The unseen glories of immensity,
In harmonies, too perfect, and too high,
For aught but beings of celestial mould,
And speak to man in one eternal hymn
Unfading beauty, and unyielding power.

The year leads round the seasons, in a choir
For ever charming, and for ever new;
Blending the grand, the beautiful, the gay,
The mournful, and the tender, in one strain,
Which steals into the heart, like sounds, that rise
Far off, in moonlight evenings, on the shore
Of the wide ocean resting after storms;
Or tones, that wind around the vaulted roof,
And pointed arches, and retiring aisles
Of some old, lonely minster, where the hand
Skillful, and moved, with passionate love of art,
Plays o'er the higher keys, and bears aloft
The peal of bursting thunder, and then calls
By mellow touches, from the softer tubes,
Voices of melting tenderness, that blend
With pure and gentle musings, till the soul,
Commingling with the melody, is borne,
Rapt, and dissolved in ecstasy, to Heaven.

'Tis not the chime and flow of words, that move
In measured file, and metrical array;
'Tis not the union of returning sounds,
Nor all the pleasing artifice of rhyme,
And quantity, and accent, that can give
This all-pervading spirit to the ear,
Or blend it with the movings of the soul.
'Tis a mysterious feeling, which combines
Man with the world around him, in a chain
Woven of flowers, and dipp'd in sweetness, till
He tastes the high communion of his thoughts,
With all existences, in earth and heaven,
That meet him in the charm of grace and power.
'Tis not the noisy babbling, who displays,
In studied phrase, and ornate epithet,
And rounded period, poor and rapid thoughts,
Which peep from out the cumbrous ornaments
That overload their littleness. Its words
Are few, but deep and solemn; and they break
Fresh from the fount of feeling, and are full
Of all that passion, which, on Carmel, fired
The holy prophet, when his lips were coals,
His language wing'd with terror, as when bolts
Leap from the brooding tempest, armed with wrath,
Commission'd to affright us, and destroy.

—The Lyre.

HAPPINESS OF ANIMALS AND BIRDS.

It is impossible to view the cheerfulness and happiness of animals and birds without pleasure; the latter, especially, appear to enjoy themselves during the fine weather, in spring and summer, with a degree of hilarity which might be almost envied. It is astonishing how much man might do to lessen the misery of those creatures which are given to him for either food or use, or for adding to his pleasure if he were so disposed; instead of which, he often exercises a degree of wanton tyranny and cruelty over them which cannot be too much deprecated, and for which, no doubt, he will be held one day accountable. Animals are so capable of showing gratitude and affection to those who have been kind to them, that I never see them subjected to ill treatment without feeling the utmost abhorrence of those who are inflicting it. I know many persons who, like myself, take a pleasure in seeing all the animals about them appear happy and contented. Cows will show their pleasure at seeing those who have been kind to them, by moving their ears gently, and putting out their wet noses. My old horse rests his head on the gate with great complacency, when he sees me coming, expecting to receive an apple or a piece of bread. I should even be sorry to see my poultry and pigs get out of my way with any symptoms of fear.—*Jesse's Gleanings*.

STRONG DRINK.

If all strong drink were pure, it would, nevertheless, be injurious to the health. It was said by an eminent phy-

siologist, that the frame of each human being can endure a certain number of pulsations; and the quicker those pulsations take place, the sooner their number is exhausted, and the sooner the frame is worn out. To use habitually drink, is like whipping constantly one's horse; at first, it makes him step out quicker, but he soon flags under the constant impulse; he disregards the lash according as he becomes accustomed to it, until, at last, to make him stir, requires constant beating. How different from the horse, who, fed with wholesome food, is allowed to go at his own steady pace, and who, not driven beyond his nature, performs his journey well and freshly!—*Toronto Christian Guardian*.

THE CONSCIENTIOUS MIMIC.

In the beginning of the last century, an actor, celebrated for mimicry, was to have been employed by a comic author to take off the person, manner, and singularly awkward delivery of the celebrated Dr Woodward, who was intended to be introduced on the stage in a laughable character. The mimic dressed himself as a countryman, and waited on the doctor with a long catalogue of ailments which he said afflicted his wife. The physician heard with amazement of diseases and pains of the most opposite nature, repeated and redoubled on the wretched patient; for since the actor's greatest wish was to keep Dr Woodward in his company as long as possible, that he might make the more observations on his gestures, he loaded his poor imaginary spouse with every infirmity which had any probable chance of prolonging the interview. At length, having completely accomplished his errand, he drew from his purse a guinea, and with a bow and scrape made an uncouth offer of it. "Put up thy money, poor fellow," cried the doctor, "put up thy money—thou hast need of all thy cash, and all thy patience too, with such a bundle of diseases tied to thy back." The comedian returned to his employer, and related the whole conversation with such true feeling of the physician's character, that the author was convulsed with laughter. But his raptures were soon checked when the mimic told him with emphatic sensibility, that he would sooner die than prostitute his talents to the rendering such genuine humanity a public object of ridicule.—*From a Scrap-Book*.

REALITIES OF LIFE.

Realities are seldom the pleasantest parts of life. Hope, memory, and even enjoyments, are more than half imaginative. Every thing is mellowed by distance; and when we come too near, the airy softness is lost, and the hard lines of truth are offered harshly to the eye. Half our sorrows are the breaking of different illusions; sometimes they must be broken; but when without danger to himself or injury to others, man can enrich the scene before him with ideal beauties, he is foolish to examine minutely the objects of which it is composed. The cottage, with its broken thatch and shining piece of water in the foreground, is picturesque and beautiful in a landscape; but what is the reality? The dwelling of misery, decorated with a horse-pond! The splendid pageants that dazzle the lesser children at a theatre are but dirty daubs of paint and tinsel; and it is the same with the stage of the world. It never answers to be behind the scenes.—*Newspaper paragraph, probably from some new work*.

WANTS IN AMERICA.

Wanted: A man to lay out crockery. He must be sprack and handy, and balance his own breakage. Wanted: A hardware lad to go South. Wanted: Part of a house in the region of East Broadway, by a family without the least disposition to meddle with other folk's affairs. Wanted: Some bricklayers to go West. Wanted: A satisfactory journeyman in the rush-bottoming line, to go South. Wanted: A grey gelding that can go straight. To save trouble, a hundred dollars will be the figure. Wanted: A good place for a respectable woman, now living at 93, Nineteenth-Street, either as seamstress, laundress, nurse, pastry-cook, confectioner, or companion after the English fashion. (3) This is comprehensive, and merits attention. Wanted: A young woman (the plainer the better), to help a small genteel family in their domestic matters. One without ringlets would be preferred. Wanted: A clerk in a soft store; one who will make business his pleasure, and not pleasure his business, may drop into a good place by applying, &c. Wanted: Twenty-five well-seasoned hands for whaling; ask for Seth Turner, North-wall. Wanted: A coloured girl who has been used to waiting; such an one need not wait long for a good place, provided six hours' sleep per night will satisfy her, and she brings character. Wanted: A situation for a youth, very genteel, whose education has been neglected, but who is stout, and of good address. N. B. He will expect a comfortable salary and decent treatment, and he can walk twenty miles a-day with ease. Wanted: Somebody to do as they would be done by in the care of a house and furniture during a forthcoming six weeks' absence of the proprietor. Sex no object. Wanted: Board and lodging for a lone gentleman where there are no children nor dogs. N. B. His appetite is moderate, and the terms must be moderate also. Wanted: A great number of customers. At Dr Lewis Teuchtwanger's establishment in Courtlandt-street, any number of customers may be instantly accommodated with any quantity of spoons, knives, ladles, forks, figures, cups, speaking trumpets, thimbles, knobs, locks, ventilators, coffin plates, door ditto, pitchers, combs, tobacco boxes, communion services, snuff mulls, muddlers, napkin-rings, strainers, and mugs of all sorts; all manufactured of American silver, and of the very best quality, for cash. Wanted: Five or six smart girls to show off millinery, and make themselves agreeable at a store of soft goods. Tuscan and Dunstable are the great staple. Wanted: A lad to go West in the boot-polishing line. If handy, he will have chances of getting on. Wanted: Several plasterers at houses now rapidly going up. Apply, &c.—*Newspaper paragraph*.

PRICE THREE HALFPENCE.

MRS WILSON'S PIC-NIC.

Who has not experienced the pleasures of a pic-nic? No species of amusement produces more general satisfaction than this; for every one sets out with a determination to be happy, and, so to speak, to enjoy even their annoyances. It has also one great advantage in the eyes of a thrifty housewife; for as each of the guests contributes his quota of provisions, the expense is equally shared by all, while to the first projector belongs the glory and honour of giving the party. Surely pic-nics must have been invented by some one to whom might have been applied the eulogy on Mrs Gilpin—

"For though on pleasure she was bent,
She had a frugal mind."

Not very long ago, the family of a respectable merchant in one of our largest manufacturing towns, took lodgings during the summer season at rather a celebrated watering-place in the neighbourhood. It would be difficult to say what was their inducement for settling here: it could not be in order to drink the waters, as they were all in perfect health; neither could it be to enjoy the country air, for they were domesticated in the heart of a town; nor could they expect solitude, since so many of their friends had followed their example, that they formed the very same society they would have done had they all remained at home. The only apparent reason was the love of change.

"My dear," said Mrs Wilson to her husband one morning, "I think since so many of our neighbours are here, it would be a very nice opportunity for getting up a pic-nic. We will go to Cruikston Abbey; and as I am sure Mrs Thomson and Mrs Dickson will be glad to join us, Harry Thomson and Charles Dickson will do very nicely to escort two of our girls; while James, and his friend young Stevenson, may take care of the other one and Mary Dickson. I think these, with the children, will be enough, for your large parties are never so pleasant as small, quiet, and select ones. So, I will run over to Mrs Thomson's this morning, and settle all about it; 'twould be a sin to waste such beautiful weather."

Mr Wilson listened to all this harangue in silence; whether it was that he, too, longed to taste the pleasures of the country, or whether he knew that when once his lady had set her mind on the thing, his opposition would be unavailing, I know not; but certain it is, that Mrs Wilson called on both the Dicksons and Thomsons that morning, that every one was delighted with the proposal, and, as Mrs Dickson suggested the propriety of catching the fine weather while it lasted, the following Thursday was fixed upon as the eventful day. Many were the cogitations of the three Misses Wilson as to what they should put on; but at last, as it was fixed that Harriet, the eldest, should ride on horseback, accompanied by her brother, Mary Dickson, and young Stevenson, she was obliged to content herself with her habit, while her two sisters determined to be in white, as that, with chip hats, was the most simple and country-like dress they could think of.

Thursday morning at last arrived, and to the great joy of all the Wilson family, old and young, the air was as warm and the sky as blue as heart could wish. It was arranged that all the party were to meet at Mr Wilson's at eleven o'clock; but Mrs Wilson's cares began long before that. Before seven in the morning she was awakened by the shouts of joy uttered by the children, Master Jacky and Miss Sarah, at the sight of the fine weather. These shouts were quickly succeeded by cries of pain; and when the poor woman rushed half dressed out of her room, she found that Master Jacky had insisted on cutting bread for the

sandwiches, and in mistake had cut his own fingers. The wound, however, was not very severe, and a cuff on the side of the head, and a piece of sticking plaster, soon set all to rights, when, having threatened to leave Master Jacky at home should he do any more mischief, Mrs Wilson returned to complete her toilette before proceeding to the weighty business of packing up the provisions. Who can describe the slices of bread that were spread with butter, mustard, and ham, to make sandwiches; the fowls that were cut up, the eggs that were boiled hard, the veal pies, the wine, the ginger beer, the tablecloths, knives, forks, spoons, and napkins; in short, all the multifarious articles that were stowed into the hampers? When, about ten o'clock, numerous other packages arrived from Mrs Dickson and Mrs Thomson, it might rather have been supposed that preparations were making for a siege than for one day's provision for three families of moderate size and moderate appetites.

By this time it was nearly eleven o'clock, and the guests began to arrive. First of all came Mrs Dickson and her daughter Mary, who mentioned that Charles would follow, having gone to call for his friend Harry Thomson. As the Misses Wilson were not yet dressed, Mary ran up stairs to Harriet's room to assist her, while Mrs Dickson looked over, criticised, and approved of, Mrs Wilson's arrangements. In a few minutes the two younger Misses Wilson appeared, quickly followed by Mrs Thomson. The latter lady no sooner entered the room than she was assailed from all sides by the question, "Where are Harry and Charles Dickson?" "What! are they not here?" was the reply; "they left our house half an hour ago!" At this account Julia and Fanny Wilson looked a little blank, for it was now past the appointed hour, and in coming down stairs they had ascertained that, besides the defection of the above-mentioned beaux, their own brother had gone out, and his friend young Stevenson had not yet arrived. "Well, how very unkind of James!—I am sure he has forgot all about it!" said Julia, looking very much inclined to cry; when Fanny, who had been watching at the window, gave notice that James and Stevenson were coming up the street. "What can be the matter with them?" said she; "they are shaking with laughter." Certainly the two young men presented as ridiculous a figure as could be imagined. James was short, stout, and florid, with bandy legs and a bullet head; while Stevenson was above six feet in height, very thin and very dark; and as they were rolling from side to side with laughter, their whole appearance was excessively odd. By the time they reached the door, however, they were a little composed, and as the horses and carriages had long before arrived, and Mary and Harriet had at last appeared, Mrs Wilson proposed that the equestrians should set out immediately, leaving the others to follow at their leisure. "I hope you have brought quiet horses for the ladies," said Mrs Wilson, as two raw-boned, long-backed, and long-tailed animals with side saddles, were led forward. "They never rode better," was the reply of the ostler; and Mrs Wilson, not being skilled in horse-flesh, was fain to believe him. The ladies were now mounted, and James and Stevenson were preparing to follow their example, when they were once more called back by the prudent mothers to receive further injunctions to be careful of their precious charges. "Now, be sure, Mr James," said Mrs Dickson, "to take good care of Mary; remember she's my only daughter; I can't afford to lose her." James laughed, and promised obedience, and the party walked their horses down the street. Scarcely, however, had they reached the corner, when they halted, spoke together a few minutes, and then, while the others moved slowly on, James trotted back to the

anxious spectators. "What's the matter, what's the matter?" cried they all. "You arn't waiting for Charles and Harry, are you?" said James. "To be sure we are," was the reply. "Oh, then, you'd better go, for they set off half an hour ago, driving tandem." And he now burst out in such a fit of laughter, as plainly showed what had been the subject of those side-shakings which he and Stevenson exhibited in coming up the street. Any little thing does for a joke when a pic-nic party is in the wind. "I did not know Harry was a good driver," said Mrs Dickson; "Charles can't drive at all!" "Neither can Harry!" screamed Mrs Thomson. "Oh, there's no fear of them," said James, "for Stevenson called on each of them this morning, and, by the help of two tea-spoons, showed them how to hold the reins."

Who can describe the anger, fear, and vexation of the two mothers! Even James's assurances of the safety of the two young Jehus had for some time no effect. At last they were somewhat calmed, and were even persuaded to enter the carriages, which it had at first been unanimously resolved they should not do, as the old ladies were too much alarmed, and the young ones too much annoyed, to expect much pleasure from the journey. But the sobs, tears, and entreaties of Jacky and Sarah, who were in agony at the mere idea of missing their promised excursion, had at last their usual effect, and the two carriages rolled off. In the first were seated Mr and Mrs Wilson, Mrs Thomson, and Mrs Dickson; in the second, Julia, Fanny, Jacky, and Sarah. The last carriage was an open one, and so very roomy as to hold six quite comfortably; for, as Mrs Wilson had said, "the young people will like to get all together." But, alas! the two whose presence was necessary for the harmony of the whole, were absent.

For several miles the carriages rolled on through a beautiful country, charmingly diversified with wood and water; the birds were singing gaily among the trees; the grasshoppers chirping merrily in the hedges; all nature seemed to enjoy itself; but the hearts of the occupants of the carriages were a melancholy contrast. Mrs Thomson and Mrs Dickson were uneasy about their sons, and Mr and Mrs Wilson, being kind-hearted, benevolent people, sympathised with them sincerely. Julia and Fanny were mortified that the pleasure of their company had not been sufficient to induce the young men to give up the tandem; and whenever Jacky and Sarah, who were as inclined to be merry and mischievous as ever, uttered a word, they were told by their sisters to hold their tongues, till at last even they became gloomy, discontented, and fretful. In this uncomfortable manner did they drive on, till, having proceeded about a third part of the way, on turning a corner they suddenly came in sight of the whole of the party, with the exception of Harriet and Stevenson. But in what a condition! Covered with mud, of which he was in vain trying to cleanse himself, Charles Dickson sat by the side of the road; while Harry Thomson, not in a much better plight, was attempting to mend the shattered gig, from which the horses had broken loose. Fortunately neither of the young men was hurt; a piece of intelligence which, as soon as the carriages appeared in sight, Mary and James hastened to communicate to their parents. It was soon arranged that one of the coachmen should take charge of the broken gig, while Mr Wilson, being a very good driver, should take his place, and the young men should each find a seat on one of the dickeys, regard for the ladies' dresses preventing them from being admitted inside in their present plight. Inquiry was now made with regard to Harriet and Stevenson; but as it appeared they had only gone a supposed short cut through the fields, harmony was

again restored, and with recovered smiles the ladies determined that now at least they should really begin to enjoy themselves, and were persuaded that all their troubles were come to a close.

Behold them at last arrived at their destination, the beautiful grounds of Cruikston Abbey. These grounds were such a favourite resort of the parties of pleasure formed in the neighbourhood, that several delightful arbours had been constructed in the finest situations for their especial benefit. To one of those the party now proceeded, leaving the servant behind with directions where they might be found in case Harriet and Stevenson should not yet have arrived. The road lay through a shrubbery; and as the dew had fallen very heavily, it was necessary to walk carefully on the path, in order to keep the feet dry. This, however, it was impossible to persuade Jacky and Sarah to do; every wild flower they saw, tempted them on the grass; and, in spite of repeated warnings, by the time they arrived at the arbour, their shoes and stockings were soaked. Poor Mrs Wilson was in great perplexity; her maternal feelings could not bear that the children should catch their deaths of cold; and yet what could she do? At last Harry Thomson suggested that while the others were unpacking the provisions, Jacky's and Sarah's shoes and stockings should be taken off, and put in the sun to dry, while they sat quietly in the arbour. This was accordingly done; and for some time the novelty of sitting without shoes or stockings was sufficient for the children's amusement; but soon they longed to help the others in running about with the provisions and laying the cloth. What was to be done? Their mother had positively forbidden their stepping on the damp floor with their bare feet, and their only amusement was trying which could place their feet nearest the ground, without actually touching it. By and bye, however, when the sandwiches were unpacked, they discovered another amusement; for, getting hold of some of the papers in which these articles had been contained, they scattered them over the floor as stepping stones, and very ingeniously contrived to be in every body's way, till at last, to the great delight of all, the shoes and stockings were pronounced dry enough to be put on, and Jacky and Sarah were dispatched to a hill at a little distance, to look out for the missing couple.

Every thing was now ready; the tablecloth was laid beneath the green trees, and every package had been opened, and its contents admired. Some few omissions were found out; for instance, no one had remembered to bring either of those two useful articles, bread or salt; but then the sandwiches could be eaten along with the other meat, and people ought not to be too nice at a picnic. Neither had any one brought a screw; still, however, the same maxim consoled them, and it was determined to break the necks of the bottles. As nothing more was to be done, the young people went to walk about the grounds for a short time until Harriet and Stevenson should arrive, when they would sit down to dinner; the three married ladies sat in the arbour conversing on domestic matters, from the teething of their last child to the honesty of their last servant, and the draining of their last new patent coffee percolator; while Mr Wilson walked about, sometimes joining the ladies, and sometimes trying a race with Jacky and Sarah.

It was now getting late. Mr Wilson had frequently taken out his watch, Mrs Thomson had several times broken a little piece from a plate of sandwiches which was next her, and even Julia, Fauny, and Mary, with their beaux, had several times come to inquire if Harriet and Stevenson were *never* coming. As for Jacky and Sarah, they would long before have been crying outright, had not their father pacified them with the legs of a fowl. At last, however, nature could hold out no longer, and they determined to dine, leaving the two defaulters to enjoy the fragments of the feast. It would be too tedious to describe the progress of the dinner: suffice it to say, that every one had such an appetite as to eat more than they had ever done in their lives before; that every gentleman drank wine with every lady; and that, when the bottles were emptied, the gentlemen amused themselves throwing stones at them.

In these agreeable employments the afternoon passed; and although it was about time to think of returning home, no Harriet and Stevenson had appeared. Mrs Wilson began to get seriously uneasy, when suddenly Jacky, who had again been posted on the hill, rushed down to say that Mr Stevenson was coming through the shrubbery, and would be with them presently. In another minute he arrived, and in reply to Mrs Wilson's anxious inquiries about Harriet, mentioned, that having lost their way among the fields, after wandering about for more than an hour he had gone up to a farm-house to inquire the road, leaving Harriet to take a canter. Unfortunately, tempted by the beautiful green grass, she had cantered into a morass, out of which he had just returned in time to extricate her and her horse. Of course, being completely covered with mud, it was impossible for her to go farther; so, taking refuge in the farm-house, she was put to bed while clean clothes were sent for from home, and Stevenson came on to request that one of the carriages might be sent round by the farm to pick her up.

And now my story is told: Harriet was found at

the farm not a bit the worse of her adventure; and, whether my readers may believe it or not, it is true that when Mrs Thomson and Mrs Dickson with their families parted from the Wilsons at their own door, the last words they said were, "Good night, Mrs Wilson: what a delightful day we have spent!"

THE MILLBANK PENITENTIARY. BY GIBBONS MERLE.

[The Millbank Penitentiary is situated on a low piece of ground near the Thames, in the south-west district of London. "The design of a building of this nature," says Britton, "for the punishment, employment, and reformation of offenders of secondary turpitude, formerly punished by transportation for a term of years, was first conceived after the disputes began which terminated in the separation of this country from the American states, to which convicts had previously been sent. * * The plan of this erection is partly that recommended by Mr Jeremy Bentham. The culprits are confined in circular buildings, with windows so constructed that the overseer, from a room in the centre, is enabled to view every room. The external wall encloses no less than eighteen acres of ground; there is a large chapel, together with an infirmary and other conveniences. The expense of building it amounted to between L.400,000 and L.500,000."—*Ed.*]

THE Penitentiary at Millbank is an institution which has given rise to much discussion, both as to the site upon which it was erected, and the system by which it is regulated. The site has certainly been ill chosen, and it must also be owned that a great mistake has been made in not elevating it somewhat above the level of the river. In the first few years after the erection of the penitentiary, the mortality was very great, and the diseases were chiefly of the character found to exist in low situations, whilst in the penitentiary of Clermont in France, which, by an extreme of absurdity, was erected on the summit of a lofty hill, none of those diseases were known, but many died in consequence of pulmonary attacks. A more generous diet and strict attention to cleanliness have latterly produced great improvement in the health of the prisoners at Millbank, and it is asserted that the sanatory state of this prison does not now fall below the ordinary average. This assertion, however, does not appear to be borne up by satisfactory evidence, and it is not denied that scrofula is very prevalent in the penitentiary. It is impossible, perhaps, to have a worse disease than scrofula in a building where so many hundred persons are confined, for it is of an insidious character, and it rarely happens that it is so perfectly eradicated as not to return, where the predisposing causes are similar in their character. It should be remembered, also, that this is a disease which may be perpetuated from generation to generation, and that it is frequently accompanied by mental injury when it is of long standing. It is the duty of the legislature to inquire carefully into the causes of the prevalence of the disease in this institution. The governor, who is at the same time the chaplain, and who appears to be a man of superior mind, attributes the malady rather to the nature of the diet than to the locality of the prison.

Each prisoner has, during four days of the week, five ounces of meat, with potatoes, and a pound of excellent bread. For breakfast and supper he has gruel, and on the non-meat days his dinner consists of bread and cheese, or soup thickened with peas, and in which vegetables are boiled. On one day of the week he has an onion, which is considered to be an antidote to the scrofula. It may be a question whether the allowance of twenty ounces of meat be sufficient for persons who are kept at work. It is true that their labour is sedentary, and that they do not require the same amount of nutritious aliment that is given to persons who work in the open air; but as the prisoners are compelled three times in the day to walk briskly in the yards for about forty minutes each time, thus performing a distance equal to a sharp walk of six or seven miles, it may be supposed that a more generous diet as to the quantity of meat, or the substitution of a small quantity of beer for water, would be more consistent with a regard for the health of the prisoners.

There are two systems of government in the penitentiary at Millbank—the silent system, in which the prisoners work and take their exercise together, but in which all communication by speech or sign is strictly forbidden under penalties of a very severe nature; and the separation system, in which communication is rendered almost impossible, as each prisoner works in his cell, and sees none of the other prisoners, except during the hours of exercise. The punishment for an infraction of the law enjoining silence, in any case, is less severe than it used to be, for at one time the slightest departure from this regulation was followed by a confinement of three days in a subterranean cell, without light and without fire, even although it should be in the depth of winter. The good sense and humanity of the governor have here been exercised with great advantage to the health of the prisoner, and at the same time his moral reformation, for it was found that this severity produced an effect directly the contrary of what was expected from it. Horrible as the punishment must appear (and those only who have been in these cells can have a true idea of the horror which they are calculated to create in the mind of the visitor), experience has shown that it was worse than useless. On the adult it had no other effect than to inspire a hatred of his persecutors, and of society at large, which sanctioned such treatment. When it produced humility, the change was unattended with contrition, and prisoners thus immured, have declared, after their liberation, that their solace in their cells

was brooding over schemes for avenging themselves upon the society by which they were persecuted. Upon boys the confinement produced only sullenness, and in some cases the horror which youths of the uneducated classes feel when left by themselves in darkness; but so far was it from effecting the desired end of maintaining the prison regulation of silence, that on many occasions, when a boy was condemned to undergo confinement in an under-ground cell, others would commit a similar offence, in order to undergo a similar punishment; thus with the waywardness of the mind so common to persons of this age and class, braving their keepers, and giving them, as they knew would be the case, additional trouble of surveillance, and at the same time yielding to a feeling almost chivalrous, and little to have been expected from such persons, except by those who have well studied human nature—that of undergoing the same punishment which they thought was undeserved by their chastised comrade. One of the keepers, in alluding to this fact, observed that all severe punishments had failed; that general mild treatment, and slight and well-regulated punishments, had alone been found effective. How true is this observation! How much good has resulted from the application of this truth in other prisons, and in the amelioration of the criminal code! Even in the treatment of the insane—and what are many of our criminal cases but shades of insanity!—a prudent gentleness has succeeded an indiscriminating severity, and the cures are much more rapid and frequent. Yet there are some men who imagine that moral turpitude, like mental derangement, can only be modified by harshness and cruelty.

The silent system, without separation, is found to have many inconveniences. The difficulty of surveillance is of course great, and it is almost impossible to prevent occasional communication. The prisoner who, in the quiet of his own cell, would commune with himself, and would by solitude be brought to a proper frame of mind, is kept in a constant state of irritation by being at all hours of the day within a few feet of comrades in misfortune, to whom he is not permitted to say even one word during the whole period of his confinement. He is thus rendered sullen; and although the terror of punishment may to a certain degree make him obedient as to the expression of his anger, the presence of his comrades, even in silence, keeps up in the mind a spirit of resistance which is highly unfavourable to reformation. The way in which communication is sometimes kept up is exceedingly ingenious. Upon the person of one prisoner was found a pen composed of the tooth of a comb, neatly split, and fastened with thread (which was easily procured, as a great number of young prisoners work together as tailors) upon a piece of wood, picked up when walking in the yard at a moment when the eyes of the guardians were not exercising their usual vigilance; a bit of coal and a little water composed the ink. How paper was obtained, remained a mystery. Another prisoner had ingeniously concealed a small black lead pencil in the bit of soap used by him for washing himself. Several communications from a female were intercepted, but the keepers could for a long time make no discovery as to the manner in which they were written, every search for this purpose being fruitless. At length it was ascertained that they were effected by a rhubarb pill, which had been given to her by order of the surgeon. She had twisted this into a point, and written with perfect ease.

The separation system is found to be more effective than the silent system without separation. The prisoners are more docile, and apparently in a better frame of mind generally; but the results even of this system have not yet been ascertained to be so satisfactory as to confirm all the hopes which were entertained by those who introduced the plan of solitude as a means of reform among criminal offenders. It is indeed true that the instances of discharged prisoners again returning to the penitentiary, under condemnation for new offences, are not very numerous; but as far as their subsequent career can be traced, the benefit is not so general as could be desired. This is not the fault of the system, but of society, which, instead of providing occupation for the discharged prisoner, regards him as an outcast, and whatever may be his anxiety to lead an honest and industrious life, closes against him the avenues to employment. The dread of receiving persons who have undergone imprisonment for an infraction of the laws, was a very natural one, when prisons were so badly conducted that the individual was more corrupt when he quitted it than when he was first imprisoned; but now, that by a new system the possibility of further contamination is prevented, and that there is at least the presumption of the existence of reform, it is neither generous nor wise to place these unhappy persons under a ban of eternal proscription. It is ungenerous to condemn thus the person who has expiated his offence, and it is imprudent to swell the list of depredators by denying to the discharged criminal the chance of supporting himself by an honest course of conduct.

On the separation system, the prisoner works and eats in his cell, which he quits only to take exercise in the yard. The principal occupations are shoemaking and tailoring. Both are taught the prisoners, but not with that degree of care which would enable them on leaving the penitentiary to earn a good livelihood by the exercise of these occupations. Generally speaking, this isolation does not affect the mind with melancholy so much as might be expected, and only

six cases of attempt at suicide have been known in three years. Even these are supposed to have been fictitious, as they took place at an hour when the parties were certain of being visited by the keepers. Educated persons feel the effect of this punishment much more severely than the uneducated; but their melancholy does not, it is said—an assertion to be received with reserve—produce insanity.

A very important observation has been made by Dr Felix Voisin, one of the government physicians of the hospital of La Salpêtrière in Paris, and founder of the Orthophranic Institution. This gentleman visited the penitentiary in my company. At this time the number of prisoners was about five hundred, a great number of whom were carefully examined by him as to their cerebral organisation. Dr Voisin, who is president of the Phenological Society of Paris, very recently examined, by order of the Academy of Sciences, the heads of the prisoners in the prison of the *Jeunes Detenus* in Paris, five hundred and fifteen in number, of whom he pronounced nearly three hundred to be of vicious mental organisation, or, to use his own words, *disgraciés par la nature*. In the penitentiary, at Newgate, he saw little more in the way of mal-organisation than would have been the case if the same number of persons of the same class had been taken indiscriminately from the streets. Vicious education, the misery of the poorer classes, and the artificial state of society in England, are the chief causes of crime. It cannot be said of the young offenders in English prisons, as with the *Jeunes Detenus* of Paris, that a large majority are born with an organisation which predisposes to vice, and to the infraction of the laws of society.

Although the prisoners at the penitentiary are isolated from the busy world whose laws they have outraged, communication with their friends is not entirely denied to them. Once in six months each prisoner is permitted to receive the visit of his relations or friends. This, however, takes place in the presence of a keeper, who stands between two iron gratings, the prisoner being at one extremity, and the visitors at the other, with an intervening distance of three or four feet. The interview is allowed to last only ten minutes, which are marked by a sand-glass. The moment that the sand has run out, the prisoner is conveyed to his cell. This indulgence produces on the whole a good effect, as most of the prisoners look forward to it with a feeling of hope, which relieves the mind in the dreary hours of solitude. It is remarked, however, with some, that this occasional and rare glimpse of happiness does but serve to increase the melancholy of the sufferer, and two or three months pass before he has recovered the equilibrium of mind which the visit has disturbed.

Religious ordinances are carefully observed in the prison, and they are peculiarly calculated to relieve the minds of the prisoners. There is a large and handsome chapel in which they assemble, and an organ, the notes of which must have a soothing effect upon these unhappy outcasts. Indeed, Sunday is the only day of the week on which they may be said to have any thing like enjoyment.

JERRY GUTTRIDGE.

A TALE OF THE EARLY AMERICAN SETTLEMENTS.

[From the Knickerbocker for May 1839.]

"WHAT shall we have for dinner, Mr Guttridge?" said the wife of Jerry Guttridge, in a sad, desponding tone, as her husband came into the log hovel, from a neighbouring grog-shop, about twelve o'clock on a hot July day.

"Oh, pick up something," said Jerry, "and I wish you would be sly and get it ready, for I'm hungry now, and I want to go back to the shop; for Sam Willard and Seth Harmon are coming over, by an' by, to swap horses, and they'll want me to ride 'em. Come, stir round; I can't wait."

"We haven't got any thing at all in the house to eat," said Mrs Guttridge. "What shall I get?"

"Well, cook something," said Jerry; "no matter what it is."

"But, Mr Guttridge, we haven't got the least thing in the house to cook."

"Well, well, pick up something," said Jerry, rather snappishly, "for I'm in a hurry."

"I can't make victuals out of nothing," said the wife; "if you'll only bring any thing in the world into the house to cook, I'll cook it. But I tell you, we haven't got a mouthful of meat in the house, nor a mouthful of bread, nor a speck of meal; and the last potatoes we had in the house, we ate for breakfast; and you know we didn't have more than half enough for breakfast, neither."

"Well, what have you been doing all this forenoon," said Jerry, "that you haven't picked up something? Why didn't you go over to Mr Whitman's, and borrow some meal?"

"Because," said Mrs Guttridge, "we've borrowed meal three times that isn't returned yet; and I was ashamed to go again, till that was paid. And besides, the baby's cried so, I've had to tend him the whole forenoon, and couldn't go out."

"Then you ain't a-goin' to give us any dinner, are you?" said Jerry, with a reproachful tone and look. "I pity the man that has a helpless, shiftless wife; he has a hard row to hoe. What's become of that fish I brought in yesterday?"

"Why, Mr Guttridge," said his wife, with tears in

her eyes, "you and the children ate that fish for your supper last night. I never tasted a morsel of it, and haven't tasted any thing but potatoes these two days; and I'm so faint now, I can hardly stand."

"Always a-grumbler," said Jerry; "I can't never come into the house but what I must hear a fuss about something or other. What's this boy snivelling about?" he continued, turning to little Bobby, his oldest boy, a little ragged, dirty-faced, sickly-looking thing, about six years old, at the same time giving the child a box on the ear, which laid him at his length on the floor. "Now, get up!" said Jerry, "or I'll learn you to be crying about all day for nothing."

The tears rolled afresh down the cheeks of Mrs Guttridge; she sighed heavily as she raised the child from the floor, and seated him on a bench on the opposite side of the room.

"What is Bob crying about?" said Jerry, fretfully.

"Why, Mr Guttridge," said his wife, sinking upon the bench beside her little boy, and wiping his tears with her apron, "the poor child has been crying for a piece of bread these two hours. He's ate nothin' to-day but one potato, and I s'pose the poor thing is half starved."

At this moment their neighbour, Mr Nat. Frier, a substantial farmer, and a worthy man, made his appearance at the door, and as it was wide open, he walked in and took a seat. He knew the destitute condition of Guttridge's family, and had often relieved their distresses. His visit at the present time was partly an errand of charity; for, being in want of some extra labour in his haying-field that afternoon, and knowing that Jerry was doing nothing, while his family was starving, he thought he would endeavour to get him to work for him, and pay him in provisions.

Jerry seated himself rather sullenly on a broken-backed chair, the only sound one in the house being occupied by Mr Frier, towards whom he cast sundry gruff looks and surly glances. The truth was, Jerry had not received the visits of his neighbours, of late years, with a very gracious welcome. He regarded them rather as spies, who came to search out the nakedness of the land, than as neighbourly visitors calling to exchange friendly salutations. He said not a word, and the first address of Mr Frier was to little Bobby.

"What's the matter with little Bobby?" said he, in a gentle tone; "come, my little fellow, come here and tell me what's the matter."

"Go on, Bobby; go and see Mr Frier," said the mother, slightly pushing him forward with her hand.

The boy, with one finger in his mouth, and the tears still rolling over his dirty face, edged along sideways up to Mr Frier, who took him in his lap, and asked him again what was the matter.

"I want a piece of bread!" said Bobby.

"And went your mother give you some?" said Mr Frier, tenderly.

"She ha'n't got none," replied Bobby, "nor 'taters too." Mrs Guttridge's tears told the rest of the story. The worthy farmer knew they were entirely out of provisions again, and he forbore to ask any further questions, but told Bobby if he would go over to his house he would give him something to eat. Then turning to Jerry, said he, "Neighbour Guttridge, I've got four tons of hay down, that needs to go in this afternoon, for it looks as if we should have rain by to-morrow, and I've come over to see if I can get you to go and help me. If you'll go this afternoon and assist me to get it in, I'll give you a bushel of meal, or a half bushel of meal and a bushel of potatoes, and two pounds of pork."

"I can't go," said Jerry; "I've got something else to do."

"Oh, well," said Mr Frier, "if you've got any thing else to do, that will be more profitable, I'm glad of it, for there's enough hands that I can get; only I thought you might like to go, bein' you was scant of provisions."

"Do, pray go, Mr Guttridge!" said his wife with a beseeching look, "for you are only going over to the shop to ride them horses, and that wont do no good; you'll only spend all the afternoon for nothin', and then we shall have to go to bed without our supper again. Do, pray go, Mr Guttridge, do!"

"I wish you would hold your everlasting clack!" said Jerry; "you are always full of complainings. It's got to be a fine time of day, if the women are a-goin' to rule the roast. I shall go over and ride them horses, and it's no business to you nor nobody else; and if you are too lazy to get your own supper, you may go without it; that's all I've got to say."

With that he aimed for the door, when Mr Frier addressed him as follows:—"Now I must say, neighbour Guttridge, if you are going to spend the afternoon over to the shop, to ride horses for them jockeys, and leave your family without provisions, when you have a good chance to 'arn enough this afternoon to last them nigh about a week, I must say, neighbour Guttridge, that I think you are not in the way of your duty."

Upon this, Jerry whirled round, and looked Mr Frier full in the face, "grinning horribly a ghastly smile," and said he, "You old miserable, dirty, meddling vagabond! you are a scoundrel and a scape-gallows, and an infernal small piece of a man, I think! I've as good a mind to kick you out of doors as ever I had to eat! Who made you a master over me, to be telling me what's my duty? You had better go home and take care of your own brats, and let your neighbours alone!"

Mr Frier sat and looked Jerry calmly in the face, with-

out uttering a syllable; while he, having blown his blast, marched out of doors, and steered directly for the grog-shop, leaving his wife to "pick up something," if she could, to keep herself and children from absolute starvation.

Mr Frier was a benevolent man, and a Christian, and in the true spirit of Christianity he always sought to relieve distress wherever he found it. He was endowed, too, with a good share of plain common sense, and knew something of human nature; and as he was well aware that Mrs Guttridge really loved her husband, notwithstanding his idle habits, and cold brutal treatment to his family, he forbore to remark upon the scene which had just passed; but telling the afflicted woman he would send her something to eat, he took little Bobby by the hand, and led him home. A plate of victuals was set before the child, who devoured it with a greediness that was piteous to behold.

"Poor cre'tur!" said Mrs Frier; "why, he's half starved! Betsey, bring him a dish of bread and milk, that will sit the best on his poor empty starved stomach."

Betsey ran and got the bowl of bread and milk, and little Bobby's hand soon began to move from the dish to his mouth, with a motion as steady and rapid as the pendulum of a clock. The whole family stood and looked on with pity and surprise, until he had finished his meal, or rather until he had eaten as much as they dared allow him to eat at once; for although he had devoured a large plate of meat and vegetables, and two dishes of bread and milk, his appetite seemed as ravenous as when he first began.

While Bobby had been eating, Mr Frier had been relating to his family the events which had occurred at Guttridge's house, and the starving condition of the inmates; and it was at once agreed, that something should be sent over immediately; for they all said, "Mrs Guttridge was a clever woman, and it was a shame that she should be left to suffer so."

Accordingly, a basket was filled with bread, a jug of milk, and some meat and vegetables, ready cooked, which had been left from their dinner; and Betsey ran and brought a pie, made from their last year's dried pumpkins, and asked her mother if she might not put that in, "so the poor starving cre'turs might have a little taste of something that was good."

"Yes," said her mother, "and put in a bit of cheese with it; I don't think we shall be any the poorer for it; for 'he that giveth to the poor lendeth to the Lord.'"

"Yes, yes," said Mr Frier, "and I guess you may as well put in a little dried pumpkin; she can stew it up for the little ones, and it'll be good for 'em. We've got a plenty of green stuff a-growin', to last till pumpkins come again." So a quantity of dried pumpkin was also packed into the basket, and the pie laid on top, and George was dispatched, in company with little Bobby, to carry it over.

Mr Frier's benevolent feelings had become highly excited. He forgot his four tons of hay, and sat down to consult with his wife about what could be done for the Guttridge family. Something must be done soon; he was not able to support them all the time; and if they were left alone much longer, they would starve. He told his wife he "had a good mind to go and enter a complaint to the grand jury ag'in' Jerry, for a lazy, idle person, that didn't provide for his family. The court sits at Saco to-morrow; and don't you think, wife, I had better go and do it?"

His wife thought he had better go over first and talk with Mrs Guttridge about it; and if she was willing, he had better do it. Mr Frier said, he "could go over and talk with her, but he didn't think it would be the least use, for she loved Jerry, ugly as he was, and he didn't believe she would be willing to have him punished by the court."

However, after due consultation, he concluded to go over and have a talk with Mrs Guttridge about the matter. Accordingly, he took his hat, and walked over. He found the door open, as usual, and walked in without ceremony. Here he beheld the whole family, including Jerry himself, seated at their little pine table, doing ample justice to the basket of provisions which he had just before sent them. He observed the pie had been cut into two pieces, and one half of it, and he thought rather the largest half, was laid on Jerry's plate, the rest being cut up into small bits, and divided among the children. Mrs Guttridge had reserved none to herself, except a small spoonful of the soft part, with which she was trying to feed the baby. The other eatables seemed to be distributed very much in the same proportion.

Mr Frier was a cool, considerate man, whose passions were always under the most perfect control; but he always confessed, for years afterwards, "that for a minute or two he thought he felt a little something like anger, rising up in his stomach!"

He sat and looked on, until they had finished their meal, and Jerry had eaten bread, and meat, and vegetables, enough for two common men's dinners, and swallowed his half of the pie, and a large slice of cheese, by way of dessert; and then rose, took his hat, and without saying a word, marched deliberately out of the house, directing his course again to the grog-shop.

Mr Frier now broached the subject of his errand to Mrs Guttridge. He told her the neighbours could not afford to support her family much longer, and unless her husband went to work, he didn't see but they would have to starve.

Mrs Guttridge began to cry. She said, "she didn't know what they should do; she had talked as long as talking would do any good; but somehow, Mr Guttridge didn't seem to love to work. She believed it wasn't his natur' to work."

"Well, Mrs Guttridge, do you believe the Scriptures?" said Mr Frier, solemnly.

"I'm sure I do," said Mrs Guttridge; "I believe all there is in the Bible."

"And don't you know," said Mr Frier, "the Bible says, 'He that will not work, neither shall he eat?'"

"I know there's something in the Bible like that," said Mrs Guttridge, with a very serious look.

"Then do you think it right," added Mr Frier, "when your neighbours send you in a basket of provisions, do you think it right that Mr Guttridge, who wont work and 'arn a mouthful himself, should sit down and eat more than all the rest of you, and pick out the best part of it, too?"

"Well, I don't s'pose it's right," said Mrs Guttridge, thoughtfully; "but somehow, Mr Guttridge is so hearty, it seems as if he would faint away, if he didn't have more than the rest of us to eat."

"Well, are you willing to go on in this way," continued Mr Frier, "in open violation of the Scriptures, and keep yourself and children every day in danger of starving?"

"What can I do, Mr Frier?" said Mrs Guttridge, bursting into a flood of tears; "I've talked, and talked, and it's no use; Mr Guttridge wont work; it don't seem to be in him. May be if you should talk to him, Mr Frier, he might do better."

"No, that would be no use," said Mr Frier. "When I was over here before, you see how he took it, just because I spoke to him about going over to the shop, when he ought to be to work, to get something for his family to eat; you saw how mad he was, and how provoking he talked to me. It's no use for me to say any thing to him; but I think, Mrs Guttridge, if somebody should complain to the grand jury about him, the court would make him go to work. And if you are willing for it, I think I should feel it my duty to go and complain of him."

"Well, I don't know but it would be best," said Mrs Guttridge; "and if you think it would make him go to work, I'm willing you should. When will the court sit?"

"To-morrow," said Mr Frier; "and I'll give up all other business and go and attend to it."

"But what will the court do to him, Mr Frier?" said Mrs Guttridge.

"Well, I don't know," said Mr Frier, "but I expect they'll punish him; and I know they'll make him go to work."

"Punish him!" exclaimed Mrs Guttridge, with a troubled air. "Seems to me I don't want to have him punished. But do you think, Mr Frier, they will hurt him any?"

"Well, I think it's likely," said Mr Frier, "they will hurt him some; but you must remember, Mrs Guttridge, it is better once to smart than always to ache. Remember, too, you'll be out of provisions again by to-morrow. Your neighbours can't support your family all the time; and if your husband don't go to work, you'll be starving again. Still, if you don't feel willing, and don't think it's best, I wont go near the grand jury, nor do nothin' about it."

"Oh, dear!—well, I don't know!" said Mrs Guttridge, with tears in her eyes. "You may do just as you think best about it," Mr Frier; "that is, if you don't think they'll hurt him much."

Mr Frier returned home, but the afternoon was so far spent that he was able to get in only one ton of his hay, leaving the other three tons out to take the chance of the weather. He and his wife spent the evening in discussing what course it was best to pursue with regard to the complaint against Mr Guttridge; but notwithstanding his wife was decidedly in favour of his going the next morning and entering the complaint, since Mrs Guttridge had consented, yet Mr Frier was undecided. He did not like to do it; Mr Guttridge was a neighbour, and it was an unpleasant business. But when he arose the next morning, looked out, and beheld his three tons of hay drenched with a heavy rain, and a prospect of a continued storm, he was not long in making up his mind.

"Here," said he, "I spent a good part of the day yesterday in looking after Guttridge's family, to keep them from starving; and now, by his means, I've nigh about as good as lost three tons of hay. I don't think it's my duty to put up with it any longer."

Accordingly, as soon as breakfast was over, Mr Frier was out, spattering along in the mud and rain, with his old greatcoat thrown over his shoulders, the sleeves flapping loosely down by his side, and his drooping hat twisted awry, wending his way to court, to appear before the grand jury.

"Well, Mr Frier, what do you want?" asked the foreman, as the complainant entered the room.

"I come to complain of Jerry Guttridge to the grand jury," replied Mr Frier, taking off his hat, and shaking the rain from off it.

"Why, what has Jerry Guttridge done?" said the foreman. "I didn't think he had life enough to do any thing worth complaining of to the grand jury."

"It's because he *hasn't* got life enough to do any thing," said Mr Frier, "that I've come to complain of him. The fact is, Mr Foreman, he's a lazy idle fellow, and wont work, nor provide nothin' for his family to eat; and they've been half starving this long time; and the neighbours have had to keep sending in something all the time to keep 'em alive."

"But," said the foreman, "Jerry's a peaceable kind of a chap, Mr Frier; has any body ever talked to him about it, in a neighbourly way, and advised him to do differently? And maybe he has no chance to work where he could get any thing for it."

"I'm sorry to say," replied Mr Frier, "that he's been talked to a good deal, and it don't do no good; and I tried hard to get him to work for me yesterday afternoon, and offered to give him victuals enough to last his family 'most a week, but I couldn't get him to, and he went off to the grog-shop, to see some jockeys swap horses. And when I told him, calmly, I didn't think he was in the way of his duty, he flew in a passion, and called me an old, miserable, dirty, meddling vagabond, and a scoundrel, and a scape-gallows, and an infernal small piece of a man!"

"Abominable!" exclaimed one of the jury; "who ever heard of such outrageous conduct?"

"What a vile, blasphemous wretch!" exclaimed another; "I shouldn't 'a wondered if he'd 'a fell dead on the spot!"

The foreman asked Mr Frier if Jerry "had used them very words."

"Exactly them words, every one of 'em," said Mr Frier. "Well," said the foreman, "then there is no more to be said. Jerry certainly deserves to be indicted, if any body in this world ever did."

Accordingly the indictment was drawn up, a warrant was issued, and the next day Jerry was brought before the court to answer to the charges preferred against him. Mrs Sally Guttridge and Mr Nat. Frier were summoned as witnesses. When the honourable court was ready to hear the case, the clerk called Jerry Guttridge, and bade him hearken to an indictment found against him by the grand inquest for the district of Maine, now sitting at Saco, in the words following, namely:—"We present Jerry Guttridge for an idle person, and not providing for his family; and giving reproachful language to Mr Nat. Frier, when he reproved him for his idleness."

"Jerry Guttridge, what say you to this indictment? Are you guilty thereof, or not guilty?"

"Not guilty," said Jerry; "and here's my wife can tell you the same, any day. Sally, haven't I always provided for my family?"

"Why, yes," said Mrs Guttridge; "I don't know but you have as well as —"

"Stop, stop!" said the judge, looking down over the top of his spectacles at the witness: "stop, Mrs Guttridge; you must not answer questions until you have been sworn."

The court then directed the clerk to swear the witnesses; whereupon he called Nat. Frier and Sally Guttridge to step forward, and hold up their right hands. Mr Frier advanced, with a ready, honest air, and held up his hand. Mrs Guttridge lingered a little behind; but when at last she faltered along, with feeble and hesitating step, and held up her thin, trembling hand, and raised her pale blue eyes, half swimming in tears, towards the court, and exhibited her care-worn features, which, though sun-burnt, were pale and sickly, the judge had in his own mind more than half decided the case against Jerry. The witnesses having been sworn, Mrs Guttridge was called to the stand.

"Now, Mrs Guttridge," said the judge, "you are not obliged to testify against your husband any thing more than you choose; your testimony must be voluntary. The court will ask you questions touching the case, and you can answer them or not, as you may think best. And in the first place, I will ask you whether your husband neglects to provide for the necessary wants of his family; and whether you do, or do not, have comfortable food and clothing for yourself and children?"

"Well, we go pretty hungry a good deal of the time," said Mrs Guttridge, trembling; "but I don't know but Mr Guttridge does the best he can about it. There don't seem to be any victuals that he can get, a good deal of the time."

"Well, is he, or is he not, in the habit of spending his time idly, when he might be at work, and earning something for his family to live upon?"

"Why, as to that," replied the witness, "Mr Guttridge don't work much, but I don't know as he can help it; it doesn't seem to be his natur' to work. Somehow he don't seem to be made like other folks; for if he tries ever so much, he can't never work but a few minutes at a time; the natur' don't seem to be in him."

"Well, well," said the judge, casting a dignified and judicial glance at the culprit, who stood with mouth wide open and eyes fixed on the court with an intentness that showed he began to take some interest in the matter; "well, well, perhaps the court will be able to put the natur' in him."

Mrs Guttridge was directed to step aside, and Mr Nat. Frier was called to the stand. His testimony was very much to the point, clear and conclusive. But as the reader is already in possession of the substance of it, it is unnecessary to recapitulate it. Suffice it to say, that the judge retained a dignified self-possession, and settling back in his chair, said the case was clearly made out; Jerry Guttridge was unquestionably guilty of the charges preferred against him.

The court, out of delicacy towards the feelings of his wife, refrained from pronouncing sentence until she had retired, which she did, on an intimation being given her that the case was closed, and she could return home. Jerry was then called, and ordered to hearken to his sentence, as the court had recorded it.

Jerry stood up and faced the court, with fixed eyes and gaping mouth, and the clerk repeated as follows:—"Jerry Guttridge! you having been found guilty of being an idle and lazy person, and not providing for your family, and giving reproachful language to Mr Nat. Frier, when he reproved you for your idleness, the court orders that you receive twenty smart lashes, with the cat-o'-nine-tails, upon your naked back, and that this sentence be executed forthwith, by the constables, at the whipping-post in the yard, adjoining the court-house."

Jerry dropped his head, and his face assumed divers deep colours, sometimes red, and sometimes shading upon the blue. He tried to glance round upon the assembled multitude, but his look was very sheepish; and, unable to stand the gaze of the hundreds of eyes that were turned upon him, he settled back on a bench, leaned his head on his hand, and looked steadily upon the floor. The constables having been directed by the court to proceed forthwith to execute the sentence, they led him out into the yard, put his arms round the whipping-post, and tied his hands together. He submitted without resistance; but when they commenced tying his hands round the post, he began to cry and beg, and promise better fashions, if they would only let him go this time. But the constables told him it was too late now; the sentence of the court had been passed, and the punishment must be inflicted. The whole throng of spectators had issued from the court-house, and stood round in a large ring, to see the sentence enforced. The judge himself had stepped to a side window, which commanded a view of the yard, and stood peering solemnly through his spectacles, to see that the ceremony was duly performed.

All things being in readiness, the stoutest constable took the cat-o'-nine-tails, and brought them heavily across the naked back of the victim. At every blow, Jerry jumped and screamed, so that he might have been heard well nigh a mile. When the twenty blows were counted, and the ceremony was ended, he was loosed from his confinement, and told that he might go. He put on his garments, with a sullen but subdued air, and without stopping to pay his respects to the court, or even to bid any one good bye, he straightened for home, as fast as he could go.

Mrs Guttridge met him at the door, with a kind and piteous look, and asked him if they had hurt him. He made no reply, but pushed along into the house. There he found the table set, and well supplied, for dinner; for Mrs Guttridge, partly through the kindness of Mr Frier, and partly from her own exertions, had managed to "pick up something," that served to make quite a comfortable meal. Jerry ate his dinner in silence, but his wife thought he manifested more tenderness and less selfishness than she had known him to exhibit for years; for instead of appropriating the most and the best of the food to himself, he several times placed fair proportions of it upon the plates of his wife and each of the children.

The next morning, before the sun had dried the dew from the grass, whoever passed the haying-field of Mr Nat. Frier, might have beheld Jerry Guttridge busily at work, shaking out the wet hay to the sun; and for a month afterwards, the passer-by might have seen him, every day, early and late, in that and the adjoining fields, a perfect pattern of industry.

A change soon became perceptible in the condition and circumstances of his family. His house began to wear more of an air of comfort, outside and in. His wife improved in health and spirits, and little Bobby became a fat hearty boy, and grew like a pumpkin. And years afterward, Mrs Guttridge was heard to say, that "somehow, ever since that 'ere trial, Mr Guttridge's natur' seemed to be entirely changed!"

OCCASIONAL NOTES.

ERRONEOUS CALCULATIONS IN LIFE ASSURANCE AND ANNUITY ENDOWMENT.

It is obviously of very serious importance to the community that right principles should preside at the institution of all benefit societies, associations for mutual life assurance, for granting annuities, &c. When the contrary is the case, and the error is on the side of too liberal promise, disappointment, and in many instances grievous hardship, must inevitably ensue. We are disposed to think that in most cases safe calculations have been made by the parties originating and managing such associations; but yet, if all of them were rigidly inquired into, the public would probably be surprised at the number—and these by no means of unpretending exterior—in which wrong data have been assumed. In some cases this error appears to have been wilful, with the view of cheating or swindling: there is at this moment in the metropolis, a Fire and Life Assurance and Annuity Company, which offers benefits far beyond what can be expected for the monies exacted, and seeks to inspire confidence by an exhibition of names of known respectability, which, however, when pointed inquiry is made, are found to belong to obscure and irresponsible persons. Such proceedings are only a more than usually detestable kind of roguery, seeing that they may lure on a victim through a course of twenty or thirty years, and only open his eyes when he is in old age, and unable to make other provision for himself. In other, and we would hope the greater number of instances, the error is not wilful, but the result of ignorance or of mistaken calculations.

An example of this nature has recently been brought under our notice by a friend, who exercises the profession of an accountant, and in whose acuteness with respect to all such matters we place the utmost confidence. The parties at fault are established in a provincial city, and their animating impulse is benevolence. Anxious to encourage foresight and self-provision amongst the middle and lower classes, they have formed what is called an Annuity Endowment Society, into which certain sums may be paid by one party, that certain other sums may afterwards be realised by another party in the shape of annuities; the general object being to enable husbands to provide for their wives, and parents for their children. The intention is excellent; but, unfortunately, for want of correct reckoning at the commencement, the prospective sums are far beyond what can be fairly expected in return for those exacted; so that, after the society shall have lasted a certain time, all the members must find that they have been involuntarily defrauding themselves and their families. As an example of the mis-calculations of this society—a person of 59, in order to secure after his death an annuity of £50 to his wife now aged 49, pays (besides entry-money £4) £20 under the name of a fine for the disparity of the ages, and £10 annually during the remainder of his life. The present value of an annual payment of £10 by a person of 59 is £109, 12s. 7d.; so that the whole sum paid by this person may be estimated at £133, 12s. 7d. Now, according to the Carlisle tables of mortality, and assuming the money to be laid out at 4 per cent., the present value of such a contingent annuity is £236, 17s., or £103, 4s. 5d. more than is exacted by the society in question. To satisfy ourselves on this point, we made inquiry of a most respectable institution in our own city, and found that an annuity of £50 for a person of 49, on the death of one aged 59, could not be obtained even at £236, 17s.: a considerably larger sum would be required. At all the other ages, sums more or less inadequate are ex-

acted. In most cases they do not amount to one half, and in none do they amount to two thirds, of the sums requisite to secure the expected benefits. The remote consequences of such errors it is distressing to contemplate.

We deem it our duty earnestly to warn all who propose to originate such institutions, to take the utmost care that the calculations are made on correct principles. We would also warn parties proposing to become members of any society for annuity endowment or life assurance, to satisfy themselves beforehand that the institution with which they are to be connected is one in which, whether from design or ignorance, they are not exposed to a disappointment of their hopes.

FOREIGN HOTEL CARTES.

The innkeepers in the countries on the Rhine follow a practice which is worth hinting to persons of the same profession in this country. They give their guests a *carte*, or piece of paper measuring about sixteen inches long and four inches broad, and which folds together like a small map. This *carte*, when folded, exhibits on the outside a view of the hotel, also its name, and the name of the keeper; on expanding it we find that the other parts of the outside consist of lists of the principal curiosities or public buildings which are worth visiting in the town and its environs; and along the whole inside we find a map of the chief routes from the place. Thus, the German hotel-keeper's *carte* is a card of his house, a local guide, and a posting itinerary—all in one bit of paper, the expense of which cannot be much greater than that of a common shop-card in England. We can show one of these things to any person who would wish to introduce the practice into this country.

A CURE FOR RHEUMATISM.

Rub dry flour of mustard upon the part affected, holding the part at the same time before a fire. Give it a good rubbing for some time, sufficient to bring out a rash on the skin, and relieve the pain. One rubbing is generally found sufficient. This is a Scotch old woman's recipe for rheumatism, and seldom fails in effecting a complete and very speedy cure.

QUACK ADVERTISEMENTS.

We perceive that a Glasgow newspaper, the Constitutional, has announced its intention of refusing the insertion of advertisements of quack medicines. This is a piece of good taste and self-denial on the part of a newspaper proprietor, which deserves to be made widely known.

WALKS OUT OF TOWN.

BY HUGH MILLER,

AUTHOR OF THE TRADITIONAL HISTORY OF CROMARTY.

No. II.

We have perused the grave of the "poor lost lad," and it turns out to be a treatise on toleration. The grave beside it may be regarded as a ballad—a short plaintive ballad, moulded in as common a form of invention, if I may so express myself, as any, even the simplest of those old artless compositions which have risen from time to time from among the people. Indeed, so simple is the story of it, that we might almost deem it an imitation, were we not assured that the volumes of this solitary recess are original from beginning to end.

It was fifty years last March since the Champion man-of-war entered the bay below, with her ancient suspended half way over the deck. Old seamen among the townfolks, acquainted with that language of signs and symbols in which fleets converse when they meet at sea, said that either the captain or one of his officers was dead; and the townspeople, interested in the intelligence, came out by scores to gaze on the gallant vessel as she bore up slowly and majestically in the calm, towards the distant roadstead. The sails were furled, and the anchors cast; and as the huge hull swung round to the tide, three boats crowded with men were seen to shoot off from her side, and a strain of melancholy music came floating over the waves to the shore. A lighter shallop, with only a few rowers, pulled far ahead of the others, and as she reached the beach, the shovels and pick-axes, for which the crew relinquished their oars, revealed to the spectators more unequivocally than even the half-hoisted ensign or the music, the sad nature of their errand. The other boats approached with muffled and melancholy stroke, and the music waxed louder and more mournful. They reached the shore; the men formed at the water's edge round a coffin covered by a flag, and bearing a sword on the top, and then passed slowly amid the assembled crowds to the burying-ground of St. Regulus. Arms glittered to the sun. The echoes of the tombs and of the deep precipitous dell below were awakened awhile by unwonted music, and then by the sharp rattle of musketry; the smoke went curling among the trees, or lingered in a blue haze amid the dingier recesses of the hollow; the coffin was covered over; a few of the officers remained behind the others; and there was one of them, a tall handsome young man, who burst out, as he was turning away, into an uncontrollable fit of weeping. At length the whole pageant passed, and there remained behind only a darkened little hillock, with whose history no one was acquainted, but which was known for many years after as the "officer's grave."

Twenty years went by, and the grave came to be little thought of, when a townsman, on going up one evening to the burying-ground, saw a lady in deep

mourning sitting weeping beside it, and a tall handsome gentleman in middle life, the same individual who had been so much affected at the funeral, standing as if waiting for her a little apart. They were brother and sister. The storms of twenty seasons had passed over the little mossy hillock. The deep snows had pressed upon it in winter; the dead vegetation of succeeding summers and autumns had accumulated around it, and it seemed as if flattened to nearly the level of the soil. It had become an old grave; but the grief that for the first time was now venting itself over it, had remained fresh as at first. There are cases, though rare, in which sorrow does not yield to time. A mother loses her child just as its mind has begun to open, and it has learned to lay hold of her heart by the singularly endearing signs of infantine affection and regard, which show us how those sympathies of our nature which serve to bind us to the species are awakened to perform their labour of love with even the first dawn of intelligence. Little missed by any one else, or at least soon to be forgotten, it passes away; but there is one who seems destined to remember it all the more vividly, just because it has passed. To her, death serves as a sort of mordant to fix the otherwise flying colours in which its portraiture had been drawn on her heart. Time is working out around her his thousand thousand metamorphoses. The young are growing up to maturity, the old are dropping into their graves, but the infant of her affections ever remains an infant—her charge in middle life, when all her other children have left her and gone out into the world, and amid the weakness of decay and decrepitude, the child of her old age. There arises, however, a more enduring sorrow than even that of the mother, when, in the midst of hopes all but gratified, and wishes on the eve of fulfilment, the ties of the softer passion are rudely severed by death. Feelings, evanescent in their nature, and restricted to one class of circumstances, and one stage of life, are unerringly fixed through the event in the mind of the survivor. Youth first passes away, then the term of robust and active life, and last of all, the cold and melancholy winter of old age; but through every succeeding change, until the final close, the bereaved lover remains a lover still. Death has fixed the engrossing passion in its tenderest attitude by a sort of petrifying process; and we are reminded by the fact of those delicate leaves and florets of former creations, which a common fate would have consigned to the usual decay, but which were converted, when they died, by some sudden catastrophe, into a solid marble that endures for ever. The lady who wept this evening beside the "officer's grave" was indulging in a hopeless and enduring passion of the character described; but all that now remains of her story forms but a mere outline for the imagination to fill up at pleasure. Her lover had been the sole heir of an ancient and affluent family; the lady herself belonged to rather a humbler sphere. He had fixed his affections upon her when almost a boy, and had succeeded in engaging hers in turn; but his parents, who saw nothing desirable in a connection which was to add to neither the wealth nor the honours of the family, interfered, and he was sent to sea, where a disappointed attachment, preying on a naturally delicate constitution, soon converted their fears for his marriage into regret for his death. Did I not say truly that the "officer's grave" was a simple little ballad, moulded in one of the commonest forms of invention!

Let us peruse one other grave ere we quit the burying-ground—the grave of Morrison the painter. It treats of morals, like that of "the poor lost lad," but it enforces them after a different mode. We shall find it in the strangers' corner, beside the graves of the two foreign seamen, whose bodies were cast up on the beach after a storm.

Morrison, some sixty or seventy years ago, was a tall, thin, genteel-looking young man, who travelled the country as a portrait and miniature painter. The profession was new at the time to the north of Scotland, and the people thought highly of an artist who made likenesses that could be recognised. But they could not think more highly of him than Morrison did of himself. He was one of the class who mistake the imitative faculty for genius, and the ambition of rising in a genteel profession for that energy of talent whose efforts, with no higher object often than the mere pleasure of exertion, buoy up the possessor to his proper level among men. There was a time when Morrison's pictures might be seen in almost every house—in little turf cottages even among halfpenny prints and broadsheet ballads; nor were instances wanting of their finding place among the paintings of a higher school. Some proprietor of the district retained an eccentric piper or gamekeeper in his establishment, or, like the baron of a former age, kept a fool, and Morrison had been employed to confer on all that was droll or picturesque in their appearance, the immortality of colour and canvass. Like the painter in the fable who pleased every body, he drew all his men after one model, and all his women after another; but, unlike the painter, he copied from neither Apollo nor Venus. His gentlemen had sloping shoulders and long necks, and looked exceedingly grave and formidable; his ladies, on the contrary, were sweet simpering creatures, with waists almost tapering to a point, and cheeks and lips of as lovely a crimson as that of the bunch of roses which they bore in their hands.

I have said that Morrison thought more highly of

his genius than even his countryfolks. As the member of a highly liberal profession, too, he naturally enough took rank as a gentleman. Geniuses were eccentric in those days, and gentlemen not very moral; and Morrison, in his double capacity of genius and gentleman, was skilful enough to catch the eccentricity of the one class and the immorality of the other. He raked a little, and drank a great deal, and in his cups said and did things which were thought very extraordinary indeed. But though all acknowledged his genius, he was less successful in establishing his gentility. There was, indeed, but one standard of gentility in the country at the time, and fate had precluded the painter from coming up to it: no one was deemed a gentleman whose ancestors had not been useless to the community for at least three generations. It must be confessed, too, that some of Morrison's schemes for establishing his claim were but ill laid. On one occasion he attended an auction of valuable furniture in the neighbouring town, and though a wanderer at the time, as he had been all his life long, and miserably poor to boot, he deemed it essential to the maintenance of his character, that as all the other gentlemen present were bidding with spirit, he should now and then give a spirited bid too. He warmed gradually as the sale proceeded, offered liberally for beds and carpets, and made a dead set on a valuable pianoforte. The purchasers were sadly annoyed, and the auctioneer, who was a bit of a wag, and laboured to put down the painter by sheer force of wit, found that he had met with as accomplished a wit as himself. Morrison lost the piano, and then fell in love with a moveable wooden house, which had served as a sort of meat preserve, and was secured by a strong lock. "You had better examine it inside, Mr Morrison," said the auctioneer; "in fact, the whole merit of the thing lies inside." Morrison went in, and the auctioneer shut and locked the door. There could not be a more grievous outrage on the feelings of a gentleman; but though the poor man went bouncing against the cruel walls of his prison, like an incarcerated monkey, and grinned with uncontrollable wrath at all and sundry through its little wire-woven window, pity or succour was there none; he was kept in close durance for four long hours till the sale terminated, and found his claim to gentility not in the least strengthened when he got out.

After living as he best could for about forty years, the painter took to himself a wife. No woman should ever have thought of marriage in connection with such a person as Morrison, nor should Morrison have ever thought of marriage in connection with himself. But so it was—for ladies are proverbially courageous in such matters, and Morrison could bid as dauntlessly for a wife as for a pianoforte—that he succeeded in finding a woman bold enough to accept of him for her husband. She was a rather respectable sort of person, who had lived for many years as housekeeper in a gentleman's family, and had saved some money. They took lodgings in the neighbouring town; Morrison showed as much spirit, and got as often drunk, as before; and in little more than a twelvemonth they came to be in want. They lingered on, however, in miserable poverty for a few months longer, and then quitted the place, leaving behind them all Mrs Morrison's well-saved wardrobe under arrestment for debt. The trunk which contained it lay unopened till about five years after the poor woman had been laid in her grave, the victim of her miserable marriage; and the contents formed a strange comment on her history. There were fine silk gowns, sadly marred by mildew, and richly flowered clothes eaten by the moths. There, too, there were pretty little heads of the virgin and the apostles, and beads and a crucifix of some value; the loss of which, as the poor owner had been a zealous Catholic, had affected her more than the loss of all the rest. And there, too, like the Babylonish garment among the goods of Achan, there was a packet of Morrison's letters, full of flames and darts, and all those little commonplaces of love which are used by men clever on a small scale, who think highly of their own parts, and have no true affection for any one but themselves.

It has been told me by an acquaintance who resided for some time in one of our northern towns, that when hurrying to his lodgings on a wet and very disagreeable winter evening, his curiosity was attracted by a red glare of light which he saw issuing through the unglazed window and partially uncovered rafters of a deserted hovel by the wayside. He went up to it, and found the place occupied by two miserable-looking wretches, a man and woman, who were shivering over a smouldering fire of damp straw. These were Morrison and his wife; neither of them wholly sober, for the woman ere now had broken down in character as well as in circumstances. They had neither food nor money; the rain was dropping upon them through the roof, and the winter wind fluttering through their rags; and yet, as if there was too little in all this to make them unhappy enough, they were adding to their miseries by mutual recriminations. The woman, as I have said, soon sank under the hardships of a life so entirely wretched; her unlucky partner survived until the infirmities of extreme old age were added to his other miseries. It is not easy to conceive how any one who passed such a life as Morrison, should have lived for the greater part of a century; and yet so it was, that, when he visited the neighbouring town for the last time, he was in his eighty-fifth year. And never, certainly, was the place visited by a more squalid, miserable-looking creature; he resembled rather a

corpse set a-walking than a living man. He was still, however, Morrison the painter, feebly eccentric, and meanly proud: even when compelled to beg, which was often, he could not forget that he was an artist and a gentleman notwithstanding. In his younger days he had skill enough to make likenesses that could be recognised; the things he now made scarcely resembled human creatures at all; but he went about pressing his services on every one who had children and spare sixpences, till he had at length well nigh filled the town with pictures of little boys and girls, which, in almost every case, the little boys and girls got to themselves. On one occasion he went into the shop of one of the town merchants, and insisted on furnishing the merchant with the picture of one of his daughters, a little laughing blonde, who was playing in front of the counter. He produced his colours, and began the drawing; but the girl, after wondering at him till his work was about half finished, escaped into the street, and one of her sisters, a sober-eyed brunette, who had heard of the strange old man who was "making pictures," came running in, and took her place. The painter held fast the intruder, and continued his drawing. "Hold, hold, Mr Morrison, that is another little girl you have got," said the merchant; "that is but the sister of the first." "Heaven bless the dear sweet creature," said Morrison, still plying the pencil; "they are so like that there can be no mistake."

The closing scene to poor Morrison came at last. He left his bed one day after an illness of nearly a week, and crawled out into the street to beg. A gentleman in passing dropped him a few coppers, and Morrison felt indignant that any one should have offered an artist less than silver. But on second thoughts he corrected himself. "Heaven help me," he ejaculated, "I have been a fool all life long, and I am not wise yet!" He crept onwards along the pavement to the house of a gentleman whom he had known thirty years before. "I am dying," he said, "and I am desirous that you should see my body laid decently under ground; I shall be dead in less than a week." The gentleman pledged himself to attend the funeral; Morrison crept back to his lodgings, and was dead in less than a day. Yonder he lies in the strangers' corner; the parish furnished the shroud and the coffin, and the gentleman whom he had invited to his burial carried his head to the grave, and paid the sexton. There are few real stories consistently gloomy throughout. Nature delights in strange compounds of the bizarre and the serious; and Morrison's story, like some of the old English dramas that terminate unfortunately, has a mixture of the comic in it. And yet, notwithstanding its lighter touches, I question whether we shall be able to find a deeper tragedy among all the volumes of the churchyard.

AMUSEMENTS FOR THE PEOPLE.

IN "A Manual for Mechanics' Institutions," just published by the Society for the Diffusion of Useful Knowledge, we find some valuable opinions strung together respecting amusements for the people. As they appear to us to call for general attention, we take leave to transfer them to these columns:—

"The subject of amusements for the working-classes is daily becoming one of greater and more serious importance, and involves the most important considerations, with which the future civilisation of the country is intimately connected.

'There is,' says Sir John Herschel, 'a want too much lost sight of in our estimate of the privations of the humble classes, though it is one of the most incessant cravings of all our wants, and is actually the impelling power which, in the vast majority of cases, urges men into vice and crime—it is the want of amusement. It is in vain to declaim against it. Equally with any other principle in our nature it calls for its natural indulgence, and man cannot be permanently debarred from it without souring the temper and spoiling the character. Like the indulgence of other appetites, it only requires to be kept within due bounds, and turned upon innocent or beneficial objects, to become a spring of happiness. But gratified to a certain moderate extent it must be in the case of every man, if we desire him to be either a useful, active, or contented member of society. Now, I would ask, what provision do we find for the cheap and innocent and daily amusements of the mass of the labouring population of this country? What sort of resources have they to call up the cheerfulness of their spirits, and chase away the cloud from their brow after the fatigue of a day's hard work, or the stupefying monotony of sedentary occupation? Why, really very little. I hardly like to assume the appearance of a wish to rip up grievances by saying how little. The pleasant field walk, and the village green, are becoming rarer and rarer every year. Music and dancing (the more's the pity) have become so closely associated with ideas of riot and debauchery among the less cultivated classes, that a taste for them, for their own sakes, can hardly be said to exist; and before they can be recommended as innocent or safe amusements, a very great change of ideas must take place. The truth is, that under the pressure of a continually condensing population, the habits of the city have crept into the village. The demands of agriculture have become stern and more imperious; and while hardly a foot of ground is left uncultivated and unappropriated, there is positively not space left for many of

the cheerful amusements of rural life. Now, since this appears to be unavoidable, and as it is physically impossible that the amusements of a condensed population should continue to be those of a scattered one, it behoves us strongly to consider of some substitutes. But perhaps it may appear to some almost preposterous to enter on the question. Why, the very name of a labourer has something about it with which amusement seems out of character: labour is work, amusement is play; and though it has passed into a proverb, that one without the other will make a dull boy, we seem to have lost sight of a thing equally obvious, that a community of dull boys in this sense is only another word for a society of ignorant, headlong, and ferocious men.'

'After a hard day's work,' says Sir Benjamin Heywood, in one of his addresses to the Manchester Mechanics' Institution, 'a man wants refreshment and ease. I would urge the directors who are this evening to be appointed, to let this be one of the earliest subjects of their consideration—think, for instance, whether social evening parties, with tea and coffee, might not be more encouraged amongst you.' Sir Benjamin Heywood then read portions of a work upon the subject of amusement for the people, by Mr Dewey, an American clergyman, from which we extract the following paragraphs:—

'There is another view in which the subject of amusements, light as it may be thought, goes deep into all questions about our national improvement and happiness. We are making great efforts in America to bring about various moral reforms. At the head of these enterprises stands the temperance reformation. And the public attention, as was natural in the appalling circumstances of the case, has been very much occupied with the immediate evil, and the obvious methods of supplying the remedy. But it seems to me that it is time to go deeper into this matter, and inquire how the reform is to be carried on and sustained in the country. "By embodying the entire nation in a temperance society," will it be said? I think not, even if that point could be gained. We must have some stronger bond than that of formal association, some stronger provision than that of temporary habit, to rely on. We must lay the foundations of permanent reform in the principles of human nature, and in the very frame-work of society. Suppose that this nation, and every individual in it, were now temperate, how are they to be kept so? The zeal of individuals in this cause will die away; the individuals themselves will die; how is the people, supposing it were made temperate, to be kept so? There was a time, in former days, when our people were all temperate—when a small bottle of strong waters sufficed for a whole army—when, that is to say, ardent spirits were used only as a medicine. Why, from those early days of pristine virtue and rigid piety, did the nation fall away into intemperance? And how, I ask again, are we to expect to stand where our fathers fell?

'In answer to this question, let me observe, that there is in human nature, and never to be rooted out of it, a want of excitement and exhilaration. The cares and labours of life often leave the mind dull; and when it is relieved from them—and it must be relieved, let this be remembered—there must be seasons of relief; and the question is, how are these seasons to be filled up? When the mind enjoys relief from its occupations, I say, that relief must come in the shape of something cheering and exhilarating. The man cannot sit down dull and stupid—and he ought not. Now, suppose that society provides him with no cheerful or attractive recreations; that society, in fact, frowns upon all amusements; that the importunate spirit in business, and the sanctimonious spirit in religion, and the supercilious spirit in fashion, all unite to discountenance popular sports and spectacles; and thus, that all cheap and free enjoyments, the hale, hearty, holiday recreations, are out of use and out of reach; what now will the man set free from business or labour be likely to do? He asks for relief and exhilaration, he asks for escape from his cares and anxieties: society in its arrangements offers him none; the tavern and the ale-house propose to supply the want; what so likely as that he will resort to the tavern and the ale-house? I have no doubt that one reason why our country fell into such unusual intemperance, was the want of simple, innocent, and authorised recreations in it. I am fully persuaded that some measure of this sort is needful, to give a natural and stable character to the temperance reform.

Let it not be said, as if it were a fair reply to all this, that men are intemperate in the midst of their recreations. The question is not what they do, with their vicious habits already acquired, but how they came by those habits; and the question again is not, whether a man may not fall into inebriety, amidst the purest recreations as well as when away from them, but what he is likely to do. In short, to do justice to the argument, it should be supposed that a people is perfectly temperate, and then may fairly be considered the question, how it is most likely to be kept so. * * *

If there were among any people authorised holidays and holiday sports—if there were in every village a public promenade, where music might frequently be heard in the evening, would not these places be likely to draw away many from the resorts of intemperance? Men cannot labour or do business always. They must have intervals of relaxation. What is to be done with these intervals? This is the question, and it is a question to be soberly answered. As it is to be met, I

repeat, with answers, and not with surmises of danger. Men cannot sleep through these intervals. What are they to do? Why, if they do not work, or sleep, they must have recreation. And if they have not recreation from healthful sources, they will be very likely to take it from the poisoned fountains of intemperance. Or, if they have pleasures which, although innocent, are forbidden by the maxims of public morality, their very pleasures are liable to become poisoned fountains.'

In-door amusements of a tranquil character, and consequently suited for those who have spent the day in hard labour, may be multiplied to infinity. An instance was given in the Penny Magazine some time ago, in which the game of chess had been introduced into a country village in Germany with great advantage. Concerts might, without much difficulty, be performed, if a music class were taught in each institution: music forms so soothing and so delightful a recreation, that it is desirable to see a love for it extended as widely as possible.

In the Lyceums recently established in Manchester and the neighbourhood, recreation has been a primary object. Besides classes for music—vocal and instrumental, which are well attended by the members—concerts of a superior character are occasionally given at each institution, the expense of which is defrayed by a small payment from each member, increased to strangers. The several music classes (which have been combined under the title of the Popular Choral Society) also give periodical concerts to their respective members free of expense. Tea-parties, either open to the public, or confined to the members of particular classes, enlivened by singing, recitations, and philosophical experiments, assemble once or twice in each quarter."

MARY STUART AND HER POETS.

POETS of all lands have sung of Mary of Scotland. Her beauty and her rank—beauty so rare, and rank so illustrious—her misfortunes and her end—misfortunes so heavy, and an end so sad and deplorable—are indeed well calculated to awake the sympathies of the sensitive followers of the muses. As for the dark shade of mystery which hangs over some portions of her conduct and career, it may well be believed that, where the comparatively cold and calculating historian cannot see clear grounds to condemn her, the poet will not become her exterminator. He sees in her but a lovely, gifted, and ill-fated being, who, if she did err, erred under the pressure of circumstances over which she had little or no control, and whose fortune it was, from sex and position, to be the sport and victim of a turbulent and ruthless age. Admiration and pity are the feelings with which the poet thinks of Mary of Scotland; witness Burns, Béranger, and Wordsworth. Perhaps some portion of the veneration felt by such children of genius for Mary Stuart, is to be ascribed to her having been herself of the fellowship of song. We do not mean directly to claim the poet of the Midsummer Night's Dream as one of the celebrators of the Scottish queen, yet it has usually been thought, that, in the passage immediately preceding his allusion to the "fair vestal—throned by the west"—Elizabeth, he intended to paint Mary in the character of the "mermaid,"

Uttering such dulcet and harmonious breath,
That the rude sea grew civil at her song,
And certain stars shot madly from their spheres,
To hear the sea-maid's music.

If he referred to Mary in these lines, as is rendered extremely probable by the circumstance that they are scarcely intelligible otherwise, Shakespeare probably meant to describe her general fascinations under the figure of the sea-maid's music. But, literally and truly, Mary had uttered "dulcet and harmonious breath," and that, too, in hearing of the "rude sea." On her leaving France, after the premature death of her husband the young Dauphin, she gave vent to her sorrowful adieu in song. It was, in truth, a sad parting for her. Though she never could have been more than the wife of a king in France, yet, to a young, beautiful, and accomplished woman, the station of queen-consort in the most polished court in the world must have seemed far preferable to the undivided possession of a throne in a land at that time rude, savage, and torn by contending factions. Unfortunately for us, Mary expressed her farewell in the language of France, and it is impossible to preserve their beauty in a translation. The following is an attempt to render them literally:—

Adieu, thou pleasant land of France,
My best-beloved land, adieu!
Take, my youth's nurse, my last sad glance,
And, days of joy, farewell to you!

The bark that parts my loves and me,
But half of me can with it bear—
The rest remains behind with these:
I leave it to thy friendly care,
That haply it hereafter may
Remind thee of the part away!

Mary is also said to have written some verses on the death of her husband, the Dauphin. These have been preserved, and are really very beautiful. They, too, are in the French tongue, and are of considerable length, but a version of at least a portion of them may be given here —

In strains that softly, sweetly flow,
Tuned to the plaintive notes of woe,
I contemplate, with eyes grief-fraught,
A loss beyond the grasp of thought,
And pass away life's fairest years
In bursting sighs and ceaseless tears.

Did cruel Destiny e'er shed
Such horror on a wretched head?
Did e'er once happy woman know
A scene so full of heartfelt woe?
For ah! behold on yonder bier
All that my heart and eyes held dear!

The things I loved in happier days
But anguish in my bosom raise:
Day's brightest glow, its purest light,
To me are drear and gloomy night:
Nor is there aught so good and fair,
As now to claim my slightest care.

Within my heart, within my eyes,
An image, woe-imprinted, lies,
Speaking what sables cannot speak—
What faintly shows upon my cheek,
Pale as the violet's faded leaf,
The tint of love's despairing grief.

Perplexed by this unwonted pain,
No place my steps can long detain,
Yet change of scene no comfort gives,
Where sorrow's form for ever lives,
My worst, my happiest, state of mind,
In perfect solitude I find.

If chance my listless footsteps leads
Through shady groves or flowery meads,
Whether it be at dawn of day,
Or 'neath the evening's setting ray,
All pains that absence can impart
Incessant rend my tortured heart.

Awhile if kindly slumbers spread
Their downy pinions o'er my head,
His hand I touch in shadowy dreams,
His voice to soothe my fancy seems.
In hours of toil, in hours of rest,
His image ever fills my breast.

There are one or two other verses, but the best are here given, and in doing so we have used a translation by an old anonymous writer, making a few changes here and there with the view of bringing it nearer the original. After all, however, the simple force of the French is much weakened. Mary Stuart was surely a creature of genius.

Burns has put a lamenting strain into the mouth of Mary, but into the mouth of the Mary of Fotheringay Castle, the life-weary prisoner of Elizabeth. Perhaps the poet has thought in some respects rather as a man would think under the circumstances, than as the spirit-broken woman, who at her last hour prayed for her enemies. There is a something of the ballad cast in "The Lament of Mary Queen of Scots, on the approach of Spring," but it is a piece not unworthy of its author.

Now Nature hangs her mantle green
On every blooming tree,
And spreads her sheets o' daisies white
Out o'er the grassy lea:
Now Phoebus cheers the crystal streams,
And glads the azure skies;
But nought can glad the weary wight
That fast in durance lies.

Now lav'rocks wake the merry morn
Aloft on dewy wing;
The merle, in his noontide bow'r,
Makes woodland echoes ring;
The mavis wild w' mony a note,
Sings drowsy day to rest:
In love and freedom they rejoice,
Wi' care nor thrall oppress.

Now blooms the lily by the bank,
The primrose down the brae;
The hawthorn's budding in the glen,
And milk-white is the ale;
The meanest hind in fair Scotland
May rove their sweets amang;
But I, the Queen o' a' Scotland,
Maugn lie in prison strang!

I was the Queen o' bonnie France,
Where happy I has been;
Fa' lightly raise I in the morn,
As blythe lay down at e'en:
And I'm the sovereign of Scotland,
And mony a traitor there;
Yet here I lie in foreign hands,
And never-ending care.

But as for thee, thou false woman!
My sister and my foe,
Grim vengeance yet shall whet a sword
That thro' thy soul shall go!
The weeping blood in woman's breast
Was never known to thee;
Nor th' balm that dries on wounds of woe
Frae woman's pitying e'e.

My son! my son! my kinder stars
Upon thy fortune shine!
And may those pleasures gild thy reign,
That ne'er wad blink on mine!
God keep thee frae thy mother's face,
Or turn their hearts to thee:
And where thou meet'st thy mother's friend,
Remember him for me!

Oh soon, to me, may summer-suns
Nae mair light up the morn!
Nae mair, to me, the autumn winds
Wave o'er the yellow corn!
And in the narrow house o' death
Let winter round me rave;
And the next flow'rs that deck the spring
Bloom on my peaceful grave!

The French people love, and have ever loved, Mary of Scotland, with a regard equal to her own for them. Their best modern lyrast, Béranger, has filled up, as it were, the fragmentary lament which came from Mary herself, and has continued through several stanzas to maintain a similar regretful tone. In English, the strain runs somewhat thus:—

ADIEUX OF MARY STUART.

Delightful land of France, farewell,
Blest cradle of my infancy,
I love thee more than words can tell!
Adieu, to quit thee is to die!

Adopted country of my heart,
Let Mary's name remember'd be
In that sweet soil from which I part;
I part an exile, leaving thee.
The breezes blow, we quit the shore,
And God, to whom I groan in vain,
Stir not the billows to restore
In storms our ship to thee again.

Delightful land, &c.

When round my brows thy royal flower
Was twined, the lily of thy pride,
How thy sons shouted in that hour!

What gallant praises bless'd the bride!
In gloomy Scotland's frozen scene
The sovereign power were vile and vain;
I ne'er would wish to be a queen,
Unless o'er Frenchmen I might reign.

Delightful land, &c.

Too fleet my happy days have flown,
With Love, and Mirth, and Pumps beguiled.
A different lot must now be known
Midst Caledonia's deserts wild.

A dire foreboding has congeal'd
My blood, and, oh, horrid sight to see!
An awful dream but now reveal'd
A scaffold, which seem'd meant for me!
Delightful land, &c.

Yes, France, still 'midst her woes and cares,
The daughter of the Stuart line
To thee will turn her thoughts and prayers,
And fix her hopes on thee and thine.
But ah, our ship too swift and light
O'er colder waves already sails,
And from my straining eyes the Night
Thy shores in mist and darkness veils.

Delightful land of France, farewell,
Blest cradle of my infancy,
I love thee more than words can tell,
Adieu, to quit thee is to die!

This little piece, which we find in a volume of translations by the anonymous author of the Exile of Idria, is upon the whole no unfavourable translation of the spirit of the original. Whether the poet of the people of France, or the poet of the people of Scotland, has succeeded best in the portraiture of Mary's feelings, we leave our readers to judge. But Burns may be more properly compared on this occasion with Wordsworth, who also has taken up the story of Mary at the time she lay in "prison strang," and has imagined for her a Lament, like that of the Scottish poet. With this beautiful piece we shall conclude this notice of Mary Stuart and her Poets, though the list might be greatly extended:—

LAMENT OF MARY QUEEN OF SCOTS, ON THE EVE OF A NEW YEAR.

Smile of the Moon!—for so I name
That silent greeting from above;
A gentle flash of light that came
From her whom drooping captives love;
Or art thou of still higher birth?
Thou that didst part the clouds of earth,
My torpor to reprove!

Bright boon of pitying Heaven!—alas,
I may not trust thy placid cheer!
Pondering that Time to-night will pass
The threshold of another year;
For years to me are sad and dull;
My very moments are too full
Of hopelessness and fear.

And yet, the soul-awakening gleam,
That struck perchance the farthest cone
Of Scotland's rocky wilds, did seem
To visit me, and me alone;
Me, unapproached by any friend,
Save those who to my sorrows lend
Tears due unto their own.

To-night the church-tower bells will ring
Through these wide realms a festive peal;
To the new year a welcoming;
A tuneful offering for the weal
Of happy millions lulled in sleep;
While I am forced to watch and weep,
By wounds that may not heal.

Born all too high, by wedlock raised
Still higher—to be cast thus low!
Would that mine eyes had never gazed
On aught of more ambitious show
Than the sweet flowerets of the fields!
—It is my royal state that yields
This bitterness of woe.

A Woman rules my prison's key;
A sister Queen, against the bent
Of law and holiest sympathy,
Detains me, doubtful of the event;
Great God, who feel'st for my distress,
My thoughts are all that I possess,
Oh keep them innocent!

Farwell desire of human aid,
Which abject mortals vainly court!
By friends deceived, by foes betrayed,
Of fears the prey, of hopes the sport;
Nought but the world-redeeming Cross
Is able to supply my loss,
My burthen to support.

Hark! the death-note of the year
Sounded by the castle-clock!
From her sunk eyes a stagnant tear
Stole forth, unsettled by the shock;
But oft the woods renewed their green,
Ere the tired head of Scotland's Queen
Reposed upon the block!

PROGRESS OF AMERICAN IMPROVEMENT.

WE take the liberty of selecting the following stirring passages respecting the progress of improvements in North America, from the communication of a correspondent in the *Athenæum*, a few weeks ago:—

"It is clear enough, as I before observed, that steam is bringing on a new era. It seems as if the people here were all crazy. Nothing is unprojected. I have mentioned the line between Liverpool and Boston, via Halifax: that is settled, and no more is said of it. But now it is reported that we are to have a line of superb iron-boats between Glasgow and New York, of a construction and power which it is confidently believed will accomplish the voyage in *ten days* regularly. All eyes, of course, are open for the *British Queen*, as another scene in this grand bewildering drama. Again, a New Orleans paper intimates that there is to be shortly a direct steam communication between that city and Liverpool, and that there is at this moment a steam-ship on the stocks in the latter port, which will be launched in time to make her first voyage next fall. These are signs of the times. They indicate, as I intimated, a new era—a complete commercial revolution, among other things; but much more, of course. Look at the personal intercommunication between the continents, and consider the effect of that in all its bearings. Let it be understood, however, that it is not the mere steam facilities of themselves that seem to aid locomotion among all classes; but the *spirit of steam*, so to speak, wakes up every thing else. Those who cannot travel in a steam-boat must travel in some other way. Those who cannot cross the Atlantic, are yet bent upon locomotion. The world, in a word, is rubbing its eyes open. This whole continent, as I have before remarked, never presented (could one survey its vast surface) such a strange exciting spectacle of activity and agitation of body and mind. Nobody is content with the old rate or ratio of doing things. It would seem as if the very steam-boats themselves had put new courage on, and that they were multiplying their forces by almost supernatural means. You estimated the boats on Lake Erie last season at forty, whereas there are now seventy. The style in which those mighty inland seas are now hourly traversed by these floating palaces, is, as Crockett says, a 'caution'—a caution for people to be prepared for all things, and to disbelieve nothing. The steamer *Cleveland* made the passage recently from Detroit to Buffalo (300 miles), with 100 passengers, in 2½ hours. And at something like this rate they are flying up and down the Mississippi.

I have alluded to the increase of personal communication between England and America. It was predicted, you are aware, that the new steamers would supersede the old liners at once. But, behold the operation of steam! It has filled up not only its own vehicles, but *all the others*. The packets—and there are fifty of them—to and from New York, were never so crowded, and in the steerage as well as the cabin; and the same is true of all the 'transient vessels.' The Old World would seem literally to be *swarming*. In May came about 12,000 passengers to New York alone. Of these, probably, three-fourths were British. On the whole, I believe, the quality of our immigration is decidedly improving."

After alluding to the vast increase of lines of canal, road, and railway, in the aggregate amounting to 4940 miles, in course of construction, the writer proceeds to speak of manufactures:—"A Poughkeepsie man has lately introduced what is here considered an improvement in pin-making. The old fashion of managing the *heads* you are familiar with; but here the wire of which the pins are made is taken into the machines, and the process of making the pins with solid heads, all from the wire, is completed by the machines, leaving nothing to be done, except the washing, and placing them upon papers. So, you see, we are in a fair way of making our own pins; and, I believe, the same may be said of *buttons*. It is but a few years since the latter were imported almost entirely. At present, nearly a sufficient supply for the United States comes from a single establishment in a Massachusetts village. This employs some hundred girls, and turns out 1000 gross, of all varieties, daily. It is said, also, that we are making progress in the manufacture of musical instruments. About 10,000 pianofortes, yearly, are made among us. In jewellery, we have long since ceased to buy from you. The French make some pretty things, which we can't yet do without.

I was speaking of westward emigration. Before forgetting the subject, I should say a word of Texas. You have not heard much lately of that region, but it has not been idle. I think it was Talleyrand who remarked, that in America the same social revolutions were to be followed in *space*, which in other and older countries were to be followed in *time*. As we go West, for the most part, it is the same as for you to live over the past. We have all the processes of settlement and civilisation continually going on, as in some great manufactory where every part of the business is done at once in the various rooms and stories. The new country, just at this moment, is this same Texas. There are now five steamers weekly between Houston and New Orleans, and six daily between Houston and Galveston. But hear what the Houston Star has to say:—"Eighteen months ago, Galveston did not contain 20 inhabitants; now it has near 2000. Two years ago this city was a naked prairie; it has now between 3000 and 4000 inhabitants. But our prosperity is not confined to the coast and our seaport towns: there were on the road between here and Washington eighteen months ago but three houses; there are now thirty-seven, and rapid preparations are making for others. The population between Washington and Lagrange has increased fourfold, and Lagrange, which at that time had never

been thought of for a town, now contains a population of 400 or 500; and Rutersville, only five miles from Lagrange, which was laid off only six months ago, now contains about 300. On the Colorado river, between Lagrange and Bastrop, there were about a dozen houses; now there are between 200 and 300. Bastrop at that time contained 20 houses; it has now 200, and many of them equal to the best in Houston. The settlement above Bastrop, on the Colorado river, then consisted of about eight or ten families; it is now one of the thickest in Texas. Many of our planters are putting in large crops of cotton, and twice as much will be produced this season as has ever been before raised in the country. So 'westward the star of empire holds its way!'

These statements are cheering, and it is only a matter of regret that one of the prime causes for the Anglo-American settlement of Texas, should have been the extension of slavery in connection with the southern states of the Union.

GENERAL CROAFURD AND THE SOLDIER.

The following anecdote occurs in the "Memoirs of Edward Costello," in a late number of the United Service Journal. It refers to the British campaign in Spain. "I happened to be on guard one day, when General Craufurd came riding in from the front with his orderly dragoon, as was his usual custom, when two of our men, one of them a corporal, came running out of a house with some bread which they had stolen from the Spaniards; they were pursued by a Spanish woman, crying lustily, 'Ladron! ladron!'—thief! thief! They were immediately pursued by the general and his orderly; the bread was given back to the woman, and the men were placed in the guard-house. The next day they were tried by a brigade court-martial, and brought out to a wood near the town for punishment. When the brigade was formed, and the brigade-major had finished reading the proceedings of the court-martial, General Craufurd commenced lecturing both men and officers on the nature of their cruelty, as he said, to the harmless inhabitants, as he called the Spaniards. He laid particular stress on our regiment, who, he said, committed more crimes than the whole of the British army. 'Besides, you think,' said he, 'because you are riflemen, and more exposed to the enemy's fire than other regiments, that you are to rob the inhabitants with impunity; but while I command you, you shall not'; then turning round to the corporal, who stood in the centre of the square, he said, with a stern voice, 'Strip, sir.' The corporal, whose name was Miles, never said a word until tied up to a tree, when, turning his head round as far as his situation would allow, and seeing the general pacing up and down the square, he said, 'General Craufurd, I hope you will forgive me.' The general replied, 'No, sir; your crime is too great.' The poor corporal, whose sentence was, to be reduced to the pay and rank of a private soldier, and to receive a punishment of one hundred and fifty lashes and the other man two hundred, then addressed the general to the following effect:—'Do you recollect, sir, when you and I were taken prisoners, when under the command of General Whitlock, in Buenos Ayres? We were marched prisoners, with a number of others, to a sort of pound surrounded by a wall. There was a well in the centre, out of which I drew water with my mess-tin, by means of canteen-straps I collected from the men, who were prisoners like myself. You sat on my knapsack—I parted my last biscuit with you. You then told me you would never forget my kindness to you. It is now in your power, sir. You know how short we have been of rations for some time.' These words were spoken by the corporal in a mild and respectful accent, which not only affected the general, but the whole square. The bugler, who stood waiting to commence the punishment close to the corporal, received the usual nod from the bugle-major to begin. The first lash the corporal received the general started, and turning hurriedly round, said, 'Who taught that bugler to flog? Send him to drill—send him to drill! He cannot flog—he cannot flog! Stop! stop! Take him down! take him down! I remember it well—I remember it well!' while he paced up and down the square, muttering to himself words that I could not catch; at the same time blowing his nose, and wiping his face with his handkerchief, trying to hide his emotion, that was so evident to the whole square."

A HINT TO ENGLISH FARMERS.

What every calm and thinking man must own to be the greatest fault at the present day in the English agriculturist, is looking to and trusting to government rather than each man to his own brains. We would assure our brethren of the plough, that it is not in the power of any government to bolster up the state of agriculture. A wise and a good government will not enact laws prejudicial to any part of the community, nor will it seek to break down the safeguards which our forefathers have built up; but they must be assured, it is not forcing wheat to be sold at a sovereign the bushel, or meat at 5s. per lb., that they will ever make the agriculture of the country prosper, or the farmer rich. Look at Manchester. Is it by the manufacturer selling his print at a sovereign per yard that enormous fortunes have been amassed? No: it is the greatest quantity produced at the cheapest rate that will ever make a prosperous trade. If wheat is low in price, the farmer must bestir himself. Instead of sitting whole evenings (as the English farmer does) soaking over a drop of cider or a little home-brewed, while he grumbles and spells the columns of an old newspaper, and abuses Parliament for the "great cry and little wool" in the way of helping "agricultural distress," let him toss aside the speeches of the would-be patriots, and let him to his fields, and see if all be right there. Let him remember, that if he can but grow one or two quarters more per acre, he will be in a better position even with the low price than he was before.—*Quarterly Journal of Agriculture.* The respectability of this work, published by the Messrs Blackwood of Edinburgh, is so high as to give great force to any opinion it may avow; but the above remarks are based on such sound principle, that authority is not required to give them acceptance. The habit of

looking so much to the favour of the legislature for the means of prosperity, must be fatal to that self-dependence which is above all things necessary to success in individual exertions.

A FIGHT—SNAKE AND DOGS.

Near the roots of many of these plants were holes resembling rabbit-burrows. Suddenly, one of the dogs (a spaniel), which had been hunting about at some distance in advance of us, gave a yell, which summoned the others to him, and we followed as fast as our bipedal powers would permit us. The dogs united in a general howl; and when we came up with them, we found them scratching almost madly in the neighbourhood of one of the above-mentioned holes, but at a very respectful distance from it, for from its interior issued an indescribable sound, which might have appalled a lion. As near as I can convey the idea of it, it was a fierce hissing, mingled with a growl. Conceiving that the tenant of this asylum might be a weasel or some animal of that tribe, we poked at the aperture with our sticks, and cheered the poor dogs on to an assault. At length, an enormous cobra de capello burst forth, furiously enraged. On the first appearance of his head, the four-footed tribe retreated a few yards, then halted, turned, and held the foe at bay, whilst the rational portion of the party commended themselves to the protection of those locomotive engines so well spoken of in Hudibras, and so naturally referred to on such occasions. Our ignominious flight continued to the full distance of twenty paces, when we halted and faced about. We then witnessed a most extraordinary spectacle. In the centre of a large circle formed by the dogs, rose the snake, with hood distended, and about a yard of his body erect, gracefully curved like the neck of a swan. In this attitude he wheeled rapidly about, fixing his diamond-like eyes, quickly as light, on any antagonist which, bolder than the rest, attempted to draw the circle closer around him. This war of "demonstrations" lasted for perhaps a quarter of an hour, the dogs barking furiously all the time, when one of them made a spring upon the reptile, when his head was partly turned in another direction; but he underrated the activity of his foe, and was bitten. A general attack now commenced, and the snake was soon torn to pieces. He died not unavenged, as Byron says. Two of the dogs received their death-wound, each bitten in the upper lip. For about ten minutes afterwards, their spirits appeared to be unnaturally excited: they then began to sicken and reel, though they were unable to vomit; violent convulsions and death soon succeeded.—*Memoirs of a Cadet.*

DESTRUCTION OF AN ANCIENT OAK.

We have to record the destruction, by the late storm, of what was once one of the finest oaks, for which the county of Nottingham has been so long and justly celebrated. This mighty monarch of the forest was supposed to have been upwards of eight hundred years old, and for centuries was the glory of the park of Grove, near Retford, the beautiful and romantic seat of G. H. Vernon, Esq., M.P. During this period, too, what a number of proprietors it has outlived, and what a variety of changes must it have experienced! In its time have flourished the families of the De Bables, the De Herces, the Nevilles, the Levings, and the Eyres, by many of whom it was prized as an heir-loom, and by all it was considered as the pride and glory of their domain. Within memory it has been thrice struck with lightning, and each time suffered to a considerable extent. The last time this calamity occurred was about five o'clock on the evening of Whit Monday, 1836, when its interior was set on fire, and the fire was not discovered until eight o'clock on the following morning. It continued to burn for three days, and before it could be extinguished nearly the whole of the living substance was consumed, so that plenty of room was afforded for the cattle to retire to when the heat of the sun compelled them to seek for shelter. Notwithstanding this disaster, however, part of the branches continued to put on their annual livery, until the morning of the 18th July, when the violence of the storm nearly completed the work of destruction. A very small portion only now remains. In a previous storm one or two of its limbs were lopped off, and these were of such dimensions that dining-tables were made therefrom. During the last century, however, independently of accidents, the corroding tooth of time had been gradually making inroads upon his noble frame, particularly near the surface of the ground, the effect of which had latterly been the means of imparting to it its name. About forty years back, a fox being hard pressed by the hounds, took refuge within its ample bosom, from which it was found altogether impossible to dislodge him by fair means, when Richard, Earl of Scarborough, who hunted the Sandbeck hounds, jocularly observed to Colonel Eyre, the then owner of the tree, that it must be burnt down in order to secure reynard; to which the gallant colonel replied, "No, my lord; I would not have it burnt down for your Sir Solomon," meaning a celebrated race-horse belonging to his lordship at that period. From that time the tree has been designated by the name of "Sir Solomon," by which cognomen it was well known to many of the residents in that part of the county of Nottingham, and more especially to many of the gentry who were accustomed to enjoy the sports of the chase in that immediate neighbourhood.—*Doncaster Gazette, August 1839.*

PERILOUS ADVENTURE AT THE FALLS OF NIAGARA.

An occurrence of the most thrilling interest lately took place at Niagara Falls. The new bridge to Iris Island is planted in a frightful rapid, where the current is from 20 to 30 miles an hour, and is only about 100 or 150 yards above the brow of the great precipice or perpendicular fall. A carpenter, named Chapin, was engaged with others in covering the bridge, and while at work upon a staging about 100 feet from Iris Island, accidentally lost his footing, and was precipitated into the rapids, and in the twinkling of an eye swept away towards the great cataract. Speedy and inevitable destruction seemed to await him; but fortunately he was uninjured by the fall, and even in this most hopeless condition retained perfect self-possession. Turning his eye towards the only point

of hope above the fearful precipice, he succeeded, by great dexterity in swimming, in effecting a landing upon a little island some twenty feet in width and length, the outermost of a group of little cedar islands situated some thirty or forty yards above the Falls, and about equidistant from Goat Island and the American shore. There he stood for an hour, looking calmly and beseechingly back upon the numerous spectators who lined the bridge and shores, but with whom he could hold no conversation on account of the distance and the roar of the rapids. There is a man in the village of the Falls, named Robinson, of extraordinary muscular power, great intrepidity, and withal an admirable boatman, who generously volunteered his services to attempt reaching the island in a boat, and bring Chapin off. A light boat of two oars, similar in construction to the Whitehall race-boats, was soon procured, and he embarked. He proceeded with great deliberation and consummate skill, darting his little boat across the rapid channels, and at the intervening eddies holding up to survey his situation, and recruit his strength for the next trial. In a few minutes he neared the island, but a rapid channel still intervened, sweeping close to the island, and rendering the attempt to land very difficult. He paused for a moment, and then with all his strength darted across, and sprang from his boat—his foot slipped, and he fell backward into the rapid current. With the spectators it was a moment of thrilling interest and breathless silence; his boat seemed inevitably lost, and himself in fearful jeopardy. Retaining, however, his grasp on the boat, he sprang in, and again seizing his oars, brought up under the lee of the little island. All again felt a momentary relief, but still the great labour and hazard of the enterprise remained to be overcome. A cool head and a strong arm only could effect it. Robinson proved equal to the task. Taking his companion on board, in the same careful and deliberate manner, though at infinitely greater hazard and labour, they effected a safe landing on Goat Island. There the spectators assembled to give them a cordial greeting. A scene of great excitement ensued; the boat was drawn up the bank, and it was moved and carried by acclamation that a collection be taken upon the spot for Chapin and his deliverer Robinson. After the collection, Robinson and Chapin took their seats in the boat, and were carried in triumph on the shoulders of their neighbours to the village. The interest of the whole scene was heightened by the presence of Chapin's wife and children, who stood on the shore watching with unavailing horror and agony what seemed his inevitable fate.—*Buffalo Commercial Advertiser.*

CAUTION TO EMIGRANTS.

We have frequently recommended that emigrants to Australia—particularly those in the steerage and intermediate berths—should, before paying their passage money, procure a written agreement from the charterer of the vessel, endorsed by the captain, explaining definitely what are the conveniences that the emigrants are to have on ship-board, as to cooking, the use of utensils, water, &c., and engaging that these will be furnished. From the following extract from a letter just received from a passenger in a vessel which had put into Rio Janeiro, it will be perceived that such a precaution is absolutely necessary.

"I regret I cannot enter more fully into detail for want of time. No doubt you will consider the plea of not having sufficient time frivolous, but I assure you I am very busy; I have been appointed steward for the week; no evasive office, especially in bad weather. The fact is, we have been grossly deceived and imposed upon by Mr —, the charterer; and if we had him here, I am pretty sure we should all be in the humour for giving him a good ducking. He gave us to understand that we should require nothing but table utensils, namely, knife, fork, spoon, and a vessel to drink out of, and that every thing in the way of cooking would be provided for us; whereas, before we had been out three days, the cook declared it to be impossible for him to wait upon more than the first cabin, and stated that he was not engaged to cook for the second cabin, neither would he; and if he had been inclined, I am sure he would not have been able, for before many days were over, when the passengers began to recover from their sickness, he required one of the sailors to help him, and they both have now full employment to prepare meals for the first cabin, the apparatus for cooking being of the most ordinary kind, and quite inadequate to the wants of so many passengers. Thus were we awkwardly situated, without pans or kettles, or even dishes to hold the victuals when they were cooked. I had some few things, but they were much too small to be of any use. At last we found a two and a half gallon tin water-can, evidently made more for sale than service; however, it has with care lasted for all purposes until the present time. In a morning it serves both as kettle and coffee-pot; it is brought off the fire on to the table, and the coffee is served out with a porringer; afterwards, soup or rice is boiled in it for dinner; then it is cleaned, and is our only substitute for a tea-pot in the evening. We are compelled to cook every thing ourselves (each of our number serving as steward for the period of seven days); even coffee is dealt out to us in the raw state. I am deputed to go ashore here (Rio) to buy culinary utensils. Upon my word, I have already suffered what you are little aware of, and what I am sure it is impossible for any human being to conceive, who has not witnessed the same. There is a dispute about who is to pay the expense of putting into port here for the stores, water, &c.; the captain wants to saddle the passengers with the expense."

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

PRICE THREE HALFPENCE.

TRAITS OF AN ENGLISH WATERING PLACE.

IN one of those strolls through different parts of the country in which I have so often indulged myself, and in which I have always found so much enjoyment from the varieties of scenery and character which they laid open to me, I once came upon a watering-place on the coast, that afforded me no small matter for a day or two's amusement. What could have been the cause of the setting up of such a place as a scene of fashionable resort, it would be difficult to tell, except that it possessed a most bounteous provision of two great articles in demand in the autumnal months in cities—salt water and fresh air, for which a thousand inconveniences would be endured. It was situated quite on the flat coast of a flat country, a few miles from one of its sea-ports, yet near enough to obtain speedily thence all those good things which hungry mortals require—and who are so hungry as people bathing in sea water, and imbibing sea air, and taking three times their usual exercise without being distinctly aware of it!

Strolling along the coast, I found a good hotel, with all the usual marks of such an establishment about it. There were quantities of people loitering about the sands in front and in the garden, and other quantities looking out of windows with the sashes up; some of them, particularly the ladies, holding colloquies out of the windows of upper stories with some of the strollers below; post-chaises, and gigs, and shandray carts, standing here and there in the side scenes; a row of bathing-machines on the shore, awaiting the hour of the tide; and a loud noise of voices from a neighbouring bowling-green. The odours of roasting and baking that came from the hotel, were of the most inviting description; I inclined to take up my abode there for a few hours at least, but on entering, I found that as to obtaining a room, or a tithe of a room, or even a chair at the table of the ordinary, it was quite out of the question. "Lord bless you, sir," said the landlady, a woman of most surprising corporeal dimensions, in a white gown, an orange-coloured neckerchief, and a large and very rosy face, as she stood before the bar, filling the whole width of the passage; "Lord bless you, sir, if you'd give me a thousand golden guineas in a silken purse, I should not know where to put you. We've turned hundreds and hundreds of most genteel people away, that we have, within this very week, and the house is fit to burst now, it's so hugeous full. But you'll get accommodated at the town." "What town?" said I; "is there a town near?" "Why, town we call it, but it's the village, you know; it's Fastside here, not more than a mile off; if you follow the bank along the shore, you'll go straight to it. You can't miss it." Accordingly, following the raised embankment along the shore, I soon descried Fastside, a few scattered cottages, placed amongst their respective crofts and gardens, and here and there a farmhouse, with its substantial array of ricks about it, denoting that the dwellers were well off in the world. But I soon found that all the cottages, and many of the farm-houses, had their boarders for the season, and that there was scarcely one but was full. I had the good luck to spy an equipage, and something like a departing group at the door of one of the cottages, and as it moved away, to find that I could have the use of two rooms, a parlour and chamber over it, if I liked to go to the expense. "Perhaps," said the neat cottage housewife, "as a single gentleman, you may not like to occupy so much room, for just at this season we charge rather high." "And pray," said I, "what may be the enormous price you are charging for these rooms, then?" "Seven shillings a-week each room, and half-a-crown for attendance," looking at me with an inquiring eye, as if apprehensive that I should be astounded at the sum. "What! the vast charge of sixteen and sixpence per week," I replied, smiling, "for two rooms and attendance?" "Yes," said the

simple dame; "but then, you see, you will have to live besides, and it all comes to a good deal. But maybe you are a gentleman, that doesn't mind a trifle." Having assured her that there would, at all events, be no insurmountable obstacle in her terms, I entered and took possession of two as rustic and nicely clean rooms as could be found under such a humble roof. I had taken a fancy to spend a few days, or a week at least, there. It was a new scene, and peopled with new characters, that might be worth studying. The cottage stood in a thoroughly rural garden, full of peas, beans, and cabbages, with a little plot round the house, gay with marygolds, hollyhocks, and roses, and sweet with rosemary and lavender. The old dame's husband was a shrimp, or fisher for shrimps, whom I soon came to see regularly tracing the edge of the tide with his old white horse and net hung behind him. She had, besides me, it seemed, another lodger, who, she assured me, "was a very nice young man indeed, but, poor young gentleman, he enjoyed but very indifferent health. Sometimes I think he's been crossed in love, for I happened to cast my eye on one of his books—he reads a power of books—and there was a deal about love in it. It was all in poetry, you see, and so on; and then, again, I fancy he's consumptive, though I wouldn't like to say a word to him, lest it should cast him down, poor young man; but he reads too much, in my opinion, a great deal too much; he's never without a book in his hands when he's in doors; and that's not wholesome, you are sure, to be sitting so many hours in one posture, and with his eyes fixed in one place. But God knows best what's good for us all; and I often wonder whether he has a mother. I should be sorely uneasy on his account, if I were her." So the good dame ran on while she cooked me a mutton chop, and took an account of what tea and sugar and such things she must send for by the postman, who was their daily carrier to the town. I listened to her talk, and looked at the pot of balm of Gilead, and the red and white balsams standing in the cottage window, and the large sleek and well-fed tabby cat sleeping on the cushion of the old man's chair, and was sure that I was in good hands, and grew quite fond of my quarters. Before the day was over, I became acquainted with the old shrimp, who came in after his journey to the next town with his shrimps, and who was as picturesque an old fellow as you would wish to see, and full of character and anecdotes of the wrecks and sea accidents on that coast for forty years past. I had been informed all about who were the neighbours inhabiting the other cottages and farms, and had a good inkling of their different characters too. I had walked out to the bank when the tide was up, and round the garden, and actually got into conversation with "the poor young man," my fellow lodger.

The next morning, I was up early, and out to reconnoitre the place and neighbourhood; and this young man having found out that I was also addicted to the unwholesome practice of reading books, took at once a great fancy to me, and went with me as guide and cicerone. I found that all the mystery about him was, that he was a youth articled to an attorney in great practice, and had stooped over the desk a little too much, but was soon likely to be as strong and sound as ever, being neither consumptive nor crossed in love, although in love he certainly was. A more simple-hearted, good-natured fellow it was impossible could exist. He had the most profound admiration of all poets and philosophers, and read Goldsmith, Shenstone, and Addison, with a relish that one would give a good deal for. As for Sir Walter Scott, and Lord Byron, and Tom Moore, he knew half of their voluminous poetical works by heart; mention any fine passage, and he immediately spouted you the whole of it; and as for the Waverley Novels, he had evidently devoured them entire, and was full of their wonders and characters. Yet, thus fond of poetry and romance, it was

not the less true that he had a fancy for mathematics, and played on the fiddle and the flute into the bargain. Nor was this all the extent of his tastes: he had quite a *penchant* for natural history; had he time, he declared, he would study botany, ornithology, geology, and conchology too; and yet, although such a book-worm himself, he seemed to enjoy the company of the other visitors there who never read at all. There was a whole troop that he made acquaintance with, and whose characters he sketched to me, particularly those of a merry set who lodged at a cottage opposite, where he often went to amuse them with his fiddle. As my business was to see what were the characters and the amusements of such a place, I desired him to introduce me to them, but in the first place to let us run a little over the country.

The country was rich and flat, divided into great meadows full of luxuriant grass, grazed by herds of fine cattle, and surrounded by noble trees, which served to break up the monotony of the landscape. Here and there you saw the tall, square, substantial tower of a village church peeping over its surrounding screen of noble elms. We were accustomed to stroll into these churchyards, admiring the singularly large and excellent churches, all of solid stone; the spacious grave-yard and the large heavy headstones, adorned with carved skulls and cross-bones; and gilded angels with long trumpets figured above the simple epitaphs of the departed villagers. The farm-houses, too, surrounded also with tall elms, and with a great air of wealth and comfort, drew our attention. As we approached nearer to the sea, the country was more destitute of wood; consisted of very large fields of corn, then beginning to change into the rich hues of ripeness; fields also of woad, a plant used in dyeing, and there extensively cultivated; and these fields intersected no longer by hedges, but by deep wide ditches called dykes, in which grew plenty of reeds, water-fags, a tall and splendid species of marsh ranunculus (*R. lingua*) and yellow and white water-lilies. As we drew near to the village, if village such scattered dwellings could be called, we were struck with the peculiar aspect of the dry lanes, and the plants which grew there, so different to those of an inland neighbourhood. They were exactly such as Crabbe has described them in such a situation:—

There, fed by fond they love, to ranket aize,
Around the dwelling docks and wormwood rise;
Here the strong mallow strikes her almy root;
Here the dull nightshade hangs her deadly fruit;
On hills of dust the henbane's faded green,
And pencilled flower of sickly scent is seen;
At the wall's base the fiery nettle springs,
With fruit globeose and fierce with poisoned stings.
Above, the growth of many a year, is spread
The yellow level of the stonecrop's bed;
In every chink delights the fern to grow,
With glossy leaf and tawny bloom below.

The great embankment secured all this from the invasion of the sea, and, winding along the flat sands, formed a delightful walk when the tide was roaring up against it. Here also the male portion of the visitors came to bathe; and when the tide was up, nothing could be more delicious. They could undress on the sunny sward of the mound at whatever distance from the others they pleased, for there were many miles of the bank; and the waves dashing gently against the grassy slope, received them on a secure and smooth sand, at a depth sufficient to allow them either to wade or swim. They generally, however, undressed near enough to swim or wade in company, and to splash one another and play all manner of practical jokes.

When the tide was out, from this bank you had a view of a great extent of level sands, monotonous enough in themselves, but animated by the view of vessels in full sail passing along the Channel to or from the neighbouring port, and by the flight and cries of the sea-birds. Along these sands we ranged every day to a great distance, collecting shells, leaping

the narrow channels of salt water left in the hollows, shooting gulls, watching the shrimps that were floating in the tide, and amusing ourselves with the crabs, which, left in the holes in the strand, were running sideways here and there in great trepidation, yet never so much alarmed as not to be ready to seize and devour those of their own species that were less in personal bulk and prowess than themselves. Then, again, we found a good deal of employment in botanising amongst the patches of sea-wilderness, which were not so often submersed by the tide as to destroy the vegetation altogether, or to produce only fucus and other sea-weeds. The rest-harrow, the eringo with its cerulean leaves, the stag's-horn plantain, the glasswort or common (not the true) samphire—these and many others had all an interest for us. In one place we found the sea-convolvulus blowing in its rich and prodigal beauty on the sands; and then we came to wild hills of sand thrown up by the billows of ages, a whole region of desolation, overgrown with the sea-wheat, and the tall yellow stems and umbels of the wild celery.

Such was the scenery; the people of the cottages were generally fishermen, with their families; and the visitors, farmers and persons of that class, often with their families. At the house opposite us, as I have said, was the merriest crew. My friend the young lawyer was in the habit of running in and out amongst them as he pleased. He proposed that we should go and dine with them, as they had a sort of ordinary table, where you could dine at a fixed and very moderate charge, as all charges indeed were there. Here we found about a dozen people. One, who appeared and proved an old gentleman-farmer, a Mr Milly, always took the head of the table; and a merrier mortal could not have been there, except he who occupied the other end, a fellow of infinite jest, like Sir John Falstaff, and to the full as corpulent. Who and what he was, I know not, save that he was a most fat and merry fellow, and went by the name of Sir John between the young lawyer, whom I shall call Wilson, and myself. This joyous old gentleman had his wife and son and daughter with him. The son was a young man as fond of a practical joke as his father was of a verbal one; nay, he was not short of a verbal one too, on occasions. He was of a remarkably dark-brown complexion, and on some one asking him how he came to be so dark, when the rest of his family were fair, he at once replied, "Oh, can't you fancy how that was? It happened when I was a child in the cradle. I got turned on my face, and had like to have been smothered. I got so black in the face, I have never recovered my colour again. My mother can tell you all about it—can't you, mother?" At this repartee all the company laughed heartily, and truly it was a company that could laugh heartily. They had merry hearts. Then there was a good worthy farmer of the real old school. I was near saying that John Farn was old, but, in fact, he was not more than five-and-thirty, but his gravity gave him an appearance of something like age. He was dressed in a suit of drab, with an ample coat of the good old farmerly cut, and jack-boots like a trooper. But John Farn had a deal of sober sound sense, and a mind that, had it been called out, would have been found noble. I became very fond of John. The rest were young farmers and tradesmen full of youth and life. They had brought their horses with them, and some of them gigs, and were fond of all mounting and scouring away on the shore for miles together.

The great business, indeed, was to bathe, and eat and drink, and ride or walk, and play at quoits or bowls. If the tide was up early in the morning, all would be up and out, and have their dip before breakfast. Then they would come back hungry as hunters, and devour their coffee, beef, and broiled ham, and shrimps fresh from the cauldron, and then out, some to ride round to have a look at the neighbouring farms, or on the shore to see the fishing smacks go out or come in. Others got to quoits or bowls till dinner; and after a hearty meal and a good long chat, they would slowly saunter up to the hotel, and see what company was there, and take a glass and a pipe with some of them, and see the newspaper, and perhaps have a game at bowls there, and then back to tea; after which they grew very social, and called on the other boarders at the cottages near, and strolled out with the ladies to the bank, which was not far off; and so wiled the time away till supper. Four meals a-day did they regularly sit down to, and enjoy themselves as much as if they had not eaten for a day or two, praising all the time the wonderful property of sea-air for getting an appetite. As sure as shrimps appeared at breakfast, did soles at supper; and after supper one drew out his bottle of wine, and another got his brandy and water, and all grew merry. Those that liked it took a pipe, and it annoyed nobody. There was plenty of joking and laughter, that it would have done the most fastidious good to hear, and as much wit, and perhaps a good deal more, than where there does not exist the same freedom. More jovial evenings I never saw. Wilson gave them a tune on his flute, or took his fiddle; they cleared the floor of the largest room, invited some of the neighbouring visitors who had wives or daughters with them, and had a dance. On such evenings Sir John Falstaff sat in the large bay window of the apartment for coolness, and wiped his brow, and sang his merriest songs. His songs were all merry, and he had a host of them: it was a wonder where he had picked them up. His son often joined him, sometimes his wife and

daughter too. It was a merry family. Surely never could care have found a way into their house. Not even the young man's brown complexion could give him a care; it only furnished him with a joke, and made laughter contagious. Never could the old man have been so fat, had care been able to lay hold on him. The whole of that huge bulk was a mass of rejoicing. How his eyes did shine and twinkle with delight as he sang! what silent laughter played around his mouth, and stole over his ruddy cheeks, like gleams of pleasantest lightning of a summer's night, as he lifted his glass to his head, and listened to some one else! But, alas! all his mirth was well nigh closed one day. He was tempted by the fineness of the weather into the tide, contrary to his wont, and his doctor's order. Some one suddenly missed him; all looked round; at a distance something like a buoy was seen floating; it was Sir John; his fat floated; his head had gone down like a stone; they just pulled him up time enough to save him, but he was blacker in the face than ever his son had been in the cradle, and got a fright that spoiled all his mirth for some days.

But there was a ball at the hotel, and every body was off to it; all except Wilson, who was not well, and myself, who staid to keep him company. Even grave John Farn, in his drab suit and jack-boots, would go. Who would have thought that there was such a taste for pleasure in John Farn? John Farn was very fond of hearing Wilson and myself talk of books. He would come to our cottage, and sit and listen for hours to our conversation, or take up some of our books himself, and read. I perceived that there was an appetite for knowledge in him that had never been called out, because it had had nothing to feed on; but it was clear that it would soon, if it was in the way of aliment and excitement, become fearfully voracious. When he found the name of Dryden in a volume, he declared that he was born in the same parish. He put the book into his pocket, and was missed all that day. Somebody, by chance, saw him issue out of a great reed bed towards evening; he had read the volume through, and declared that he should think ten times better of his parish now for having produced such a man. Who would have thought that John Farn, the Northamptonshire farmer and grazier, and who had lived all his life amongst bullocks, and whose whole talk was of them, would have fastened thus suddenly on a volume of Dryden's poems! But John used to accompany Wilson and myself, botanising along the shore and the inland dykes; and it was curious to see with what a grave enthusiasm he would climb in his great jack-boots over the roughest fences; how he would leap across those wide dykes; how he would splash through the salt-water pools and streams to tear up a flower or a sea-weed that we wanted; and with what an earnest eye he would look and listen as we mentioned its name, and pointed out its class in the volume, or related its uses! There was an undiscovered world, and a great one, in the soul of that John Farn.

The more I saw of that man, the more I liked him. The stores of yet unstirred life, both of intellect and feeling in his frame, became every day more strongly apparent. He would sit with us on the sea-bank for hours watching the tide come up, or watching its play and the play of light and shadow over it when at flood, and drink down greedily all that was said of this or other countries, all that had in it knowledge of any kind. His whole body seemed full of the joyous excitement of a youth that in years should have passed over him, but was yet unspent, and was now only found. He rose up one day and said, "Let us hire a ship and sail out to some other country." At the moment we laughed at the idea, but John Farn persisted with the utmost gravity in his proposal, and eventually we did hire a smack, and sailed across to Norfolk. We visited Lynn; walked over the grounds of the school where Eugene Aram was an usher when he was taken for the murder; and nothing but the threatening of the weather would have prevented us crossing over to the Continent. As it was, it was delightful to see the childlike enjoyment with which that grave man saw the breezy expanse of ocean, the fiery colour of its waters as the vessel cut through them in the night, the seals that lay on a mid-sea rock as we sailed along, and the birds of ocean screaming and plunging in its billows.

There was a legion of things in the bosom of John Farn that he knew nothing of all the years that he had been buying and selling cattle, but were now all bursting to the light with a startling vigour. I wonder whether they have since troubled him like blind giants groping their way to the face of heaven, or whether, amid his cattle and his quiet fields, they have collapsed again into dim and unconscious dreams; but the last action which I witnessed in him, made me sure that his moral feeling was as noble as I suspected his intellectual strength to be great.

There was a robbery at Uriah Sparey's. Money and other articles were missed from the packages of the guests. The suspicion fell on a servant girl. Great was the stir, the inquiry, and the indignation. Mrs Uriah Sparey was vehement in her wrath. She insisted that the affair should not be talked of lest it should bring discredit on her house; but to satisfy her guests, she would turn the girl out of it that instant. The girl with tears protested her innocence, but in vain. When she came to open her own box, she declared that she was robbed too. Her wages, and the money given her by visitors, were all gone. Mrs Sparey exclaimed, that "never did she see such an

instance of guilty art as this! The girl to remove from herself the charge of theft, to pretend that she herself was robbed!"

If the girl was guilty, she most admirably affected innocence; if she was of a thievish nature, never did nature so defend vice under the fair shield of virtuous lineaments. All saw and felt this; all had been much pleased with the appearance and behaviour of the girl. Her vows of innocence were now most natural; her tears fell with all the hot vehemence of wronged truth; she earnestly implored that every search and every inquiry should be made, that she might at least regain her character; her money she cared little for. But Mrs Uriah Sparey only exclaimed, "Minx! get out of my house! I see what you want; you want to fix the theft upon me!" All started at that singular exclamation, and fixed their eyes on Mrs Sparey; she coloured; but no one spoke. The girl stood weeping by the door. Then said John Farn, "Go home, my girl, go home, and let thy father and mother see into the matter for thee." At these words, the girl, whose tears were before flowing fast but freely, burst into a sudden paroxysm of sobs and cries, and wrung her hands in agony. "What is the matter?" asked John Farn; "has the poor girl no parents?" "Yes, yes!" she exclaimed, suddenly looking at him, and the tears stopping as if choked in their bed; "but how can I go to them with the name of a thief?" The colour passed from her face, and she laid hold on a chair to save herself from falling. "Mary!" said John Farn, "I will not say who is the thief; but this I say, I will hire thee for a year and a day, and there is a guinea for earnest, and another to pay thy coach fare down. Be at my house in a fortnight, and till then go and see thy mother. Let them call thee thief that dare!" With that he rose up, gave Mary his address, paid his bill to Mrs Sparey, and marched out of the house with his little round portmanteau under his arm. We all hurried out after him, gave him by turns a hearty rattling shake of the hand as he was about to mount his horse; and that was the last I saw of John Farn. I know no more of him, yet would I, at a venture, rather take the heart of that man, though compelled to take the long drab coat and the jack-boots with it, than that of many a lord with his robes of state, and all his lands and tenements besides.

Such were a few days and their real incidents passed by me at a rural watering-place some years ago.

MOVING SAND-HILLS.

THE phenomenon of a moving hill of sand is by no means an uncommon one on various parts of the earth's surface, and, not unfrequently, whole villages and towns have thereby been overwhelmed and destroyed. To such shifting mounds the name of *dunes* is usually given by geologists, and from a similar root the more familiar term of *dovns* seems to be derived. Dunes or downs of sand are commonly found within a short way of the sea-shore, being composed of the fine particles cast up by the waves, and afterwards dried in the sun, and carried inland to a greater or lesser distance by the wind. The coasts of Holland present an example of vast quantities of detritus taken down to the sea in the first instance by rivers, and subsequently thrown back upon the land, forming long chains of sand-hills or downs. The shores of France, Spain, and various other countries, exhibit the same phenomena at particular points. On the shores of the Bay of Biscay, moving sands are so common as to have occasioned much injury to the land and the inhabitants, both in early and recent times. About the year 1770, a whole village near St Pol de Leon, in Brittany, was so completely buried by one great movement of drift-sand, that nothing could be seen of it but the spire of the church. In the same region, according to Cuvier, these dunes are at this hour covering large tracts of land. They advance with irresistible force, burying forests in their route, and impelling before them lakes of fresh water, derived from the rains which cannot find a way through them into the sea. "One village in the department of the Landes, named Mimisan, has been struggling for twenty years against them; and one sand-hill, more than sixty feet high, may be said to be seen advancing hourly. In 1802, the propelled lakes invaded five fine farms belonging to Saint Julien; they have long since covered a Roman causeway leading from Bourdeaux to Bayonne, and which was seen about forty years since, when the waters were yet in a low state. The river Adour, also, has been turned more than a thousand toises out of its former course by the same causes." Ten other villages in the Landes, the author (Cuvier) now quoted tells us, have advancing sand-hills in their immediate vicinity, which threaten them with slow but sure destruction. In truth, it is wrong to say *slow* destruction, for the progressive movement of the dunes in the Landes has been calculated at not less than *sixty*, and in some cases *seventy-two* feet, per annum.

Sometimes assuming the shape of conical mounds, and sometimes appearing in the form of flat heaps or masses, these shifting sands have also done much harm at different periods on the British coasts. In Suffolk, in the year 1688, part of Downham (a name ominously indicative of the character of the district) was overwhelmed by sands which had begun to move, about one hundred years before, from a point about five

miles to the south-west. The drifting mass travelled over the intervening distance in the course of the century, and covered more than a thousand acres of land. On the north coast of Cornwall, a considerable extent of country has been inundated by sands, constituting hills several hundred feet in height. So completely have these vast mounds shifted their whole bulk from spot to spot, that the ruins of ancient buildings, originally overwhelmed by them, have again been laid bare in the rear of their line of progress. A pot of old coins was found in the same situation in one instance, by which a guess could be made at the period of entombment. The changes had certainly occupied many centuries.

Sand-hills or dunes appear to be composed in many instances of comminuted shells, mingled with the river-borne matter, and with the particles derived from the attrition of sea-shore shingles. On the western coast of the Hebrides, which feel the whole force of the Atlantic waves, there are, as might be expected, large masses of sand thrown ashore, forming in some places patches of several miles in length, and at other points constituting hillocks from twenty to sixty feet high. "This sand (says Mr Macgillivray) is constantly drifting; and in some places islands have been formed by the removal of isthmus. The sand consists almost entirely of comminuted shells." The same writer gives a curious proof of the ease with which sand of this description is transported from spot to spot by the winds. Though this shell-sand is usually rather coarse in the grain, yet, during high and dry winds, "by the rubbing of its particles on each other, a sort of dust is formed, which at a distance resembles smoke, and which, in the island of Berneray, I have seen driven into the sea to the distance of upwards of two miles, appearing like a thin white fog." Doubtless the admixture of this shell-sand, from its brittleness and lightness, increases greatly the ease, in many cases, with which dunes are moved by the breeze. The coast of the Netherlands, as has already been mentioned in the present work, is lined with sand-hills formed by the action of the wind on the shore, and these hills now constitute the best protection to the low countries against the encroaching tendencies of the sea.

Many other examples of these sand-hill phenomena might be selected; but enough has been said regarding sea-borne sands. There are drifting sands of a different character, which have effected far greater changes on the face of the earth, and have far more deeply influenced the comforts and affected the lives of its inhabitants. What were the original limits of the desert-sands, and what the former condition of many regions now covered by them, it is scarcely possible to determine; but certain it is, that they have shifted to an immense extent within the knowledge of man, and have produced deplorable consequences. By the action, seemingly, of the west winds, the sands of the African interior have been gradually forced in more and more upon the banks of the Nile, until they have engulfed many cities, and the ruins of cities, and have covered a great portion of the tillage lands of Egypt. The number of cities, towns, and villages, thus effaced from the earth, is too large to be calculated. The French traveller, Denon, tells us that their summits still appear externally in many instances, and feelingly observes, that "nothing can be more melancholy than to walk over villages swallowed up by the desert-sands, to trample under foot their roofs, to strike against the peaks of their temples, and to reflect that here were cultivated fields, that here grew lofty trees, and that here were even the homes and habitations of men—and that all have vanished!" These remarks will bring to the mind of many readers the buried condition in which the majority of the recovered sculptures and monuments of Egypt were found, and particularly the great Sphinx, the base of which extraordinary piece of sculpture was sunk thirty or forty feet in the sands, having little more than its massive head above ground, to point out where it stood. Although the desert-sands, however, have wrought such vast apparent ruin, by swallowing up the glorious monuments of past ages, there is a degree of consolation to be derived from this very fact—this very engulfment. The sands are in one sense conservators of the things they entomb. By no other mode of interment or keeping, could the fine sculptures, stuccoes, and paintings, discovered by Burchhardt, Beechey, and Belzoni, have been handed down to us in so perfect a state. Mr Lyall, who makes this remark, points it out, also, as not improbable, that the sands which have shifted may shift again, and in such a manner that "many a town and temple of higher antiquity than Thebes or Memphis may one day re-appear in their original integrity, and a part of the gloom which overhangs the history of earlier nations be dispelled."

But, alas! the numberless human lives which the desert-sands have destroyed, can never thus be restored to the light of day. Whole caravans, numbering individually hundreds of followers, have been overwhelmed in this way, in various lines of travel, as well in Asia as in Africa. In Arabia, as we are informed by Burchhardt, the bones of dead men and camels are the principal guides of the pilgrim. The sands which cause the greater part of these deaths come usually in the form of a wind, bearing fine particles on its wings, which blind and suffocate the unfortunates who chance to be in their path. Bruce had an opportunity of closely observing these sand-winds or simooms, so closely, in truth, as to make his own position extremely

dangerous. They move along in columns of great height, in a whirlwind fashion, and well defined in their outline and extent. In the same countries, sands also move slowly along the earth, as the dunes of Europe move; but the chief source of fear and destruction to travellers is the whirling sand-wind. Captain Lyon's experience of central Africa corresponds with the observations of Denham and Burchhardt. When near the Soudah mountains, "we did not see (he says) the least appearance of vegetation, but observed many skeletons of animals, which had died of fatigue on the desert, and occasionally the grave of some human being. The sand-winds never cause the carcasses left on the ground to change places, for in a short time a mound is formed round them, and they become stationary."

In commencing this paper, it was merely our purpose to notice the immediate effects of shifting sands, whether in the shape of dunes, downs, or simooms, upon the face of the earth, as well as upon the condition of those who move thereon. Their ultimate and more comprehensive consequences, in a geographical as well as a geological point of view, it was not our purpose to inquire into. But it may be observed that these effects are great and important. In many places, where the shifting sands, originally of a moving character, have finally become stationary, and have remained so for a considerable period, their masses have assumed the shape of sandstone, or of firm and fixed rock. In Cornwall, where the moving period can almost be determined, some portions of the dunes are now so indurated as to be used for building purposes. Such is the case, also, in many other places. These mobile sands, therefore, must be viewed as powerful agents in changing, renewing, and re-arranging the solid crust of the globe. In other respects, their influence is equally powerful, for there cannot be a doubt that they have altered, and are still altering, to a great extent, the appearance and productive capabilities of large regions to the east, north, and north-east of the central African deserts whence they came. To them many geographers attribute the changes which seem to have taken place in Arabia, Arabia Petrea, and Palestine. A great part of these countries was once fertile to a wonderful degree, and extremely populous, as we learn from the most authentic records, corroborated by existing and visible ruins. The same regions are now, to a great extent, but a barren, sandy, rocky desert, and it has been feared that the sands will, in time, overrun all Lesser Asia, if not other countries still farther away. There is this hope and solacement, however, attending the worst view of the subject, that their agency must be paralysed, in a great measure, as they approach temperate or cold latitudes. The tendency to induration will always increase with the diminution of temperature. We have sea-dunes, it is true, in Europe, but these are endurable evils compared with the shifting sands and simooms of the desert; and these, it is to be trusted, Europe can never see, as long as the present order of things exists.

ADVENTURE OF A CANADIAN TRADER.

In the month of November 1771, David Ramsay, a merchant who had emigrated from Scotland to the Canadas, and had devoted himself to the employment of trading with the Indians, set out on one of his customary expeditions, for the prosecution of this profitable but precarious traffic. Accompanied only by a younger brother newly come from the mother country, a lad of about sixteen years old, Ramsay launched his small boat, laden with a variety of Indian goods, upon Lake Erie, along which he coasted until he reached the mouth of a river which falls into it, at a distance of 150 miles from Fort Erie. He ascended this stream a considerable way, before fixing on a spot to winter in, according to his usual custom on such occasions. The place he ultimately selected was in the bounds of a well-frequented hunting-ground, where he thought he would be in the way to make exchanges with the Indians for their furs and skins. Near to this spot was the residence of a single Pawnee family, consisting of one man, with his two squaws and two children. From these people Ramsay met with an amicable reception, and immediately began to build a log-house for the shelter of himself and his brother, with their goods. With great labour he succeeded in constructing a strong hut of piled logs, the interior of which he divided into two rooms, the innermost intended for holding the goods, and for sleeping in. A strong partition, with a low door in it, separated the two apartments, and gave a promise of security to the persons and property of the inmates.

It was late in December ere Ramsay completed his task, and the river on whose banks he had fixed his location was firmly frozen up for the season. Just at this time, three Indians of the Chippewaw nation came to the place, and built a hut near to that of the trader, as a residence for themselves during the winter hunt. Ramsay soon saw reason to fear both these men and his Pawnee neighbours. They were not at the pains, indeed, to conceal their mischievous feelings towards him; and as it was impossible for him to alter his position till the spring again opened up the navigation, he found it necessary to adopt a conciliatory, or rather submissive, system with them, as he was but

too much at their mercy. He was obliged to give them rum when they demanded it, and to credit them with whatever goods they chose to ask. All this did not satisfy them, and they gave him open hints of their inclination to treat him as the Saint Dusky Indians had recently treated another Englishman, who had "made private property of his goods," and had been put to death in consequence.

Ramsay became convinced that he and his poor brother must fall a sacrifice to these savages, and a circumstance occurred in January which only strengthened this conviction. Two Indian youths arrived at the hut of the Pawnee, on their way from Detroit to Niagara, and about the neck of one of them hung a broad belt of wampum, eight or nine inches long, which the trader knew to be the emblem—the fiery cross—of Indian war. The Indians noticed his attention to the belt, and laughingly told him that it was the belt of peace; a remark which confirmed him in his suspicion that a general war with the whites was in agitation, on the plea of which the savages were sure to fall on him at once. He accordingly became still more on his guard, kept his muskets always loaded, and fixed a sharp strong iron spear to a pole, by way of a defensive weapon. The return of the Pawnee from escorting the two youths on a part of their way to Niagara, brought on the crisis which the trader had apprehended. The three Chippewaws and the Pawnee approached his hut with all the formalities of Indian warfare, and commanded him to deliver up to them blankets, ammunition, and rum. Ramsay, a man of intrepid heart and powerful frame, answered them from his little castle with a direct and firm refusal, adding, that they had already got from him much more than they would ever pay, or ever intended to pay. "War will come with the leaves of spring," cried one of the savages scornfully, "and then will you be sufficiently paid." However, the resistance of Ramsay seemed to be unexpected by them. Uttering conjointly one of their frightful yells, they retired to some distance to consult together. They did not venture on further measures, either then or afterwards, but advanced day after day in the same manner, pouring forth the most violent threats, and using every means to intimidate Ramsay into submission. The dauntless trader gave them ever the same firm reply.

Some time in February, one of the Chippewaws to whom Ramsay had done some favour formerly, came privately to him, and said that the Chippewaws were going away, and that he could not leave the place without informing the trader that the Pawnee and his squaws were resolved to take his life and goods. Ramsay at first thought there was some finesse here; but the three Chippewaws did go away, and came back no more. After this time, the Pawnee squaws approached almost daily to his hut, with cords round their waists, and tomahawks stuck in them, as if to take a prisoner. These seem to have been merely menaces. About the middle of March, when the moon was nearly full, one of the squaws came to Ramsay, and begged for a cup of rum, declaring that two of the family were ill. He gave her a small cupful. On the same night, about twelve o'clock, one of the children came to the hut, and by the like entreaties moved the trader to give away a similar quantity a second time. Expecting to be troubled no more, Ramsay composed himself to rest, but was again aroused by the voices of the two Pawnee children, beseeching for admittance. One of these children was a girl nearly twelve years old, and the other a boy of lesser age. On asking the girl why she made the request, she said that the Pawnee was "threatening to kill and eat her brother, and he never broke his word." Ramsay knew not what to think of this; but he considered internally that the children could scarcely do him any harm, and permitted them to come into the inner room, where they lay down on the floor to sleep.

Even under these precarious circumstances the trader fell asleep. He was awakened, about two in the morning, by repeated strokes on the partition-door, and springing up, saw through the chinks of the logs that a blazing fire had been kindled in the outer apartment, beside which stood the two squaws, while the Pawnee was planted before the partition-door, striking at it with an axe, with all his might. Ramsay called to him to desist instantly, otherwise he would fire upon him. The savage paid no attention, but, with a powerful blow, split open the greater part of the door. Seizing the spear-headed pole, Ramsay made a thrust at the other's breast through the aperture. The lunge had not force enough to hurt the Pawnee, who, with another heavy blow, broke open the door altogether. The trader saw that the next fall of the axe would be upon his own head, and there being now nothing between them, he drove the spear into the breast of the Indian with such force, that the effort brought him down upon the floor of the outer apartment, above the body of his mortally wounded foe. Before he could recover his feet, he received a violent stroke from one of the squaws with a heavy stick or bar of wood. Had it alighted on his head, it would have stunned him fatally, but it struck his shoulder; and ere the blow could be repeated, he had regained his weapon, and dealt his assailant a thrust which brought her to the ground. Turning round, he had just time to avoid by a spring the long glittering knife which the other squaw had raised to plunge into his unprotected back. A third time he made a lunge with the deadly spear, and his third assailant

fell on the floor beside the others. The almost entire nakedness of their bodies, and the thick coarse nature of the weapon, rendered the strokes, which were in the chest, most fatal. They all died within a short time after the infliction of their wounds, which had itself been the work of a few seconds.

The bright moonlight looked in on a bloody scene that night in the little hut of the wilds. Ramsay, who had acted under the momentary and pressing impulse of self-defence in every successive stroke he gave, looked on the three bleeding bodies for a time in a sort of stupor. When the groans of the dying ceased, the only sounds that broke on the stillness of the scene were the weeping voices of the Indian children. A remembrance of the necessity for removing all evidences of the catastrophe before any other Indians could possibly come to the spot, aroused the trader from his trance. Before daylight, he had dug a pit, and interred the three bodies. A heavy snow, then falling, hid all marks of blood and other traces out of doors, while those inside the hut were removed by other means. In the course of the succeeding day, Ramsay dismantled the Pawnee hut, and conveyed its mats, &c., across the ice to a retired valley, where he set to work and raised a new hut of small size, for the reception of his brother and the Indian children. His chief motive for this was to ensure his brother's safety, and we may also suppose that he was unwilling to give any Indian visitors an opportunity of examining the children. When he left the new hut, he charged his brother, if he heard the report of firearms from the other log-house, to quit the place, and make the best of his way to the white settlements.

No human being, however, came near Ramsay, and on the 4th of April the ice began to break up. With all possible speed, the trader hauled his boat to the river, and having embarked his goods, began to descend towards Lake Erie, with his brother and the young Indians. The latter he could not think of deserting, and he reflected, moreover, that they might be useful as witnesses in justifying him before the colonial tribunals. Lake Erie was full of ice, and the course of the little party, after their entrance on it, was perilous and painful. On the 17th of April, Ramsay saw a canoe with two Indians. Believing war to have begun between the whites and red men, he prepared for an attack, but on their approach he recognised one of the men to be a Chippewaw with whom he had passed a winter formerly. On being spoken to, this Indian said that he was hunting along the shore with his companion, and that no others were with them. They said that "they would visit him when he got ashore." After parting with them, the trader spoke to the girl. "Do you wish to see the ground red again?" said he. "I have seen enough of blood," replied the young Indian. Encouraged by her answer, Ramsay requested her to say nothing of the past catastrophe, and she promised to do so. Next day the trader effected a landing, and constructed a rude temporary hut or tent, as the ice was too heavy on the lake to permit him yet to proceed with prudence towards Fort Erie. His brother and the two children were out collecting wood for fuel, when four Chippewaw men, with two squaws and several young children, landed from two canoes, and made for the hut. The appearance of two additional men, contrary to what those in the boat had told him, confirmed Ramsay in the belief that war had been begun. He concealed a knife in his belt as they approached, and threw on his blanket-coat to hide it. When the party came up, they unceremoniously helped themselves to the contents of a pot which was on the fire, and asked for rum. Ramsay said he never drew rum himself, but when his companion came with the children from the woods, he would give them some. When his brother did come with the children, he could not avoid giving them the rum. The Indians asked to whom the two children belonged. The bold trader's heart beat thick at the question. He answered, that they were the children of a white man and an Indian mother. "Girl," said one of the men, "are you the child of a white man?" The girl, whether from revengeful feelings, or from mere want of guile, at once replied, "No!"

Ramsay heard in this word the knell of fate to himself and his brother. Resolving instantaneously to make an appeal to the justice of the Indians, he sprang to his feet, drew his knife, and struck a tree by his side with it, uttering at the same time one of those prefatory cries or yells by which the red orators invoke attention to their harangues. "You know me," he began, addressing one of the Chippewaws, and using the Indian style of discourse, as well as their language; "I have lived with you. I have been by your side in the hunt, and have slept with you by the hearth. Did I ever harm you, or any of the red sons of my Great Father?" The Chippewaw filled up the pause with a "No." "I came peacefully and confidently among the Indians to buy from them their furs, and to give them blankets in exchange, that the snows might not chill them and their squaws. I came to give them powder, that they might have plenty of venison in their lodges. I came to give them every thing that could render their lives comfortable. Do I speak a lie?" In the same manner as formerly, the Chippewaws replied in the negative, and Ramsay went on to disclose the whole truth respecting the death of the Pawnees, describing the gifts he had made them, their ingratitude, and the assault he had finally perpetrated by night, with all its consequences. At inter-

vals in his speech, the trader appealed in their own fashion to his hearers, saying, "Are you angry?" The Chippewaws uniformly responded "No;" and when the story was told, they applauded Ramsay's conduct. "You are brave," said they; "you have done right. The Pawnees are wicked men—they are dogs!"

Notwithstanding these expressions, Ramsay, being persuaded that war had been declared, still thought that the Chippewaws could not be friendly to him, whatever they might think of his behaviour to the Pawnees. He therefore resolved to embark immediately on the lake, preferring that course, although the sun had now nearly set, to the risk of passing a night with the Chippewaws. As he was preparing to enter the boat, he missed the two children, and asked the squaws where they were. "They are gone to the woods," was the answer. The trader sent his brother to look for them, and in the mean time he himself stood leaning on his fusée, keeping a careful look about him. The four Chippewaws came up to him at this moment, and entered into familiar conversation with him; but when he turned his eye for one instant in the direction where he looked for his brother, the Indians rushed upon him simultaneously, disarmed him, and pinioned his arms above the elbow. They then led him back to the fire, and one of them struck him a violent blow in the face, which caused a severe bleeding from the nose and mouth, and made him indeed believe his jaw to be broken. He spoke not a word, but sat with downcast eyes till he heard the moanings of his brother, who on his return had also been seized and bound. The love of an elder brother for a younger one is a pure and beautiful feeling. The boy was to Ramsay a memorial of home, a sacred deposit committed to his charge by a tender mother. He exclaimed, "You are men! do not hurt a harmless boy. I am your captive. Dispose of me as you will, but do not injure the boy." The Indians made no reply, but placed the lad on the opposite side of the fire from his brother, and across its flickering light the two looked their last farewells, as they then thought, to each other.

The sun had by this time set. The Indians demanded rum from Ramsay, and the boy was temporarily unbound in order to get it from the boat. Two of the savages went with him and brought back a small kettleful, which they began to drink immediately. The other two Indians, however, would not taste it, but compelled Ramsay, on pain of instant death, to drink as much as the others. Meanwhile, one of the squaws patrolled round the party with a watchful eye, while the other woman frequently told the trader to "pray, for his hours were few." The men, too, entertained him with the repeated announcement that he would be burned to-morrow on the fire before him. In this manner passed the time, till the kettle, which held little less than half a gallon, was emptied by the two Indians and Ramsay. The savages again requested to have it filled, and the boy went a second time to the boat. He did not bring it quite full, and when the angry Indians demanded the cause, the trader said the boy did not understand the Indian tongue well, but if they would let him give the lad directions in his native speech, he would fill it up. The Indians assented, and Ramsay, aware that they knew some English, cried to his brother, "Fill it full, and slip a gully into ilka ane o' your hose when ye're there." The boy understood well; but while he was looking for the knives, the patrolling squaw, who had followed and watched him, exclaimed, in screaming tones, "Kill your prisoner! The boy is searching for weapons!" Two knives were instantly raised for execution, when Ramsay cried, "The squaw is mistaken. Let me call the boy, and you may search him." He then loudly called to his brother, telling him again in Scotch to leave the knives, or "gullies." Happily, the boy could not find them, and this danger passed by. The same two Indians began to the second kettle, and became deeply intoxicated. With brandished knives, they compelled Ramsay to take cup for cup with them. In spite of the danger of his situation, the liquor took its effect upon him, and about twelve o'clock, as he thought, he fell asleep.

In after life he had never any recollection of the dreadful scene that attended his awakening. The younger Ramsay, who could not sleep, related that the two sober Indians sat apart in consultation, for some time after David seemed to fall into a slumber. At length, one of them moved stealthily across to Ramsay, and the boy saw the knife raised, ready for the stab, in the Indian's hand. But the assassin seemed to have stumbled on the foot of Ramsay, or otherwise disturbed him, for the boy saw his brother make a rapid clutch with his hand, and seize the arm or hand of the Indian in which the knife was. The struggle between them had not lasted a moment, when the boy, by one powerful effort, slipped his arms from the cords with which the drunken men had bound them, and darting to the side of the other sober Indian, who was intent only on watching for Ramsay's death groan, snatched the knife from his hand. The boy was in another instant at the side of his brother, and had divided his bonds. Ramsay, as we have said, was a powerful man. He had now the additional strength of madness; for desperation, the sudden awakening, and the wild draughts of liquor he had taken, made him little else than a maniac. He wrested the knife from the Indian the instant his arms were free, wounded him, and would have killed him on the spot had not the man fled. Ramsay, without the delay of

a second, flew upon the other sober Indian ere he could get a new weapon, and passed the knife into his heart. The noise by this time had awakened the intoxicated men. Ramsay bounded upon them like a wild beast, and struck them down one after another, ere they could gather their faculties or think of resistance. The awful state of excitement in which the trader's mind was, may be guessed from the fact, that he killed one of the children also. The squaws fled from the spot with the others. Incapable of thought himself, Ramsay was led hurriedly to the boat by his brother. But the tale of blood was not yet complete. The first Indian, having returned and possessed himself of a knife, followed the trader to the boat. A struggle took place on the edge of the water, which was there knee deep. Both men fell into it, and from that grapple the Indian never rose. His blood dyed the waters of his native Erie.

The brothers reached Fort Erie on the 4th of May, after a most painful passage; for they never again approached the shore. Ramsay immediately told his story to the officers of the Fort, and delivered himself up into their hands. He was soon after sent with his brother to Niagara, to be examined in presence of a Chippewaw chief and several principal warriors of the nation. The "patrolling" squaw and the Pawnee girl were present. The result was an acquittal by the Chippewaw warriors. But, as colonial justice demanded a more regular trial, Ramsay was sent to Montreal, where he suffered an imprisonment of several months. He was finally liberated and absolved, no accuser appearing against him.

The scene of these bloody incidents is no longer the habitation of red men. Chippewaw and Pawnee hunt the moose no more on the shores of Lake Erie.

[We derive the foregoing from a manuscript volume, written by a gentleman who was engaged in the American war.]

MISS ROBERTS'S EAST INDIA VOYAGER.

In this recently published volume,* all persons bound for India, and to be employed either in the civil or military service, will find, as far as we can judge, much useful advice respecting matters requiring their attention, particularly as to choice of a vessel and cabin, and the necessary outfit of clothes and other articles. So much advice of one kind and another is indeed given by the authoress, who has been in India, and can speak of many things from personal experience, that we should imagine the perusal of the book must be indispensable to the "outward bound." For those also who wish to proceed, as it were, post haste by Alexandria and the Red Sea, there are some valuable hints. We perceive from this part of the volume that the journey by the Alexandrian route is performed as follows:—London to Paris; Paris to Lyons and Marseilles; thence by steam-boat, touching at Leghorn and Naples, to Malta; and by another steamer from Malta to Alexandria; from Alexandria by canal to the Nile, and onwards by boat to Cairo; thence by a land journey on donkeys to Suez; down the Red Sea from Suez to Bombay, touching at Mocha—total length of time from London to Bombay, sixty-one days, and expense, L.153, 19s. 9d. It may be added, that in certain seasons the navigation of the Red Sea is unsafe, or at least troublesome, on account of its exposure to sudden and heavy squalls; and this, we are afraid, will ever prevent it from becoming a line of route to India for regular traffic.

By way of presenting a specimen of Miss Roberts's observations and advices, we select the following passages, addressed to cadets:—"There are numerous persons who, if living in any part of Europe, would manage to find occupation for their time, who are in India utterly unable to discover a method of employing many hours of leisure, and therefore become a prey to ennui: military men have frequently a considerable quantity of spare time upon their hands; and should they accustom themselves to bestow it wholly upon the billiard room, they will suffer proportionately when that resource fails them, as it often must, since there are numerous stations in the country unprovided with such a refuge for the destitute. It is therefore of infinite importance to the youth who has obtained a cadetship, that he should cultivate and encourage some useful pursuit; and so great now is the spread of intelligence, and the facilities of acquiring knowledge are so many, that few need go out to India wholly dependent upon society for the means of beguiling time. Those who have a taste for drawing will find in it an inexhaustible source of amusement, and should lose no opportunity whatever in obtaining proficiency in sketching from nature. The study of architecture will likewise be found exceedingly useful, buildings being continually required in India; officers, in many places, having to construct their own bungalows, stables, or outhouses of various kinds. A competent knowledge of the art of surveying and making maps will frequently advance a young officer, who can make himself useful to government when taking possession of new territory, and civil as well as military engineering may be studied with great advantage by officers not belonging to that particular branch of the service. Instances frequently occur when it is of consequence that some person should be found upon the spot adequate to the undertaking of works of importance,

* London, Madden and Company, Leadenhall Street.

which otherwise must be postponed until the arrival of an officer of engineers. The principles of road making should always be understood, together with the construction of temporary bridges, rafts; and, in fact, an acquaintance with mechanics of every kind may be turned to good account in India, where Europeans are continually thrown amongst expert workmen, who are perfectly ignorant of science, and who, though following with great precision the instructions which they receive, can originate nothing. Many officers in India superintend the building of their own carriages, turning out very handsome equipages in remote stations where a vehicle of the kind had never been seen before; others make up articles of furniture in the same way in their own houses, for labour being cheap, and the greater part of the materials required at hand, there is no difficulty whatsoever in procuring any thing after a given pattern. The armourer of a native regiment made some excellent Italian irons from a model cut in paper, while a common carpenter constructed very beautiful bird cages, though he had never seen any thing of the kind before, from a pattern cut in pasteboard, and strung with cotton threads.

A piece of garden ground is usually attached to every European residence in India, and excepting in large stations, where experienced gardeners are attainable, its productiveness, particularly with respect to European vegetables, must in a very great measure depend upon the owner of the mansion. The Mallees, or gardeners, are in India generally stationary, an appendage to the garden, and coming into the service of the new tenant, instead of following the fortunes of the late resident. These men, if left to themselves, will fill the ground with tobacco plants, and other things convertible to their own use, either for family consumption or for sale. It will be necessary to supply them with the seeds for exotics of every kind, and slips of pot herbs, which may easily be conveyed from station to station in mould. To an early riser the care and culture of a garden affords delightful occupation; it will also give employment to the hour which marks the sun's decline, and, likewise, during many days in the rainy season, as well as the cold weather, the period in which it is most interesting, European vegetables being planted immediately after the rains have ceased.

A love of natural history opens endless fields of pleasurable research to those who have encouraged a taste for it; but at the same time, it must be said that the enthusiastic pursuit of any one of its branches may prove fatal to the party thus ardently engaged in it. India, unfortunately, can show a list of victims who have lost their lives from exposure to the climate, in their unwearied desire to extend their acquaintance with the wild tribes of the jungle, and to enrich their collections of specimens. Geology cannot always be followed up without peril, since it too often leads men who are devoted to this interesting branch of science, to remain out under a burning sun much longer than is consistent with safety; pursued with moderation, and a due regard to health, however, it forms a delightful resource, every day revealing new and valuable products in a country, of which, hitherto, comparatively speaking, little or nothing has been known.

Beautiful and interesting collections of birds may be made in India at a small cost of trouble or expense; their skins, as well as those of other animals, may be kept unstuffed till after their arrival in England, with very little disadvantage to their capability of being set up in all their pristine beauty. It is advisable not to remove the skull bone, as that materially assists in preserving the shape of the head. The following receipt for a solution which has been found very effectual, is given for the purpose of enabling the traveller, either at sea or on shore, to enrich his collection with whatever interesting animal may fall in his way. Take of common soap, or shavings, four drachms; gum-arabic in powder, two ditto; white oxide of arsenic in powder, six grains; boil these ingredients in four ounces of water, for about twenty minutes, taking care to stir it well during the time, and label the bottle which contains it with the word 'poison.' This solution is to be laid on sparingly on the inside of the skin with a brush or feather: two or three applications will in general suffice for the purpose. A deal box lined with lead foil, similar to that which guards the interior of a tea-chest, is recommended as the best depository for a traveller's museum; and when the skins are perfectly dried, they may be placed between layers of cotton, well peppered, or impregnated with camphor. In all the bazaars of India, a seed is sold which is very effectual in keeping off the attacks of insects, and will always be supplied by native servants for the purpose. The presence of a naturalist as a passenger on board ship is exceedingly desirable, since nothing can contribute more agreeably to the amusements and the employments of a voyage, than scientific researches directed towards objects of general interest. A taste is hereby diffused among persons who never troubled themselves before about natural philosophy; and those who may have found the study to be dry and unproductive, perceive its great utility, and find their enjoyments materially increased in looking at common objects with a view to ascertain their peculiar properties, the manner of their formation, and the uses to which they may be applied. Although it may be desirable to attain the very highest degree of science in every department undertaken by the student, slight observations upon any thing new or striking which

meets the eye of a traveller, are of importance in directing the attention of more experienced persons to the subject. The periodicals of India afford great facilities to those who desire to make the fruits of their researches known. Vast quantities of the most useful information are to be found in these valuable productions, as yet almost wholly supported by amateur contributors, who, neither writing for money, nor ambitious of shining by their style, communicate the results of their experience in an easy, unaffected manner, very much to the purpose."

THE SCOTT-BALLANTYNE CONTROVERSY.

THIS is a painful subject; but, having touched upon it a twelvemonth ago, a regard for impartiality makes it necessary that we should bring it down to the present date, when, we would hope, it has been laid at rest for ever. In the interval, Mr Lockhart has replied to the first pamphlet of the Ballantynes, using a title for his publication which we would rather avoid transferring to these pages; and the Trustees of Mr James Ballantyne have in turn replied to this. The result of the whole we shall now endeavour to present in an intelligible though necessarily compressed form to our readers.

We must first remind them that the controversy took its rise in the view which Mr Lockhart originally chose to take of the nature and consequences of Scott's connection with the two Ballantynes. The brothers, conjunctly and severally, were represented in his *Life of Scott*, as needy adventurers, who contrived to entangle Sir Walter, in an hour the blackest in his calendar, in business connections with them; who hung upon him like dead-weights, and dissipated his funds at all hands during a long succession of years; and who ultimately brought him to bankruptcy and ruin. Sir Walter Scott, on the other hand, was studiously put forward in the light of a gentleman of birth and fortune, who, without having any personal taste or turn for business, allowed himself, out of a weak and incomprehensible liking for the individuals alluded to, to become commercially implicated with them; and who, producing by the exercise of his great talents vast annual sums, in addition to his handsome income from other sources, permitted his reckless and unworthy associates, year after year, to apply to their own ends, and squander at pleasure, the whole or the main part of his unparalleled earnings, without ever once troubling himself about the manner in which the fruits of his toil were disposed of, or reflecting what involvements, over and above all, these unscrupulous partners, having his name and credit at command, might be hourly amassing, to fall all one day upon his own heedless and unaided shoulders.

The first pamphlet of the Trustees put, as we thought, a considerably different face upon the matter; and such was the general impression on the public mind, if we are to judge from the remarks of the newspaper press. Next, however, came Mr Lockhart's pamphlet, renewing all the former charges in an aggravated form, and producing documents and calculations to substantiate them. He asserts, at the very outset, that when the copartnership between Scott and Ballantyne was formed in 1805, the latter, though his stock appeared equal, was largely in debt; but as he advances no evidence to prove this, with the exception of one obviously perverted remark of the Trustees, the assertion need not detain us. The following, however, is a charge of a tangible kind. Alluding to the accounts of the copartnership for the first half year, Mr Lockhart sarcastically observes, "It must be allowed James starts well. During the first six months of the concern, his profits, according to his own accounts, were £366, 14s. 11d.: his monied drafts were, according to the same documents, for the same period, £1193, 0s. 6d." He contrives to make this charge appear in a very strong light; but the Trustees, in their second publication, overturn it by a simple statement. The greater part of the £1193 was made up of sums, for outstanding debts due to himself, which he received as alone entitled to them, though he at the same time transferred them into the company's hands, and entered them accordingly in the books. The Trustees complain, with much appearance of justice, of Mr Lockhart's having overlooked the opposite side of the account, which would have explained this matter. But his error does not stop with the first half year. Continuing his examination step by step, he arrives at the following conclusions:—James Ballantyne's profits from 1805 to 1809, were, in all, £3936, 9s. 10d., and his personal drafts £5963, 12s. 3d.; while Scott's profits were £1968, 4s. 11d., and his drafts £1391, 2s. 3d. "Thus," he continues, "while Scott left undrawn of his share of the profits the sum of £577, 2s. 8d., the careful and prudent tradesman, James, had overdrawn his share by no less than £2027, 2s. 5d." It is difficult to say by what terms such assertions as these should be characterised, when it appears from an accurate examination of the *very accounts* on which they are ostensibly based, and of which the Trustees have printed an abstract in their Reply, that James

Ballantyne's drafts exceeded his just and unquestionable dues by no more than by £148, instead of £2027; and that Scott, in place of leaving £557 undrawn, left but £286 (fractionals omitted). It was from the proceeds of old accounts, as has been said, not company funds, that Ballantyne's excess of drafts was made; and to understand the cause of his drawing such large sums of money in the years mentioned, it must be remembered that he was solely liable for all *outstanding engagements* previous to 1805. These he had to settle; and hence, those very drafts upon which the accusation against him is founded, might really have been made at the call and instigation of the other partner, who could not but be anxious to see the concern freed from all its previous obligations. But, however the money was applied, it is clear enough that Mr Ballantyne was not guilty of the plundering over-drafts upon the common funds of the company, with which Mr Lockhart directly charges him. What he took was his own; for an excess at any particular term of £148 is not worthy of notice in so large a concern. At an immediately preceding term we find a surplus of £343 in his favour, and so on. Besides, the fact that Scott only drew £100 from the business during the first year, is carefully paraded by Mr Lockhart, while the drafts of the succeeding years are as carefully kept in the background. Sir Walter's demands progressively increased, and in 1809 he drew £724, being nearly (not, as the Trustees incorrectly say, upwards of) £200 more than his year's profits, which amounted to £550.

In 1809, the copartnership was placed on a new footing, but the partners were left by it in the same relative position. After this arrangement was entered into, a new and most remarkable transaction characterised the history of the concern. To pay floating debts, and give the house the advantage of ready capital, apparently, Scott gave a loan to the company of £3000, or rather increased some small previous loans to that amount. At this period money could be got from the banks at six, or at most at seven per cent.; yet, upon the avowed plea that "the state of his family required that he should make the most" of his money, he charged "the company with interest at the rate of fifteen per cent." When we remember that Ballantyne was the two-thirds partner, and that, consequently, two-thirds of this usurious burden fell upon him, the transaction assumes an aspect widely at variance, to say the least of it, with Mr Lockhart's representations of the unselfish thoughtlessness of Scott in his pecuniary dealings with the company. Lockhart, following Scott, speaks of this fifteen per cent. as "trade interest," thereby implying that it was a common thing for a partner lending money to a company to receive such interest. But it appears that such a term is as great a novelty in commercial language, as the transaction or rather exaction itself is in commercial dealings. However, supposing that a lending partner had some claim to such a "trade interest," certainly Major Scott, who lent £1200 of this money, and who actually got a security for the sum on the company's premises, had no right to "trade interest." Yet for his money he received 15 per cent. Mr Lockhart, indeed, says that "Scott never received interest upon any of his advances [any part of this £3000, which was advanced in separate sums] except once or twice." Replying in their usual way, the very best possible, the Trustees present a portion of the company's accounts, showing that "from Whitsunday 1808 to Martinmas 1811, Scott received £1446 as interest on his advances." Tolerable interest, indeed, in three and a half years, for less than £3000! This whole affair is a strange one, but the strangest part of it all is, that Scott, when new arrangements were entered into in 1816 and 1822, appears to have charged this whole £3000 as a debt due to him by James Ballantyne personally, although it was clearly a company debt, with a share of which Sir Walter, notwithstanding his being the lender, was unquestionably chargeable.

"While the printing establishment of James Ballantyne and Company was thus prosperous—while its celebrity was daily increasing, and its profits averaged above £2000 per annum—in an evil hour the book-selling and publishing house of John Ballantyne and Company was projected." No man who looks attentively at the account given of its commencement and history in the "Life" itself, can doubt for an instant that the planning, establishing, conducting, and ruining of this concern, were the work of Scott, and Scott alone. Every important work issued by the publishing house was suggested by Scott; and the grossly injudicious nature of almost every one of these speculations brought speedy ruin on the business. Of all the works thus produced, a work called "Lixall Poetry," and the "Edinburgh Annual Register," were perhaps the most ruinous. The first was got up at an expense of £2500, and scarcely a copy sold. The second caused, while it lasted, a dead loss of £1000 a-year. "Could a concern, so conducted, possibly prosper?" the Trustees well may ask. According to James Ballantyne's calculation, 15,000 pounds worth of unsaleable stock had been created by these adventures. Scott, by his own showing, put into the publishing affair only £1500. Can we wonder, then, that the concern came to be sustained solely and entirely upon accommodation paper? Besides, "the presses of the printing-office were kept constantly at work on the heavy jobs of the publishing concern: but it is easy to see that, when the publishers were labouring to meet their engagements to strangers,

those to their printers would be the last to be provided for." The debts to the printing-office remained unpaid, or, what is the same thing, were paid in bills which were never retired, and were left finally afloat on the sole responsibility of the printing company. Supposing this to be so, let the reader mark the consequence. James Ballantyne was a one-fourth sharer in the publishing house, and a two-thirds sharer in the printing concern. Sir Walter Scott was a one-half sharer in the former, and a one-third sharer in the latter. Had the publishing house paid its debt to the printing-office, James Ballantyne would have paid a fourth, and received two-thirds; Sir Walter would have paid one-half, and received one-third. Observe, therefore, that Ballantyne was in the situation of a large loser by the non-payment of the debt, but Scott in the position actually of a *gainer*! The injustice of this sort of transfer seems to have escaped the notice of the Trustees.

However, such looseness of dealing was now of little moment. The printing concern had become fairly involved in a multitude of obligations and responsibilities, almost entirely, it is shown by the Trustees, in consequence of its connection with the publishing house; and Scott, conscious, seemingly, that he was the cause of all this, took the whole affair upon his shoulders in 1816. James Ballantyne, having now taken upon himself new responsibilities of a domestic nature, seems to have been glad to escape into the situation of a salaried servant, giving up the whole stock and funds to Scott, on condition that the latter, while becoming proprietor of all, should become responsible for all. We find no account in any of the papers before us, of the amount of the liabilities of the company in 1816. In the year 1822, when Ballantyne again became a partner, the current bills for which the company was answerable had accumulated to L.36,000. Referring expressly to the intervening period, Lockhart says, "Scott, on his part, continued, as of old, too much occupied with his own romantic creations, to have much time for minute scrutiny of his commercial affairs." Besides many other documents of similar import, there are letters of the date under consideration from Scott to Ballantyne, which alone render this statement absolutely ludicrous, showing, as they do, that Sir Walter watched monthly, daily, hourly, over the concern, was cognisant of its most minute transactions, and alone planned all the necessary ways and means to carry it on. As to the cause of the progressive increase of the company's liabilities, when we remember that Scott, previous to 1821, had laid out L.29,083 in land alone; that this land subsequently cost large sums in draining, planting, and enclosing, and yielded for a long time not one penny in return; that he was spending vast sums on the building and furnishing of Abbotsford; that his outlay on objects of virtu was in itself very great; and, moreover, that he had indulged in a most lavish style of hospitality for some years previously—we shall then find a cause, and the *only* cause, adequate to the production of such an effect. And that this *was* the cause, is proved by numberless documents in the Reply of the Trustees.

James Ballantyne again became a partner in 1822, but the state of matters was in no way altered. Sir Walter continued, as between 1816 and 1822, to be the true manager of the company's pecuniary affairs, and the mass of floating bills went on increasing, through the operation of the same causes as formerly. There was this difference only, that, whereas Scott had drawn, between 1816 and 1822, the whole profits of the printing-office, the *proper* business of which still continued prosperous, James Ballantyne now got his share as partner, according to the new arrangement. Mr Lockhart states, that "from May 1822 to January 1826, James Ballantyne drew from the business the sum of L.9331, 15s. 6d." "He was bound by the company contract (of 1822) not to take more than L.500 a-year, or about L.1750; so that there is an overdraft on the part of Ballantyne, in direct violation of the contract, of no less than L.7581, 15s. 5d. If we compute interest on this insane expenditure, we shall bring it considerably above L.8000!" Mr Lockhart further says, that these "sums are taken from accounts in Ballantyne's own handwriting." This last assertion (say the Trustees) "is grossly untrue." They then show, from accounts in the printer's handwriting, that, deducting cash payments into the business, the cash drafts of Ballantyne amounted to L.5356, 3s. 3½d. during the period in question, and that his real share of profits, and of the proceeds of novels published, amounted to L.9100. Thus, so far from drawing beyond his *dues* at all events, he left in the business an undrawn surplus in his favour of L.3743, 16s. 8½d. "If he deviated (say the Trustees) from the arrangement that the partners were to limit their drafts to L.500 a-year, Scott did so to an enormously greater amount." In fact, the arrangement appears to have been tacitly set aside by both, almost as soon as made. This did not affect the issue, which was brought on in 1826 by the failure of Hurst and Company, and Constable and Company, with which latter firm Ballantyne and Company were deeply connected by a reciprocal system of bill acceptances. The single liabilities of Ballantyne and Company amounted to L.46,000, and by the failure of the two other companies mentioned, these were increased to L.88,000. This was the close of the affair.

A number of lesser circumstances adduced by Mr Lockhart against Mr James Ballantyne are satisfac-

torily explained in the second pamphlet of the Trustees. These chiefly refer to the personal habits of Mr Ballantyne, which Mr Lockhart would fain fix as not less extravagant than his mode of conducting his business was lax and negligent. The showings of the Trustees on the first point speak for themselves, and we would add that, from what we can recollect of the domestic habits of Mr Ballantyne, they did not appear by any means extraordinary for a man gaining between one and two thousand a-year by his business, while we can say with equal confidence, from what we have ascertained through our own experience and that of friends, that his printing-office was decidedly the most ably and carefully managed, for all ends with which its customers had to do, in Edinburgh. Upon the whole, we conceive the friends of this estimable person to have completely and triumphantly made out their case in his defence.

Such being our impression, we cannot but regret that Mr Lockhart should have deformed his otherwise most agreeable and valuable book by what must now appear as so injuriously misrepresenting an innocent man. And not only this, but, by giving way to the erroneous impressions which existed in his mind, he has caused the exposure of a series of details in Scott's life, which will for ever *vulgarise* his name to a certain extent, and may even be said—wanting the explanations which he alone could have given them—to do something worse than this. For our part, since these things want the explanations of the party, we pass them by as charges altogether. We know enough of great and good in Scott, to be assured that he could have explained them. But they will have a depreciatory effect with the many. To conclude, it is distressing for a friend of Scott, as we had the honour in some humble measure to be, to consider how exquisitely painful the whole affair would have been to himself. Through his whole life, he maintained an unsullied reputation, and shone above other men in nothing more than in his keeping himself free from all low personal squabbings. Thus to have so many of his most delicate personal and domestic affairs harrowed up and cangled over before the public, is almost enough to bring him back in indignant re-animation from the grave.

CURIOSITY-HUNTERS.

THE following sketch of a remarkable class of beings termed *Virtuosos*, or *Curiosity-hunters*, is from the "Pictures of the French, drawn by themselves,"* and is, in our apprehension, as graphic and piquante as that of the Horticulturist, which we lately quoted.

"Adjacent to the 'Bourse,' that splendid edifice, raised by the genius of modern architects, with the assistance of Greek patterns, and numerous masons and stone-cutters, stands a smaller building, which might be easily taken for a tenement of trivial importance, did not large placards inform you that it is the Auction Mart, frequented by the public brokers. In that place, sacred to the Company of Auctioneers, every thing is put up to be bid for, every thing is to be sold—from travelling-carriages down to the autograph letters of Ninon de l'Enclos. Morning and evening the Auction Mart is open to the public; every one may inspect the articles to be disposed of; all are at liberty to crowd round the desks of the brokers, and indulge themselves in the pleasure of augmenting, by a few francs or centimes only, the marketable value of the greatest as well as of the most insignificant reputation possessed by artists, statesmen, or simple mechanics.

It is in the Auction Mart that we meet with those isolated characters—those really remarkable individuals of the present age, who alone possess a certain originality peculiar to themselves, and who alone disdain to mix with the common herd, in order that they may seek those paths, the grass of which is untrodden by the feet of the multitude. These remarkable beings are the lovers of virtu—and by this phrase I mean to embrace all those whom a passion for antiquarian research, and a desire to obtain a collection or museum more or less considerable, of things fabricated by human industry, or formed by the supernal energies of the great Creator, have launched into an arena where the victims of a ruling predilection are in a constant state of agitation.

As it is necessary to proceed methodically in all things, I shall begin by stating that there are three kinds—three species of antiquaries.

The first is the *Virtuoso* whose appearance is wild and uncultured, dirty and ragged from head to foot, with black nails, unshaven beard, uncombed hair, battered hat, and capacious pockets always full. This is the true *Virtuoso*—the antiquary who collects for the sake of the collection.

The second class comprises those merchants who move in good society—those dealers in curiosities—those tradesmen whose servants wear laced liveries, and whose carriages are haply adorned with armorial bearings—whose manners, language, and habits, are those of the true *Virtuoso*, but who only disburse their money for the sake of large gains.

The third species is the fashionable *Virtuoso*—he who

constitutes himself a *Virtuoso*, in order to keep pace with the age, and possess, like his acquaintances, a drawing-room fitted up in the style of the times of Louis XV., a dressing-room in the fashion of the *Renaissance*, a dining-room of the fourteenth century, with some Toledo blades, a few shields, the morion of a Covenanter, a cup in which he drinks when with his friends, a few Flemish jugs in blue and grey earthenware, and three Gothic windows which intercept the rays of the sun, and only admit through the casement a yellow, red, or blue light, that confers upon his features the hue of a yellow fever, scarlatina, or cholera morbus, should he only place himself in the way of the sunbeam which falls, thus disguised, upon his arm-chair.

Every *Virtuoso* must necessarily belong to one of the three classes which I have just described: the *Eccentric Virtuoso*, the *Speculating Virtuoso*, and the *Fashionable Virtuoso*. Amongst the votaries of the first class—those true poets of their kind—the most celebrated is an old man, dry, wrinkled, shabby, slovenly dressed in a species of brownish greatcoat, with his head covered by a black silk skull-cap, above which bulges out an enormous hat, of dubious colour, greasy about the brim, greasy in the crown, greasy in the band, greasy inside, greasy all over. This hat for the last thirty years has regularly accompanied its master to all the auctions, and attends upon him, whatever be the state of the weather, in his walks on the quays, and to the houses of all the dealers in rubbish and curiosities. This hat and this man are known by the name of *De Menussard*. M. de Menussard possesses a most splendid collection of *Sèvres* porcelain, made of *soft clay*. At his house—in his cupboards, in his closets, in his boxes—are concealed, as it were in a tomb, whole sets, traysful, and vases of *Sèvres* porcelain, made of *soft clay*, with the ground or borders of deep blue, light blue, turquoise blue, emerald green, or pink. After two years of research, perseverance, and anxiety, he bade for an emerald-green dinner-service, which had belonged to the Prince de Rohan, and purchased it at the public auction rooms on the Place de la Bourse for 30,000 francs. A little tray of a dark blue colour, containing five cups and saucers, and bearing the initials and esotericisms of King Louis XV., did not cost him less than 12,000 francs. It is, however, necessary to observe, that each of the cups and saucers of that tray was ornamented with medallions, upon which were portraits of the principal court ladies of the French Sardanapalus.

M. de Menussard is rich, well educated, and well born; he lives alone, shut up with his china-ware. He has neither carriages nor livery servants: an old female acts as his housekeeper. His toilet, his food, and his lodging, cost him but little. He never goes to the theatre; he has no friend; and he has never travelled farther than *Sèvres*. Nor to *Sèvres* has he journeyed more than once; and then he returned home on foot, fatigued, muddy, wet by the rain to the very skin, furious against the manufactory at *Sèvres*, against the age itself, and exclaiming, with indignation, 'There is neither religion nor creed now upon earth!—every thing is destroyed!—a decline—a total decline! To think that one of the glories of France has been suffered to fall into decay! The barbarians—the Goths—the Visigoths—not to manufacture any thing more of *soft clay*! Hard clay—nothing but hard clay! It is enough to make the hair stand upon one's head!' From that day, does any one dare to speak to him about the modern *Sèvres* porcelain, he shrugs up his shoulders, and a bitter smile plays upon his lips; but he does not utter a single word! The *soft clay* is every thing to him. When he cannot leave his lodgings, when the shops where curiosities are sold are closed, or when there is no auction to take place throughout Paris, it is then that M. de Menussard shuts himself up in the most secluded of his apartments. One by one he extracts from their cupboards, from their boxes, all his beautiful china, his plates, his dishes, his blue, pink, or green cups, or those with nosegays, medallions, or of a white or coloured ground: he contemplates them with admiration and with tenderness. Armed with a soft and fine piece of flannel, he wipes, he polishes, he caresses them: and then, when their toilet is thus completed, he talks to them, he converses with them, he questions them.

He only knows one thing—only loves, adores, cherishes one object—and that is the *soft clay* of *Sèvres*. The rest of the world may fall in, crumble, and he would not pay attention to the ruins. He never reads a newspaper; he is not an elector; does not belong to the National Guard, nor to any thing of that kind; he is the admirer of the *soft clay* of *Sèvres*. This passion for collecting curiosities—this mania—this idolatry of the *soft clay* of *Sèvres*—have exiled, as it were, M. de Menussard from the rest of the human species, from his fellow-creatures, and from all mundane sentiments; they have rendered him selfish, stern, and inflexible in his resolutions, and miserly in every thing, save the purchase of the *soft clay* of *Sèvres*. He entertains no compassion for the poor: the recital of a great misfortune extracts not a tear from his eye. He would see a whole quarter of the town burning before he would stir an inch from his own door, or suffer himself to experience the slightest emotion at the catastrophe; but if one of his cups, one of his plates, or one of his vases, were to break, his lashes would be bathed in tears; groans and complaints would escape from his bosom; he would find in his heart a mine of poetic treasure to deplore the loss of his cup, his plate, or his vase; and he would be lost in astonishment were the rest of the world to remain insensible to his anguish. He would be capable of killing the man that should break the smallest particle of his possessions in *soft clay*. In fine, he would traverse conflagrations, purgatories, and the regions below, to save the smallest saucer of *soft clay* that might be in danger of destruction; and he would not put his feet into water to save a drowning child! Love is a passion which renders ferocious those who experience it. M. de Menussard, with his black silk skull-cap, his greasy hat, his shabby coat, his upright and tarnished hair, his beard but indifferently cared for, his hands chilled by perpetual contact with earthenware, and his worn-out shoes, is perhaps, of all lovers and ad-

* At present in the course of being published in parts, with illustrative engravings, by W. S. Orr and Company, London.

mirers of this age, the most fervent, the most sincere, the most true, the most enthusiastic, and, on that account, the most excusable in his selfishness and ferocity.

By the side of M. de Menussard may invariably be encountered, at the Auction Mart on the Place de la Bourse, a celebrated collector of autographs, who possesses the writing of all famous personages: but within the last month he has laboured under a mortal affliction—ten lines of Molière's own writing escaped him, and became the property of a celebrated English amateur. He will not recover the shock; his days are numbered; he hears nothing, sees nothing, but walks about like a miserable wretch on whom some inveterate fatality is heavily weighing. He considers himself as a dishonoured individual: his collection of autographs was once reputed to be the finest of all collections existing, and now it is only the second in rank.

M. de Menussard shrugs up his shoulders when he sees the collector of autographs: he even says that he is mad.

And, indeed, the Virtuoso in autographs, like the Virtuoso in *soft clay*, the Virtuoso in pictures, and all other amateurs who carry their love of one thing to the passion of collecting thousands of specimens of the adored object, may be easily classed amongst the insane portions of those afflicted with monomania. They are harnessed to a single idea, and see nothing beyond it; for all the universe, and existence itself, are concentrated in the one idea which they pursue, and are pursued by.

There are unknown collectors of every kind, and of every species. All Paris must remember that celebrated Viscount, who made a collection of the most famous red hair. Another subject to the monomania of making collections, and who was laughed at by all the world, amassed a complete museum of the smallest female shoes that it was possible for him to procure. They might be seen at his house, arranged upon shelves, and ticketed like volumes in a library. He was acquainted with all living and all dead feet: a handsome foot, with a neat shoe, transported him with admiration. He would consider himself a neglectful guardian were he not to know the female who possessed that pretty foot; he would make all manner of inquiries concerning her; would write to her, to put her in the way of preserving her charming foot; would implore her not to use shoes too tight for her; would point out the species of leather she should order her shoemaker to use for her; and would conclude by soliciting, as the sole recompense for so much trouble, a pair of shoes for his collection—his museum—his treasury!

Lord D— loves nothing but snuff-boxes; he has a quantity of all kinds, and each is exceedingly precious. He has divided them into three classes; the boxes of celebrated men, the boxes ornamented with images or paintings, and the boxes of curious materials or workmanship. He has sacrificed considerable sums to this really remarkable collection. He boasts with pride of being able to exhibit to the curious in such matters six real *Blarenbergs*—more than the number possessed by the late king of England, George IV., who was particularly fond of snuff-boxes and of *Blarenbergs*. His collection of *Petitots* is almost as fine as that of the king of France; and all his *Petitots* have retained their original settings, of the latter years of Louis XIV.—a period when they were encrusted in snuff-boxes, which served as royal presents. The late M. de B—, a great collector of enamels, endeavoured for a long time to persuade Lord D— to dispose of two little enamellings of Limoges, of a certain epoch, and faultless in design, which adorned a small snuff-box that was reputed to have belonged to M. Abel Poisson, the brother of the Marquise de Pompadour, and superintendent of finances in the reign of Louis XV.; but Lord D— never disposes of, nor exchanges, a single thing. His entire collection of snuff-boxes is contained in a case which travels, dwells, and sleeps, if not absolutely *with*, at least *near* him. Lord D— has undertaken two journeys to St Petersburg to procure the snuff-box which formerly belonged to Catherine the Great, and which served as a species of frame for the portrait of Potemkin. Lord D— has bequeathed all his snuff-boxes to a grand-nephew, upon the single condition that they are never to be disposed of, and that they should be tended with all the honours and care which they deserve. An annual income of £1000 sterling accompanies this bequest, in order to recompense the legatee for his trouble, and secure a continuation of those luxuries and comforts which the boxes have so great a right to demand.

It would require, not a volume, but many hundreds of volumes, to describe and analyse the different tastes of curiosity-hunters—to paint in true colours, and depict in a faithful manner, this eccentric class of individuals. These species of Diogenes, shut up in their tubs, demand nothing better of the world than permission to enjoy in freedom the light of their sun—their predilection—their *Vada*—their monomania! One of those happy beings—those lunatics—those martyrs to a single idea—lived five-and-twenty years shut up with mummies; he saw nothing but mummies; and he at length looked upon them as animated creatures, living like the rest of the world, as his neighbours lived. To each had he given a name, by which he knew, caressed, and cherished it. To such a pitch did he carry his folly, that he eventually fell in love with a hideous corpse enveloped in bandages; its countenance wearing a horrible expression; its lips and cheeks black, haggard, faded, and dried up. He pretended that this wretched object was no other than the daughter of Pharaoh II., and that the box which contained it revealed its royal origin and death through the medium of hieroglyphic designs. A meeting of learned men took place; and it was unanimously agreed that the mummy should be elevated to the rank of a royal mummy, and of a sacred mummy. From that moment, the Virtuoso, its master, entertained towards this mummy a greater attachment than for any of her sister mummies. He dreamt of that young princess: he saw her, in his dreams, playing with the waters at the source of the Nile, and followed by the green crocodiles, which she attracted by her sweet voice from the river. Indeed, never did lover adore his mistress as the Virtuoso loved his mummy. For some time he was scarcely seen: he

shut himself up with the daughter of Pharaoh II., and poured forth his soul in respectful adoration at the feet of her dumb Royal Highness. One morning, after a cold and wet night, the Virtuoso found his mummy lying upon the ground. The sacred bandages were loosened; the form of his beauty appeared to him unveiled for the first time, but broken and spoiled; the fall it had experienced had ground it almost to powder. He endeavoured to raise and readjust one upon another the sad remains; but—oh horror!—the Virtuoso became suddenly aware that his Egyptian princess was a man! This was for him a mortal blow—a nameless sorrow: he languished for some time, and died at last, and was interred in the coffin of his loveliest mummy!

THE EMULATIVE PRINCIPLE.

THE article entitled "Hints respecting Mental Ability," which appeared in Number 397, has called forth some remarks from an esteemed friend, which we think calculated to enforce some of the doctrines there laid down. After a few complimentary sentences, the writer thus proceeds:—

"Every person must have observed the general anxiety of parents that their children should excel those of others. A boy is sent to school, not unfrequently at an age when his tender frame renders every exercise of his mind prejudicial to his health, and when he stands more in need of the rein than the spur; in this state his feeling of emulation is easily wrought upon from his own innate love of superiority, while the flame is fanned by his observing the pleasure it gives his parents; as he advances in years, his studies increase in difficulty, and this feeling is fostered in the same proportion, until it becomes the ruling passion; the attainment of knowledge for its own sake is in some measure lost sight of, and its chief value appears to consist in its being the means of obtaining distinction. Let us consider how this process must inevitably terminate. I must premise, however, lest I be misunderstood, that I do not object to the bestowal of rewards for positive merits for the correct performance of any given task; this is a principle quite in accordance with the nature of things. My object is to show that it is pernicious to bestow rewards for excellence which is merely comparative.

Let us take the case of many of our public academies in any of the three kingdoms. A prize is proposed for the greatest number of lines committed to memory, of original verses composed, or of pages translated in Greek, Latin, or French; here a boy actuated by the ambition more or less natural to every one, is never led to say to himself, "How can I use my powers of mind so as to be able to render that account of them for which I am responsible?" but, "How shall I be able to outstrip my competitors?" I must ascertain how much each of them is likely to do, and then I shall know when I have done enough." The natural effect of all this is to create the feeling of envy and jealousy, if his rivals completely outstrip him, or of redoubled exertion, if there be any prospect of his overtaking and surpassing them. Bodily exercise, so essential to the preservation of health, is neglected; the midnight oil is not spared; natural rest is abridged; the little sleep he does allow himself is disturbed by nervous excitement; the restorative power ceases to perform its functions; dyspepsia, with all its fearful attendants, ensues; and the mind, once vigorous and healthy, becomes completely shattered; and, what is deeply to be deplored, it is the most highly gifted that are in greatest danger: those of moderate talents, having no hope of attaining the envied summits of literary fame, are content to move along with calm but steady progress. With reference to the dangers of over-stimulation, the evidence of Dr Farre, before a committee of the House of Commons in 1832, is well worthy of an attentive perusal. I subjoin the following extracts from it:—

"A physician always has respect to the preservation of the restorative power, because, if once this be lost, his healing office is at an end. . . . The ordinary exertions of man run down the circulation every day of his life, and the first general law of his nature by which God (who is not only the giver, but also the preserver and sustainer, of life) prevents man from destroying himself, is the alternating of day and night, that repose may succeed action. . . . Man, possessing a superior nature, is borne along by the very vigour of his mind, so that the injury of continued diurnal exertion and excitement on his animal system, is not so immediately apparent as it is in the brute; but in the long-run he breaks down more suddenly; it abridges the length of his life. . . . I have frequently observed the premature death of medical men from continued exertion. I have advised the clergyman, as his Sabbath, to rest on one of the ordinary days of the week; it forms a continual prescription of mine." In an appendix to the above evidence, as reprinted by the Scottish Lord's Day Society, Dr Farre writes:—"The short life of over-stimulation is not a merry but a miserable one, and the shortened life of over-exertion, before its close, is followed not by ease and enjoyment, but by the living death of torpor. The effect of forcing the mind is as ruinous to the body as it is destructive of the end for which it is so inordinately exercised, for, as torpor of the body from over-labour is marked by a sluggish condition of all the corporeal functions, so the torpor of mind consequent on its over-exertion, is attended with the like inaction of all the sensorial powers which belong to the mere animal portion of the mind of man. It occurs in men of every rank *ho over-think*, as well as in those who over-act or over-stimulate, and in an increased ratio when the latter fatal habit is used to force the labour of the former. It is found in the sovereign, the legislator, the lawyer, the clergyman, the physician, the warrior, the student, or aspirant after honours, the merchant, the manufacturer, the artisan, and the labourer: in all, in proportion to their measure of talent and over-doing, is this slow and

miserable but premature death, instead of a green old age, too frequently found."

These observations of an eminent physician, of more than thirty years' experience, cannot be read without advantage. There is, doubtless, great danger of men contracting habits of indolence; but in the present age of competition and over-stimulation, there is even greater danger of running to the opposite extreme, and ending in a second childhood, if not worse. Our great objection to academic emulation, *practically*, is, that it is the means of establishing those habits which, in mature life, work such great evil.

Being a clergyman, it may not be improper for me to make a few remarks on the theology of the question. "Thou shalt love thy neighbour as thyself," is the law prescribed by God to man. If I strive to outstrip my neighbour, my obedience to this law is impossible; the very entertaining of such a motive is a positive violation of this rule. Instead of cherishing any delight at seeing myself in advance, my duty clearly is to do all in my power to assist him in making the same progress with myself; nor is it enough to perform the outward act of doing what may tend to this; I am required to be actuated by the feeling of pleasure in doing it, and of pain in seeing him fall short of it. It is on this principle St Paul, in the inspired volume, condemns emulation, and classes it with the grossest sins of our nature. Whenever such a condition of genuine Christian feeling has been attained, envy and jealousy, and with all the kindred passions that torture the bosom of fallen man, will obviously cease to exist; and were such motives generally prevalent, the face of society would be completely changed.

I may be asked, after all that has been stated, What do I propose to be done? My answer is ready and brief. Let parents beware of expressing satisfaction with their children merely because they have surpassed others, or of holding out such an object as one to be desired by them; on the contrary, let them teach their children to rejoice in the good of others, and express their approbation of them only when they have done something actually good in itself.

Again, in schools or universities, I should recommend the more general adoption and more extensive application of the principle involved in the good old practice of granting degrees; let a standard be laid down, varying according to the place, age, and circumstances of the parties; let certain subjects of examination, or text-books, be fixed upon in any department; and let all who have acquitted themselves in a satisfactory manner, when examined at the end of their course, be classed as M. L., M. G., M. M., &c., Master of Latin, Greek, Mathematics, &c. With such a plan there might be a thousand, or there might only be one; the evils to which we have alluded as arising from estimating merits comparatively, would be obviated, and the public would have the satisfaction of knowing that an individual so designated, had, in the opinion of competent judges, acquired a definite amount of knowledge of certain subjects, and not merely that he was superior to others, which might either imply great merit or none at all.

LETTER OF BENJAMIN FRANKLIN.

THE following is a copy of a letter written by Benjamin Franklin, to M. Le Roy, a French gentleman in Paris, and which we believe has never before been in print. The original, from which we copy, is in the hands of Sir John Robison, Edinburgh.

LONDON, January 31, 1769.

DEAR SIR—I received your obliging favour of Nov. 15. I presented your compliments to Sir John Pringle, who was glad with me to hear of your welfare, and desired me to offer his best respects whenever I wrote to you. The Farmer's Letters were written by one Mr Dickinson of Philadelphia, and not by me, as you seem to suppose. I only caused them to be reprinted here with that little preface, and had no other hand in them, except that I see some of my sentiments formerly published are collected and interwoven with those of others and his own, by the author. I am glad they afforded you any amusement. It is true, as you have heard, that troops are posted in Boston, on the pretence of preventing riots and protecting the custom-house officers; but it is also true that there was no intention among the people there to oppose the landing of these troops, or to resist the execution of the law by arms. The riots talked of were sudden, unpremeditated things, that happened only among a few of the lower sort. Their plan of making war on this country is of a different kind. It is to be a war on commerce only, and consists in an absolute determination to buy and use no more of the manufactures of Britain till the act is repealed. This is already agreed to by four provinces, and will be by all the rest in the ensuing summer. Eleven ships now here from Boston and New York, who would have carried, one with another, £50,000 sterling each in goods, are going away in their ballast, as the parliament seems determined not to repeal. I am inclined to think, however, that it will alter its mind before the end of the session. Otherwise it is to be feared the breach will grow wider by successive indiscretions on both sides.

The subject you propose to me, the consequences of allowing a free exportation of corn, the advantages or disadvantages of the *Concurrence*, &c., is a very extensive one; and I have been, and am at present, so much occupied

* That the same law regulates the expending of mere bodily power in the lower animals, appears from the following interesting note appended to the reprint of Dr Farre's evidence:—

"Mr Bianconi of Clonmel, in Ireland, whose establishment of 'day cars' run during six days of the week over two thousand miles of country in Ireland, and who is also contractor for carrying the royal mail in cars over seven hundred miles of cross roads, gives in evidence this result of his experience, 'That a horse can run ten miles per day for six days of the week better than eight miles per day seven days of the week.' He simply remarks thereupon, 'I am persuaded that man cannot be wiser than his Maker.'"

pied with our American affairs, as that, if I were ever so capable of handling it, I have not time to engage in it at present to any purpose. I think, however, with you, that the true principles of commerce are yet but little understood, and that most of the acts of parliament, edicts and edicts of princes and states, relating to commerce, are political errors, solicited and obtained by particulars for private interest, under the pretext of public good.

The bearer of this, Captain Overy, is a particular friend of mine, who now only passes through Paris for Lyons and Nice, but in his return may stay in your city some time. He is a gentleman of excellent character and great merit, and as such I beg leave to recommend him to your civilities and advice, which may be of great service to him, as he is quite a stranger in Paris.—With the greatest esteem and respect, I am, dear sir, your most obedient and most humble servant,

B. FRANKLIN.

Your English is extremely good; but if it is more easy for you to write in French, do not give yourself the trouble of writing in English, as I understand your French perfectly well.

THE BOATMAN OF THE PENTLAND FIRTH.

THE remote though picturesque and beautiful estate of Melsetter is situated in the parish of Walls, in one of the Orkney Islands named Hoy. The surrounding scenery cannot fail to strike the most listless observer with admiration and awe. It presents the singular combination of lofty rock, heath-clad mountain, cultivated plain, ocean, lake, and bay. On the north, the Hoy Hills rise in rapid succession, each seeming to vie with the other in height. About the centre, and at the foot of these ranges of hills, are two very pretty little lakes, with a limpid stream winding its lonely way to the sea. From the House of Melsetter to the romantic fishing hamlet of Rackwick, is an uninterrupted series of stupendous rock scenery, occasionally exceeding five hundred feet in height, sometimes perpendicular and smooth, in other places rent, shivered, and broken down in huge fragments, occasionally overhanging the deep, and frowning on the stormy surges of the Pentland Firth. From Rackwick to Hoymouth, facing the Atlantic Ocean, this rock scene is continued without any interruption.

See Hoy's old Man! * whose summit bare
Pierces the dark blue fields of air;
Bared in the sea, his fearful form
Gooms like the spirit of the storm;
An ocean Habel, rent and worn
By time and tide—all wild and torn;
A giant that hath warred with heaven,
Whose ruined scalp seems thunder-riven;
Whose form the misty spray doth shroud;
Whose head the dark and hovering cloud;
Around his dread and lowering mass,
In sailing swarms the sea-fowl pass;
But when the night-cloud o'er the sea
Hangs like a sable canopy,
And when the flying storm doth scourge
Around his base the rushing surge,
Swift to his airy clefts they soar,
And sleep amid the tempest's roar,
Or with its howling round his peak
Mingle their drear and dreamy shriek!

Towards the south and east is an extensive cultivated plain, the shores of which form part of the fine and commodious harbour of Longhope, well known as a place of safe retreat for vessels passing through the Pentland Firth, so famous for the rapidity of its current, and so great a terror to mariners of almost every country. During the last war it was no uncommon thing for a fleet of upwards of a hundred large vessels to set sail together from this harbour, and a fine sight it was to behold so many ships spreading their canvass to the breeze, and moving majestically along the shores of the island. It was while contemplating the above scenery, one stormy morning in the month of September, a few years ago, from the windows of the House of Melsetter, that I desecrated some ships in the Pentland Firth, which, with the aid of a glass, I soon discovered to be whale-ships on their way home from Davis' Straits. One of them had a signal flying for a boat to land some of the crew, natives of the island. The sea at the time was running tremendously high; the wind and tide, directly opposed to each other, seemed contending as if to decide which should obtain the mastery, and thus caused the sea to boil up in solid columns to a great height, and the spray to fly about in all directions. The only thing which could possibly have led the people on board to expect a boat in such a storm, must have been an impression that no storm would scare away Orkney boatmen. In this impression they were right, for no sooner was the signal observed than a boat was launched, in which four men attempted to proceed to the ship; but, alas! the storm proved too severe for even Orkney seamen. In the midst of a dangerous eddy she was so beset with the wind, tide, and boiling of the sea, as to be past all management, and in a few minutes went down. I immediately hurried to the beach, and shall never forget the scene of distress which there presented itself. The mournful cries of the wives, children, and relatives of the drowning men, would have softened down a heart of adamant. Within speaking reach of the shore, yet beyond the power of mortal man to afford any aid, the men were distinctly seen in the water bravely trying to right the boat by cutting away the

masts; but they failed in the attempt. One of them waved his hat towards the shore, and was faintly heard exclaiming, "Oh, my wife and children!" This was far too much for his wife, who in the agony of grief would have leaped into the sea, but for the protection of the people who had hastened to the scene of distress. The storm continued to rage with unabated fury, and the unfortunate boatmen sank to rise no more.

A few minutes after the sad catastrophe, a boatman, a native of the island, so celebrated for his prowess at sea as to be termed amphibious, determined to make a second attempt to go to the vessel, at rather a more sheltered point. He fortunately succeeded in gaining the ship, and returned safely to land with the men who had disembarked. This individual has been known to lie out in the Pentland Firth for nights together, in an open boat, and alone, during the most stormy weather. While, in a few days, disastrous accounts at sea would be quite current, he with his boat would return to land perfectly skaitless; hence he is also supposed, by the more superstitious of the islanders, to be under the special protection of some supernatural being. I once made a passage with him, during which he related some of his sea exploits—wonderful to any one but himself—with the greatest coolness. He may be truly considered as no unworthy representative of Neptune, or one would be almost inclined to pronounce him to be Neptune himself incarnate. I believe, however, his "hair-breadth escapes" are solely owing to a thorough knowledge of the various intricate tides and eddies of the Firth, in conjunction with expert boatmanship. Here, then, lives a hero of no ordinary stamp, but one of whose existence no note has ever been taken. Useful, however, in his station, and happy in the services which he is permitted to render to his unfortunate fellow-creatures, what benefit could he derive from worldly honour, or the fleeting breath of fame?

SONG OF THE HIGHLAND DROVER,

RETURNING FROM ENGLAND.

Now fare thee well, England, no farther I'll roam,
But follow my shadow that points the way home;
Your gay southern shores shall not tempt me to stay,
For my Maggie's at home, and my children at play!
'Tis this makes my bonnet sit light on my brow,
Gives my sinews their strength, and my bosom its glow.
Farewell, mountaineers! my companions, adieu!
Soon, many long miles when I'm sever'd from you,
I shall miss your white horns on the brink of the burn,
And o'er the rough heaths, where you'll never return;
But in brave English pastures you cannot complain,
While your Drover speeds back to his Maggie again.
O Tweed! gentle Tweed, as I pass your green vales,
More than life, more than love, my tired spirit inhales;
There Scotland, my darling, lies full in my view,
With her bare-footed lasses and mountains so blue:
To the mountains away; my heart bounds like the hind;
For home is so sweet, and my Maggie so kind.
As day after day I still follow my course,
And in fancy trace back every stream to its source,
Hope cheers me up hills, where the road lies before
O'er hills just as high, and o'er tracks of wild moor;
The keen polar star nightly rising to view;
But Maggie's my star, just as steady and true.
O ghosts of my fathers! O heroes, look down!
Fix my wandering thoughts on your deeds of renown,
For the glory of Scotland reigns warm in my breast,
And fortitude grows both from toil and from rest;
May your deeds and your worth be for ever in view,
And may Maggie bear sons not unworthy of you.
Love, why do you urge me, so weary and poor?
I cannot stop faster, I cannot do more;
I've paid silver Tweed; 'e'en the Tay flows behind;
Yet fatigue I'll dudkin;—my reward I shall find;
Thou, sweet smile of innocence, thou art my prize;
And the joy that will sparkle in Maggie's blue eyes.
She'll watch to the southward;—perhaps she will sigh,
That the way is so long, and the mountains so high;
Perhaps some huge rock in the dusk she may see,
And will say in her fondness, "That surely is he!"
Good wife, you're deceiv'd; I'm still far from my home;
Go, sleep, my dear Maggie—to-morrow I'll come.
—From Poems by Robert Bloomfield.

DUELLING AMONG THE ENGLISH.

On this subject, the following occurs in the recently published Journal of a Persian Prince, detailing his residence in England:—"The duel is allowed here. Sometimes this happens in such circumstances as the following:—If a man should be at an assembly, and should have something said to him improper or disgraceful, he who feels it to be such would at once leave the room. Then he will relate it to some friend, saying that he heard so and so, at such a place, in such a party, which he did not like at all. Then his friend will reply, 'So and so perhaps did not intend to insult you; he might have said it by accident; write a note, and I will carry it to him, and learn more fully.' Then the plaintiff will write to him a respectful letter as follows:—'At such and such a day, at such an assembly, I heard you say such words, which made my heart feel angry; please to explain to me what you meant.' Then the friend will carry the note, and request an answer. If the object of the accused is not to insult him, he will write him an answer as follows:—'Upon my honour I never intended to create any displeasure in you, and should I have said any thing which you consider improper, I now beg your pardon.' Such an answer will settle the question. But, if otherwise, he will neither excuse himself nor beg pardon, but will answer as follows:—'I have received your letter, which I will thus answer: meet me on such a day, at such a place, and thereby you will be informed, and learn all the particulars.' This will give him to understand that the object is a duel. Then he informs his friends of it, and commences preparations to meet his opponent; and like-

wise the other will inform his friends that he has already appointed the time to fight with such a man. Then the friends of both endeavour to settle the question between them; but, generally, this cannot be effected without fighting the duel. However, when all mediations fail, then the two individuals, accompanied by their respective friends as witnesses, meet at the appointed place, exactly at the fixed hour, which will be published in the newspapers. When the two come to this place with their pistols, then the friends use their utmost influence of mediation; if at last all should be in vain, then they separate from each other a distance of twenty feet, and the signal will be given, when both fire. Then it becomes a matter of chance; sometimes both of them are hit and perish, and perhaps no one is hit, or one dies, and the other is saved. Thus the question is finished; this act is permitted by their law, which does not condemn it, and it has been a well-known practice among the fools of this nation from the ancient times. It is quite similar to the old foolish custom of the heathens, who threw both the plaintiff and defendant into the fire, believing that the flame would only burn the criminal and not the innocent. Thus, also, these people believe that the bullet will not hit the innocent, and this old foolish custom is continued among the imprudent class of the Franks."

ADHESIVENESS OF TIMBER.

At one of the sectional meetings of the British Association, Mr Eaton Hodgkinson read a table of different species of wood, and the power which they possess to resist a force tending to crush them. The following are a few of the principal woods and number of pounds which they would sustain on the square inch, without sinking under the pressure. The weight was applied in all instances in the direction of the fibres. Yellow pine, 5375 lbs.; cedar, 5674 lbs.; red deal, 5748 lbs.; poplar, not quite dry, 4307 lbs.; green larch, wet, 2301 lbs.; green larch, dry, 5368 lbs.; plum tree, green, 5364 lbs.; beech, rather green, 7733 lbs.; beech, dry, 9363 lbs.; dry ash, 9363 lbs.; English oak, 5364 lbs.; Spanish mahogany, 5198 lbs.; elm, 10,331 lbs.; box from 9365 to 10,000 lbs.; kingwood, 12,645 lbs.—*Newspaper paragraph.*

THE SWELL MOB.

That class of elegantly dressed London thieves usually called "the swell mob," subsists chiefly by "hustling," or robbing in crowds. Six, eight, or ten of them, join forces, and go to a fair, market, or race-course. They soon mark a victim; they follow him till a push occurs, either accidentally by meeting a group of people, or intentionally made by themselves. Two go before the man, the others close up behind; their victim is hemmed in, a push takes place, he is jostled and hustled about, the thieves cry out to those behind not to press so; the press is increased; the victim being surrounded, his pockets are presently turned inside out. No time is lost; if he does not readily raise his hands, but keeps them in his pockets, or at his side, to guard his property, his hat gets a tip behind; perhaps it is knocked over his eyes. To right his hat he raises his arms, nor does he get them down again till he is eased of every thing in his possession. His hob and vest pockets are emptied by the thief standing beside him, and placing one arm against the chest of the dupe, by this means keeping his arms and head up, whilst with the other he unbuttons the coat and rifles the pockets; the trousers pockets and coat pockets are emptied by those behind; others behind them immediately take the property. When the gentleman has been robbed, the signal is given to that effect; the push subsides. The person immediately discovers his loss; he looks about him, and is, in the language of the thieves, "stunned." But no detection takes place; the mob move away in different directions, and again assemble and repeat their game.—*Report of the Constabulary Force.* In most instances, persons may guard against the depredations of these wretches, by avoiding crowds, and pursuing a steady pace in walking; in short, by minding their own business. The victims of personal robbery in large towns, are with few exceptions people who are chargeable with some kind of imprudence of behaviour.

KNOW WHEN YOU ARE WELL OFF.

A certain man, in the time of the Khalif of Bagdad, laid claim to the gift of prophecy. They took him to the Khalif, who asked him, "What sayest thou?" He said, "The angel Gabriel comes down to me once in every three days." "And what is the miraculous sign granted thee?" said the Khalif. The man replied, "That my breath should have odour of the best musk." The Khalif pitied him, and said, "The brain of this poor fellow is unsettled; take him to my kitchen, give him every day a pilaw, and a young and fat boiled fowl, and morning and evening let him have perfumed and medicated drinks." After ten days he sent for him, and said, "Oh, dervish, how is thy state?" He said "Very good." He said, "Does Gabriel yet descend to thee?" He replied, "Yes; formerly he came once in the three days, but during the ten days he only came once." The Khalif asked, "What message did he bring?" He replied, "He said to me, 'thou art in an excellent position; take heed and move not lest thou lose it.'"*—Asiatic Journal.*

PEOPLE'S EDITIONS.

The works most recently issued by Messrs Chambers in their series of PEOPLE'S EDITIONS, are Guizot's History of Civilisation in Europe, newly translated from the French, price 1s. 4d. Stephens's Incidents of Travel in Greece, Turkey, and Poland, price 1s. 10d. The same author's Incidents of Travel in Egypt, Arabia Petraea, and the Holy Land, price 1s. 10d., and Essays, Moral and Humorous, also Essays on Imagination and Taste, by Addison, price 3s. 3d. Altogether, twenty-nine works of approved excellence are now published, at the aggregate price of 34s. 8d.; the original prices of these works, as nearly as they can be ascertained, amounted to £27. 4s. 6d.

SOME MORE HINTS RESPECTING MENTAL ABILITY.

If the general notions respecting mind are so erroneous as we lately described them to be, it is not surprising to find the world's appreciation of various mental endowments to be bestowed upon somewhat vague and capricious principles.

If we consider which class of persons receive most praise for high mental endowment, and are personally objects of the greatest interest in consequence, we shall find that they are those who have succeeded in the elegant and amusing arts, particularly that of literature. An eminent statesman will be spoken of as a great man, chiefly because of his historical or political importance. A distinguished barrister or a highly employed physician will be allowed to be an *able* man. Such beings as clever tradesmen and artisans are understood to exist. But if we hear of men who are run after as miracles of intellect, it is ten chances to one that we find them to be poets, or novelists, or in some other way connected with light literature, or, by a rarer chance, actors, painters, or sculptors. To these men alone is *genius* attributed—that more spiritual kind of mind, as it seems to be considered. Other men, however great results they may work in the world, seem to be regarded as ordinary mortal creatures in comparison: their brains seem to be thought of a grosser consistence. It would almost appear as if the character of the poet at least, if not of some of his compeers also, were thought to partake to a certain extent of the supernatural—as if they were not just so much "lower than the angels" as common men. One of the results of this prepossession is, that these men, to use a familiar phrase, are *lionised* and over-flattered, and in many instances puffed up with the idea that all kinds of intellectual display besides theirs are little better than drudgery.

That there is much fallacy here, we have no manner of doubt. The faculties required for elegant and comic literature, and for the higher branches of the imitative arts, are certainly of no mean order. Good powers of observation, a keen perception and relish of the beautiful and the ludicrous, the comparing, constructing, and imitative faculties, and (in the litterateur at least) the gift of ready and apt expression, are all needed, together with an endowment of a more general nature, which we can only describe as a fine quality and temperament of mind. But these gifts are not the very highest comprehended by the human intellect. Reason, or the power of tracing cause and effect, and, from mists of falsehood and error, extricating the bright truth, is a faculty far loftier and rarer, and one which is of infinitely greater service to man; and of this faculty there is little show amongst the cultivators of the *belles lettres* and *beaux arts*. These men are often, indeed, very slenderly endowed with the reasoning or judging faculty, and may also be, and generally are, very ignorant. A sound judge, contrasting their qualifications with those of the class of greatly informed and philosophical minds, which are comparatively few in numbers, and little noted by the common world, would be at no loss to assign them their true place. It only happens that their qualities are of a kind which the multitude can understand and enjoy, while deep thinkers benefit their race, it may almost be said, without their race knowing of it. The productions of the artist (including in this term the literary artist) appeal also to the more intimate affections, and become hallowed by a thousand fine associations: hence their names, if they have had the genuine matter in them, become more endeared to a remote posterity than even to their contemporaries. The author of a single popular song will be remembered with respect, while the elicitor of some important moral truth, or the arranger of some great department of human knowledge, will be known by name only to those who know much.

The general disposition to think of as clever or in-

genious men only those who shine in the elegant arts, does injustice to a still larger body of able men—those, namely, who are engaged in the front ranks of the world's ordinary business. The daily occupations of many such men require the exertion of as much mind, and that of as ingenious and powerful a quality, as the doings of the common run of literary men; and it is only from accident that the work of the one class is trumpeted abroad, while that of the other is never heard of. It is also often from accident that minds are brought into the gin-horse play of the desk-room, which might have "waked to ecstasy the living lyre." Scott, as we are informed by his biographer, "considered literature by itself as a thing of far inferior importance to the high concerns of political or practical life." This is perhaps overstating the matter, for literature is itself, in its higher branches, a very important part of the concerns of political and practical life; but certainly there is a prepossession as to its professors, which can only be accounted for by reference to the notoriety which attends it as a course of action, and the affections which it establishes between writer and reader. Much talent is engaged in it in most countries—but nothing in amount compared with what is devoted to the most commonplace pursuits. We verily believe that there is scarcely a master manufacturer, or considerable merchant, nay, even a tradesman of tolerably large undertakings, who is not, to all intents and purposes, as much a man of talent (meaning by this an aggregate of mental power) as any litterateur or artist of all but perhaps the very highest class. And the productions of many of these persons, who on account of them have acquired some note, could, we truly believe, have been produced by "many men, many women, and many children," in the ordinary walks of life.

This leads us to consider the common estimates formed respecting literary talent. The late James Hogg used to speak of a lady of his acquaintance, herself a literary woman of some local distinction, who so much revered the doings of the pen, that any one who had published a book, albeit it might be the sorriest or maddest volume of "poems on various occasions," was sure of her esteem. The enthusiasm of this lady was only an exaggeration of a prevailing error. The power of committing thoughts to print is still looked upon by the multitude as a kind of wonder. When a man is somewhat of an adept in this art, and has at the same time little sense and little morality, he is considered a perfect anomaly, as if this power were necessarily to be attended with every other brilliant and estimable qualification. Thus we have such phenomena as editors of newspapers without a particle of principle, poets without a grain of natural sentiment, and dexterous miscellaneous writers destitute of information and powers of just thinking. The error lies in the respect we entertain for the mere power of writing. This power depends mainly on the gift of Expression, one of the secondary intellectual faculties. It does not suppose the existence of good ideas: it only implies the power of clothing those which exist, or are transmitted through the mind, in tolerable language. This gift of expression is one which all possess more or less, and which many have in considerable endowment. Women generally have it in greater strength than men. Besides this faculty of language or expression, a certain quickness of mind, a very humble and ordinary endowment, is almost the only other intellectual peculiarity necessary to the *clever* writer. And these qualifications are nearly the whole stock of perhaps nine-tenths of the men who use their pens in the public service in this country. It is easy, of course, to see how judgment, information, and principle, should be so often wanting in that class of men. That very fallacy of the public, which pays so much respect to the mere power of writing, must be greatly instrumental in at least keeping this class destitute of the more solid qua-

lifications. Finding all desirable homage to be paid to the simple power of scribbling, they are content to be no more than scribblers. Why should a newspaper editor, for example, endeavour to be logical? If he can rail "in good set terms," if he can taunt, and gibe, and "thunder," is he not "a clever writer," "a man of splendid talents," and so forth? He has not the least need to be reasonable. On the contrary, his most valued qualification will be some tincture of skill in that ancient art, which consists in "making the worse appear the better reason." There are of course modifications of the fallacy. We may find, for instance, a man who, besides the gift of expression, has some imagination and high-flown sentiment. This man will be a popular orator. He will become famous. Fame will give him authority, and he will become a leader amongst his tribe, although destitute of that solid judgment which is essential above all things to the right conduct of great affairs. Thus, persons of very inadequate endowments often acquire a great, though it must always be a temporary, ascendancy. Others, again, in addition to the gift of expression, and the usual knowing faculties, and quickness of mind, will show considerable humour, and thus become distinguished in light literature, or in acting or caricaturing. But though, in such instances, one or two other respectable qualities are added, the whole character is still greatly over-estimated. We still see a few second or third rate faculties receiving the homage which is alone due to those of the first order.

We have hitherto alluded chiefly to the intellect; but the moral feelings are also a part of mind, and here we think something analogous could be made out. The greater number of the professors of literature and the other elegant arts, as they manifest chiefly a secondary class of intellectual, so do they also manifest chiefly a secondary class of moral, faculties. Of that spirit of conscientiousness which is true to every thing—even the remotest from self—true to truth itself above all things; of that benevolence which seeks for the good of each and all; or of any other very lofty sentiment, we find few and rare traces in popular literature. The praise of the world is all in all, both with the author and with the creatures of his imagination. And how often does it happen with these persons, that, as their intellect is illogical and unsound, so also are their sentiments false, and their practice, both in the application of their intellect, and in their domestic circumstances, vicious! May we not also say that for this the world affords some cause in its erroneous views as to mind? It sees intellect displayed in some one direction: it praises it, not only without regard to its grade in the intellectual scale, but without regard to the moral feelings which exist in the same mind; the latter particular being looked upon as something quite apart, or which for the time may be left out of view. We think this mode of judging of men altogether wrong. We would take the whole mental nature into consideration. If we find a lively writer full of absurd reasoning, or a man of good thinking powers displaying bad moral practice, we say that man has not a good mind. It is a mind with a great flaw. We may pity the fault, but we cannot allow that he who displays it is entitled to any of the soft and laudatory appellations which are too apt to be bestowed upon him.

The diffusion of more just views respecting mind, would do much to raise both the intellectual and moral tone of the cultivators of literature. At present, whatever is clever is admired, whether it be a mere display of words, or a collection of sound thoughts; and much confusion prevails in the minds of most men as to the motives and aims of all ordinary intellectual efforts. There is no recognised or sanctioned scale for readily measuring either the importance and utility of a literary composition, or the worthiness of the sentiments which have animated the writer. This is certainly to be much lamented, and it will evidently be long before

the deficiency be fully and rightly supplied. Yet even now and here a hint might be given as something towards a right test. We would say decidedly, that, amongst intellectual efforts, those which elicit new and useful truths, and, amongst moral displays, those which bear a regard to truth, justice, and the good of mankind, are of the first class. Those, in the one department, which create beautiful forms and ideas, to please kindred imaginations, and those in the other which proceed upon and tend to cultivate feelings of honour and a generous ambition, we would assign to a second place. Beneath this we shall not go in a formal manner; but if, in considering what was called a clever piece of writing, and finding it unilluminated by information, undirected by just thought, unirratiated by ennobling sentiment, designed not to clear, but to obscure the path of mankind towards happiness, or directly meant to maintain the interests of some overbearing section or class; if, we say, mankind, instead of senselessly applauding such a composition, would say, "Here is an ignorant, illogical, grovelling, and venal slave, as dangerous to his race at large as a highwayman or a swindler is to single parties, and with no intellectual power worth speaking of but that which merely gives a flow of words"—we might then expect to see that kind of writing go somewhat out of fashion, and a better come in its place. The young aspirants in the trade would then know that something was required besides the knack of using the pen. They would endeavour to acquire knowledge; they would reverence knowledge in others; they would be deterred from erroneous reasoning and the advocacy of vicious things; sound conscientiousness and philanthropy would be found to be among the requisites for their office, and such qualities would be elicited in them, instead of being left dormant, or perverted, as at present.

LABOUR SONGS.

FIRST ARTICLE.

SOME of the stiff critics of the last century speak of love and conviviality as the themes of song; but in point of fact songs have been composed on all subjects respecting which men feel with any degree of fervour. A song is properly a strain of sentiment sufficiently energetic to occasion or justify our giving it a measured and musical form; and, accordingly, if our definition be correct, there may be songs about every thing which excites any feeling whatever in the human bosom. There are war songs in the rudest nations, and political songs in the most advanced. We have hunting songs for squires, and sea songs for sailors. The patriot may be cheered with a lay containing a burst of national self-esteem, and even the highwayman can cock his pistols to the tune of "Hark, I hear the sound of coaches." There are also a few songs sacred to particular trades, and some which have been designed to be sung during work: the Grecian lasses are represented by Homer as singing to the sound of the lyre while engaged in the vintage, and Aristophanes speaks of women who

"—warbled as they ground the parched corn."

These allusions show that to sing to labour is a very ancient, and, we may consequently infer, a very natural procedure. It is, in fact, at once an expression of the labourer's feelings under the cheering influence of his employments—for all employment is, or ought to be, cheerful—and a means in itself of increasing that cheerfulness. Even the *yo-ho* of the mariner as he raises the anchor is an inspiring sound, albeit it has no literary meaning. So also is the strange gabble of the oyster-dredgers, in our Firth of Forth, of which David Herd has been at the pains to set down some snatches in his Collection of Scottish Songs—though, without the music, its virtues can scarcely be guessed at, as the subjoined passage will show.*

* Aherdour, Aberdeen,
Grey clath to the green,
Grey clath to the sands;
Trip it, trip it through the lands;
Through lands, or if hare
Hunt the dog frae the deer,
Hunt the deer frae the dog,
Waken, waken, Willie Tod,
Willie Tod, Willie Tay,
Cleckit in the month o' May,
Month o' May and Averile,
Good skill o' raisins,
Jentlens and fentlens,
Jeery ory alie;
Weel rowed five men,
As weel as your ten;
The oysters are a gentle kin,
They winna tak unless ye sing,
Come buy my oysters aff the bing,*
To serve the sheriff and the king,
And the commons o' the land,
And the commons o' the sea;
Benevolent and that's gude Latin.

* Heap

The Scottish Highlanders still keep up their ancient fashion of singing to their work. When the women, for instance, assemble to assist each other in the domestic process of fulling or thickening cloth—called by them the *Luagh*—they accompany their exertions with songs. According to Pennant, "twelve or fourteen women, divided into two equal numbers, sit down on each side of a long board ribbed lengthways, placing the cloth on it: first they begin to work it backwards and forwards with their hands, singing at the same time: when they have tired their hands, every female uses her feet for the same purpose, and six or seven pair of naked feet are in the most violent agitation, working one against the other: as by this time they grow very earnest in their labours, the fury of the song rises: at length it arrives at such a pitch that, without breach of charity, you would imagine a troop of demons to have been assembled." In the 244th number of the Journal will be found a song in the Scottish dialect, descriptive of this process, and such as might be supposed to be sung by the women engaged in it. In the Highlands, at no distant date, hand-mills, called Querns, were very common. One of these utensils consisted of two stones, one revolving like an upper mill-stone above the other. It was placed on a cloth, and two women sat down to it, one on each side. They grasped alike a stick, by which the upper stone was quickly revolved. Corn, *graddened*, or burnt out of the ear, was put into a hole in the centre, and the meal came out at the edges upon the cloth. It employed two pair of hands four hours to grind a single bushel of corn. The process was thus very tedious and clumsy; but it was the only available means of grinding corn in a simple state of society, and the songs with which it was accompanied made it heartsome enough. With these explanations, the reader will be prepared to understand a song of pleasant domestic feeling composed by the late Mr Robert Jamieson, of Edinburgh, and published originally in his collection of "Popular Ballads and Songs."

THE QUERN-LILT.

The cronech* stills the dowie heart,
The jurram stills the bairnie;
But the music for a hungry wame's
The grinding o' the quernie.
And loes me on my little quernie!
Grind the gradden,† grind it,
We'll a' get crowdie when it's done,
And bannocks steve to bind it.
The married man his joy may prize,
The lover prize his aries;
But gin the quernie gang na round,
They baith will soon be earless.
Sae loes me, &c.
The whisky gars the bark o' life
Drive merrily and rarely;
But gradden is the ballast gars
It steady gang, and fairly.
Then loes me, &c.
Though winter steek the door wi' drift,
And ower the ingle hings us,
Let but the little quernie gae,
We're blythe, whatever dings us.
Then loes me, &c.
And how it cheers the herd at e'en,
And sets his heart-strings dirlin',
When, coming frae the hungry hill,
He hears the quernie birlin'.
Then loes me, &c.
Though sturt and strife, wi' young and auld,
And flytin' but and ben be;
Let but the quernie play, they'll soon
A' lown and fidgin-fain be.
Then loes me, &c.

The Highland women also sang to the cows while milking them, not only for the sake of its cheering effect on themselves, but under an impression, similar to that of the oyster-dredgers, that the cow was thereby rendered the more willing to part with her milk. Mr Jamieson has written a song on this subject too, but, before presenting it, it is necessary to give the following prose note:—"On a very hot day in the beginning of autumn, the author, when a stripling, was travelling a-foot over the mountains of Lochaber, from Fort Augustus to Inverness; and when he came to the house where he was to have breakfasted, there was no person at home, nor was there any place where refreshment was to be had nearer than Duris, which is eighteen miles from Fort Augustus. With this disagreeable prospect, he proceeded about three miles farther, and turned aside to the first cottage he saw, where he found a hale-looking, lively, tidy, little, middle-aged woman, spinning wool, with a pot on the fire, and some greens ready to be put into it. She understood no English, and his Gaelic was then by no means good, though he spoke it well enough to be intelligible. She informed him that she had nothing in the house that could be eaten, except cheese, a little sour cream, and some whisky. On being asked, rather

sharply, how she could dress the greens without meal, she good-humouredly told him that there was plenty of meal in the croft, pointing to some unreaped barley that stood dead-ripe and dry before the door; and if he could wait half an hour, he should have brose and butter, bread and cheese, bread and milk, or any thing else that he chose. To this he most readily assented, as well on account of the singularity of the proposal, as of the necessity of the time; and the good dame set with all possible expedition about her arduous undertaking. She first of all brought him some cream in a bottle, telling him, 'He that will not work, neither shall he eat;' if he wished for butter, he must shake that bottle with all his might, and sing to it like a mavis all the time; for unless he sang to it, no butter would come. She then went to the croft; cut down some barley; burnt the straw to dry the grain; rubbed the grain between her hands, and threw it up before the wind, to separate it from the ashes; ground it upon a quern; sifted it; made a bannock of the meal; set it up to bake before the fire; lastly, went to milk her cow, that was reposing during the heat of the day, and eating some outside cabbage leaves 'ayont the hallan.' She sang like a lark the whole time, varying the strain according to the employment to which it was adapted. In the meanwhile, a hen cackled under the eaves of the cottage; two new-laid eggs were immediately plunged into the boiling pot; and in less than half an hour, the poor, starving, faint, and way-worn minstrel, with wonder and delight, sat down to a repast, that, under such circumstances, would have been a feast for a prince."

THE DEY'S* SONG.

Pbroo, pbroo! my bonnie cow,
Pbroo, hawkie! ho, hawkie!†
Ye ken the hand that's kind to you,
Sae let the drappie go, hawkie.
Your caufie's sleepin' in the pen,
Pbroo, hawkie! ho, hawkie!
He'll soon win to the pap again;
Sae let the drappie go, hawkie.
Pbroo, pbroo, &c.
The stranger is come here the day,
Pbroo, hawkie! ho, hawkie!
We'll send him singin' on his way;
Sae let the drappie go, hawkie.
The day is meeth and weary he,
Pbroo, hawkie! ho, hawkie!
While cozie in the bield were ye;
Sae let the drappie go, hawkie.
He'll bless your bouk‡ when far away,
Pbroo, hawkie! ho, hawkie!
And scaff and raff § ye aye shall hae;
Sae let the drappie go, hawkie.
Sic benison will saif ye still,
Pbroo, hawkie! ho, hawkie!
Frae cantrip, elf, and quarter ill;
Sae let the drappie go, hawkie.
The stranger's blessing's lucky aye;
Pbroo, hawkie! ho, hawkie!
We'll thrive, like hainet girs,¶ in May;
Sae let the drappie go, hawkie.
Pbroo, pbroo, my bonnie cow!
Pbroo, hawkie! ho, hawkie!
Ye ken the hand that's kind to you,
Sae let the drappie go, hawkie.

The negroes in the West Indies, who have naturally a good deal of the musical faculty, are accustomed to sing to any labours in which many join, and which require simultaneous effort; but we do not recollect having seen any of their ditties in print, excepting one in *The Pirate*, beginning, "Thus said the captain to his gallant crew," &c. and containing no allusion to labour. The world has been made aware by Mr Moore that the boatmen of the St Lawrence sing to their work, and that the effect is beautiful. Alluding to one of their airs, he says, in descending from Kingston to Montreal, "I remember, when we have entered at sunset upon one of those beautiful lakes into which this river so grandly and unexpectedly opens, I have heard this simple air with a pleasure which the finest compositions of the first masters have never given me, and now there is not a note of it which does not recal to my memory the dip of our oars in the St Lawrence, the flight of our boat down the rapids, and all those new and fanciful impressions to which my heart was alive during the whole of this interesting voyage." The air alluded to was that which he has made familiar in every drawing-room in the kingdom by his verses for it—

Faintly as tolls the evening chime,
Our voices keep tune and our oars keep time;
Soon as the woods on shore look dim,
We'll sing at St Ann's our parting hymn;
Row, brothers, row, the stream runs fast,
The rapids are near, and the daylight's past! &c.

It is remarkable how few labour songs exist amongst ourselves. In Ritson's English Collection there is not one, nor is our Scottish anthology in a very different case. Our living poets might surely venture upon less promising essays than that of supplying a variety of ditties for the workshop—at least for those particular occupations which admit of singing in the course of them. There is one modern bard who has thought of the thing, and produced one song, which has certainly the merit of containing some good and just thoughts, however unlikely it may be to gain popular accept-

* A female attendant on cattle is so called.
† A familiar name for a cow in Scotland.
‡ Bulk—figure, or body.
§ A share of whatever is to be had.
¶ Such blessing will save you still.
¶ Spared grass.

* A song of wailing for the dead.

† Parched corn.

ance—and with it we conclude our speculations for the present :—

THE WEAVER'S SONG.

Weave, brothers, weave!—Swiftly throw
The shuttle athwart the loom.
And show us how brightly your flowers grow,
That have beauty, but no perfume!
Come, show us the rose, with a hundred dyes,
The lily, that hath no spot;
The violet, deep as your true loves' eyes,
And the little forget-me-not!
Sing, brothers, sing! weave and sing!
'Tis good both to sing and to weave:
'Tis better to work than live idle;
'Tis better to sing than to grieve.

Weave, brothers, weave!—Weave, and bid
The colours of sunset glow!
Let grace in each gliding thread be hid,
Let beauty about you blow!
Let your skein be long, and your silk be fine,
And your hands both firm and sure,
And Time nor chance shall your work untwine,
But all—like a truth—endure!
So—sing, &c.

Weave, brothers, weave!—Toil is ours;
But toil is the lot of men:
One gathers the fruit, one gathers the flowers,
One sows the seed again!
There is not a creature, from England's king
To the peasant that delves the soil,
That knows half the pleasure the seasons bring,
If he have not his share of toil:
So—sing, &c.

JUNCTION OF THE ATLANTIC AND PACIFIC OCEANS.

THE project of joining the Atlantic and Pacific Oceans has excited attention almost since the discovery of the American continent, and there can be no doubt that it would have been carried into execution long ere this, had the district in which the communication might be most conveniently made, been in the possession of almost any other European people than the Spaniards. As there now seems to be a prospect of the Anglo-Americans becoming the possessors, or at least the rulers, of Mexico, the idea of uniting the Atlantic and Pacific may be regarded as less visionary than it has hitherto been. In fact, the project has been revived with some likelihood of its speedy accomplishment, and the line of route to be assumed has become a matter of discussion both in Britain and America. To help on the good cause, we offer the following sketch of the district through which the canal-cutting may be performed.

The neck of land stretching as a connecting link between North and South America, embraces the part called the Isthmus of Panama, which is most southerly, Guatemala, and a portion of Mexico; on the east lies the Gulf of Mexico, and on the west the Pacific Ocean. By the intervention of rivers and lakes in various parts of the tract, nature has in some measure prepared the way for establishing a ship canal between the two seas. In the more northerly or Mexican portion, called the Isthmus of Tehuantepec, the breadth of the land is one hundred and twenty miles. Here two rivers run in opposite directions, and these it is reported could be made navigable so far into the interior, as to render a canal of twenty miles alone sufficient to connect the two waters. If the Mexican Spaniards had possessed the smallest ingenuity or desire for improvement, they would have had this intermediate tract surveyed, and a canal formed, if at all practicable. As the matter stands, there is no existing survey in which any confidence can be placed, and therefore we are at a loss to know what are the difficulties to be overcome in the way of excavation or lockage.

A plan which has found much more favour in the eyes of the world, as well as of scientific men, is that which would carry the line of communication through the lake of Nicaragua, which is situated in the middle of the neck, in an apparently convenient manner for forming part of a navigable channel between the two oceans. It extends about one hundred and twenty-three miles in length, about forty in breadth, and has almost every where a depth of sixty, and often of ninety feet, so that it is admirably adapted for the purposes of navigation. This great basin receives a number of streams, but the only visible issue of its waters is the river San Juan (St John), which flows from its south-eastern extremity into the Atlantic Ocean. On the north-west the lake of Nicaragua communicates with another sheet of water called Lake Leon or Matiares, upwards of thirty-five miles in length, and nearly fifteen in breadth, by means of a channel called the Rio Tapitapa, which is about twenty miles in length. The distance overland from the Lake of Nicaragua to the Pacific is only seventeen English miles, and from Lake Leon to the same ocean it is still less; but we know not which is the most practicable route. "It would be an important service rendered to geography," says an able writer,† "would any person

endeavour to ascertain the levels on this line of road, and the physical obstacles it would be necessary to overcome, to form a water communication. It is believed some such survey has been set on foot by the American government, or by a company of the United States; in the mean time, the only observations we have are from a Spanish manuscript, existing in the archives at Guatemala, and copied by Mr Thompson (in his work on that country), which states, that the engineer Don Manuel Galisteo executed a survey in 1781, by means of a water level, from the Gulf of Papagayo in the Pacific, as far as the Lake of Nicaragua; and that the bottom of the lake was found to be forty-six Spanish feet above the level of the sea. The distance between the lake and the sea, at the proposed communication, is by this measurement 29,880 English yards, or fifteen geographical miles nearly; and the greatest actual height of any part of the land is nineteen feet above the level of the lake: thus we are assured of a grand natural reservoir of water at a sufficient elevation. But the practicability of a communication with the Pacific, either by this line or through the Lake of Leon, or with the Atlantic by the Rio San Juan, or some great transversal valley, is not yet ascertained with any certainty." Here, then, in the first place, it will be necessary to cut a canal of seventeen miles length from the Lake of Nicaragua to the Pacific, and as the land seems gradually to decline to the ocean, and is in no part more than nineteen feet above the level of the lake, this really seems a very insignificant undertaking. It is not to be compared for a moment with hundreds of works of the same kind executed in the United States, Great Britain, and other places.

Our attention must next be drawn to the Rio San Juan, which flows from the Lake of Nicaragua to the Atlantic. In Colonel Galindo's map, published in the journal above quoted, this stream appears to be about one hundred and twenty miles in length. It is broken by falls, but, Mr Davis Robinson informs us, is navigable for sloops throughout its whole length; and Captain Phillips, a more recent authority, states that "the river and lake are at present navigated by boats which are called bungaloes (or, as we should call them, river barges), of about two tons burthen. I have seen a string of twelve or fourteen of these boats arrive in one day at San Juan de Nicaragua, from Granada, laden with hides, indigo, money, &c. If the stream is not strong enough to impede the passage of the bungaloes at present, there can be little doubt of the success attendant on the introduction of steam-boats," and so on.* But as the navigation of the river by small craft, such as are here mentioned, would not answer the intended purpose, it would be necessary to deepen the bed of the river, and to make a cut to avoid the falls. This would prove the heaviest part of the undertaking, and yet even this work is completely thrown into shade by many others for which bills are annually passed through the North American Congress. Judging from Colonel Galindo's map, the length of the inland navigation here would be,

	English miles.
From the Atlantic to the lake through the river San Juan	120
Through the lake to the head of the canal	85
The canal	17
Total	222

In 1824, three companies in England, Holland, and the United States, were in terms with the government of Central America for executing this canal; but the scheme was abandoned like many others created during that bubble period. It is now, however, pretty certain that the government of the North American Union will either carry through this work, or one similar to it at a place which we shall now describe.

If appearances on the map alone were to be consulted, the Isthmus of Panama seems the spot marked out by nature for a junction of the two oceans. Here the neck of land that unites the two continents is narrowest, being in one part only thirty miles across; and here the chain of the Andes in two places subsides to a level with the land, so that a canal is quite practicable, provided the land itself do not rise to too great a height. "It will be seen," says Mr Lloyd, of whose survey we feel ourselves indebted, "that the spot where the continent of America is reduced to nearly its narrowest limits, is also distinguished by a break for a few miles of the great chain of mountains, which otherwise extends, with but few exceptions, to its extreme northern and southern limits. This combination of circumstances points out the peculiar fitness of the Isthmus of Panama for the establishment of a communication across."† Mr Lloyd's attention was chiefly directed to the practicability of a railroad along a level tract of country which lies between the mouth of the river Trinidad on the Atlantic side, and the town or river of Chorrera on the Pacific side, a work which would certainly prove of great utility; but a large ship canal is what the wants of the commercial world require. This can only be effected in this part by joining the head waters of the rivers here situated, which flow partly to the Atlantic and partly to the Pacific. The largest is the Chagres, which empties itself into the Atlantic, after receiving the Trinidad and many other streams. On the Pacific side, the largest river is the Rio Grande, the upper part of

which approaches within about four miles of the Mandinga or Obispo, a tributary of the Chagres. The intervening country being nearly a level, presents no serious obstacle, so that a canal might easily be made to join the two streams, and thus the junction of the oceans is effected. The rivers, it is true, are too shallow for ships; but Senor Gazo, an authority in these matters, and many other persons, are of opinion that by deepening the bed of the Obispo, and carrying the canal from it to that point of the Rio Grande, where the latter stream becomes navigable for vessels of small tonnage, the desired object would be effected. Still, as large vessels could not sail right across, the idea of a grand oceanic canal would be but imperfectly realised. But surely there is nothing impracticable in rendering the Rio Grande navigable for large vessels; and allowing that the canal were to be cut from the Chagres direct to it without interfering with the Obispo at all, the distance would only be twelve miles. The following interesting facts bearing on this point are from a work recently published. "I have lately seen a letter from Mr Ferraud, the North American consul at Panama, to Mr Wheelwright, in which he says, that the distance from the Chagres to the Rio Grande is about twelve miles; that labourers are plenty in the country; a thousand may be obtained at about two dollars per week; that wood, limestone, and all materials for the completion of a canal, are to be found on the spot; and that the country is nearly level."* Here, then, we have labour cheap, material for a trifle, and a level country to cut; what is wanted but English or American enterprise to carry through the undertaking? To render the Chagres navigable at all seasons, it would be necessary to erect weirs at certain places; and to obviate an inconvenience occurring at its mouth, by which vessels drawing more than twelve feet of water cannot enter, Mr Lloyd informs us that the river might "easily be connected with the bay of Limon," where there is excellent and secure anchorage. The same writer describes some curious and interesting phenomena respecting the difference of level of the two oceans, by which it appears that the Pacific is several feet higher than the Atlantic, but this might be obviated for inland navigation by one or two locks.

Cupica, the most southerly portion of Panama, lying on the Pacific, is thought by Humboldt the most favourable point for connecting the two oceans by a navigable canal. At the distance of about fifteen miles inland, over a country perfectly level, or with a very gentle rise, we arrive at the river Naipi, a branch of the Atrato, which flows into the Atlantic.

Farther to the south, that is, higher up the Atrato, there is a river called the San Juan de Chirambira, which flows to the Pacific. The upper branches of the two rivers approach within ten or twelve miles of each other, at the sixth degree of north latitude. A quebrada or ravine stretches from the one to the other; and it is a fact worthy of record, that this natural facility was taken advantage of by the priest of the neighbouring parish, who caused the Indians to dig a channel here, which, being subject to periodical inundations, became filled with water, and thus, forming a communication between the two rivers, united the two oceans at the same time. He must have been an enlightened ecclesiastic that curate of Novita, so the parish over which he presided was called. Through this channel, boats laden with cocoa have occasionally passed from sea to sea for more than half a century. It is said that the canal might be easily enlarged by directing the course of some of the neighbouring rivers into it. In this case a line of boat navigation could be more readily established here than at any other place. But to render a canal in the isthmus useful on a great scale, it must be what Humboldt calls "a canal of oceanic navigation." It ought to admit ships large enough to trade between the Old and New World with advantage, for we have the example of the Caledonian Canal before us to prove, that unless ships can sail freely, speedily, and without damage, through an artificial channel, they will not proceed by such a course. We conclude, therefore, by saying, that if there is to be a canal from the Atlantic to the Pacific, it must be on a gigantic scale, otherwise it need not be undertaken.

The advantages which would be derived from establishing ship-navigation across the isthmus, are too vast and various to be individually pointed out. In the first place, they would be greater to the United States than to any other country, because by such a canal the voyage from all ports on the Atlantic side of North America, to all ports on the Pacific or western side of both South and North America, would be shortened two-thirds, one-half, one-third, one-fourth, and so on, according to the situation of the place. From Britain, and all other parts of Europe and Africa, the distance to the western coast of the New World would also be shortened, although, of course, not to the same extent in proportion to the length of the voyage. All that long and often harassing voyage round Cape Horn would be saved. It would immensely shorten the voyage between this country and China, and many other parts of Asia, as well as Australia, and every port and island in the Pacific Ocean. On the United States it would confer the same advantage, and in a much higher degree. We wish we had data for calculating the amount of money which would

be saved to the shipping interest of Britain alone in one year, by means of this canal; but such cannot yet be obtained. We have no doubt, however, but that it would be large enough to startle those who have not looked into the subject, and create surprise in all that such an undertaking as the junction of the Atlantic and Pacific Oceans has been so long delayed.

A SEAMAN'S TALE.

LISTENING one evening to the conversation of the seamen during a passage made from Portsmouth to New York in the *Juliana*, in 1775, I heard them telling one another what were the respective causes which had sent them to sea. One of them, a very good-looking, well-mannered, and neatly dressed young man, on being asked what had made a sailor of him, replied smilingly, "Upon my word, it was a little *stumble over a stone*." No further queries were put to him at the time, but my curiosity was so much excited by the young seaman's words, as well as by the superior cast of his looks and deportment, that I took an early opportunity to enter into conversation with him, and to ask him the particulars of his story. He told me as follows:—

"My father, sir, is a humble tradesman in a small town in Dorsetshire, near to a sea-port of some magnitude, and there was I born and brought up. My father, whose name is Roger Alison, trained me to his own business of a joiner, and I continued at it till nearly eighteen, when an accident changed my whole prospects in life. The street of our town was narrow, and directly opposite to our shop was a little inn, kept by a Mr and Mrs Whitroe, whose only daughter Sally was nearly of my own age. We had from an early age entertained a strong partiality for one another; and as Sally had all the drudgery of drawing and serving the beer, it was my great amusement and delight at leisure hours to assist her in her toil. Though a sweet and well-formed girl, she was not strong, and was very grateful to me. In fact, we were declared lovers, as far as any body could be so at our age. But one day, when Sally required my assistance, I started like a deer from our own door to run across the street, stumbled, fell in the mud, and rent my clothes rather extensively. A great many people were then in the street and about the doors, and they set up a general laugh. As I rose, I saw a little smile even on Sally's countenance. There was nothing very cruel in this, as it was plain that I was not hurt. But an exposure of this kind puts a young fellow sadly to the blush, particularly if he is just at that age when he begins to think himself a man. I slunk hastily back to our own house, and, like a great booby, sat brooding and blushing over the accident; so much so, that, in the heat of my childish vexation, I packed up my clothes in a small bundle, and, without saying a word to any one, set off that night for Poole. By morning I got there, and finding a vessel on the point of sailing for the Newfoundland fishery, offered myself without wages, and was accepted. On the second morning I was far out of sight of my native Dorsetshire.

After seeing the fishing over for the season, feeling a disinclination still to return to England, I got a passage to Marble-head, on the North American coasts, and there entered myself in a new vessel for a Levant voyage. I began to like the life of a seaman, and during this second voyage applied myself, with the help of the mate, to the study of navigation, in which I became a considerable proficient. On returning to Marble-head from the Levant, I was paid my wages, which I laid out in books to complete me in navigation, and on clothes, as well as other necessities. My third voyage was to the West Indies; and when it was over, I entered on others from the same port, for the space of about three years in all. During this time, the people with whom I came in contact about the port had adopted the notion that I was a lad of good family and breeding, which my decent style of dressing when on shore, and also my good behaviour, had probably originated. I was admitted to the acquaintance of various respectable families of the place, and particularly that of Mr Reade, an extensive and rather wealthy trader. This gentleman became my warm friend, and gave me the charge of rigging a new vessel of his that was soon to be launched, and of which I was to be chief mate. Mr Reade had three daughters, to whose society I was also freely admitted. Of these girls, Miss Ruth Reade was my favourite; but I never presumed to think of her as a match for one like me. Yet, when I brought presents from my trips, I was sure, almost unconsciously, always to make Ruth's the best.

One day, Mr Reade said to me, "Suppose I were to make you captain of the new brig, do you think, William, you have experience enough to manage her?" I answered, "I have impudence enough to try, if you will trust me with her." "Well," returned he, "come to my house this evening; the girls want to see you, and then we can talk about it." It for the first time struck me, from Mr Reade's manner on this occasion,

that he had a thought of connecting me with his family, as well as with his vessel. I was punctual in my visit at night, and my suspicion was confirmed, on finding that the family contrived to leave me alone for a time with Ruth. I grew greatly agitated at the moment, and told the young lady that I felt suddenly unwell. She expressed great concern, and I took my leave, and went home to reflect on my situation.

A connection with such a family as Mr Reade's was beyond my most sanguine hopes as regarded my settlement in life, and the idea of being loved by the young and beautiful Ruth was so flattering, that at first I felt resolved to take advantage of the prize which fortune seemed to hold out to me. But as I lay that night on my solitary bed, the image of my poor Sally, my own dear Sally, rose uppermost in my mind. The recollection of all our fondness for each other, from our very cradles, came fresh upon my memory, and with her remembrance came also that of my poor parents, weeping for their only child, who had cruelly left them ignorant hitherto of his fate. I arose from my bed next morning in some measure a changed being, resolute to go without delay to England, and also to let the Reades know, if it proved necessary, that, for the sake of Sally Whitroe, I would go a disengaged man, ready to give her my hand, if I found that she loved me still, as I did her. When I saw Mr Reade, I told him of my determination about my parents, and he commended it; but it was when I went to his house, and was again left alone with Ruth, that my trial came. I sat for some time silent, and the tears came to my eyes. Ruth also was silent, and her eye was also tearful. "Will you go then?" she said at length in a soft voice. Still I could not find words to tell what I was resolved at heart to do. I only took her hand, and put it to my lips. "Suppose, William," said she, "you should write to your parents, and invite them to come to you. Tell them your prospects are good; and if they agree to come, my father will give you a vessel to go for them." I saw now, that the longer I delayed to tell the sweet girl the whole truth, the more painful it would finally be. "Dear Miss Reade," I said, "you know but part of my errand to England. I came now—I came resolved to tell you all—." Here I stopped. "Oh! William," cried Ruth hurriedly, "you could not have an attachment to any one before leaving England? You were so young!" My eyes remained fixed on the ground. "Oh! then it is so," she continued, and a new flood of tears from her eyes threw me into the greatest distress. "Tell me all," she said after a time; "let me be your confidant at least."

I then told her my whole history, and ended by saying, "Forgive me, dear Ruth, if on examining my heart I find that one I loved long ago still occupies the first place there." "I have nothing to forgive, William," she replied; "I had hoped that it was otherwise, for you are the first and only object on whom my own affections have been placed. But I esteem you the more for your constancy, and approve of what you propose to do." We parted, and I promised, at her anxious request, to write immediately on reaching England.

Not many months afterwards, I found myself in Dorsetshire, and entering, with a beating heart, my native town. I had taken a postchaise for the last part of my journey, and was very well dressed, so that I was not surprised that the landlord of the inn did not know me, although but four years had elapsed since my departure. I was at the time of life, too, when a year or two make a great change. It was with a most anxious and trembling heart that I asked if Roger Alison was alive. "Oh yes," said the landlord, quickly; "do you bring any news of his son Billy? The poor old soul is almost killed with fear and anxiety about him." "I have seen the young man you speak of, I believe," said I. "Oh then," cried the landlord, "I must go instantly and tell old Roger." I cried "stop!" from a mixture of feelings, but the friendly landlord was off. The way between the inn and my father's house was short. I ran to the window, and gazed in the direction. In a few minutes I saw my good father hurrying towards me as fast as his limbs could carry him. He did not know me. "Oh, sir, you have seen my son? Where is my poor boy?" "Father! do you not know me?" We sank into each other's arms, and had scarcely parted from that embrace, when my mother also entered the room. My father had entreated and desired her to stay at home till he brought her the tidings which might have come, but she could not remain, and now made her way into the room, exclaiming, "I must see the gentleman who has seen my son." I stepped forward, crying, "My dearest mother!" and she immediately fainted away.

Soon after, escorted by all the neighbours, who had gathered about the inn door, I again re-entered the house where I was born. Hitherto not a word had escaped my lips about Sally, but as soon as I was alone with my father and mother, I asked for their opposite neighbours. My father answered that Mr and Mrs Whitroe had that day gone to a little distance from the town on a visit. Sally was not mentioned, but there was an expression in the countenances of my parents which went to my very heart. They told me no more, till, being able to bear suspense no longer, I asked for Sally. "Oh! William," exclaimed my mother, "have you then heard nothing of that poor lost girl?" "Lost!" I cried, starting to my feet; "lost!—how! where!—tell me at once—put me out

of suspense!" "Be calm, my dear William," said my father; "your mother has spoken rashly. Sit down, and I will tell you the whole."

My father now began thus:—"From that hour when you left us, my son, Sally Whitroe was inconsolable. She took to her bed, and refused all nourishment, or at least would not take enough to sustain life in any one. I need scarcely say, William, that both her parents and your mother and I had seen how much you were attached to each other, and often had we rejoiced in private over the hope of seeing you united. Her father and myself had each been left with some little patrimonies, and we had added to its amount; and the thought that you, our only children, would enjoy our means when we were gone, was very pleasing to us. We were not surprised at the effect of your departure on Sally, but her condition was very alarming to her parents. At length, when our inquiries were so far successful as to reveal to us that you had gone from Poole to the Newfoundland fishing, the tidings were communicated to Sally. She started from her bed. 'Oh! thank God,' she said, 'is my dear William heard of at last?' I assured her that such was the case, and that you would surely come back when the fishing ended, or at least write to us. [How my heart smote me for my cruelty as my father said this!] Sally recovered rapidly after this period, and was soon able to go about; but there was still a painful degree of anxiety about her looks and manner. Her parents thought they would please her and do her good by giving up the business which they pursued, and which brought her into too much stir and noise. 'Can you do this without losing money and hurting your interests?' was the good girl's question to her father. 'We can, Sally,' said he, 'and I have often thought of it before.' 'Then,' replied Sally, 'it will gratify me much. I wish to have a little leisure to improve myself, and acquire a few accomplishments, for I know well that William will be improving himself wherever he is, and I would make myself worthy of him—if indeed he ever come back to me.'

In truth, my dear son, all the poor girl's thoughts were still about you. Her parents commenced the linen-draper business, and Sally devoted herself to the cultivation of her mind, and the acquisition of many little female accomplishments. Every day she came and sat for an hour with your mother and me, talking about you, and you only. At last she heard of a young lady, of respectable family, who was going to France to complete her education at a convent. Sally expressed a strong wish to accompany her, and Mr Whitroe was prevailed upon to agree to her wish. Within six months after you left us, she and her companion set out for Monteville in Normandy, and they were accompanied thither by Mrs Whitroe and by your mother, who thought the journey would do her health good. Sally's last parting words to your mother were, to send the intelligence of your arrival to her immediately, or whatever tidings might come from you.

Great was our disappointment, my dear William, when the captain of the Newfoundland fishing-vessel, on being inquired at, told us that you had left him and gone to Virginia. We dared not tell the truth to Sally, but wrote to her that you had written to say that you were going to stay abroad some time longer for self-improvement. We, moreover, said that you had sent kind messages to her, and that your wish was to make yourself deserving of her. This deception we had to repeat during the two years that she was away. At the end of that time she returned, bringing with her a Miss Simon, a young lady of Plymouth, who had been her friend abroad. Alas! Sally was not long, as we had feared, in asking us to permit her to read the letters of her 'dear William.' The question afflicted us so much that it was vain to think of longer concealing the truth. 'I feared this,' said Sally, with tears; but after a time she comforted us, saying, 'I am assured we shall yet see him again.'

Sally had improved herself so much, that she was regarded as a most accomplished girl, and people in the neighbourhood who had never noticed her before, were now happy to have her in their circle. A young clergyman proposed for her, but, my dear William, Sally told him 'her heart was with you'; and when he said you were probably dead, she replied, that 'her affections were then with you in the grave.' After the departure of her friend Miss Simon, she spent her whole time in some quiet employments, till she received a summons to go to Plymouth, according to a promise made, and be her friend's bridesmaid, on her union with Captain Toucher, an officer in the army. She went to Plymouth accordingly, but she did not return. In place of herself there came a letter from her to her parents, announcing that Captain Toucher had received a company in a regiment then serving in North America, that Mrs Toucher was going with him, and that she had resolved to accompany them; for she was sure that she would find you in that country, and be the happy means of restoring you to your parents. Mr and Mrs Whitroe were at first greatly distressed, but they could not remedy the matter, as Sally had sailed immediately on writing. Her father, therefore, sent after her a letter of credit on certain merchants in New York. We have not yet heard from her, as all this happened but a short time back."

My father here closed his narration. I was so deeply impressed with Sally's constancy, that I was for starting immediately in pursuit of her. But a

little reflection made me more patient. Besides, Mr and Mrs Whitroe came to me, and treated me like a beloved son. At the entreaties of all, I agreed to stay till a letter came from Sally. The interval I employed in writing to Miss Reade, telling her the whole story, and engaging her to find out and be kind to my Sally. When the letter at length wrote, announcing her arrival in New York, I again bade adieu to my parents and friends. Thinking it dishonourable in an English seaman to be an idle spectator in an English ship, I engaged with the captain of this vessel to work my passage out, and here I am on my way to New York.

I was delighted with the spirited handsome fellow, who thus told me his story, and I thought to myself that it was no wonder two fine girls should have loved him so. In America, I afterwards learnt, he found and married his constant Sally. As for Ruth Reade, a creature so kind-hearted as she could not but be happy in life, though her first affections were not rewarded as they deserved.

[The above story is transcribed, with only some alterations in language, from the same manuscript volume to which we were indebted for the *Adventure of a Canadian Trader*, inserted in last number; the said volume having been the genuine composition of a gentleman who was engaged as a British officer in the American war of independence.]

OCCASIONAL NOTES.

A POINT IN SHOPKEEPING.

Except in London, and in a few of the larger provincial towns in England, the best modes of constructing and laying out shops attractively are little understood. The chief point in the London shop system is accessibility. There must be perfect facility of access. A very small obstacle would be considered injurious. A shop approachable by steps would be placed at a serious disadvantage in comparison with one level with the street, and in point of fact few London shops have steps at the door. The principle which guides the objection to steps rests on a well-defined feeling. The persons who visit shops may be divided into two classes—those who go with a deliberate intention to buy, and those who are inclined to buy something, but are not very sure if the shop which they enter possesses the kind of thing they would like. This latter class is by far the most numerous, and it is to them that the shopkeeper must in the main look for support. His art, therefore, consists, first, in rendering the exterior of his shop attractive, and, second, in rendering it perfectly easy of access. Inasmuch as a small pebble at the margin of a brook will divert the course of the stream, so will a small obstacle at the door of a shop turn aside a customer. The entrance ought to be so convenient that the passenger should slide in almost imperceptibly, as if drawn insensibly into a whirlpool. One instant, he is in the street; and the next, before he knows rightly what he is about, he should be alongside the counter. Thus, his half formed notion that he wishes to buy something, must not be impeded by steps. His purpose is not sufficiently strong to encounter the trouble of mounting an elevation; and, besides, steps tend very much to cut off his retreat, should he not find what he is in quest of. There is a feeling about him, that, by mounting steps, he would show his determination to buy, and that he should have some difficulty in coming out again with any degree of decency if he did not make a purchase—all which is most injurious to the interests of the shopkeeper who has heedlessly planted himself at the top of a stair, or who has even not more than two or three steps at his door. Reader, if you are about to set up a shop, take care to have it constructed right slick off from the trottoir. No steps!

GRANITE.

One of the finest kinds of granite which is any where to be met with, exists to an incalculable extent at Kingston, on the sea-shore, a few miles from Dublin. It is a composition of sparkling crystals black and white, but the white predominating. Nothing can exceed this beautiful stone in hardness and durability; and it is therefore exceedingly suitable for the erection of public edifices requiring imperishable materials. We should suppose that this or Aberdeen granite, both being alike excellent, might with great advantage be employed in the construction of the new House of Parliament. The public edifices of London are in general built with a species of freestone, which is too easily destroyed by the atmosphere.

RAILWAY SLEEPERS.

In speaking of granite, we are reminded of rather an important fact connected with the laying down of lines of railway. The iron rails in the line betwixt Dublin and Kingston were at first laid upon square and substantial granite blocks or sleepers; but after a trial it was found, that, from the unyielding quality of the blocks, the vehicles were injured in their rapid transit, and, besides, the noise made by the train was too great to be comfortably endured. The blocks were consequently raised and thrown aside; they are seen scattered along the sides of the way. The rails are now laid upon wooden beams, placed longitudinally beneath them, and giving support, not at points like stone sleepers, but from end to end of the rails, or continuously throughout. At certain intervals, the

beams on the two sides are connected by cross bars of wood. Since this arrangement was adopted, the train sweeps along the line with smoothness and velocity, there being no jarring of parts, and as little noise as could reasonably be expected. It might prove of consequence for railway companies to take this fact into consideration when determining whether they will adopt stone or wooden sleepers.

ARAGO'S LIFE OF WATT.

THE *Eloge*, or Memoir of James Watt, addressed to the French Academy of Sciences, by M. Arago, the secretary of that distinguished institution, has been translated into English, and recently laid before the public in an accessible form.* As a piece of biography, it has little or no merit, for a number of important facts in Watt's life are omitted; and the style of the work from first to last is high-sounding and insubstantial, and therefore inappropriate in narrating the career of a man of plain practical science. As a running and frequently eloquent commentary, however, on the successive discoveries of Watt, particularly his great works in connection with the steam-engine, the *Eloge* of Arago possesses no small degree of interest.

It will be recollected that the stupendous inventions of Watt were at first received with great indifference, and even strenuously opposed. When alluding to this fact, so disgraceful to us as a nation, M. Arago makes the following animated comments:—"Thus, then, was the steam-engine completed. The improvements it received from Watt are evident, and of their immense utility there cannot be a doubt. You will, therefore, anticipate, that it would immediately displace, as a draining apparatus, the comparatively ruinously expensive machines of Newcomen. This, however, was far from being the case. The author of a discovery has always to contend with those whose interests may be affected, with the obstinate partisans of whatever is ancient, and, finally, with those who are jealous—and these three classes united form (must we confess it?) the great majority of the public. Yet, to avoid a paradoxical result, I leave out of my calculation all those who had double motives. It is time alone that can disunite and scatter this phalanx of opponents. Nor will time alone do it. They must be energetically and unceasingly attacked, and the means used must be varied, as is done by the chemist, whom experience has taught that the complete solution of certain compounds requires the successive employment of several acids. The strength of character and firmness of purpose which in the long run defeat the most wily intrigues, are seldom united with an inventive genius. Watt, were it necessary, might be quoted as a convincing proof of the fact. His grand invention and most felicitous conception, that steam might be condensed in a vessel quite separated from the cylinder in which the mechanical action is going forward, was completed in the year 1765; and in two years, scarcely any progress was made to try its applicability upon the great scale. At length, however, his friends put him in communication with Dr Roebuck, the founder of the great establishment at Carron, so celebrated even at the present time. The engineer and the projector now associated themselves together, Watt yielding to him two-thirds of his patent. A machine was speedily constructed upon the new principles; it confirmed all the anticipations of theory; its success was complete, although, in the mean time, Dr Roebuck's fortune was injured. The invention of Watt would, without doubt, have repaired it; all that was required, was to apply to money-lenders; but our brother associate thought it more simple to renounce his discovery and to change his career." He engaged himself for several years as a surveyor of canals, improver of harbours, &c. in Scotland.

"Were I now for an instant to forget my duties as the organ of the Academy, and to aim at producing a smile rather than insisting upon important truths, the fact before us would supply the materials of a striking contrast. I might adduce not a few authors, who, at our weekly meetings, are wont to demand, with all their heart and might, leave to communicate the solitary remark, the trifling reflection, the hasty note which was conceived and written the previous evening. I might represent them cursing their destiny, when our laws, or the priority of another's communication, postponed their paper for a week; although they have the guarantee of the *paquet cacheté* being deposited in our archives. On the other hand, we see the great inventor of a machine destined to constitute an epoch in the annals of the world, submit, without a murmur, to the stupid neglect of capitalists, and apply his superior genius for eight years to the preparation of plans, to the making of surveys, to troublesome calculations of levelling, and to measurements of masonry. How strikingly does this exhibit the serene character, the subdued ambition, and the true modesty, of Watt! But, indifference such as this, however noble its causes, was not devoid of blame. It is not without reason that society stamps with its reprobation those who withdraw from circulation the gold hoarded in their coffers. And is that individual less culpable who deprives his country, his fellow-citizens, and the age in which he lives, of the treasures a thousand-fold more valuable, which are the products of the mind; who retains for himself alone those immortal discoveries, the sources of the noblest and purest delights of the

soul; and who does not bestow on the artisan mechanical contrivances which may indefinitely multiply the products of industry, which may diminish, to the profit of civilization and humanity, the effects of the inequalities of our lot, and which may ere long afford us the satisfaction of visiting the humblest dwellings, without discovering the heart-rending spectacle of fathers of families, and wretched children of both sexes, assimilated to the brutes, and hurrying prematurely to the tomb!

Towards the commencement of the year 1774 (after what we must call the indifference of Watt was overcome), he formed a connection with Mr Boulton of Soho, near Birmingham, a gentleman equally distinguished by his knowledge of the arts and his enterprising spirit. The two friends applied to Parliament for prolongation of the privilege, for Mr Watt's patent was dated in the year 1769, and had only a few years to run. The introduction of the bill gave rise to an animated discussion. The celebrated mechanist thus writes to his aged father, in a letter, dated London, May 8, 1775:—"After a series of violent and various opposition, I have at last got an act of Parliament. The affair has been attended with great expense and anxiety; and without many friends of great interest, I should never have been able to have carried it through, as many of the most powerful people in the House of Commons opposed it." I was curious to learn to what class of society those members of Parliament belonged, to whom Mr Watt alludes, and who refused to the man of genius a small fraction of that wealth which he was about to create. Conceive my surprise, when I learned that at their head stood the celebrated Burke! Is it then the fact, that a man may be given to profound thought, may possess extensive knowledge and sterling honesty, be pre-eminently endowed with oratorical talents to move and carry along with him political assemblies, and yet be wanting in plain common sense?"

Watt fortunately outlived these rebuffs. From the establishment at Soho, his improved engines were dispersed over the country, especially Cornwall; the firm of Boulton and Watt receiving the value of the third part of the coal which was saved by the use of the machines. "And we may judge of the commercial importance of the invention by the fact, that in the single mine of Chacewater, where three pumps were employed, the proprietors thought it worth their while to purchase the rights of the inventors, at the price of £2500 per annum for each engine. Thus, in a single establishment, the substitution of the condenser effected in fuel alone a reduction in expense of more than £7500 per annum. On the expiration of the term to which his patent had been extended, namely, the beginning of the year 1800, Mr Watt withdrew himself entirely from business."

While in retirement in the decline of life, Watt did not allow his faculties to slumber; he was jealous of any decline in his mental capacity. "At one time (says M. Arago) our associate imagined that his faculties were declining, and, in keeping with the seal he had adopted (an eye surrounded with the word *obscurare*), he determined to satisfy his doubts by making observations on himself; and, accordingly, when upwards of seventy years of age, he determined to select some kind of study on which he might try his powers, and for a time was in despair, because he could find no subject that was new to him. At length he thought upon the Anglo-Saxon tongue, which is a difficult language; and immediately it became the subject of the desired experiment, when the facility with which he mastered it soon convinced him there was no ground for his apprehensions." He thus busied himself in various useful and entertaining pursuits till near the period of his lamented death in 1819.

We cannot do better than conclude these sketches of the career of this illustrious individual by quoting M. Arago's observations on the encouragement given in England to men of science:—"The peerage in England the first of dignities, the highest of rewards; and you will naturally suppose that Watt was created a peer. So far was this from being the case, that it was never even thought of! Were we to speak the truth, we should say, so much the worse for the peerage. Such a neglect, however, in a nation so justly proud of its illustrious men, could not but greatly astonish me. When I inquired into the cause of this neglect, what think you was the response? Those dignities of which you speak, I was told, are reserved for naval and military officers, for influential members of the House of Commons, and for members of the aristocracy. 'It is not the custom,' it was said, and I quote the very phrase, 'to grant these honours to scientific and literary men, to artists or engineers.' I well knew it was not the custom in the reign of Queen Anne, because Newton was never a peer of England. But after a century and a half of progress in science and philosophy, when all of us, within the short span of life, have seen monarchs banished, forsaken, proscribed, and replaced upon their thrones by mere soldiers of fortune, who have hewn out their renown by their swords, surely I might be permitted to hope that the time had passed when it would be attempted to divide men into exclusive classes; that, at all events, it would not be declared openly, and in the style of the inflexible code of the Pharaohs. Whatever may be your services, your virtues, or your acquirements, not one of you shall ever rise above the level of your caste. Such a senseless custom (since custom it is) should no longer be permitted to disfigure the institutions of

* One volume, thin octavo. A. and C. Black, Edinburgh.

a great people. Let us hope better things of the future. The time will come when the science of destruction shall decline before the arts of peace; when the genius which multiplies our powers, which creates new products, and dispenses comfort throughout immense masses of our population, shall occupy, in general esteem, the place which reason and sound sense have even now assigned to it."

The feeling which dictates these remarks is doubtless good; but we nevertheless think that there would have been something odd in making Watt a peer. A peerage, being a kind of reward which took its rise in the middle ages, is quite a suitable reward for any distinction in things which remind one of those ages, as the science of destruction, for example, or the squabbles which we consider as government. But the distinction of Watt arose from things which appertain to an advanced and enlightened age, and its rewards should be of an appropriate kind—certainly not a hereditary title.

SLEEPY HOLLOW.

[BY GEOFFREY CRAYON, GENT.]*

HAVING pitched my tent, probably for the remainder of my days, in the neighbourhood of Sleepy Hollow, I am tempted to give some few particulars concerning that spell-bound region; especially as it has risen to historic importance, under the pen of my revered friend and master, the sage historian of the New Netherlands. Besides, I find the very existence of the place has been held in question by many; who, judging from its odd name, and from the odd stories current among the vulgar concerning it, have rashly deemed the whole to be a fanciful creation, like the Lubber Land of mariners. I must confess there is some apparent cause for doubt, in consequence of the colouring given by the worthy Diedrich to his descriptions of the Hollow; who, in this instance, has departed a little from his usually sober if not severe style; beguiled, very probably, by his predilection for the haunts of his youth, and by a certain lurking taint of romance, whenever any thing connected with the Dutch was to be described. I shall endeavour to make up for this amiable error, on the part of my venerable and venerated friend, by presenting the reader with a more precise and statistical account of the Hollow; though I am not sure that I shall not be prone to lapse, in the end, into the very error I am speaking of, so potent is the witchery of the theme.

I believe it was the very peculiarity of its name, and the idea of something mystic and dreamy connected with it, that first led me, in my boyish ramblings, into Sleepy Hollow. The character of the valley seemed to answer to the name; the slumber of past ages apparently reigned over it; it had not awakened to the stir of improvement, which had put all the rest of the world in a bustle. Here reigned good old long-forgotten fashions; the men were in homespun garbs, evidently the product of their own farms, and the manufacture of their own wives; the women were in primitive short-gowns and petticoats, with the venerable sun-bonnets of Holland origin. The lower part of the valley was cut up into small farms, each consisting of a little meadow and corn-field; an orchard of sprawling, gnarled apple-trees, and a garden, where the rose, the marigold, and the hollyhock, were permitted to skirt the domains of the capacious cabbage, the aspiring pea, and the portly pumpkin. Each had its prolific little mansion, teeming with children, with an old hat nailed against the wall for the house-keeping wren; a motherly hen, under a coop on the grass-plot, clucking to keep around her a brood of vagrant chickens; a cool stone-well, with the moss-covered bucket suspended to the long balancing pole, according to the antediluvian idea of hydraulics; and its spinning-wheel humming within doors, the patriarchal music of home manufacture.

The Hollow at that time was inhabited by families which had existed there from the earliest times, and which, by frequent intermarriage, had become so interwoven as to make a kind of natural commonwealth. As the families had grown larger, the farms had grown smaller, every new generation requiring a new subdivision, and few thinking of swarming from the native hive. In this way, that happy golden mean had been produced, so much extolled by the poets, in which there was no gold, and very little silver. One thing which doubtless contributed to keep up this amiable mean, was a general repugnance to sordid labour. The sage inhabitants of Sleepy Hollow had read in their Bible, which was the only book they studied, that labour was originally inflicted upon man as a punishment of sin; they regarded it, therefore, with pious abhorrence, and never humiliated themselves to it, but in cases of extremity. There seemed, in fact, to be a league and covenant against it, throughout the Hollow, as against a common enemy. Was any one compelled, by dire necessity, to repair his house, mend his fences, build a barn, or get in a harvest, he considered it a great evil, that entitied him to call in the assistance of his friends. He accordingly proclaimed a "bee," or rustic gathering, whereupon all his neighbours hurried to his aid like faithful allies; attacked the task with the desperate energy of lazy men eager to overcome a job; and when

it was accomplished, fell to eating and drinking, fiddling and dancing, for very joy that so great an amount of labour had been vanquished with so little sweating of the brow.

Yet let it not be supposed that this worthy community was without its periods of arduous activity. Let but a flock of wild pigeons fly across the valley, and all Sleepy Hollow was wide awake in an instant. The pigeon season had arrived! Every gun and net was forthwith in requisition. The flail was thrown down on the barn floor; the spade rusted in the garden; the plough stood idle in the furrow; every one was to the hill-side and stubble-field at day-break, to shoot or entrap the pigeons, in their periodical migrations.

So, likewise, let but the word be given that the shad were ascending the Hudson, and the worthies of the Hollow were to be seen launched in boats upon the river, setting great stakes, and stretching their nets, like gigantic spider-webs, half across the stream, to the great annoyance of navigators. Such are the wise provisions of nature, by which she equalises rural affairs. A laggard at the plough is often extremely industrious with the fowling-piece and fishing-net; and whenever a man is an indifferent farmer, he is apt to be a first-rate sportsman. For catching shad and wild pigeons, there were none throughout the country to compare with the lads of Sleepy Hollow.

As I have observed, it was the dreamy nature of the name that first beguiled me, in the holiday roving of boyhood, into this sequestered region. I slumbered, however, the populous parts of the Hollow, and sought its retired haunts, far in the foldings of the hills, where the Pocantico "winds its wizard stream," sometimes silently and darkly, through solemn woodlands; sometimes sparkling between grassy borders, in fresh green meadows; sometimes stealing along the feet of rugged heights, under the balancing sprays of beech and chestnut trees. A thousand crystal springs, with which this neighbourhood abounds, sent down from the hill-sides their whimpering rills, as if to pay tribute to the Pocantico. In this stream I first essayed my unskilful hand at angling. I loved to loiter along it, with rod in hand, watching my float as it whirled amid the eddies, or drifted into dark holes, under twisted roots and sunken logs, where the largest fish are apt to lurk. I delighted to follow it into the brown recesses of the woods; to throw by my fishing gear, and sit upon rocks beneath towering oaks and clambering grape-vines; bathe my feet in the cool current, and listen to the summer breeze playing among the tree-tops. My boyish fancy clothed all nature around me with ideal charms, and peopled it with the fairy beings I had read of in poetry and fable. Here it was I gave full scope to my incipient habit of day-dreaming, and to a certain propensity to weave up and tint sober realities with my own whims and imaginings, which has sometimes made life a little too much like an Arabian tale to me, and this "working-day world" rather like a region of romance.

The great gathering-place of Sleepy Hollow, in those days, was the church. It stood outside of the Hollow, near the great highway; on a green bank, shaded by trees, with the Pocantico sweeping round it, and emptying itself into a spacious mill-pond. At that time the Sleepy Hollow church was the only place of worship for a wide neighbourhood. It was a venerable edifice, partly of stone and partly of brick, the latter having been brought from Holland in the early days of the province, before the arts in the New Netherlands could aspire to such a fabrication. On a stone above the porch were inscribed the names of the founders, Frederick Filipssen, a mighty patron of the olden time, who reigned over a wide extent of this neighbourhood, and held his seat of power at Yonkers; and his wife, Katrina Van Courtlandt, of the no less potent line of the Van Courtlandts of Croton, who lorded it over a great part of the Highlands.

The capacious pulpit, with its wide-spreading sounding-board, were likewise early importations from Holland; as also the communion table, of massive form and curious fabric. The same might be said of a weather-cock, perched on the top of the belfry, and which was considered orthodox in all windy matters, until a small pragmatical rival was set up, on the other end of the church, above the chancel. This latter bore, and still bears, the initials of Frederick Filipssen, and assumed great airs in consequence. The usual contradiction ensued that always exists among church weather-cocks, which can never be brought to agree as to the point from which the wind blows, having doubtless acquired, from their position, the propensity to schism and controversy.

Behind the church, and sloping up a gentle acclivity, was its capacious burying-ground, in which slept the earliest fathers of this rural neighbourhood. Here were tombstones of the rudest sculpture, on which were inscribed, in Dutch, the names and virtues of many of the first settlers, with their portraits curiously carved in similitude of cherubs. Long rows of grave-stones, side by side, of similar names, but various dates, showed that generation after generation of the same families had followed each other, and been garnered together in this last gathering-place of kindred.

Let me speak of this quiet grave-yard with all due reverence, for I owe it amends for the heedlessness of my boyish days. I blush to acknowledge the thoughtless frolic with which, in company with other whippers, I have sported within its sacred bounds, during the intervals of worship; chasing butterflies, plucking wild-flowers, or vying with each other who could leap over the tallest tomb-stones, until checked by the stern voice of the sexton.

The congregation was, in those days, of a really rural character. City fashions were as yet unknown, or unregarded, by the country people of the neighbourhood. Steam-boats had not as yet confounded town with country. A weekly market-boat from Tarrytown, the "Farmer's Daughter," navigated by the worthy Gabriel Requa, was the only communication between all these parts and the metropolis. A rustic belle in those days considered a visit to the city in much the same light as

one of our modern fashionable ladies regards a visit to Europe; an event that may possibly take place once in the course of a lifetime, but to be hoped for, rather than expected. Hence the array of the congregation was chiefly after the primitive fashions existing in Sleepy Hollow; or if, by chance, there was a departure from the Dutch sun-bonnet, or the apparition of a bright gown of flowered calico, it caused quite a sensation throughout the church. As the dominie generally preached by the hour, a bucket of water was providently placed on a bench near the door, in summer, with a tin cup beside it, for the solace of those who might be athirst, either from the heat of the weather, or the drouth of the sermon.

Around the pulpit, and behind the communion-table, sat the elders of the church, reverend, grey-headed, leathern-visaged men, whom I regarded with awe, as so many apostles. They were stern in their sanctity, kept a vigilant eye upon my giggling companions and myself, and shook a rebuking finger at any boyish device to relieve the tediousness of compulsory devotion. Vain, however, were all their efforts at vigilance. Scarcely had the preacher held forth for half an hour, on one of his interminable sermons, than it seemed as if the drowsy influence of Sleepy Hollow breathed into the place: one by one the congregation sank into slumber; the sanctified elders leaned back in their pews, spreading their handkerchiefs over their faces, as if to keep off the flies; while the locusts in the neighbouring trees would spin out their sultry summer notes, as if in imitation of the sleep-provoking tones of the dominie.

I have thus endeavoured to give an idea of Sleepy Hollow and its church, as I recollect them to have been in the days of my boyhood. It was in my striping days, when a few years had passed over my head, that I revisited them, in company with the venerable Diedrich. I shall never forget the antiquarian reverence with which that sage and excellent man contemplated the church. It seemed as if all his pious enthusiasm for the ancient Dutch dynasty swelled within his bosom at the sight. The tears stood in his eyes, as he regarded the pulpit and the communion-table; even the very bricks that had come from the mother country seemed to touch a filial chord within his bosom. He almost bowed in deference to the stone above the porch, containing the names of Frederick Filipssen and Katrina Van Courtlandt, regarding it as the linking together of those patronymic names, once so famous along the banks of the Hudson; or rather as a key-stone, binding that mighty Dutch family connection of yore, one foot of which rested on Yonkers, and the other on the Croton. Nor did he forbear to notice with admiration the windy contest which had been carried on, since time immemorial, and with real Dutch perseverance, between the two weather-cocks; though I could easily perceive he coincided with the one which had come from Holland.

Together we paced the ample churchyard. With deep veneration would he turn down the weeds and brambles that obscured the modest brown grave-stones, half sunk in earth, on which were recorded, in Dutch, the names of the patriarchs of ancient days, the Ackers, the Van Tassels, and the Van Warts. As we sat on one of the tomb-stones, he recounted to me the exploits of many of these worthies; and my heart smote me, when I heard of their great doings in days of yore, to think how heedlessly I had once sported over their graves.

From the church, the venerable Diedrich proceeded in his researches up the Hollow. The genius of the place seemed to hail its future historian. All nature was alive with gratulation. The quail whistled a greeting from the corn-field; the robin carolled a song of praise from the orchard; the loquacious cat-bird flew from bush to bush, with restless wing, proclaiming his approach in every variety of note, and anon would whisk about, and perk inquisitively into his face, as if to get a knowledge of his physiognomy; the woodpecker, also, tapped a tattoo on the hollow apple-tree, and then peered knowingly round the trunk, to see how the great Diedrich relished his salutation; while the ground-squirrel scampered along the fence, and occasionally whisked his tail over his head, by way of a huzza!

The worthy Diedrich pursued his researches in the valley with characteristic devotion; entering familiarly into the various cottages, and gossiping with the simple folk, in the style of their own simplicity. I confess my heart yearned with admiration to see so great a man, in his eager quest after knowledge, humbly demeaning himself to curry favour with the humblest; sitting patiently on a three-legged stool, patting the children, and taking a purring grimalkin on his lap, while he conciliated the good-will of the old Dutch housewife, and drew from her long ghost stories, spun out to the humming accompaniment of her wheel.

His greatest treasure of historic lore, however, was discovered in an old goblin-looking mill, situated among rocks and waterfalls, with clanking wheels and rushing streams, and all kinds of uncouth noises. A horse-shoe, nailed to the door to keep off witches and evil spirits, showed that this mill was subject to awful visitations. As we approached it, an old negro thrust his head, all dabbled with flour, out of a hole above the water-wheel, and grinned, and rolled his eyes, and looked like the very hobgoblin of the place. The illustrious Diedrich fixed upon him at once as the very one to give him that invaluable kind of information, never to be acquired from books. He beckoned him from his nest, sat with him by the hour on a broken mill-stone, by the side of the water-fall, heedless of the noise of the water, and the clatter of the mill; and I verily believe it was to his conference with this African sage, and the precious revelations of the good dame of the spinning-wheel, that we are indebted for the surprising though true history of Ichabod Crane and the headless horseman, which has since astounded and edified the world.

But I have said enough of the good old times of my youthful days; let me speak of the Hollow as I found it, after an absence of many years, when it was kindly given me once more to revisit the haunts of my boyhood. It was a genial day, as I approached that fated region.

* Washington Irving, who is now residing in his native country, America, some months ago, under his assumed name of Geoffrey Crayon, commenced a series of papers, principally descriptive of early recollections, in the Knickerbocker, or New York Monthly Magazine, and some of which have already been copied into English periodicals. The above, which is one of the series, we copy from the Knickerbocker for May 1839.

The warm sunshine was tempered by a slight haze, so as to give a dreamy effect to the landscape. Not a breath of air shook the foliage. The broad Tappan Sea was without a ripple, and the sloops, with drooping sails, slept on its glassy bosom. Columns of smoke, from burning brushwood, rose lazily from the folds of the hills, on the opposite side of the river, and slowly expanded in mid air. The distant lowing of a cow, or the noontide crowing of a cock, coming faintly to the ear, seemed to illustrate, rather than disturb, the drowsy quiet of the scene.

I entered the Hollow with a beating heart. Contrary to my apprehensions, I found it but little changed. The march of intellect, which had made such rapid strides along every river and highway, had not yet apparently turned down into this favoured valley. Perhaps the wizard spell of ancient days still reigned over the place, binding up the faculties of the inhabitants in happy contentment with things as they had been handed down to them from yore. There were the same little farms and farm-houses, with their old hats for the housekeeping wren; their stone-wells, moss-covered buckets, and long balancing poles. There were the same little rills, whimpering down to pay their tributes to the Pocantico; while that wizard stream still kept on its course, as of old, through solemn woodlands and fresh green meadows: nor were there wanting joyous holiday boys, to loiter along its banks, as I had done; throw their pin-hooks in the stream, or launch their mimic barks. I watched them with a kind of melancholy pleasure, wondering whether they were under the same spell of the fancy that once rendered this valley a fairy-land to me. Alas! alas! to me every thing now stood revealed in its simple reality. The echoes no longer answered with wizard tongues; the dream of youth was at an end; the spell of Sleepy Hollow was broken!

I sought the ancient church, on the following Sunday. There it stood, on its green bank, among the trees; the Pocantico swept by it in a deep dark stream, where I had so often angled; there expanded the mill-pond, as of old, with the cows under the willows on its margin, knee-deep in water, chewing the cud, and lashing the flies from their sides with their tails. The hand of improvement, however, had been busy with the venerable pile. The pulpit, fabricated in Holland, had been superseded by one of modern construction, and the front of the semi-Gothic edifice was decorated by a semi-Grecian portico. Fortunately, the two weather-cocks remained undisturbed on their perches, at each end of the church, and still kept up a diametrical opposition to each other, on all points of windy doctrine.

On entering the church, the changes of time continued to be apparent. The elders round the pulpit were men whom I had left in the gamesome frolic of their youth, but who had succeeded to the sanctity of station of which they once had stood so much in awe. What most struck my eye, was the change in the female part of the congregation. Instead of the primitive garbs of homespun manufacture, and antique Dutch fashion, I beheld French sleeves, French capes, and French collars, and a fearful fluttering of French ribbons.

When the service was ended, I sought the churchyard in which I had sported in my unthinking days of boyhood. Several of the modest brown stones, on which were recorded, in Dutch, the names and virtues of the patriarchs, had disappeared, and had been succeeded by others of white marble, with urns, and wreaths, and scraps of English tomb-stone poetry, marking the intrusion of taste, and literature, and the English language, in this once unsophisticated Dutch neighbourhood.

As I was stumbling about among these silent yet eloquent memorials of the dead, I came upon names familiar to me; of those who had paid the debt of nature during the long interval of my absence. Some I remembered, my companions in boyhood, who had sported with me on the very sod under which they were now mouldering; others who in those days had been the flower of the yeomanry, figuring in Sunday finery on the church green; others, the white-haired elders of the sanctuary, once arrayed in awful sanctity around the pulpit, and ever ready to rebuke the ill-timed mirth of the wanton strippling, who, now a man, sobered by years, and schooled by vicissitudes, looked down pensively upon their graves. "Our fathers," thought I, "where are they?—and the prophets, can they live for ever?"

I was disturbed in my meditations by the noise of a troop of idle urchins, who came gambolling about the place where I had so often gambolled. They were checked, as I and my playmates had often been, by the voice of the sexton, a man stayed in years and demeanour. I looked wistfully in his face; had I met him any where else, I should probably have passed him by without remark; but here I was alive to the traces of former times, and detected in the demure features of this guardian of the sanctuary, the lurking lineaments of one of the very playmates I have alluded to. We renewed our acquaintance. He sat down beside me, on one of the tomb-stones over which we had leaped in our juvenile sports, and we talked together about our boyish days, and held edifying discourse on the instability of all sub-lunary things, as instanced in the scene around us. He was rich in historic lore, and to the events of the last thirty years, and the circumference of thirty miles, and from him I learned the appalling revolution that was taking place throughout the neighbourhood. All this I clearly perceived he attributed to the boasted march of intellect, or rather to the all-pervading influence of steam. He bewailed the times when the only communication with town was by the weekly market-boat, the "Farmer's Daughter," which, under the pilotage of the worthy Gabriel Requa, braved the perils of the Tappan Sea. Alas! Gabriel and the "Farmer's Daughter" slept in peace. Two steam-boats now splashed and paddled up daily to the little rural port of Tarrytown. The spirit of speculation and improvement had seized even upon that once quiet and unambitious little dorp. The whole neighbourhood was laid out into town lots. Instead of the little tavern below the hill, where the farmers used to

loiter on market-days, and indulge in cider and gingerbread, an ambitious hotel, with cupola and verandahs, now crested the summit, among churches built in the Grecian and Gothic styles, showing the great increase of piety and polite taste in the neighbourhood. As to Dutch dresses and sun-bonnets, they were no longer tolerated, or even thought of; not a farmer's daughter but now went to town for the fashions; nay, a city milliner had recently set up in the village, who threatened to reform the heads of the whole neighbourhood.

I had heard enough! I thanked my old playmate for his intelligence, and departed from the Sleepy Hollow church, with the sad conviction that I had beheld the last lingerings of the good old Dutch times, in this once favoured region. If any thing were wanting to confirm this impression, it would be the intelligence which has just reached me, that a bank is about to be established in the aspiring little port just mentioned. The fate of the neighbourhood is therefore sealed. I see no hope of averting it. The golden mean is at an end. The country is suddenly to be deluged with wealth. The late simple farmers are to become bank directors, and drink claret and champagne; and their wives and daughters to figure in French hats and feathers; for French wines and French fashions commonly keep pace with paper money. How can I hope that even Sleepy Hollow can escape the general inundation? In a little while, I fear the slumber of ages will be at an end; the strum of the piano will succeed to the hum of the spinning-wheel; the trill of the Italian opera to the nasal quaver of Ichabod Crane; and the antiquarian visitor to the Hollow, in the petulance of his disappointment, may pronounce all that I have recorded of that once favoured region, a fable.

THE CURIOUS CASE OF A—R—, A FEMALE IMPOSTOR.

THE skill with which some persons will feign diseases, and the firmness with which they will submit to painful surgical operations, in the hope of gaining some slight personal benefit, as, for instance, exemption from work, or charitable support in idleness, are strongly exemplified in the following remarkable case, which occurred in the Richmond Hospital, Dublin, about twenty years ago, and is reported to the College of Physicians of that city by Mr R. Carmichael, surgeon. We quote it, with Mr Carmichael's additional account of the case, from a volume of the *Phrenological Journal* for 1825:—

"A young woman, named A—R—, was admitted into the Richmond Hospital on the 23d July 1818, on account of a painful swelling of the left hand and arm, extending considerably above the elbow. The appearance of the limb resembled that which occurs in pleurisy dolens; the fingers were bent; no fluctuation or symptoms of matter could any where be discovered; the pain was excessive, so as altogether to prevent rest, unless strong anodynes were employed; the symptomatic fever was considerable.

The patient ascribed the complaint to a needle, which she averred had broken in the palm of her hand about six weeks before, and stated that at present she felt the point of it at the back of her hand. Upon this part I immediately cut down, but was not so fortunate as to light on the needle. Warm fomentations and poitices were ordered, together with frequent mercurial cathartics, but the pain and tension gradually increased. Some time afterwards, the skin and fascia covering the muscles a little above the wrist on the fore part of the arm, where the tension was greatest, were divided to the extent of three inches, so as to lay bare the muscles; but this was not attended with any relief, although the incision was afterwards extended towards the palm of the hand, the original seat of the disease, by dividing the annular ligament of the wrist. A dark-coloured fungus in a few days sprang up from the divided parts, which considerably projected beyond the surface of the skin.

The swelling of the arm extended to within three inches or less from the top of the shoulder, where it terminated abruptly. Diarrhoea set in, and her constitution was evidently sinking under the constant pain and irritation of the disease. Amputation was therefore recommended, and performed on the 21st of September, close to the shoulder-joint at the termination of the swelling. The circulation was completely commanded by pressure on the artery above the clavicle, for there was not sufficient room for the application of a tourniquet.

On examining the limb after amputation, the thickening and enlargement was found to arise altogether from the deposition of lymph and serum, nor were there any where the slightest signs of suppuration. The bones of the carpus and extreme ends of the radius and ulna were observed to be so far softened as to yield, and be easily broken down by the pressure of the nail, probably owing to the absorption of the earthy principle.

In searching for the broken needle, we not only discovered what we sought, but to our surprise half a dozen others, each about half an inch in length, embedded in the pronator quadratus muscle under the site of the incision; some of them lying between the radius and ulna, and others fixed in the periosteum of the bones. Similar fragments of needles were afterwards found by the pupils—one in the palm of the hand, and others in the fore-arm above the quadratus, but none of them had entered either tendon or nerve.

The muscle in which they lay was almost changed to a firm gelatinous structure, and they were everywhere surrounded by firm lymph, almost of the consistency of softened cartilage, which seems to be the

process employed by nature to insulate such extraneous bodies from the surrounding parts as do not excite suppuration. These fragments, ten in number, I send for the inspection of the association.

It is obvious that so many needles could never have pierced the arm without the knowledge of the patient, who has every appearance of intelligence and shrewdness, indeed rather too much of the latter; yet, on being presented with these needles the day after amputation, she solemnly declared she knew nothing of having been wounded by more than one. The superintendants of the Dublin Female Penitentiary, an asylum for reclaimed females, in which she is an inmate, and which is admirably well conducted, have no hesitation in attributing the infliction of these evils to herself; though it is to be presumed the extent of the punishment was little in her contemplation. She had, however, a taste for this kind of deception; for on another occasion she complained, during an entire year, of excruciating pain in her chest, attended with paroxysms of difficult breathing, that seemed often to approach the last gasp; but after enduring such a sufficiency of blisters and issues, and bleeding both local and general, as Doctor Mills, and Doctor Edward Percival, and myself, thought it prudent to prescribe, she suddenly recovered, and with great candour acknowledged that all her complaints had been dissembled; yet to account for all this finess, which cost her so much bodily pain, she could give no reason more satisfactory than that she had suffered herself to be seduced by the instigations of the devil: but this explication involves a still stranger incongruity; for she has the character of being remarkably devout, and is seldom without a prayer-book in her hand, and a jargon of religious cant in her mouth. I conjecture that she is not much inclined to bodily exertion, and would rather undergo any torment than work; and possibly she may have derived some little advantages, by exciting the commiseration of the benevolent ladies who superintend the institution; she, however, when too late, became sensible of her folly, and before the operation I have described I heard her remark, that she well deserved the punishment she was about to suffer."

Mr Carmichael proceeds to state, that, being anxious to learn some further traits of the disposition of this extraordinary individual, he made some inquiries concerning her conduct at the Dublin Female Penitentiary, where she was an inmate both before and after the amputation of her arm. "Here I was informed, that on her first admission into the institution she appeared so repentant of her former mode of life, as to interest in her favour, not only the immediate superintendents, but those benevolent ladies who form the committee of management of this excellent establishment. She never appeared without the Bible, or at least some religious tract, in her hand, and at night-time the Bible was regularly laid under her pillow. Finding that her hypocrisy succeeded so well in exciting the attention and indulgence of the matron and governess, she was encouraged to a further trial of her talent at deception. Her second grand step was to feign madness; her ravings were all of a religious character, and, to use the expression of one upon whom she played with great success her battery of tricks, 'her ejaculations appeared to have so much of meekness and devotion, and she seemed to possess so sweet a frame of mind,' that the witnesses of this young arch-hypocrite's impostures were often affected even to tears, wrung from them by her well-feigned repentance for the false step she had taken.

In these ravings she constantly murmured out the praises of the matron, and such persons of the institution as had the power of indulging her with the enjoyment of temporal comforts. This 'method in her madness' unfortunately excited suspicions about the reality of her lunacy in the mind of Jane, an intelligent upper-servant of the institution. She accordingly watched her narrowly, and discovered that the dissembler never raved when she thought herself alone or unobserved; but if even a footstep was heard in the passage, then the wandering mind of the maniac became apparent.

The consequence was, that Jane upbraided her sharply for her hypocrisy and imposture. Prince Hohenloe himself could not have evinced more miraculous powers; for, lo! the madness of the maniac suddenly ceased; but, unfortunately for Jane's celebrity in this line, this marvellous cure proved but a metastasis; epileptic fits intervened, during which she foamed at the mouth, and the convulsions appalled the beholder. The indefatigable and wondrous-working Jane rescued her again from the pressure of disease, by ascertaining, beyond contradiction, that the foam which flowed from her mouth in such abundance during the paroxysms, was simply owing to her churning a piece of soap, which she had previously introduced.

To the fits succeeded the pain in the side, and difficulty of breathing, alluded to in the former part of the paper, which were so severe, that bleedings and blisters without number were insufficient to remove the malady; which, however, at length yielded to low diet, and a large issue, capable of containing two or three beans, which was opened in her side over the seat of the supposed pain. The penetrating Jane herself was deceived this time, or was too modest to interfere where regular practitioners were consulted.

After this, the catastrophe of her arm, already detailed, took place, by which she received so severe but just a punishment.

The extraordinary individual who is the subject of this paper, is small in stature, her features are regular, but display such an expression of determination, and of wily fox-like cunning, as to render her disposition obvious to the most careless observer. She never ventures to look the person in the face with whom she is conversing. I lately inquired, in an earnest manner, as one interested in her conduct, what were the motives which induced her to insert the needles in her arm. Keeping her eyes steadfastly fixed on the ground, she endeavoured to evade this question by entering into a history of her life, and other irrelevant matters. On being pressed for a direct reply, none more satisfactory could be obtained, than that she was tempted by the devil; but on perceiving that I was but little pleased with her evasions, she added, that she was weary of life, and took this (*likely*) method of putting a period to her existence.

I understand that her grandmother, by whom she was reared, and afterwards consigned to the Dublin Female Penitentiary for her misconduct, stated to the governors of that institution, that from the time she was capable of speaking, she was so incorrigible a liar, that no person could place the slightest reliance upon her veracity.

After her recovery from the amputation of her arm, she was called before the governors of the penitentiary, and formally dismissed the institution on account of her misconduct. She appeared very repentant, and with tears acknowledged the justice of her sentence; but no person could believe in her penitence. Since that time I have allowed her to remain in the surgical ward of the House of Industry as a deputy nurse-tender. I have not since heard of any complaints of misconduct; but it is to be recollected, that her character is so well known, that there is no person who would place the slightest reliance upon a word she says; therefore she probably permits her most preponderating faculties to remain in a state of inactivity.

A cast of the head of this persevering impostor was examined by the editor of the *Phrenological Journal*, who presents a note of the development of the organs to his readers, in which he describes Secretiveness, Firmness, and Imitation, as very large, drawing of course the inference that these were the means by which she was enabled to devise and pursue her extraordinary tricks. On this, however, we pronounce no opinion.

MISS SEDGWICK ON HEALTH.

A HEALTHY mind in a healthy body was esteemed by the ancients the greatest blessing. This truth being proclaimed so long ago, is it not strange that we have not better learned before this time to secure, by all pains and care, the healthy body? Perhaps you are a little sceptical. You do not believe that the powers of your mind, the evenness of your temper, and the kindness of your disposition, depend, in any sense, on the state of your body. I appeal, then, to your own observation and experience.

Providence has put into your own hands the means of health. It was too precious a boon to be trusted to any one's keeping but your own; and, remember! the gift involves a solemn responsibility. Health will be counted among those talents for the use of which you are to answer to God. It is then surely one of the *must* have, and one of your first duties is to study the laws that govern it—this is *physical education*.

It is a solemn truth, and one, my young friends, that should be familiar to you, that, *for the most part*, we bring the sicknesses we suffer upon ourselves. If not the effect of our own sin, or imprudence, they are traceable to the neglect or ignorance of the guardians of our youth, or they are entailed on us by our parents. They perhaps received them from their parents. They were sent by Providence, and sent as the penalty for the violation of His laws.

Take, for example, a young girl bred delicately in town, shut up in a nursery in her childhood—in a boarding-school through her youth—never accustomed either to air or exercise, two things that the law of God makes essential to health. She marries; her strength is inadequate to the demands upon it. Her beauty fades early. She languishes through the hard offices of giving birth to children, suckling, and watching over them, and dies early; and her acquaintance lamentingly exclaim, "What a strange Providence, that a mother should be taken in the midst of life from her children!" Was it Providence? No! Providence had assigned her threescore years and ten; a term long enough to rear her children, and to see her children's children, but she did not obey the laws on which life depends, and of course she lost it.

A father, too, is cut off in the midst of his days. He is a useful and distinguished citizen, and eminent in his profession. A general buzz rises on every side of "What a striking Providence!" This man has been in the habit of studying half the night, of passing his days in his office and in the courts, of eating luxurious dinners, and drinking various wines. He has every day violated the laws on which health depends. Did Providence cut him off? The evil rarely ends here. The diseases of the father are often transmitted; and a feeble mother rarely leaves behind her vigorous children.

It has been customary, in some of our cities, for young ladies to walk in thin shoes and delicate stockings in mid-winter. A healthy blooming young girl, thus dressed in violation of heaven's laws, pays the penalty; a checked circulation, cold, fever, and death. "What a sad Providence!" exclaim her friends. Was it Providence, or her own folly?

A beautiful young bride goes, night after night, to parties made in honour of her marriage. She has a slightly sore throat, perhaps, and the weather is inclement, but she must wear her neck and arms bare, for who ever saw

a bride in a close evening dress? She is seized with inflammation of the lungs, and dies before her bridal days are over. "What a Providence!" exclaims the world, "cut off in the midst of happiness and hope!" Alas! did she not cut the thread of life herself?

A girl in the country, exposed to our changeable climate, gets a new bonnet instead of getting a flannel garment. A rheumatism is the consequence. Should the girl sit down tranquilly with the idea that Providence has sent the rheumatism upon her, or should she charge it on her vanity, and avoid the folly in future?

Look, my young friends, at the mass of diseases that are incurred by intemperance in eating, or drinking, or in study, or business; by neglect of exercise, cleanliness, pure air; by indiscreet dressing, tight-lacing, &c., and all is quietly imputed to Providence! Is there not impiety as well as ignorance in this?

We repeat it. Diseases are the consequences of the violation of God's laws. Were the physical laws strictly observed from generation to generation, there would be an end to the frightful diseases that cut short life, and of the long maladies that make life a torment or a trial. It is the opinion of those who best understand the physical system, that this wonderful machine, the body, this "goodly temple," would gradually decay, and men would die, as a few now do die, as if falling to sleep.

I cannot close this chapter, my dear young friends, without begging you to observe how the evil effects of our own sins are tempered to us by the benevolence of the Deity. Truly, "He pitieth us as a father pitieth his children!" Much spiritual good may be, and often is, extracted from bodily suffering. In our sicknesses we may acquire fortitude, patience, humility, and thankfulness. In the sicknesses of others, we learn self-sacrifice, compassion, and forbearance.

But who doubts that health is better than sickness? Study then, my young friends, the laws on which it depends, and obey them.—*Means and Ends*, by Miss Sedgwick, lately published.

COD-FISHERY OF NEWFOUNDLAND.

AMONG the different branches of industry, that of fishing, which in other countries ranks only as a secondary pursuit, possesses in Newfoundland such a superior importance as to claim our first attention. Almost from the earliest discovery of America, this occupation was followed upon a large scale by the maritime nations; but for a long time it was chiefly confined to the great bank, and to vessels sailing from European ports. As soon, however, as permanent settlements began to be formed, it was found that the south-eastern coast, rocky and deeply embayed, afforded a supply almost equally exhaustless, the produce of which could be cured there much more cheaply and conveniently. When, therefore, the coast-fishery was established, the ships employed on the banks found extreme difficulty in making head against it; and though the merchants procured the most violent orders for the extirpation both of the fisheries and settlements, these proved altogether unavailing. The one branch continually increased, while the other declined, till it did not now employ above eight or ten sloops. If the French and Americans, to the grief of our colonial patriots, still carry it on to a certain extent, we may conclude that it is entirely owing to the want of the same convenience on shore. The first operation of the coast-fisher is to erect what is termed a fish-flake, raised upon posts which support a platform covered with dry fern. It stretches so far into the sea, that boats can readily approach. From the spot thus prepared, the boats at dawn of day push out to the best fishing-ground within reach, which, from circumstances not yet fully understood, is sometimes very near, and sometimes changes to a considerable distance. Across each boat is a succession of bins, like the counters of a shop, separated by flat spaces, on each of which stands a fisherman. He is furnished with two lines, having two hooks fastened to each. These are baited chiefly with capelin, or herrings, and sometimes even with the flesh of birds. When all these fail, a jigger or artificial fish of lead is thrown in, and is often caught at by the voracious animal. The nets are cast, one on each side of the boat; the first filled is drawn up, the fish stunned by blows are thrown into the bin, and the hooks, after being rebaited, are returned to the sea. The opposite net, which is then drawn up, is handled in the same manner. This task continues till the boat is filled, often in a very short time. The men then hasten to the flakes, upon which the fish are hastily thrown by a pike stuck in the head, not injuring the body. The crew again return to the fishing-ground, whence, in the course perhaps of an hour or two, they bring in a fresh cargo. From the top of the flake the fish is carried into the salting-house, where a new class of operations commences. This structure is provided with one or more tables, round which, invested in leathern aprons, are seated three important personages, the cut-throat, the header, and the splitter. The first, with a sharp-pointed double-edged knife, cuts open the fish through its whole length. The header, to whom it is then passed, removes the head and entrails, preserving in many cases the liver and sounds, and dropping the rest into the sea. The splitter, to whom it is next transferred, by two dexterous cuts removes the back-bone; an operation considered so nice, that he receives the highest wages, and ranks next to the master. These three operations are usually performed upon half a dozen subjects in the course of a single minute. The fish thus prepared is placed in hand-barrows, and conveyed to the salter, whose business is also considered very important. Having spread over each a due portion of salt, he piles them above each other, with the backs undermost. When they have thus remained for a few days, the salt is washed off with a soft mop, during which process they are placed in a box with holes underneath for the water to run off. Further to complete the draining, they are piled in long heaps, bearing the odd name of water-horses. After the fish have remained a day in this state, they undergo the final process of drying. This is effected by spreading them on flakes with the fleshy side uppermost, and leaving them thus exposed till sun-

set, turning them once a-day. At night they are piled above each other, with the backs uppermost, in heaps called fagots or flackets, which often accumulate till they resemble haystacks. If rain occurs during the day, those lying out are hastily thrown into this shape. Even when well dried, they are left in this form to sweat, as the sailors term it; when, being deemed thoroughly cured, they are lodged in warehouses.—*Edinburgh Cabinet Library: Historical and Descriptive Account of British America.*

THE SOLAR SPOTS.

THE surface of the sun has of late presented a very striking and diversified aspect, when contemplated through a powerful telescope. The spots of all descriptions by which its disc is divaricated have been more numerous, and some of them much larger, than have been observed for several years past. On Monday the 2d current [Sept. 1839] almost the whole surface of this luminary seemed to be diversified with large and small spots of every description peculiar to the sun. A cluster containing four or five very large spots, and about thirty or forty smaller ones, disappeared from the western part of the disc next day, but a very great number of both large and small spots still remain. At present (September 4) there is a very large cluster approaching the centre of the disc, which consists of about eighteen large spots, the smallest of them not much less than the size of the earth, and some of them much larger. Besides these, there are within the compass of the same cluster above eighty smaller spots, which can be distinctly counted by means of an achromatic telescope magnifying one hundred and twenty times—making about a hundred spots in all within the limits of one cluster. The smallest of these spots cannot be less than from five to nine hundred miles in diameter. One of the spots which lately passed off from the western margin of the disc, measured about the one-thirtieth part of the sun's diameter, and consequently must have been about thirty thousand miles in diameter, or nearly four times the diameter of the earth; and if it is to be considered as a solid body, it must be above sixty times larger than the earth. It contained an area of more than seven hundred millions of miles. Besides the cluster noticed above, there are five other clusters nearer the western edge of the disc, containing several large and a number of smaller spots, amounting in all to about seventy or eighty; so there are at present nearly two hundred spots, great and small, diversifying the surface of this luminary. The largest cluster will likely remain for about eight days longer before it disappears from the western limb. Some of the other spots will disappear in the course of three or four days. There are indications of other clusters about to appear on the eastern limb. Each of the larger spots has a dark nucleus, surrounded with a penumbra, or fainter shade, nearly of the same shape as the nucleus. Some of the nuclei appear nearly round, others elliptical, others conical, and some of them are divided in the middle by a bright streak. When these spots are near the margin of the sun, they appear surrounded with a mottled appearance, such as is seen on some parts of the lunar disc—evidently indicating elevations and depressions, or, in other words, mountains and vales of very great magnitude. These mottled appearances generally precede the appearance of spots on the eastern limb, and plainly show that there is a very great diversity of surface and scenery on this magnificent orb, and that changes and operations of inconceivable magnitude are continually going forward, probably for the purpose of preserving this central body in a proper state for diffusing light and heat, and other influences, to surrounding worlds. Four or five of the larger spots may be distinctly seen by means of an opera glass which magnifies about two or three times, and even by the naked eye, provided a coloured glass is interposed between the eye and the sun, or a common plain glass smoked with the flame of a candle.—*Dundee Advertiser.*

HYDROPHOBIA.

Mr Murray, known as a lecturer on chemistry, and author of several chemical works, has recently written a letter to the editor of the *Manchester Guardian*, embodying his opinion as to the nature of the disease of hydrophobia, and its means of cure. The following is the remedy he proposes:—"Let a mixture of two parts of nitric and one part of muriatic acid, both by measure (evolving chlorine in a concentrated form), be applied to the wound as soon as possible, and more than once. I thus treated the wounds of a man whose hand had been dreadfully lacerated by a mad dog, while separating another dog from its attack; and as the latter became also rabid, it afforded full proof that the rabid virus in the former was at its maximum of malignity. Nearly fifteen years have rolled away, and the man has continued free from hydrophobic attack."

WITTICISMS OF SIR HERCULES LANGRISHE.

Like the poetry of ancient bards, the witticisms of Sir Hercules Langrishe have met with oral tradition. Some of them were strongly expressive of his national feeling. On one occasion, when riding with the lord lieutenant in the Phoenix Park, his excellency complained of his predecessors, and asked why they had left the place in such a wet and swampy state; Langrishe replied, "They were too much occupied in draining the rest of the kingdom." On another occasion, being asked where could be found the best history of Ireland, he answered, "In the continuation of *Rapin*."—*Life and Times of Henry Grattan.*

CHAMBERS'S EDUCATIONAL COURSE.

The latest published works in CHAMBERS'S EDUCATIONAL COURSE, are the First Book of English Composition, price 6d. The Moral Class-Book, designed to aid in the inculcation of moral, economical, and religious duties, price 1s. 6d. And the Elements of Algebra, with numerous improvements to suit advancements in science, by A. Bell, price 4s. 6d. Other Works are in preparation.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

THE CROCK OF GOLD.

In the county of Wexford, and in a nook which, fifty years ago, was completely apart from the ordinary route of travellers, are situated the Seven Castles of Clonmines. An arm of the sea, called "the Scar," separates them from the parish of Bannow. In my childhood they were to me objects of deep interest; I had no playmate, no companion; and when my relatives went on friendly visitings in the neighbourhood, they would take me with them; it being a fixed principle that I was never to be left to the care of servants. One of our best and dearest friends dwelt in a house called Barristown, nearly opposite those fine old ruins; and happy indeed was I, when the carriage was ordered to prepare for a drive thither. It was inhabited at that period by a very aged lady and her youngest son, an old bachelor; her granddaughter also lived with them, a young lady of most amiable mind and manners.

Sally H., though a young woman when I was born, was, nevertheless, my playfellow, my adviser, my friend; and proud was I, as a little girl, to have a tall lady for my companion. She would pet me, and scold me, and reason with me, and tell me stories. She had such mild soft eyes, so gentle a voice, and a certain degree of refinement in her manners—the result, perhaps, of delicate health—that now, through the vista of years, I revert to her as one of the sweetest and fairest of my memories. She used to say I would forget her when I came to England; a prophecy that always made me weep. But she did me injustice; I never did forget her, nor the double violets she used to drop over the pew, on entering church, into my lap; nor the delight I felt when placed on her side-saddle, her long fair arm holding me in my seat, dear kind creature! When the world has been only a little hard with us, how sweetly comes the remembrance of kindness bestowed on our youth! It seems as if there never had been kindness like unto that; and we wonder how the world is changed, grown chill, and cold, and estranged. And we love to shut our eyes upon all things present, and live over again with the dear ones of the olden time, our young and thoughtless years! But this is worse than idle; we are with the present, and of the present.

When last I drove by old Barristown, it looked grim and grey, shut in with its own loneliness—nothing about it telling of existence, except the rooks that cawed above the one tall ivied tower, where the old lady slept and died. It looked grey and sad, and well it might; for those who made it ring again with hospitality, were all—all—in their silent graves. It frowned at the sunshine like a thing that would not be comforted. I was glad to send my thoughts and my gaze across the waters to the ruins of the Seven Castles of Clonmines, and they looked, as they had always done to me, land-marks of mystery, and full of the deepest and most solemn interest. Time, which had destroyed the charm of the more modern structure, had only added a few more ivy wreaths to the old castles. I could hardly discern even if they had crumbled nearer to the earth, for the ivy, with the solicitude of the truest friendship, concealed all defects, and laboured to keep the mouldering stones together. Very, very beautiful, the old castles looked, lying in the Vale of the Scar, covering a considerable extent of the greenest meadow-land it is possible to imagine, and leading the mind back to the olden time when wassail and superstition celebrated their alter-

nate orgies within those walls. A bridge beyond the castles, called "Wellington Bridge," crosses the arm of the sea I have already mentioned, and facilitates communication between the secluded neighbourhood of Bannow and Ross and Waterford. Before the bridge was built, those who wished to get to the opposite side were obliged to wait till the tide was out, and cross at the ford. The country girls proceeding to Ballyhack to sell their eggs, used to take off their shoes and stockings, and wade across, carrying their marketing on their heads; if the tide ran strong, they would link hands, and cross in numbers. And I remember but one or two accidents; though, since they have got the bridge, crossing the ford is spoken of as a barbarism—I should say, since they have got the road to the bridge; for be it known to the methodical readers of "Chambers's Journal," that the bridge was finished three years before the road was made. But things are better ordered now.

The morning was fine, and leaving Barristown and its host of memories, I thought I should like a ramble round the Seven Castles, and in a short time I was scrambling among the ruins with little Daniel Muckleroy for my guide—the guide being far more ignorant of the locale than myself, yet *too Irish* to suffer his ignorance to appear.

"Dan, do you know who built these castles?"

Dan (a little perplexed), "Myself can't say *exactly* how old they are, but some hundred thousand years, any way!"

"But who built them?"

"Oliver Crom'ell, my lady."

"And who destroyed them, Dan?"

"Bedad, ma'am, it was Oliver Crom'ell."

"What! did he build them up and pull them down?"

"Bedad, my lady, I'll go bail he did that same; for ye see, my lady, he had a *bad heart* to the country, and could never let well alone."

This attributing of all things bad to the great Cromwell, is universal throughout Ireland. Dan's mode of reasoning was by no means singular, strange as it must sound to English ears.

"You think he was a bad fellow, Dan?"

"The Lord between us and harrum, my lady! he was the devil himself! My great-grandfather see him onst, and a bad light he was to him, and his, and us, and every foot a' land he could lay his eye, let alone his hoof on. Oh, bedad! he was all out the worst sight ever came across ould Ireland, or I needn't be standing before yer ladyship in the *skin of my feet*."

Dan's winding up of his country's distress by such a picture was quite in keeping, but it was so odd that I turned away to prevent his seeing me smile; and at the moment I perceived one of the most remarkable figures I ever saw. A tall thin man, bent nearly double, but still looking very tall and spectre-like, was creeping round a buttress of the nearest tower; one thin bony hand grasped a massive ivy bough which wound like a huge serpent up the grey wall, and he supported himself on something between the narrow spade they use for digging potatoes, and a pick-axe. The handle was long enough to be used as a leaping pole, and the end furnished with an iron cross, upon which he leant. It appeared to me that without such support he could not walk, and yet he moved, or rather shuffled along, with considerable rapidity. His coat was long and grey, patched with many colours; and a bag, originally made of sacking, was slung across his back by a leathern belt, from which depended more than one string of "holy beads," and a multitude of shreds of different-coloured cloths, several rabbit skins, and one or two skins of birds of prey. He wore no stockings,

but his shoes were bound on, sandal-fashion, with knotted cords crossed more than half way up his legs. His hair was thin, and white as snow, receding from a high narrow forehead, which a phrenologist would at once pronounce as proud and dreamy. He wore no hat, but a cowl of grey cloth fell behind, and in bad weather he could protect his head from the pelting of the storm by drawing it forward. Indeed, his head was a model of ancient beauty, rising so nobly above his cowering figure; and the pure white hair was well thrown out by the dark-green ivy which formed an appropriate background to the solitary wanderer. His features looked worn and attenuated, but their extreme sharpness proceeded from the thinness of the face. His eyebrows were long and bushy, and his eyes grey, restless, and piercing. He paused and bowed his head—for all of the peasant class are courteous—and manifested no desire either to retreat or advance.

"God save you, Daddy Whelan, sir!" said little Muckleroy; adding, under his breath, "he'll root the ould towers themselves up some of these days."

"God save ye kindly!—who's spaking to me?" answered and inquired the old man.

"A lady from England, and little Dan Muckleroy, anty Muckleroy's grandson," was the reply.

"A lady from England!" repeated the old man, relinquishing his grasp of the ivy bough; and, after a moment, he smoothed down his white hair, drew his cowl a little over his head, and advancing close to where I stood, crossed his hands on the top of his singular staff, and gazing with his glittering eyes in my face, inquired, in a low mysterious tone of voice, "Had ye a *drame*?"

It is quite impossible to describe the eagerness of the old man's manner; his mouth open, as if panting for intelligence; his eyes—the word I have used is the only one that can convey an idea of their expression—*glittering* with a wildness that almost amounted to insanity; the very grasp in which he held his staff showed how anxious he was for my answer.

"Had I dream t—yes, many."

"Ay, lady, many; but about—about—the *crock of goold*—about *that*, lady dear! Was it a *drame* about that brought ye here t—what else could bring a laughing-eyed lady among ruins and dry bones? The *crock o' goold*, lady, did ye *drame* of *that*?—if ye did, send little Dan away; he doesn't know the secret. I do—the witch hazel, and the holy *drop*—I have 'em all—I'll find it."

"Then why have you not found it for yourself?" I asked.

The brightness of his eyes faded, the lids dropped; the very muscles of his hands relaxed; the excitement was over for the moment; he passed his hand across his brow, and repeated, "Why hav'n't I?—why hav'n't I? I hadn't the luck yet; I lie down under the light of the new moon, but I don't *drame*; I never dreamt but the onst; but that was enough. I saw it—I had it—the *crock* in these two hands—the goold rolling like the waves of the sea at my feet—that was a *drame*!—have you dreamt such, lady, have ye? I know the *charrum*—the witch hazel, the holy drop, the first tear of the new moon!" and he repeated again and again the same words, his eyes glittering, his excitement increasing.

"Daddy Whelan," said my attendant imp, "have ye tried under the flat grey stone down by the water? Granny dreamt onst that there was a *crock* of goold there."

"I don't know—I forget—maybe I did—maybe I didn't—I find *my marks* in many a green hillock, and under many an ould tower; but I have not found the

crook of gold yet. You'll never find it by yerself, lady. So, if ye had a drame, tell me; we'll find it together, we'll divide it together."

It was in vain I assured Daddy Whelan I had not dreamed a dream. Had it not been that little Dan hit upon a new spot where to direct his attention, the old treasure-seeker would have still insisted that I too must have dreamed of a *crook of gold*.

I watched him stealing away amid the ruins, and then sat down on a bench of soft green moss to recall the story my old friend Sally had told me, in my childish days, about the old man I had seen so unexpectedly for the first time, but of whom I had so often heard.

"Never," she said, "build your hopes of future well-doing upon chance, but rather upon industry, whether of the head or of the hands; both have it in their power to win independence, though they do it in a different way. My uncle knew two young men in the gentleman's county—the county Kilkenny—of the name of Whelan, Roger and Michael. They were left a large tract of land by their father, which was divided equally between them. It was in parts wild and uncultivated, but it was all he had to give, except his blessing; and the blessing of a parent gladdens a good child's heart. Roger, the eldest, was a wild, dreamy fellow; and instead of setting steadily to work to mend matters and improve his farm, he was always talking of the 'luck' some people had, and how hard it was to be obliged to labour on bad land. It was in vain that Michael told him it was worse to have no land to labour on; he idled and complained. His brother worked night and day, at first with little success, but time helps industry; and what was really owing to industry, Roger said was owing to luck. 'If,' said Roger to Michael, one sunny Sunday evening, when, after walking round and round and through and about the old ruins of Jerpoint Abbey, 'if I could only find a crook of gold, I'd be a made man. I'd have as fine a hunter as Squire Nixon, and such lashings of whisky and fresh cod and oysters for every Friday in and out of Lent. Abel Ryan found one, and why shouldn't I?' While he spoke, he kept poking, poking with his stick among the stones of the mouldering archway, beneath which they, the brothers, stood; and as he did so, it chanced that he dislodged a stone, and in a crevice, a sort of hole between the stones, he discovered several old silver coins. This astonished one brother, and elated the other, whose wish that he might find a crook of gold was fast strengthening into the idea that he should find one. It was in vain that Michael reasoned with Roger, and urged him to take the new-found treasure to the landlord, whose property, according to the law of the land, it most undoubtedly was. Roger laughed at his scruples, and kept the coin; but though he had the money, he did not exactly know how to dispose of it. The sum was far too small to take him abroad, and he feared to show it at home, for the news would have flown like wildfire, and the castle be either rooted up or thrown down by those who would have expected to be as fortunate as Roger Whelan. Soon after this occurred, the time arrived for planting seed potatoes. Michael had got his ready, and hinted to his brother that the season was passing, and his ground remained uncultivated.

"How do you think," was the treasure-seeker's reply, "that I can be able to spend my time digging thick clay, when I am, as you, and you only, know, night after night, through and through the ruins of old Jerpoint. Don't I know the red goold is in it? And how do you think I can give my mind to such work as that, when I know what's before me?" It was no use talking to the infatuated man. "Give me," he continued, "the bit and the sup, and a good coat to my back, a new spade and pick-axe; suffer me to go and to come, and I'll give you my share of the land, the dirty barren soil that it is: stockings and croppings, just as it is, take it, and welcome."

"Well," answered Michael, "I will manage it, Roger, till you come to your senses; and then I'm thinking you'll be glad enough to get it back."

Roger Whelan," continued my friend, "was a fine handsome fellow, tall and comely, and was at the time very much in love with a very pretty girl, who had a good deal of money; but her parents found out that Roger was always out at nights. The country was, as it generally is, in an unquiet state; and despite Michael's assurances to the contrary, Mary Morgan's 'people' believed that Roger was in some way connected with the disturbers of the public peace, at the very time when, to do him justice, he disturbed nought but the wild rabbits, the bats, owls, rooks, and wild birds, that sheltered amid the ruins of Jerpoint. Neither Roger nor Michael would tell why Roger was from home at nights; and after some hesitation, and a few tears, Mary relinquished her handsome lover for a short, steady, little husband, who lived to be a rich citizen of the city of Waterford. 'Never mind,' said the discarded lover; 'she'll be sorry for it yet, when she hears Mister Roger Whelan, Esq. talked of, and hears the bay of my hounds on the hills, and sees my carriage overrunning all the pigs on the quay of Waterford'; then, maybe, she'll be sorry for changing her mind." The forgetfulness of his fair one, however, preyed upon his spirits; and having gone into Kilkenny, he was tempted to change one or two of his precious coins; and after having drunk the worth of his money in whisky, he was imprudent enough to boast that he had many more of the same 'curiosities'

at home. The landlord, seeing that the coins were unlike any he had ever seen before, took them to a 'knowing man,' a little crabbed body who lived near the church gate of Saint Xanis, and was as near an approach to a dealer of curiosities as could be supposed to exist in an Irish country town, where the great of those days spent more than their spare money in show and claret, and the small had never any money to spare. Still the old man existed; and when he purchased the coins from the whisky dealer, something seemed to occur to him, which he did not communicate to any one; but finding that it was still early in the day, he set out to walk to a gentleman who resided about five miles from Kilkenny, on the Ross road. To him he showed the coins; and much to poor Michael's horror, Roger Whelan was arrested at the end of the week, on the accusation of having stolen these coins from that very gentleman's house. About a fortnight before the unfortunate treasure-seeker found them among the stones of Jerpoint Abbey, the house had been beset by some Whitefeet, or Peep-of-day boys, or whatever they chose to call themselves, seeking for arms, and professing to take nothing else—a profession they generally adhered to. But one of them had doubtless been tempted by the glitter of a drawer of coins and medals in a bureau, which they had broken open to get at some curious Spanish pistols the gentleman was known to possess. After having obtained possession thereof, he doubtless did not know how to dispose of them, and secreted them in the ruin, where Roger unfortunately discovered them.

I confess my opinion is, that the law in those days was administered in a very one-sided manner; but I must at the same time admit, that circumstantial evidence was strongly against poor Roger; he had acquired for himself the character of an idle wandering fellow, and the only one to support his story was Michael; but the counsel for the crown said, 'What brother was there who would not say as much for another brother?'

"Plaze yer honor," answered Michael, "he is my brother, poor boy; and though he's foreint me, where I never thought he'd be, and the first of his family that ever *stud* in sich disgrace, and though I'd sell the coat off my back, and the flesh after it, if that would save him, still I'd not tell a lie, and by so doing sell my soul to the devil. Gintlemen counsellors, you're used to it, but I'm not: he has tould the blessed truth. 'Treasure-seeking he was, that's sartin, whin, with a bit of a stick—the very one that stud his friend many a turn, yet, like many friends, betrayed him at the last—poked out the unnatural pieces of money, bad luck to them; and if he had taken my advice, and just carried them to the landlord, there would have been no more about it, only maybe the right made out. Look, gintlemen, I can say no more than this; look round at me, Roger, *avick*, the born picture of our blessed father, the boy that lay with myself many and many a night and day upon the bosom of our own mother; look at me, my own heart-brother, and hear me pray on my knees that curses by day and night may fall hot, heavy, black, and bitter on yer head, if you knew any thing about the dirty money until that blessed minute when, unknowst to yerself, you let the light of day shine on the treasure, and thought yer fortune made.' To this his brother replied with a deep and sincere AMEN! Many in the court wept, for all who knew respected Michael, and considered Roger as an 'innocent boy, who would never do any harm to any one but himself.' Poor Roger, however, was sentenced to seven years' transportation, to which was added the information, that the law showed great mercy in not sentencing him to death.

"God bless you, Michael," said Roger, when he embraced his brother for the last time; 'all the country knows I'm innocent; and who can tell but I may find the *crook of goold yet*, when all's said and done? The money was hid there, any way.'

"If ever," said Michael to his wife, when he returned home, 'if ever poor Roger comes back to ould Ireland, it will be to go treasure-hunting; his brain is struck with it, as indeed every brain is when it takes a foolish notion that reason can't conquer.'

Five years had passed, and the only matter connected with the brothers worth recording, was, that the man who really took the old money from the gentleman's bureau, having wound up his misdeeds by the crime of murder, was discovered; and when about to suffer, confessed his sorrow that a 'dacent boy's son, Roger Whelan by name, should have been turned out of the country for his fault.' This was a joyful hearing to all Michael Whelan's friends, and they were many; his conduct had won him the approbation of rich and poor; and it had long been evident, that if Roger failed to find a *crook of gold*, it was equally certain that Michael would soon make one, as every thing prospered that he undertook. The ignorant said, he had great luck—the wise, that he had great industry.

The news of Roger's pardon, and consequent permission to return home, spread through the country; but long before there was a possibility of a ship reaching Botany Bay, a tall, worn, spectral-looking man presented himself beneath Michael's roof, and was soon pressed to the arms of the whole family.

"My own dear brother," said the true-hearted Michael, "you are indeed returned; and now your farm is worth the having; it is stocked, and cropped, and thriving; we will work together, and live together. But how is it you are so quickly returned?"

'Don't laugh at me, Michael,' was the reply; 'but I had one drame, which I never shall rest till I work out; it kept up my heart for three long years of slavery, and I'd often pray to drame it again, but I never did. I dreamt I was in Ireland, standing by cross roads that divided some ould ruins into four halves, and milk came pouring down one road, and water down another, and a swarm of bees flying down another, and a herd of cattle driving down the last; and as I stood, a voice said, "Seek, and have;" and I thought I made with my hands a trough like, where the milk and water mixed like whisky and water, and the bees hung over it, and the cattle drank of it; and I could tell the place, if I saw it. And behold, I worked, worked at the hollow; and, all of a sudden, I raised up a crook of goold between these hands; and as I did so, the red, red goold fell at my feet, like the waters of the wide ocean, for plenty; and through all manner of dangers, I made my way back to Ireland, on the sly; and for the last three months I've been disguised like a bocher, or a natural, seeking through the ruins of old Ireland for the *crook of goold*—but I haven't found it yet.'

'Nor never will,' said Michael. 'Let me read the dream for you. Didn't your hands make the trough, and did not milk and water rest there, and cattle rest there, and honey rest there? and are not they the fruits of labour? And out of that trough came the crook of goold; and so it will, out of the labour of your hands. That is the only *crook of goold* the Whelans will ever find, depend upon it.'

This interpretation did not, however, suit the treasure-seeker; on all other subjects he was sane enough; but nothing could change his desire to find, instead of labour for, wealth. And yet his brother told my uncle, he does labour, and labour hard. He risked much in venturing to Ireland before he knew that his innocence had been declared. But he did not care: his whole ideas were in the *crook of gold*. There is not a part of Ireland that he will not travel to, spend night after night burrowing in the earth like a wild animal, no matter what the weather is, or what the season; and the first question he asks of every stranger he meets is, 'Had ye a drame?'

This was one of the tales my gentle friend told me with a desire to correct my fondness for castle-building; which is indeed even now one of my faults. She enlarged upon the utility of Michael's course of life, and pointed out how totally lost to himself and to society poor Roger was. "He comes here sometimes, and asks my grandmother's leave to inspect our castle; a permission we never refuse, upon condition that he does not meddle with the foundation. He makes his appearance once every three years, spending some time at Dunbrody Abbey, some time at Clonmines, a night here, another at Danes Castle, another at Coolhill, at Duncormuck; and so getting into the barony of Forth, which is full of old castles, he travels by day, and digs by night; but he has not yet found his crook of gold."

How well I remembered the evening when, sitting on my friend's knee in the great bow-window of the drawing-room at Barristown, she told me that story! The Castles of Clonmines had flung their shadows on the water, and the evening was as calm and silent as the grave. I remember asking her to send me word when next the old treasure-seeker came to the neighbourhood, that I might see him, only at a little distance; and I also remember her saying, that "he might never come again, for that exposure to all weather's had brought on premature old age, and he seemed ill and worn the last time he was there."

Alas! dear Sally had departed long, long ago to a better world; and I, after residing many years in another land, had, by one of those curiously turned romances of re-life that laugh at fiction, encountered the treasure-seeker upon the very spot where, years ago, I knew he loved to linger and explore—the very old man whom my poor friend had supposed too worn and ill to return again! Indeed, I had been so certain of his death, that I had never thought of inquiring about him. I know not how long I might have remained among the ruins, musing over the story I have recorded, and recalling the looks and voice of her who told me many such tales, had not my little busy companion, Daniel Muckleroy, begged "my honour's" pardon, but "would I be pleased to tell him which I liked best—travelling by night or by day, or in rain or sunshine?" This recalled me to a sense of the rapidity with which time had passed, and I became aware that the evening approached. I had hoped the sun would have set over the castles with the red, red glory I had so often witnessed, bestowing his radiant benediction with all his brightness; but no; the clouds were grey and heavy, the whistle of the plover was more frequent than usual, and a moaning came from the not far off ocean—a sound perfectly distinct from the roaring that accompanies the progress of the storm-king, or the loud ripple that beats music to the breeze; it was a moaning—those who know the sea will understand what I mean—a heaving, as if the mighty waters groaned inwardly at the approach of a tempest.

"The clouds have gathered above our heads, ma'am, and ye haven't noticed them; and there was a brood about the moon last night; and early as it is, sorta crow, the craythur, that hasn't come home; and since ye seemed so struck, my lady, with Daddy Whelan, if ye'll just be pleased to step here, you'll see him in his *Wiment* intirely."

I walked on to where the boy stood, and I was

pleased, when, looking earnestly in my face, he added, "Daddy's of decent people, ma'am; and sure you wouldn't laugh at him! He's as innocent as a baby, only touched in the head with the trouble he had onst, and the fancy of a crock o' goold." There was warm feeling round the heart of that wild Irish boy, though he was standing in the skin of his feet.

Roger Whelan was preparing for a stormy night, and the prospect seemed to have imbued the old man with new life; he had fastened his cowl more closely round his head, and was seated on the grey stone my guide had pointed out; his curious staff placed upon his knees, his elbows resting upon it, and his attention divided between the arrangement of a piece of candle in an old lantern, which I had not before perceived, and the course of the clouds, that were, without any apparent wind, careering above our heads. I advanced nearer, but he did not heed me.

"My lady," whispered little Daniel, "he's dug round and round that stone a thousand times, but the neighbours fill up the marks; his brother, Mither Michael, has come to live in this county, and likes to keep the Daddy, as we call him, near at hand. He wouldn't stay in the place if he found his own marks, but go to break fresh ground; granny says he's more easily deaved than he used to be."

Suddenly a shivering flash of lightning ran amid the clouds, and a few drops of rain warned me to take shelter under a ruined arch close to the grey stone, upon which the treasure-seeker was seated.

"Daddy, sir," said Dan, "come in the shelter; it's bad for old bones to get cold."

The old man turned his face suddenly towards the smiling child, and holding forth a long arm-bone, which was fastened beneath the shreds to his singular belt, and was polished as ivory, he exclaimed, "This doesn't feel the cold; it's been stripped these hundred years and more. I had dug the whole night, and the thunder howling, and the lightning, not laughing like the weeny flash that passed us now, but dancing mad with divilment through the heavens and over the earth. It was in Adair I was rooting—rooting—for the crock of goold, inside the proud lord's walls, and he thinking none like me could get at his hid treasure. And I saw the handle, the handle of the crock, forewent me, in the hole, and I made a plunge and seized it. I knew it was the handle, and I was so wild wid joy, that I forgot myself, and shouted, and heard the shout repeated as loud again by some of the *achoes*, and muttered over by others according to their fancy. And I knew I had done wrong to spake, but I held fast; and, ah! ah! I pulled, and he pulled; but I held fast, and tore this up—this! Do ye understand it!—the spirit that had owned the goold, had power after I shouted. So he kept his crock of goold, but I got his arm-bone! That was my best chance; I never can have such a chance except when they," and he pointed downwards, and spoke in a lower tone, "when they get tarryified with the thunder; then's my best chance, and I shall have it to-night; if I had but a drame. Are you sure you had not a drame, lady?" he added, peering at me as he had done before.

I asked him if he remembered his friends at Barristown, for I was anxious to ascertain if his mind wandered on all subjects.

"Ay, well!" he replied, and his voice changed again; "God be good to them!—the warm welcome, the open house, the old Lady Queen of the Castle! she often dramed for me: and her son—the flower of the gentry—and the fair young lady, I brought a white rose-tree from Woodstock, and set it on her grave, though she would never try to drame for me! Poor thing, she did not believe in drames; but she knows the truth of them none! It's a quare world, and every thing in it. What is it from first to last but a drame, leading by visions to eternity! Sure, in our own short time, the people are gone from Barristown like a drame! and yet they war in it onst, and so with the money in my crock of goold! Sure, after that, what can ye say agin' the drames! Isn't all life a drame! There's another flash o' lightning! I love to read my drame-book by flashes o' lightning! and I love it at sea, the fire and the wather sporting wild sport together! Ah, thin, if ye hadn't a drame, lady, whin will ye go out of this, for ye're troubling the earth! Don't ye hear how the thunder growls?"

"May I not wait till the storm is over, Daddy?" I inquired, not without some apprehension, for the old man's features were assuming a troubled aspect, though my little guide did not seem alarmed.

"Oh, *agra*! yes; a lady and a stranger; only the sooner the better, unless you could sleep, and tell me yer drame. God help me," he added, shivering, for the wind had risen, and was rattling amid the ruins and the ivy; "God help me! I shall soon be little more than a drame myself!"

It is impossible to convey an idea of the sadness of the tone with which he uttered this prophecy. They were the last words he spoke to me. The storm was short-lived; and though I bade him good-day, he would not answer me; the boy said he was vexed the "tunder" was over. Be that as it may, I heard the click-click of his sharpening the end of his axe, as if determined on his singular purpose.

Poor Roger Whelan! one of my last received letters from Ireland contained this passage: "I have just left the prosperous and contented dwelling of Michael Whelan; he is a very old man, full to the brim of the happy years of an industrious life, though just now much grieved by the death of his wandering brother,

'the Treasure-Seeker,' for despite his eccentric obstinacy, which, as he advanced in years, deepened in my opinion into positive madness, he loved him tenderly. Roger's end was as remarkable as his life. He had been occupied, as usual, one stormy night in the old churchyard of K—; and the storm he so delighted in, but too faithfully assisted the excavation he had made. A portion of the north wall gave way, and buried the picturesque old man beneath its ruin."

Poor dreamer! he had left his brother's house under the strong excitement of a new vision, and his end was in keeping with his life. The prosperity arising from the industry of the one brother, and the comfortless life and tragical end of the other, form the best commentary upon the most feasible means of obtaining a crock of gold.

SUPPOSED CHANGES IN THE WEATHER OF LATE YEARS.

ONE can scarcely meet with a single old or even middle-aged person now-a-days, who does not affirm and believe, that, within his own experience, the temperature of the weather, and indeed the general character of the seasons, have sustained some remarkable changes in our island. The warmth of our summers, and, still more particularly, the severity and duration of our winters, are represented by such individuals as having undergone most striking modifications. The same extremes, they say, either of heat or cold, of placidity or storm, are now unknown. It is not unusual, for instance, to hear aged country persons, both from their own recollections and the traditions handed to them by their fathers, allege that in times fifty to eighty years ago, the heat was so intense in summer that the labours of the field could not possibly be carried on at mid-day, and that for at least two hours daily, all out-of-door operations had to be suspended. They also tell similar stories respecting the intensity and length of the winters; so that, if they are to be believed, the weather is altogether a different thing in these degenerate days. In order to investigate the correctness of these reminiscences and traditions, we have thought it worth while to examine the Meteorological Records of our island during the past century, in order to see what the barometer and thermometer have to say on the point. Fortunately, we find the necessary materials for our purpose in the good old magazine files, which, though displaying nothing like the literary merit of the present monthly periodicals, contain a mass of useful matter of all kinds, for which posterity will look in vain in similar modern works.

The Scots Magazine presents regular, and, we have no doubt, pretty accurate monthly observations of the weather, as indicated by the barometer and thermometer, for a succession of years. We here give a table, showing the weather for the first twelve months on which continued and complete observations were made in the work alluded to. The choice, being made from this cause, is of course as impartial as may be. The first barometrical column shows the highest point, and the second the lowest, which the mercury attained at any time during each month; and the same with the thermometrical columns. The two columns of variations indicate the greatest change in the instruments during any twenty-four hours of the month. The observations in the table commence with April 1751, and end with March 1752. They were made in Edinburgh or its vicinity, but we are not told how often, or at what precise hours, the instruments were looked at.

	Barometer (in Inches and 10ths)			Thermometer (Degrees)		
	Highest.	Lowest.	Variation.	Highest.	Lowest.	Variation.
April 30-0	29-1	0-3		57-0	43-0	4-0
May 30-4	29-2	0-3		58-0	47-0	5-0
June 30-3	29-6	0-5		68-0	53-0	5-0
July 30-1	29-4	0-6		65-0	59-0	3-0
Aug. 30-3	29-4	0-3		64-0	57-0	3-0
Sept. 30-3	29-3	0-6		62-0	50-0	6-0
Oct. 30-4	29-4	0-3		56-0	46-0	5-0
Nov. 30-5	29-0	0-4		54-0	42-0	8-0
Dec. 30-4	29-5	0-3		51-0	37-0	6-0
Jan. 30-4	29-0	0-2		51-0	42-0	4-0
Feb. 30-2	29-4	0-3		51-0	38-0	5-0
Mar. 30-6½	29-3	0-4½		55-0	39-0	6-0

The writer of the table calls the reader's attention to the fact that the "barometer, according to these monthly calculations, never rose during the year above 30 inches 6½ tenths, and never subsided lower than 29 degrees; while the utmost ascent of the thermometer was 68 degrees, and its greatest descent 37 degrees, so that it only traversed, in the several changes from spring to spring, about 32 degrees in all." The severest cold of the year seems to have been in December, and yet the lowest point of that month was only 37 degrees, or 5 above freezing. November and January were 42 degrees, about the same as April.

"The greatest variation in the temperature during any twenty-four hours of the whole year was but 8 degrees."

The next year to which we shall refer, and the results of which may be compared with the preceding, is the twelvemonth beginning April 1818, which we again select from an accidental, and of course impartial, cause, it being the first year in which suitable observations were made in the new series of the Scots Magazine. The meteorological tables given in this work, and from which we extract the following calculations, were drawn up from a register kept near Perth, in latitude 56 degrees 25 minutes, and at the elevation of 185 feet above the level of the German Ocean. We arrange the table precisely in the form of the preceding one, to render the comparison easy and plain. The observations were made several times a-day.

	Barometer (Inches and 10ths)			Thermometer (Degrees)		
	Highest.	Lowest.	Variation.	Highest.	Lowest.	Variation.
April 30-5	28-9	0-5		58-0	26-0	26-0
May 30-3½	29-3	0-2½		71-0	38-0	23-0
June 30-4	29-2	0-5		79-0	45-0	25-0
July 30-2½	29-6	0-4		80-0	38-0	27-0
Aug. 30-2	29-3	0-4½		75-0	43-0	22-0
Sept. 30-1	29-1	0-5		68-0	36-0	20-0
Oct. 30-2	28-9½	0-6½		62-0	36-0	17-0
Nov. 30-0½	29-0	0-6½		56-0	33-0	16-0
Dec. 30-5	29-1	0-5½		50-0	24-0	20-0
Jan. 30-3½	28-7	1-1		52-0	21-0	17-0
Feb. 29-9	28-7½	0-7½		49-0	21-0	16-0
Mar. 30-1½	28-9	1-1½		55-0	26-0	18-0

The years to which these two tables (both made up from observations in the open air) refer, have been selected accidentally, it is to be remembered. The points given in each table are precisely the same, namely, the highest and lowest points of the two instruments, with the greatest variations in any twenty-four hours, in the course of every month. And what result do we find from comparing the two tables? One widely inconsistent, most certainly, with the notion that summers were warmer and winters colder many years back than they have been of late. As for the barometer, the mercury rose, during 1818, only to the same point or nearly so as in 1751 (the first being 30.5 and the other 30.6½ tenths); but during 1818, the barometer fell considerably lower than in 1751, 29 being the lowest point during the latter year, while in five months of the former twelve months, it fell below 29, and in January reached 28.7. What is of chief consequence, however, is the greater extent and rapidity of the variations in the barometer during 1818. The greatest variation in any twenty-four hours in 1751 was 6-tenths of an inch; in two months of 1818, the range extended to a degree and 1-tenth. Taking these single monthly variations as an indication of the general barometrical variations in both years, we arrive at the conclusion that the weather must have been less equable, or, in other words, must have shifted more rapidly from one extreme to another, in 1818, than in 1751.

The thermometrical tables present a much more remarkable contrast. While in 1751 the thermometer never rose above 68, and never fell below 37, we find it as high as 80 and as low as 21 in 1818. In three other months of the latter year, we find it as high as 71, 75, and 79, and in seven other months we have it so low as 36, 36, 33, 26, 26, 24, and 21 (a second time). All these months, therefore, exhibited extremes of temperature that, on the whole, render the year 1818 a striking contrast, both as regards heat and cold, to the year 1751. The winter and summer of the latter are remarkably mild in comparison. As respects the variations of temperature in any twenty-four hours of each month, the tables display a difference which proves the same point still more forcibly. While 8 degrees was the greatest change in any twenty-four hours of 1751, the least change in any month of 1818 was 16 degrees, and more often it ranged between 20 and 27, which last was the greatest variation.

Though taken at random, we are inclined to think, from recollection, that 1818 was considered a year somewhat warmer than common during the summer months. We therefore take the preceding year, 1817, the observations for which were made at the same spot on the banks of the Tay. The barometrical fractions in the following table are in a different form, and the variations are not given, but these points are not very important here.

	Barometer (Inches).		Thermometer (Degrees).	
	Highest.	Lowest.	Highest.	Lowest.
January	30-360	28-340	56-0	25-0
February	30-450	28-900	54-0	29-0
March	30-250	28-465	52-0	22-0
April	30-580	29-560	63-0	27-0
May	30-180	29-070	57-0	33-0
June	30-160	29-110	76-0	41-0
July	29-950	29-185	66-0	44-0
August	29-990	28-905	65-0	42-0
September	30-090	28-490	69-0	35-0
October	30-350	28-555	51-0	29-0
November	30-250	28-890	56-0	30-0
December	29-956	28-293	46-0	15-0

It will be apparent to every one that this table confirms the deductions made from the preceding ones. The winter cold of 1817 presents a great contrast, as far as these tables go, to that of 1751-2, and the thermometer rose higher, too, in the summer months. We cannot tell what were the greatest variations in any twenty-four hours of the months of 1817, but we

may conclude from the differences between the highest and lowest points of the same months, that the daily variations much exceeded those of 1751-2.

This comparison would lead one to think that the equability of the weather in 1751 must have been, on the whole, somewhat uncommon. The way to discover the truth of the matter is, of course, to turn to other years. In the Scots Magazine for 1755, we find tables of the weather copied from the Gentleman's Magazine, and which must have been made up in England, probably at London. In January, February, November, and December, of 1755, the highest and lowest points of temperature are stated, respectively, at 50 and 27, 44 and 31, 55 and 28, and 50 and 34. For May, June, July, and August, of the same year, we find the highest points of the thermometer to be, respectively, 65, 77, 70, and 66.

The highest and lowest points of the thermometer in the two first and two last months of 1785, as observed at Edinburgh, were respectively 48 and 27, 39 and 21, 50 and 29, 45 and 23. The highest and lowest points of the thermometer during the three summer months of the same year were respectively 89 and 43, 83 and 46, 67 and 40. The highest and lowest points in January, February, November, and December, of 1788, were respectively 50 and 25, 47 and 20, 55 and 29, 44 and 18. The highest and lowest points during the three summer months of the same year, were respectively 78 and 43, 72 and 45, 76 and 43. In the year 1787, we find the greatest heat of any day in July to have been 77.

We thus see, by irrefragable evidence, that in these years, selected at random from the last century, there was the same mixed hot and cold weather as we now experience—the summers abounding in cold disagreeable days, and the winter's cold interrupted by occasional mild weather. The conclusion to which every candid mind will arrive is, that it is in a great measure an erroneous conception, that the winters were so much colder and the summers so much warmer in past years than they are now. The reason, it seems to us, why the belief alluded to is entertained by people of advanced years, is simply, that the very hot years and very cold years which they have seen in the course of their lives, have left a strong impression on their minds, while all the others have been forgotten. Thus, on calling up their weather recollections, they find only a number of these remarkable years engraven on their memories, and as the intervals are blank, they not unnaturally fill up the picture with tints of the same kind as those remembered.

PICTURE OF A GERMAN STUDENT.

THE German gentleman is well known to be upon the whole a dull and phlegmatic being. His character has, however, one short period of fermentation, during which it takes sufficiently fantastic forms. This is the university-attending period. The singular peculiarities which then shine forth in him have attracted much attention amongst other nations, and many sketches of the *burachen*, as the students are called, have been presented in our own literature. We remember none that have given us more amusement than the following, which occurs in a clever novel recently published under the title of "Morton of Morton's Hope: an Autobiography."—

"The next morning I lounged up the Weender Strasse. The day was fine, and the streets were thronged with more than the usual number of Students and Philistines. As I got near the end of the street, I saw one or two small boys, and half-a-dozen house-maids, looking with wonder at a strange figure, preceded by a strange dog, that was passing along the side-walk. On looking at him at first, at a short distance, I took him for a maniac escaped from the lunatic asylum. He wore a cap, embroidered in crimson and gold, shaped like a shaving basin, and of the sort usually denominated beer-caps, a dressing-gown of many colours, strapped tightly about his loins with a leather girdle, in which were thrust two horse-pistols, and a long basket-hilted 'schläger,' or duelling-sword, and on his feet a pair of red Turkish slippers. His neck was open, and his legs bare from the ankle to the knees. In one hand he brandished an oaken cudgel, and in the other he held a small memorandum-book. He was preceded by a small dog of the comical breed called 'Deckel,' a kind of terrier, which considerably resembles the English turnspit. The individual one which now presented itself, was, like all its class, as ugly as a dog can well be. His body was very long, and his legs very short; his colour was a mixture of black and a dirty red; his tail curled itself as gracefully as a pig's, his knees were bowed outwards, so as to form a perfect parenthesis, and he turned out his toes like a country dancing-master. In order to heighten the effects of these personal charms, his master had tied a wreath of artificial flowers round his neck, and decorated his tail with fancy-coloured ribbons. Attired in this guise, the dog and his master proceeded gravely down the street, apparently without heeding the laughter of the admiring spectators. There seemed to be no students in the immediate vicinity, and the Philistines were beneath his notice. As I approached him, I observed something familiar in his countenance, and, immediately afterwards, the singular individual caught me by the hand, and kissed me affectionately on both cheeks. It was Rabenmark, my Leipzig acquaintance. He invited me to accompany him to his rooms, and smoke a pipe. I complied, and turned about with him; and we continued our walk down the street.

A few minutes' walk brought us to his lodgings. We ascended two flights of stairs, and entered his apartment. The sitting-room was tolerably large, and in its furniture

and arrangements, a perfect specimen of a regular 'kneipe.' The floor was without carpet, and sanded; and the household furniture consisted of a table, a sofa, and half-a-dozen chairs of the most unpretending kind. The great expense had been, however, evidently made in providing the pipes, pictures, and other student luxuries. A large and well-executed engraving of a celebrated duel, which, from the notoriety of the combatants, and its tragical issue, had become historical, hung on the right side as you entered. On the left, the wall was covered with a large collection of 'silhouettes'; these are a peculiar and invariable characteristic of a German student's room. * * The third side of the room was decorated with a couple of 'schlagers,' or duelling-swords, which were fastened crosswise against the wall. * * On the fourth side of the room were ranged a collection of pipes, which were the pride of his heart. They were about twenty, ranged in a systematic row. The bowls were of porcelain, exquisitely painted; some with portraits of pretty women, some with copies from Ostade and Gerard Dow, and some with the arms of his intimate friends. The stem of each was about three feet in length, and of the fragrant polished cherry. The tassels were large and rich, and of every combination of Landsmanschaft colour. Besides these were half-a-dozen meerschams, of all the different kinds: there was the 'milk meerscham' from Vienna, exquisitely carved, and delicate as sugar work; the 'oil meerscham' from Hanover, carefully polished, and scientifically embrowned towards the bottom by its own smoke; besides the 'wax meerscham,' the 'raw meerscham,' and various others. Besides these articles, there were some half dozen engravings in frames, a fowling-piece, a sabre, and two or three different species of caps hanging in different parts of the room. 'There,' said Rabenmark, entering the room, unbuckling his belt, and throwing the pistols and schläger on the floor; 'I can leave my buffoonery for a while and be reasonable; it's rather tiresome work this renommising.' 'Have the kindness to tell me,' said I, 'what particular reason you have for arraying yourself and your dog in such particularly elegant costumes, and for making such an exquisite exhibition of yourself during your promenade?' 'No particular reason,' he answered: 'but it is about the most simple way of arranging matters on the whole. I am a fox. When I came to the university three months ago, I had not a single acquaintance. I wished to introduce myself into the best Landsmanschaft, but I saw little chance of succeeding. I have already, however, become an influential member. What course do you suppose I adopted to gain my admission?' 'I suppose you made friends of the president or senior, as you call him, and the other magnates of the club,' said I. 'No. I insulted them all publicly, and in the grossest manner. Look here,' he continued, taking down one of the schlägers from the wall, and showing me the list of the duels he had already perpetrated, written, according to an universal custom, on the white leathern lining of the hilt. The number of entries was already about fourteen. 'See,' said he; 'these first half dozen are the senior, con-senior, and some other members of the Pommerania; they were my first six duels.' 'I suppose you got well peppered by such old stagers,' said I; 'but I hardly see how that was to expedite your admission.' 'Oh! that was a very simple matter,' replied Rabenmark; 'for in the first place you are wrong in your flattering supposition. Instead of being peppered I was very successful; and after I had cut off the senior's nose, sliced off the con-senior's upper lip, moustachios and all, besides bestowing less severe marks of affection on the others, the whole club, in admiration of my prowess, and desiring to secure the services of so valorous a combatant, voted me in by acclamation.' 'Do you find any particular satisfaction,' said I, 'in your club, and the university life?' 'Oh, it is boy's play,' said he; 'but then I am a boy, in years at least. I have a certain quantity of time on my hands. I wish to take the university as a school for action. I intend to lead my companions here, as I intend to lead them in after-life. You see I am a very rational sort of person now, and you would hardly take me for the same crazy mountebank you met in the street half an hour ago. But, then, I see this is the way to obtain superiority. I determined at once, on arriving at the university, that, to obtain the mastery over my competitors, who were all extravagant, savage, eccentric, was to be ten times as extravagant and savage as any one else. You do not suppose I derived any particular satisfaction from tying up Fritz's tail with ribbons; but then it is as good a way of bullying as any other; and, besides, these student duels are capital exercise.' 'Suppose, however, that Mr Weissbier had happened to have been a less tractable person than he proved to be?' 'Why, I should have been obliged to shoot him.' 'You forget the less agreeable alternative. He might have done you the same favour.' 'Oh, no—impossible. I shall not die till I am nineteen years and nine months old. If I pass that period, I shall live some twelve or thirteen years longer; I forget the exact number; but I have it written down in my common-place book somewhere.' This I found afterwards to be a settled conviction. Nothing could induce Rabenmark to admit the possibility of his death till that age. It was a prediction in his family by some gipsy, I suppose, for he was, as I have said, a Bohemian. His age was, at the time of which I am writing, exactly eighteen and a half. 'Perhaps,' said he, politely, 'you would like to see a duel or two. They are very pretty gladiatorial exhibitions. There are always plenty going on every day, and they are quite as amusing as the *combats des animaux* at Paris.' 'I should have no objection,' said I, 'as it seems customary to admit spectators.' Here Rabenmark threw open the window, and called to a passing acquaintance. 'Katt! do you go "los" to-morrow afternoon?' (To go los, or loose literally, is the cant expression for fighting.) 'Yes; with Poppendorf,' was the answer. 'Very well. Oh! by the way, have the kindness to step to a certain Pott of the Bremen club, and to Kopp and Fizzleberg of the Brunswick, and challenge them each for me, on twenty-four gangs, small caps.' 'Very well. I shall see you at the Kneipe to-

night?' 'Yes. Adieu.' 'Adieu.' 'There, Mr Morton,' continued Rabenmark, 'you see in five minutes a student's whole life. A young man usually spends three years at the university. As most of the German universities are in coalition, whatever time he spends at one, is counted for him at the next, and he consequently usually passes a whole year at one, the next term at another, and so on. The first two years of the three, a student generally employs in fighting duels, and getting drunk. After he has fought his fifty or a hundred duels, and drunk as much beer as he is capable of, he usually, at the end of his second year, leaves his club, and spends his third and last year in diligent study. His examination—and a very strict one it is—succeeds: and if he can pass it, he receives his doctor's degree, whether of theology, philosophy, law, or medicine, and retires into private life.' 'But I suppose he remains a long time a troublesome and ferocious individual?' 'On the contrary. Nobody ever hears of him. It is a singular anomaly—the whole German student existence. The German students are no more Germans than they are Sandwich Islanders. They have, in fact, less similarity with Germans than with any other nation. You see in them a distinct and strongly characterised nation, moving in a definite though irregular orbit of its own, and totally independent of the laws which regulate the rest of the social system of Germany. It presents the singular phenomenon of a rude though regularly organised republic, existing in the heart of a despotism. In fact, every one of the main points of the German's character is directly the opposite of those of the German student. The German is phlegmatic—the student fiery. The German is orderly and obedient to the authorities—the student ferocious and intractable. The German is peaceable—the student for ever brawling and fighting. The German is eminently conservative in his politics—the student always a revolutionist. The government of all the German States is despotic—the student's whole existence is republican. The German is particularly deferent to rank and title. In the student's republic, and there alone, the omnipotent "Vou" sinks before the dexterous schläger, or the capacious "beer bummel." Lastly, the German is habitually sober, and the student invariably drunk."

BIOGRAPHIC SKETCHES.

ISAAC WATTS.

ISAAC WATTS was born at Southampton, in Hants, on the 17th of July 1674. His father kept a boarding-school in that town, and was a man of sense and education, besides being distinguished for the zeal and sincerity of his religious opinions. On the latter account, he is said to have suffered much inconvenience during the persecutions inflicted in the reign of Charles II. on the Protestant dissenters, to which class he belonged. It is not to be wondered at, under these circumstances, that young Watts should have been early imbued with a deep sense of religion. At the same time, he was noted, from his very childhood, for the sprightliness and vivacity of his wit, as well as for his arduous and success in the acquirement of the ordinary learning of the schools. Under the care of his father, and of the Rev. John Pinhorn, master of the free academy of Southampton, he made such proficiency in the Latin, Greek, and Hebrew tongues, that a subscription for his support at the university was proposed by those friends who witnessed this part of his career; but this aid was declined by the youth, as his acceptance of it might have been construed into a desertion of the dissenting body, to which he had already resolved firmly to adhere. In accordance with this determination, he was sent to London in 1690, to study the higher branches of knowledge at the academy of Mr Rowe, a dissenting clergyman of eminence. His progress here amply sustained the high promise of his preceding years.

In 1694, Isaac Watts returned to Southampton, and spent the ensuing four years partly in the house of his father, and partly at Stoke Newington, in the capacity of tutor to the family of Sir John Hartopp. On his twenty-fourth birthday he preached his first sermon, having previously prepared himself, by the most earnest study, for the assumption of the pastoral office, which he viewed as the great end and business of his life. He was soon afterwards chosen assistant to Dr Chauncy, and became that gentleman's successor in the year 1702. He had but a short time entered on his charge, however, when he was attacked by a severe and dangerous illness, which withdrew him for a long time from his public labours, and rendered the appointment of a helper necessary. After his recovery, Mr Watts continued to perform his duties without further intermission till the year 1712, winning the esteem of all around him by his learning, abilities, and piety.

Before the period mentioned, he had also earned the applause of the world in the character of a Sacred Poet. From the age of fifteen, according to his own statement, he had been addicted to versifying, and the natural bias of his mind gave a devotional cast to all the exertions of his muse. Between 1706 and 1712, he appears to have published his "Lyrical Hours, or

Poems chiefly of the Lyric kind;" a second collection entitled "Hymns and Spiritual Songs;" and an "Essay towards the Improvement of Psalmody." His principal subsequent efforts in poetry were his "Divine Songs and Hymns for Children;" the "Psalms of David, imitated in the language of the New Testament;" and a "Collection of Juvenile and Miscellaneous Pieces in Verse." The first of these works appeared in 1715, the second in 1718, and the last in 1734. A few poetical pieces were also found among his manuscripts, and published after his decease.

In his preface to one of the earliest of these works, the author enters into an animated defence of sacred poesy, and points out the extraordinary beauty of those portions of the Scriptural writings which bear this character. He closes his prefatory remarks with this modest avowal: "Let minds that are better furnished for such performances pursue these studies, if they are convinced that poesy can be made serviceable to religion and virtue. As for myself, I almost blush to think that I have read so little and written so much. I cannot court the world to purchase this book for their pleasure or entertainment, by telling them that any one piece entirely pleases myself. The best of them sinks below the idea which I form of a divine or moral ode. He that deals in the mysteries of heaven, or of the muses, should be a genius of no vulgar mould." The world, fortunately for the fame of Isaac Watts, saw more beauty in his productions than had been apparent to his own severely critical eye. We shall give to those not well acquainted with his writings an opportunity, to a certain extent at least, of reviewing this judgment, though at the risk of quoting what many are already familiar with. The following piece, after some consideration, has been fixed upon as calculated to afford a fair idea of the style of the poems in the "Lyrical Hours." We give it nearly entire:—

HAPPY FRAILTY.

"How meanly dwells the immortal mind!
How vile these bodies are!
Why was a clod of earth designed
To enclose a heavenly star?"

Weak cottage where our souls reside!
This flesh a tottering wall—
With frightful breaches gaping wide,
The building bends to fall!
All round it storms of trouble blow,
And waves of sorrow roll;
Cold winds and winter storms beat through;
And pain the tenant-soul.

Alas, how frail our state!" said I,
And thus went mourning on,
Till sudden from the cleaving sky
A gleam of glory shone.

My soul felt all the glory come,
And breath'd her native air;
Then she remembered heaven her home,
And she a prisoner here.

Straight she began to change her key,
And, joyful in her pains,
She sang the frailty of her clay
In pleasurable strains.

"How weak the prison where I dwell!
Flesh but a tottering wall—
The breaches cheerfully foretell
The house must shortly fall.

No more, my friends, shall I complain,
Though all my heart-strings ache
Welcome disease, and every pain;
That makes the cottage shake!

Now let the tempest blow all round,
Now swell the surges high,
And beat this house of bondage down,
And let the stranger fly.

I have a mansion built above
By the Eternal Hand,
And should the earth's old basis move,
My HEAVENLY HOUSE must stand."

Another piece, much better known than the preceding, and certainly of higher merit, is that entitled the Day of Judgment—remarkable also as being one of the few compositions in which the peculiar structure of Latin verse has been successfully imitated in English.

When the fierce north-wind, with his airy forces,
Rears up the Baltic to a foaming fury,
And the red lightning with a storm of hail comes
Rushing amain down,

How the poor sailors stand amazed and tremble!
While the hoarse thunder, like a bloody trumpet,
Roars a loud onset to the gaping waters
Quick to devour them.

Such shall the noise be, and the wild disorder,
(If things eternal may be like these earthly)
Such the dire terror when the great Archangel
Shakes the creation;

Tears the strong pillars of the vault of heaven,
Breaks up old marble, the repose of princes;
Sets the grave open, and the bones arising,
Flames all around them.

Hark the shrill outcries of the guilty wretches!
Lively bright horror, and amazing anguish,
Stare through their eyelids, while the living worm lies
Gnawing within them.

Thoughts, like old vultures, prey upon their heartstrings—&c.

We have been unable to refrain here from marking in italics some particular expressions, which, for force and intensity, have scarcely any parallels in poetry. The remainder of the poem is equally impressive, but we prefer to leave space for some pictures of a milder kind from the pages of Watts. It is a curious proof (and many similar ones might be adduced) of the incalculable value of simplicity in literary composition, that those pieces which our author professedly "attempted in easy language for the use of children," are

in reality the most admired of all his poetical efforts with readers of every age and every degree of intellectual advancement. Unfortunately, he wrote but few poems of this kind, intending those which he did produce as merely "a slight specimen of moral songs, such as he wished some happy and condescending genius would undertake for the use of children, and perform them much better." It might have been difficult, however, to fulfil the latter point of this request, for few poets have ever produced anything so perfect in its way as

THE ROSE.

How fair is the rose! what a beautiful flower,
The glory of April and May!
But the leaves are beginning to fade in an hour,
And they wither and die in a day.
Yet the rose has one powerful virtue to boast
Above all the flowers of the field:
When its leaves are all dead, and fine colours are lost,
Still how sweet a perfume will it yield!
So frail is the youth and the beauty of men;
They bloom and look gay like the rose,
But all our fond care to preserve them is vain;
Time kills them as fast as he goes.
Then I'll not be proud of my youth or my beauty,
Since both of them wither and fade,
But gain a good name by well doing my duty:
This will scent, like a rose, when I'm dead.

The following is equally fine, and contains a moral which young and old may alike profit by.

THE ANT OR EMMET.

These Emmets—how little they are in our eyes!
We tread them to dust, and a troop of them dies
Without our regard or concern:
Yet, as wise as we are, if we went to their school,
There's many a sluggard, and many a fool,
Some lessons of wisdom might learn.
They don't wear out their time in sleeping or play,
But gather up corn on a sun-shiny day,
And for winter they lay up their stores:
They manage their work in such regular forms,
One would think they foresaw all the frosts and the storms,
And so brought their food within doors.
But I have less sense than a poor creeping ant,
If I take not due care for the things I shall want,
Nor provide against dangers in time;
When death or old age shall stare in my face,
What a wretch I shall be in the end of my days,
If I trifle away all their prime.
Now, now, while my strength and my youth are in bloom,
Let me think what will serve me when sickness shall come,
And pray that my sins be forgiven;
Let me read in good books, and believe, and obey,
That when death turns me out of this cottage of clay,
I may dwell in a palace in heaven.

It is from these and others of his minor pieces that we receive the most favourable idea of Watts as a poet. His larger odes and epistles are correctly and pleasingly written, and contain here and there fine thoughts and expressions, but they for the most part display too much of that quality of mediocrity which, according to the old critical canon, is tolerable in all things but verse.

In the year 1712, the ministerial labours of Mr Watts were a second time interrupted by a severe and lasting illness, which did not permit him again to officiate in public for four years, and left effects upon his constitution that were visible to the close of his days. It was at this period that he was invited to reside in the house of Sir Thomas Abney, of which he continued an inmate for the succeeding thirty-six years of his life. In this family "he enjoyed (says his biographer Dr Gibbons) the uninterrupted demonstrations of the truest friendship. Here, without any care of his own, he had every thing which could contribute to the enjoyment of life, and favour the unwearied pursuits of his studies. Here he had the privilege of a country recess, the fragrant bower, the spreading lawn, the flowery garden, and other advantages, to soothe his mind, and aid his restoration to health; to yield him, whenever he chose them, most grateful intervals from his laborious studies, and enable him to return to them with redoubled vigour and delight." The bulk of his prose works, both religious and philosophical, were composed during his residence with this truly friendly family; among these works, the treatise entitled "Logic, or the Right Use of Reason in the Inquiry after Truth," attained to particular and merited celebrity. Generally speaking, these productions are marked by great ability, good sense, and research. It might have been better, however, had he been able to throw off more completely the shackles of the schools, and given more liberal play to the workings of his own unbiassed intellect upon philosophical questions, as he declares his wish to do, in the following lines upon "True Philosophy," as he titles it:—

Custom, that tyranness of fools,
That leads the learned round the schools,
In magic chains of forms and rules,
My genius storms her throne!
No more, ye slaves, with awe profound
Beat the dull track, nor dance the round;
Loose hands, and quit the enchanted ground;
Knowledge invites us each alone.
I hate these shackles of the mind,
Forged by the haughty wise:
Souls were not born to be confined,
And led, like Samson, blind and bound;
But, when his native strength he found,
He well avenged his eyes.
Thoughts should be free as fire or wind;
The pinions of a single mind
Will through all nature fly:
But who can drag up to the poles
Long fettered ranks of leaden souls?

It was difficult for a philosophical inquirer in his day, however, to act up to these just and vigorous aspirations. The scholastic fetters were not yet rusted enough, or rather were still too firmly fastened on in youth, to be easily shaken off.

In 1728, the Universities of Edinburgh and Aberdeen did themselves honour by conferring on Watts, without his knowledge, the degree of Doctor in Divinity. On the 25th of November 1748, he died in the dwelling of which he had been so long a venerated inmate, at the age of seventy-four, and leaving behind him a reputation, from the moral beauty of which no detraction has ever been made.

THE SCOTCH COSTUMES OF LONDON ARTISTS.

It has long appeared to us a very curious thing, that English landscape painters, both professional and non-professional, both those who stay at home and those who travel to see nature and art as they actually exist, should continue, in spite of all representations to the contrary, to depict the people of the Lowlands of Scotland as dressed either in tartans or kilts. It seems to be of no use to tell our English friends that garments of that fabric or fashion are practically unknown in this portion of Scotland, and in fact never had an existence within it. Tartans and kilts they insist upon giving us, reason or no reason, to the end of the chapter. A sort of stupid ignorance is at the bottom of these gentlemen's conceit for the kilts. If they had read the history of our common country, or made the slightest inquiry, they would have learned that the Lowlands, consisting of the entire south, and a large tract of the east, of Scotland, are Anglo-Saxon, and have no more to do with the Highlands than the county of Middlesex has with Wales. Within this Lowland or Anglo-Saxon territory, which comprehends the cities of Edinburgh and Glasgow, and, with one or two exceptions, all the large towns in the country, the English language has been spoken, and the English dress worn, from a period coeval with their use in England. Making, however, no inquiry on the point, and guided only by the consideration that Highland regiments, and the equally conspicuous representations of Scotsmen at the doors of tobacconists' shops, are dressed in kilts, our English artists determine that all Scotsmen are kilted, and kilted they must be in all pictures accordingly. Thus, views of Edinburgh, executed in London, show the men on the streets dressed in kilts, the women dressed in tartan gowns and tartan boots, and carrying tartan parasols, the children wearing tartan bonnets, and the girls on the Calton Hill dressed in tartan petticoats, and spreading out washings of tartan shirts. People may laugh, but all this is true. We lately saw a picture of the pretty south-country town of Dumfries, executed in London, and in which every figure in the market-place was in kilts or tartans, or had something else Highland about them. One figure was particularly amusing. Over a respectable pair of trousers and frock coat, the draughtsman had hung a shaggy tasselled purse or sporran, such as is usually worn by a Highland soldier in full dress. Beyond this, ignorance and absurdity could scarcely be expected to go.

The travelling artists who execute these draughts of Lowland scenery, as we are told, are not the persons properly chargeable with the offence to which we allude. It seems that in most instances they leave the figures in their drawings to be filled in by a different class of persons in London, whose knowledge of Scottish costume is gained entirely from the aforesaid Highland regiments, the figures which decorate the shops of tobacconists, or the actors and actresses in the theatres. Be this, however, as it may, the offence against good taste and truth is the same.

It may appear somewhat farcical that we should trouble ourselves to notice these petty errors of taste in English landscape painters. To speak quite honestly, we might have allowed the matter to pass as it has hitherto done, if it had not afforded the materials of a little mirth. But it has also its serious side. It is, we apprehend, a fixed principle in pictorial delineation, that the painter shall truly, and with all the judgment he can command, represent nature as she really is, not as she is arbitrarily supposed to be. To be faithful to nature, each country ought to be represented only with its own proper costumes, not those of another. But it may be answered, the English generally do not comprehend the difference between the Highlands and Lowlands of Scotland. Exactly so: they are ignorant, and studiously remain in ignorance, of certain historical facts with which they should be made acquainted in youth. The history of Greece and Rome are made the subjects of regular study at schools in England, but the history of Scotland, an integral portion of the United Kingdom, is rarely seen either in or out of school. One of the results of this kind of ignorance we now point out. There is an universal confusion of ideas as to Highlands and Lowlands in the English mind. In almost every pictorial representation of Scotland we see this confusion strongly portrayed.

We see it marked with equal strength in the acting drama. In the Italian Opera-House in London, in the piece called the *Bride of Lammermoor* (Lammermoor is a district of Scotland close to the English border) all the male characters, Mr Bidethebent excepted, are dressed in tartans and kilts. Bucklaw, a south-country laird, is in kilts, and young Ashton is dressed with a red coat and kilt, like an officer in a Highland regiment, while Lucy Ashton is garnished with a Highland bonnet and a tartan scarf. As for the Rev. Mr Bidethebent, who, being a clergyman, could hardly be put in a kilt with any show of decency, he is favoured so far as to figure in the black serge gown of a monk, and the long scoop-like hat of a Spanish priest. These things, we say, mark the little knowledge of the English on a very simple matter of national dress and manners. Perhaps the remarks we have made may attract the attention of professed critics in the fine arts, and be the means of curing an absurdity not very creditable to the taste of our southern neighbours.

WHAT CONSTITUTES A PATENT.

THE following explanations of what peculiarities in an invention are necessary in order that the inventor may obtain a patent, are from a newly published work of accuracy and research, and calculated to be of great use to both professional and unprofessional persons, entitled "A Manual of the Law of Scotland, by John Hill Burton, Advocate." It may be proper to state, that, in the original work, authorities are quoted for every fact stated.

"It is a requisite of any invention for which a patent may be obtained, that it be complete of its kind, constituting when embodied a vendible article. It is held that the discovery of a mere principle cannot be protected—a practical result in the form of an article of commerce must be shown; and so if one make a discovery in mechanics or chemistry, from which he expects great practical results to be attainable, while in the mean time he is unable to produce any, he cannot obtain a patent. The invention must have been made by the claimant of the patent, and not suggested by another person. It must not have been used before, either by the petitioner or any other person. By 'using' appears to be meant the employment for some article of trade. There are few cases in which one can avoid, in the literal sense, 'using' an invention before it can be pronounced successful. So, in the case of the refracting glasses, Dolland, who obtained a patent, was entitled to retain it, though Dr Hall had invented the same commodity, as the latter had not 'used it' by communicating the commodity to the public; the result would have been different had he used it as a vendible commodity, though he had concealed the method of construction. 'In a late instance,' says Mr Carmichael, 'at a trial of a patent cause, several witnesses spoke of having seen the invention at the workshop of the plaintiff's workmen some months before the sealing of the patent: this was not considered such a publication as to injure the validity of the grant.' It follows, that if several persons are in common aware of the same invention, no one of them can obtain a patent; but that, if several persons simultaneously make the same invention without communicating it to each other, or using it, he who first applies is entitled to a patent, to the exclusion of the others. It has to be observed, too, that use in one part of the United Kingdom will not invalidate a patent for any other part, if obtained by the original inventor or importer from abroad.

The law on this subject is now to a certain extent modified by statute. If it be found by verdict of a jury that a patentee is not the first inventor of part or the whole of the subject of his patent, some other person having previously invented or used it, or if the patentee himself discover this to be the case, he may petition the queen in council to confirm his patent, or grant a new one. The petition and objections are heard before the judicial committee, who, if they are satisfied that the patentee believed himself to be the first inventor, and that the invention had not been publicly used before the date of his patent, may recommend that the petition be acceded to. When a patent comes under judicial discussion, and the decision is in favour of the patentee, the judge can give a certificate of the fact, the effect of which is, that if the validity be again questioned, the certificate may be produced; and if the decision be in favour of the patentee, he is to receive treble costs, unless the judge specially certify that he should not.

It is specially provided in the English statute of James I., and would probably be held law in Scotland, that a patent may be obtained by the first user of a foreign invention. The above principles apply to such a case, and so a patent for a foreign machine was protected, though a model of the machine had been previously sent to England, the model not having been used.

The invention must be useful and beneficial; it would appear at first sight that there is little danger of a patent being disputed, unless the invention proves its utility by its vendibility, but a patent being held for a useless invention may be the means of preventing another person from applying that invention to some useful purpose. The invention must be completely new as to all material parts. It does not follow, however, that it must form a new article or commodity not previously known; it may be a new arrangement of things already known, or simply an addition to, or an improvement of, something already in use. 'An improvement on any known machine, whereby such machine is rendered capable of performing more beneficially,' is a fit subject for a patent; and so is any skillful arrangement of common materials, so as to make them productive of some beneficial effect not previously occasioned by them, as in the case of Mr Hartley's method of arranging iron plates in buildings as a protection from fire. In such cases, however, the patent must

be taken out only for the addition or improvement. It would appear that no person can obtain a patent for a mere improvement on a commodity for which another person is in possession of a patent—at least to the prejudice of the patentee; and it is held 'that where an improvement to a patent is made after the enrolment of the specification, it becomes the property of the patentee, provided that the improvement cannot be used of itself, but, to be useful, must be superadded to the patented invention.' Though the applicant must be the sole inventor, it is not necessary that he must have gone through the process connected with the first construction with his own hands. 'The rule of law respecting the assistance from servants may be thus stated. If the servant make a new discovery by himself, such invention becomes his property; but if the master plans and the servant only executes with alterations of his own, then the master is the true inventor of the machine.'

A patent may be taken out for a combination of previously known machines or commodities, if the invention of the new combination be all that is claimed, or for an addition to any existing combination, if no more than the addition be taken credit for.

'The application of a known substance or material to a new purpose, when there requires art to adapt it, is the subject of a patent.' This is well illustrated by the case of the patent for percussion-locks. The detonating powder used for the purpose was well known before, but the patentee having first applied it as a priming for fire-arms, and used a lock adapted to the purpose, the application of locks of a different construction was held an infringement. It is observed that the use of the lock by the patentee, in this case, was necessary to convert his discovery into a vendible commodity, and that he could not have supported a patent for the mere 'application of certain well-known explosive mixtures as priming for fire-arms, without going into a detailed account of how that was to be done.'

The title under which the patent is petitioned for is an object of great importance, as it is by the applicability of the title to the thing said to be invented that the lodger of a caveat knows whether the application will interfere with himself or not. It must convey an idea of what has been invented, but of nothing more. Thus, Lord Cochrane's patent for naphtha-lamps was found void, because it was called 'a method or methods of more completely lighting cities, towns, and villages,' whereas, though it was only for such a purpose that his invention could apparently be used, from the noxious nature of the materials, the invention was after all but a lamp suitable for the purpose of burning naphtha, and should, it was said, be called so. Where Mr Wheeler invented a method of colouring porter by a small quantity of deep-coloured malt mixed with pale malt, instead of the old practice of preparing the whole malt of a certain depth of colour, and called the invention 'a new and improved method of drying and preparing malt,' it was said that there was no new method of drying and preparing malt in the invention, but merely a new way of colouring porter, and that it should have been called 'a new method of preparing malt for the purpose of colouring beer or porter.'

The title must not contain more uses for the commodity than those which it is adapted to; so Felton's patent in 1827, for 'a machine for an expeditious and correct mode of giving a fine edge to knives, razors, scissors, and other cutting instruments,' was held bad, because the machine described would not sharpen scissors."

WELEES AND DERVISHES.

ONE of the most amusing chapters in Mr Lane's work on the Manners of the Modern Egyptians, is that upon the Mahomedan saints who are seen in Cairo and other parts of Egypt. These men, who are called *welees*, and who are under the direction of a superior termed the *kootb*, lay claim to a miraculous knowledge of things concealed from the senses of ordinary mortals, and for this, and their excessive devotional spirit, are held in extreme veneration by the people. "If a person (says Mr Lane) were to express a doubt as to the existence of true *welees*, he would be branded with infidelity, and the following passage of the Koran would be adduced to condemn him: 'Are not the favourites of God those upon whom no fear shall come, and who shall not be grieved.' This is considered as sufficient to prove that there is a class of persons distinguished above ordinary human beings." And the *welees* take care to impress the belief that they are the persons meant.

Commissioned by the *kootb*, the *welees* perform the office of religious watchmen in certain districts of Cairo, and in the performance of which office they have opportunities of showing their supernatural acquirements. Mr Lane tells the following story of a devout tradesman, who, being exceedingly desirous of being made a *welee*, applied to the *kootb*, and he was appointed accordingly. "His prayer was granted; the *kootb* said, 'Take charge of the district which consists of the Durb-el-Ahmar and its immediate neighbourhood;' and immediately the person thus addressed found himself a *welee*, and perceived that he was acquainted with things concealed from ordinary mortals. As soon as he had entered upon his office, he walked through his district, and seeing a man at a shop, with a jar full of boiled beans before him, from which he was about to serve his customers as usual, took up a large piece of stone, and with it, broke the jar. The bean-seller immediately jumped up, seized hold of a palm-stick that lay by his side, and gave the *welee* a severe beating; but the holy man complained not, nor did he utter a cry: as soon as he was allowed, he walked away. When he was gone, the bean-seller began to try if he could gather up some of the scat-

tered contents of the jar. A portion of the jar remained in its place; and on looking into this, he saw a venomous serpent in it, coiled round, and dead. In horror at what he had done, he exclaimed, 'There is no strength nor power but in God! I implore forgiveness of God, the Great! What have I done! This man is a *welee*, and has prevented my selling what would have poisoned my customers.' He looked at every passenger all that day, in the hope of seeing again the saint whom he had thus injured, that he might implore his forgiveness; but he saw him not, for he was too much bruised to be able to walk. On the following day, however, with his limbs still swollen from the blows he had received, the *welee* limped through his district, and broke a great jar of milk at a shop not far from that of the bean-seller, and its owner treated him as the bean-seller had done the day before; but while he was beating him, some persons ran up, and stopped his hand, informing him that the person whom he was thus punishing was a *welee*, and relating to him the affair of the serpent that was found in the jar of beans. 'Go and look,' said they, 'in your jar of milk, and you will find at the bottom of it something either poisonous or unclean.' He looked, and found in the remains of the jar a dead dog. On the third day, the *welee*, with the help of a staff, hobbled painfully up the Durb-el-Ahmar, and saw a servant carrying upon his head a supper-tray covered with dishes of meat, vegetables, and fruit, for a party who were going to take a repast in the country. He put his staff between the servant's legs, and overthrew him, and the contents of the dishes were scattered in the street. With a mouth full of curses, the servant immediately began to give the saint as severe a thrashing as he himself expected to receive from his disappointed master for this accident; but several persons soon collected around him, and one of these bystanders observed a dog eat part of the contents of one of the dishes, and a moment after fall down dead; he instantly seized the hand of the servant, and informed him of this circumstance, which proved that the man whom he had been beating was a *welee*. Every apology was made to the injured saint, with many prayers for his forgiveness; but he was so disgusted with his new office, that he implored God and the *kootb* to release him from it, and, in answer to his solicitations, his supernatural powers were withdrawn, and he returned to his shop more contented than before. This story is received as true by the people of Cairo, and therefore I have inserted it; for in treating of superstitions, we have more to do with opinions than with facts. I am not sure, indeed, that it is altogether false: the supposed saint might have employed persons to introduce the dead serpent and dog into the vessels which he broke. I am told that many a person has obtained the reputation of being a *welee* by artifices of the kind just mentioned."

Mr Lane afterwards mentions that there are many instances of *welees* afflicting themselves by austerities similar to those practised by the fanatical devotees in India. "At present (he continues) there is living in Cairo, a *welee* who has placed an iron collar round his neck, and chained himself to a wall of his chamber, and it is said that he has been in this state more than thirty years: but some persons assert that he has often been seen to cover himself over with a blanket, as if to sleep, and that the blanket has been removed immediately after, and nobody found beneath it! Stories of this kind are related and believed by persons who in many respects are endowed with good sense; and to laugh, or express discredit, on hearing them, would give great offence. I was lately told, that a certain *welee* being beleaded, for a crime of which he was not guilty, his head spoke after it was cut off; and, of another decapitated under similar circumstances, that his blood traced upon the ground, in Arabic characters, the following declaration of his innocence: 'I am a *welee* of God, and have died a martyr.'"

Dervishes, or *Durweeshes*, are a different class of holy men among the Mahomedans; they seldom aspire to the character of *welees*. Dervishes are of various orders, and seem to be united in fraternities, very much like freemasons in this country. Some are agriculturists or tradesmen, who only assist at particular rites and ceremonies; others are entirely devoted to religious exercises; and a few lead a wandering life, and subsist on alms, which they often demand with great effrontery. The religious exercises of dervishes consist, for the most part, of the repetition of certain pious exclamations in a chanting tone for hours together, or of dancing in a circle in a truly maniacal manner to tunes played upon a flute and drum. One order of dervishes follows the occupation of charming away serpents from houses, and another order pursues a new profession, namely, that of bringing a blessing into dwellings by introducing calves, which are trained to perform certain tricks, and are called after particular saints deceased. "A venerated saint (says Mr Lane) called El Azab, who lived at Tefahineh, a village in Lower Egypt, had a calf which always attended him, brought him water, &c. Since his death, some Riffae dervishes have been in the habit of rearing a number of calves at his native place, or burial place, above named; teaching them to walk up stairs, to lie down at command, &c., and then going about the country, each with his calf, to obtain alms. The calf is called 'Egl El-Azab,' the calf of El-Azab. I once called into my house one of these dervishes with his calf, the only one I have seen. It was a buffalo calf,

* Edinburgh, Oliver and Boyd. 18mo, pp. 714.

and had two bells suspended to it, one attached to a collar round its neck, and the other to a girth round its body. It walked up the stairs very well, but showed that it had not been very well trained in every respect. The Egl El-Azab is vulgarly believed to bring into the house a blessing from the saint after whom it is called."

THE DAGUERRETYPE.

IN consequence of an agreement with the French government, by the terms of which M. Daguerre and his partner M. Niepce receive a divided annuity of ten thousand francs (L.416, 13s. 4d.), the true and perfect method of Photogenic Drawing, upon the principles of the Daguerreotype, has now been made public by the inventor. The pamphlet in which the stipulated disclosures appear, has been excellently translated by Dr J. S. Memes, and of this version we avail ourselves in laying before our readers a summary of the facts now brought to light on this interesting subject.

M. Arago, in reporting on the matter to the Chamber of Deputies, traced the history of the invention in a clear and eloquent way. After describing the discovery and gradual perfecting of the camera, he says, in allusion to that instrument, "No person has ever witnessed the neatness of outline, precision of form, the truth of colouring, and the sweet gradations of tint, without regretting that an imagery so exquisite and so faithful to nature could not be made to fix itself permanently on the tablet of the machine—who has not put up his aspiration that some means might be discovered by which to give reality to shadows so exquisitely lovely? Yet, in the estimation of all, such a wish seemed destined to take its place among other dreams of beautiful things—among the glorious but impractical conceptions in which men of science and ardent temperament have sometimes indulged. This dream, notwithstanding, has just been realised." M. Arago then adverts to the property possessed by nitrate or chloride of silver, of becoming black by the action of light. This property was early known to chemists, but no one seems to have thought of turning it practically to account in the production or reproduction of drawings, till Mr Wedgwood, in 1802, proposed a mode of copying window-paintings by means of paper washed with chloride of silver. Subsequently, many persons were in the habit, for mere amusement, of making experiments on the same principle. Betwixt the sun and prepared paper they placed an engraving, which was quickly reproduced on the paper beneath, but with the lights and shadows reversed. This arose from the dark parts of the engraving intercepting the light, while it passed more or less freely through the other portions. But the fruits of these experiments were totally valueless, as they could not even be looked at for a few minutes without becoming one entire black blank, through the continued action of the light. M. Niepce, a country gentleman living near Chalons, on the Saone, engaged, so early as 1814, in a train of experiments for the fixation of the photogenic images, both as they were obtained through the camera and by other means. He had made some remarkable discoveries on the subject previously to 1826, when he accidentally learnt that M. Daguerre, a Parisian artist of high reputation, was deeply occupied with similar studies. This led to a partnership between these gentlemen, for the further prosecution of the subject to their mutual advantage; and at the death of M. Niepce in 1833, the connection was kept up by his son. The complete and admirable process ultimately discovered, was in a great measure, however, the result of the single and unaided labours of M. Daguerre. What that process is, we have now to display from the inventor's own description of the Daguerreotype and its operations—or, in other words, of the apparatus for photogenic painting, and its mode of use.

"The designs (says M. Daguerre) are executed upon thin plates of silver, plated on copper. Although the copper serves principally to support the silver foil, the combination of the two metals tends to the perfection of the effect. The silver must be the purest that can be procured. As to the copper, its thickness ought to be sufficient to maintain the perfect smoothness and flatness of the plate, so that the images may not be distorted by the warping of the tablet; but unnecessary thickness beyond this is to be avoided on account of the weight. The thickness of the two metals united ought not to exceed that of a stout card. The process is divided into five operations."

The First Operation is that of *preparing the plate*, which is commonly from six to eight inches long, by four or six in breadth. In the original pamphlet, as well as the translation by Dr Memes, engravings are given of the various articles and instruments required in the different processes. The materials for the first operation are, olive oil, fine cotton, finely ground and dried pumice-stone, a phial of nitric acid diluted with sixteen parts of distilled water, and a wire frame for placing the plate upon, while heat is applied to it by a spirit-lamp. With these articles the plate is thus prepared. "The size of the plate will depend of course on the dimensions of the camera. We must begin by polishing it carefully. To accomplish this, the surface of the silver is powdered all over with the pumice, by shaking the bag without touching the plate.

Next, with some cotton dipped in a little olive oil, the operator rubs the plate gently, rounding his strokes. During this operation, the plate must be laid flat upon several folds of paper, care being taken to renew these from time to time, that the tablet be not twisted from any inequality in the support. The pumice must be renewed and the cotton changed several times. It will be readily apprehended of what importance it is to attend to these directions, since upon the high polish of the silver depends in a great measure the beauty of the future design. When the plate is well polished, it must next be cleaned by powdering it all over once more with pumice, and rubbing with dry cotton, always rounding and crossing the strokes, for it is impossible to obtain a true surface by any other motion of the hand. A little pledget of cotton is now rolled up and moistened with the diluted acid already mentioned, by applying the cotton to the mouth of the phial and inverting it, pressing gently, so that the centre only of the cotton may be wetted and but slightly, care being taken not to allow any acid to touch the fingers. The surface of the plate is now rubbed *equally* all over with the acid applied by the pledget of cotton. Change the cotton repeatedly, and keep rubbing, rounding as before, that the acid may be equally spread, yet in so small a quantity as just to skim the surface, so to speak. It will be seen when the acid has been properly diffused, from the appearance of a thin veil spread regularly over the whole surface of the plate. Once more powder over pumice, and clean it with fresh cotton, rubbing as before, but very slightly.

The plate is now to be subjected to a strong heat. It is placed upon the wire frame, the silver upwards. The spirit-lamp is applied below the hand, moving it round, the flame touching and playing upon the copper. This operation being continued at least five minutes, a white strong coating is formed all over the surface of the silver, if the lamp has been made to traverse with proper regularity; the lamp is now withdrawn. A fire of charcoal may be used instead of the lamp, and is perhaps preferable, the operation being sooner completed. In this latter case the wire frame is unnecessary, because the plate may be held by one corner with pincers, and so held over the fire, moving it at the same time till all is equally heated, and the veil appear as before described. The plate is now to be cooled *suddenly*, by placing it on a cold substance, such as a mass of metal or stone, or, best of all, a marble table. When perfectly cold, it is to be again polished; an operation speedily performed, since the gummy appearance merely has to be removed, which is done by the dry pumice and cotton repeated several times, changing the cotton frequently. The polishing being thus completed, the operation of the acid is to be repeated three different times, dry pumice being powdered over the plate each time, and polished off very gently with the cotton, which must be very clean, care being taken not to breathe upon the plate, or to touch it with the fingers, or even with the cotton upon which the fingers have rested, for the slightest stain upon the surface will be a defect in the drawing. Lastly, every particle of dust is removed by gently cleaning the whole edges and back also with cotton."

The Second Operation consists in *coating the plate*. M. Daguerre's great merit undoubtedly lies in his discovery of the use of iodine, in producing a sensitive coating to receive the images photogenically. The coating operation, it need only be mentioned, requires a small quantity of broken iodine, and a small square box. In the middle or upper part of this box, the plate is fixed horizontally, with its face downwards, having been previously fixed on a board by means of side-catches and bands of the same metal as the plate. At the bottom is placed a quantity of the iodine in a small saucer, and the exhalation rising from it, at a natural temperature, gives a decided *gold tinge* to the plate. The time required for this varies from five minutes to half an hour, and the plate must be taken out on the instant of its reaching the pure gold tinge, as the plate is useless, if it passes that hue. An examination, therefore, must be made now and then by lifting the plate, but this must be performed quickly, that the light may not act on the surface. The whole of these operations, indeed, must be performed in a darkened apartment. By using a taper, there is least chance of injury to the plate from the light. A piece of gauze, stretched across the box between the iodine and the plate, is used to regulate the evaporation.

The Third Operation consists in placing the plate, now of a gold tint, in the camera, to receive the required image or images. The camera must be previously fixed in the proper position, and the focus adjusted and tested by a piece of white paper, as in

ordinary cases. Avoiding light and contact, the plate is then quickly placed in the camera, along with the board on which it was fixed, as already mentioned, with plated bands and tacks holding it down by the edges. When the aperture of the camera is opened, the operator has nothing to do but to take up his watch, and stand by till the proper time for removal. Unfortunately, that time is difficult to ascertain. When the external objects are brilliantly illuminated by the sun, three minutes will complete the operation. When there is little light reflected from external objects, from three to twenty minutes will be required. The operator must make the best guess he can upon the principle now stated. There is nothing visible on the plate when taken from the camera, so that he has no guide in this respect. In northern latitudes, more time will always be necessary than in more southerly climes, where the intensity of the sun-light is greater.

When the plate is removed from the camera, it is subjected to the Fourth or Mercurial Operation, by means of which the images are *disengaged*, or developed. The chief apparatus here required consists of a tall square-sided box, fully the breadth of the plate, and more than twice as high, reckoning the limbs on which it stands. Daguerre seems to have this box, in whole or in part, made of black iron, but does not assign any reason for preferring such a material to wood. The box, however made, should have a hinged top, and a small glass window in the upper part of one of its sides, and should be open below in such a way that a spirit-lamp may be applied to the under part of a cup, placed in the bottom of the box, and containing three ounces of mercury. In this mercury the bulb of a thermometer must be placed, and the upper part of this instrument must be visible. In a box made of wood, the upper part of the thermometer may be passed through a hole in one of the sides, the instrument lying angularly. Such is the arrangement in the under part of this apparatus. The upper portion must be so arranged that the plate, with the board on which it is placed, can be fixed across the interior of the box at an angle of 45 degrees, the face of the plate downwards, in order to receive the fumes of the mercury. The top or door of the apparatus is then gently shut. "When all things are thus disposed, the spirit-lamp is lighted, and placed under the cup containing mercury. The operation of the lamp is allowed to continue till the thermometer, the bulb of which is covered by the mercury, indicates a temperature of 60 degrees centigrade. The lamp is then immediately withdrawn; if the thermometer has risen rapidly, it will continue to rise without the aid of the lamp, but this elevation ought not to exceed 75 degrees centigrade.

The impress of the image of nature exists upon the plate, but it is invisible. It is not till after the lapse of several minutes that the faint tracery of objects begins to appear, of which the operator assures himself by looking through the glass, by the light of a taper, using it cautiously, that its rays may not fall upon and injure the nascent images of the sketch. The operation is continued till the thermometer sink to 45 degrees centigrade; the plate is then withdrawn, and this operation completed."

The Fifth Operation consists in the fixing of the impression or image, by removing the coating of iodine, on which the light would still act. A saturated solution of common salt, filtered and warmed, or, what is better, a weak solution of hyposulphite of soda, not heated, some cold distilled water, and some warmed distilled water, with two (sheet copper) troughs, are the chief materials required in this process. The plate, when removed from the mercurial box, is freed from the board attached to it, and plunged into one of the troughs, containing cold distilled water, care being taken not to touch the centre of the plate. It is again *immediately* removed, and plunged into the saline solution in the other trough, and, being laid there face upwards, is stirred about by means of a little copper-wire hook. The yellow tinge now leaves the plate; and when this is seen to have taken place, the plate is placed on an inclined plane (of japanned white iron), and distilled water, hot, but not boiling, poured freely over it. All these operations are but the work of a minute or two; and when the last is finished, the plate must be dried rapidly by blowing on it, and moving it in the air, else stains will be left on the drawing. After this, the drawing cannot be washed out; but rubbing, or the continued action of vapours, would destroy it. "To preserve these sketches, then, place them in squares of strong pasteboard, with a glass over them, and frame the whole in wood. They are thenceforth unalterable even by the sun's light."

These are the whole photogenic operations of M. Daguerre, detailed in as simple a manner as possible. Regarding the apparatus, it may be observed that the more closely the directions of the inventor are followed, the better, though, as in the case of the copper troughs for example, there is perhaps no great necessity for using the precise materials specified. Earthenware dishes, or ashets, as they are called, may do well enough. In some other respects, and particularly in the cleaning and preparing of the plates, the most minute attention must be paid to the directions given. The exclusion of light, also, and the avoidance of contact with the plates, must be pointedly attended to, and all the apparatus cleaned carefully after use.

When finished in a perfect way, the design on the plate is exquisitely beautiful, and though impression

of it cannot be multiplied as from a graven plate, it is in a perfect state for the engraver to copy, and he can do this with far more ease and correctness than in the case of ordinary drawings. We have seen one brought from Paris, and now in the possession of a gentleman in Edinburgh, which gives a representation of a portion of the streets of the French capital, and in a manner so minute, so delicate, and so wonderfully perfect in shading, as to give one a striking idea of what this invention will yet do for the fine arts. The plate seems to be about eight inches by six, and is set in pasteboard, glazed, and framed. The windows of the houses, blinds, sign-boards, stones of the pavement, and other points in the view, are brought out with great force. At the time we write, this specimen is the only one, we believe, yet brought from Paris; but, ere long, multiplied specimens will doubtless be in the hands of our countrymen, and these not the production of Parisian, but of native men of science. We have had the gratification of seeing M. Daguerre's processes practically worked out by one of our ablest chemists and experimenters, Dr Fyfe of Edinburgh. Though operating on plated copper not prepared for the purpose, and comparatively very imperfect in level and finish, Dr Fyfe has succeeded in making several very successful representations.

In England, a French artist of the name of Ste. Croix is at present exhibiting the wonders of the Daguerreotype. We find in a London paper the following remarks from a spectator of this gentleman's operations:—"The picture produced on the polished silver surface by these means is one of the most curious and beautiful objects of art that we have ever beheld. It is seen with all the truth and beauty of nature, as in a mirror, with the additional charm of brilliant concentration similar to that which is furnished by an opera glass, and (still more wonderful) with a soft tint of blue in the sky. M. de Ste. Croix assures us that the extent and distance of the landscape does not present any impediment to the success of his operations, and that the prospect of Paris taken from the Pont Neuf by M. Daguerre is quite as perfect as that taken across the street or across the table. The capacity of the Daguerreotype for doing justice to an 'interior' was pleasingly illustrated by a mirrored sketch of the artist's own table, with basin, ewer, towel, &c., of which the early sunshine had just completed a faithful picture as his visitors entered."

Although it is mentioned here that a "soft tint of blue" existed in the sky, we believe this to be a visual deception, arising from the admirable minuteness of the shading. M. Daguerre has nowhere alluded to the production of natural tints in his designs. At the same time, some doubt certainly appears to exist on this point. M. Arago, in his Report, speaks of the *couleur locale* of the plates, which expression Dr Memes professes himself unable to understand, "as photographic designs have no local colour." There are, indeed, many improvements yet to make in this art. The process is at present difficult, and the materials expensive. The rationale, moreover, of several of the processes, is not understood by the inventor himself, and operators are left without any determinate rules of guidance. But the matter is now handed over to the whole world of science, and we may confidently anticipate rapid improvements. No invention ever reached perfection in the very infancy of its course.

What we may yet expect from the Daguerreotype is finely shown by the philosophic Arago. "To copy the millions and millions of hieroglyphics which entirely cover to the very exterior the great monuments at Thebes, Memphis, Carnac, &c. would require scores of years, and legions of artists. With the Daguerreotype, a single man would suffice to bring to a happy conclusion this vast labour. Arm the Egyptian Institute with two or three of Daguerre's instruments, and on several of the large engravings in that celebrated work, the fruit of our immortal expedition, vast assemblages of real hieroglyphics would replace fictitious or purely conventional characters. At the same time, these designs shall incomparably surpass in fidelity, in truth of local colour, the works of the ablest artists. Again, these photographic delineations having been subjected, during their formation, to the rules of geometry, shall enable us, with the aid of a few simple data, to ascertain the exact dimensions of the most elevated parts, and of the most inaccessible edifices. The preparation employed by M. Daguerre is a re-agent much more sensible to the action of light than any other hitherto in use. Never have the rays of the moon, we do not say in a natural state, but even when concentrated by the most powerful lens, or in the focus of the largest reflector, been capable of producing any perceptible physical effect. The plated discs prepared by M. Daguerre, on the contrary, receive impressions from the action of the lunar rays and the succeeding operations to such an extent as permits the hope that we shall be in a situation to make photographic charts of our satellite. In other words, in a few minutes we shall be able to execute one of the longest, most tedious, and most delicate operations of astronomy.

Let us not hesitate, then, to announce the fact: the re-agents discovered by M. Daguerre will speed on-wards the progress of those sciences which confer the highest honour on the human mind. By their aid the philosopher will be enabled henceforth to proceed on the principle of absolute intensities; he will compare lights by their effects. If he find it useful, the same

tablet will present him with the impression of the dazzling beams of the sun, and with the pencillings of rays three hundred thousand times fainter than those of the moon—the rays of the stars. In short, when observers apply a new instrument to the study of nature, what they expected from it has always proved little indeed compared with the series of discoveries which the instrument originated. In this instance it is upon the *unforeseen* that we are especially to reckon." These deductions are not less just than sublime.

MARIANA.

[BY ALFRED TENNYSON.]

"Mariana in the moated grange."—*Measure for Measure.*

With blackest moss the flower-plots
Were thickly crusted, one and all,
The rusted nails fell from the knots
That held the peach to the garden wall.
The broken sheds look'd sad and strange,
Unlifted was the clinking latch.
Weeded and worn the ancient thatch,
Upon the lonely moated grange.
She only said, "My life is dreary,
He cometh not," she said:
She said, "I am aweary, aweary;
I would that I were dead!"
Her tears fell with the dews at even,
Her tears fell ere the dews were dried,
She could not look on the sweet heaven,
Either at morn or eventide.
After the flitting of the bats,
When thickest dark did trance the sky,
She drew her casement curtain by,
And glanced athwart the glooming flats.
She only said, "The night is dreary,
He cometh not," she said:
She said, "I am aweary, aweary,
I would that I were dead!"
Upon the middle of the night,
Waking she heard the nightfowl crow:
The cock sang out an hour ere light:
From the dark fen the oxen's low
Came to her: without hope of change,
In sleep she seemed to walk forlorn,
Till cold winds woke the grey-eyed morn
About the lonely moated grange.
She only said, "The day is dreary,
He cometh not," she said:
She said, "I am aweary, aweary,
I would that I were dead!"
About a stonecast from the wall,
A sluice with blacken'd waters slept,
And o'er it many, round and small,
The clustered marsh-mosses crept.
Hard by a poplar shook all day,
All silver green with gnarled bark,
For leagues no other tree did dark
The level waste, the rounding grey.
She only said, "My life is dreary,
He cometh not," she said:
She said, "I am aweary, aweary,
I would that I were dead!"
And ever when the moon was low,
And the shrill winds were up an' away,
In the white curtain, to and fro,
She saw the gusty shadow sway.
But when the moon was very low,
And wild winds bound within their cell,
The shadow of the poplar fell
Upon her bed, across her brow.
She only said, "The night is dreary,
He cometh not," she said:
She said, "I am aweary, aweary,
I would that I were dead!"
All day within the dreamy house,
The doors upon their hinges creak'd,
The blue fly sang i' the pane; the mouse
Behind the mouldering wainscot shriek'd,
Or from the crevice peep'd about.
Old faces glimmer'd through the doors,
Old footsteps trod the upper floors,
Old voices call'd her from without.
She only said, "My life is dreary,
He cometh not," she said:
She said, "I am aweary, aweary,
I would that I were dead!"
The sparrow's chirrup on the roof,
The slow clock ticking, and the sound
Which to the wooing wind aloof
The poplar made, did all confound
Her sense; but most she loath'd the hour
When the thick-motted sunbeam lay
Athwart the chambers, and the day
Downsloped was westerling in his bow.
Then, said she, "I am very dreary,
He will not come," she said:
She wept, "I am aweary, aweary,
Oh God, that I were dead!"

—Tennyson's Poems.

BANKING IN EARLY TIMES.

A banker in early times pursued a very different trade from that which occupies the attention of the opulent and influential class so called at the present day. It is well known that the latter derive their profits from the employment of fluctuating sums of money deposited in their hands for convenience and safety by the public, and for the security of which the respectability of the banker is a sufficient guarantee. But this is a refinement of comparatively recent introduction, with which our forefathers were wholly unacquainted. As late as the time of Swift, bankers gave and took a bond on receiving and lending money, and made their profit by obtaining a higher rate of interest, or usury as it was called, on the latter operation, than they allowed on the former. Ten or twelve per cent. was the customary rate of interest during the reign of Queen Elizabeth, at which period, we mean no disrespect to the banker when we say that he united in his person the trades of the usurer, the pawnbroker, the money-scrivener, the goldsmith, and the dealer in bullion. A German traveller who visited England in 1593, says that he saw in Lombard Street "all sorts of gold and silver vessels exposed to sale, as well as ancient and modern coins, in such quantities as must surprise a man the first time he sees and considers them."

It is a curious circumstance that Lombard Street should have retained its character as well as its name for about five centuries and a half; and it may not perhaps be out of place to mention, that within the last thirty years several gold and silver lacemen lived there, a link between the ancient and modern occupants of the street, which has now almost wholly disappeared.—*Life and Times of Sir Thomas Gresham.*

THE SILK-WOOL OF THE ALPACA.

At one of the meetings of the British Association at Birmingham, "Some remarks were made on the introduction of a species of Auchenia into Britain, for the purpose of obtaining wool, by Mr W. Danson. Samples and manufactured specimens of Alpaca wool, in imitation of silk (and without dye), as black as jet, were exhibited; and Mr Danson stated, that the animals producing it ought to be propagated in England, Ireland, Scotland, and Wales; and to the two latter places the Alpaca is well suited, being an inhabitant of the Cordilleras, or mountainous district in Peru. Importations have already taken place to the extent of one million of pounds, and are likely to increase. There are five species of Llamas, of which the Alpaca has fine wool, six to twelve inches long, as shown by the specimens exhibited, the Llamas, the hair of which is very coarse, and the 'Vicuna,' which has a very short fine wool, more of the beaver cast. The Earl of Derby has propagated the Alpaca in his private menagerie at Knowsley, and Mr Danson understood that Mr Stephenson, at Oban, in Scotland, has a few of these animals. The wool of these animals would not enter into competition with the wool of the sheep, but rather with silk. It is capable of the finest manufacture, and is especially suited to the fine shawl trade of Paisley, Glasgow, &c. The yarn spun from it are already sent to France in large quantities, at from 6s. to 12s. 6d. per pound, the price of the raw Alpaca wool being now 2s. and 2s. 6d. per pound. Mr Vigors stated, that one of the objects of the Zoological Society of London was to introduce animals which might be made available for draught, food, or clothing. Amongst others, this animal had been kept in the Society's gardens. They bred and looked well, but were subject to disease, which was the case with most foreign animals at first. Animals were generally found adapted to the districts in which they lived, as the camel, &c., but animals which afforded food and clothing are usually capable of universal dispersion, as the horse, sheep, &c. He believed that in the course of time the Llamas referred to would be acclimated amongst us. These animals also brought forth their young at an unseasonable period, Christmas; but in general animals changed their season of bringing forth, in order to adapt it to the climate they lived in."—*Athenaeum.* [We should like to hear of some further investigations into the subject; it is one of public importance.]

YANKEE PEDLAR.

A clever trick was played by a Yankee pedlar upon one of the captains of the steam-boats running from New York to Albany, on the Hudson river. The Yankee was fully aware of the custom of putting people on shore who attempted to gain a passage for nothing, and his destination was to a place called Poughkeepsie, about half way between New York and Albany. He therefore waited very quietly until he was within a mile or two of Poughkeepsie, and then went up to the captain. "Well, now, captain, I like to do things on the square, that's a fact; I might have said nothing to you, and run up all the way to Albany—and to Albany I must go on particular business—that's a fact; but I thought it more honourable like to tell you at once, I haven't got a cent in my pocket; I have been unfortunate; but, by the 'tarnal, I'll pay you my passage-money as soon as I get it. You see I tell you now, that you mayn't say that I cheat you; for pay you I will, as soon as I can, that's a fact." The captain, indignant, as usual, at being tricked, called him certain names, swore a small quantity, and as soon as he arrived at Poughkeepsie, as a punishment put him ashore at the very place the keen Yankee wished to be landed at.—*Captain Marryat's Diary in America.*

ACCIDENTAL DISCOVERY OF THE STEAM-ENGINE.

The discovery of the method of making a vacuum by the condensation of steam, was reproduced, before 1698, by Captain Thomas Savery. His discovery of the condensing principle arose from the following circumstance:—Having drunk a flask of wine at a tavern, and flung the empty flask in the fire, he called for a basin of water to wash his hands. A small quantity which remained in the flask began to boil, and steam issued from its mouth. It occurred to him to try what effect would be produced by inverting the flask and plunging its mouth in the cold water. Putting on a thick glove to defend his hand from the heat, he seized the flask, and the moment he plunged its mouth in the water, the liquid immediately rushed up into the flask and filled it. Savery stated that this circumstance immediately suggested to him the possibility of giving effect to the atmospheric pressure, by creating a vacuum in this manner. He thought that if, instead of exhausting the barrel of a pump by the usual laborious method of a piston and sucker, it was exhausted by first filling it with steam, and then condensing the same steam, the atmospheric pressure would force the water from the well into the pump-barrel, and into any vessel connected with it, provided that vessel were not more than about thirty-four feet above the elevation of the water in the well. He perceived also, that, having lifted the water to this height, he might use the elastic force of steam in the manner described by the Marquis of Worcester to raise the same water to a still greater elevation, and that the same steam which accomplished this mechanical effect would serve, by its subsequent condensation, to reproduce the vacuum, and draw up more water. It was on this principle that Savery constructed the first engine in which steam was ever brought into practical operation.—*Lardner's new work on the Steam-Engine.*

PRICE THREE HALFPENCE.

VISITS TO THE SCHOOLS IN DUBLIN.

HAVING long felt an interest in the condition and progress of elementary education in Ireland, I took the opportunity, during a late visit to Dublin, to make some personal inquiries on the subject, the result of which may not be uninteresting to the public. I knew no one connected with any of the existing systems of instruction, but it is impossible to be long in Dublin without gaining kind friends and acquaintances, who are willing to give all the explanations in their power, and to show what can be seen in the public institutions; and accordingly I had no difficulty in procuring the information which I required. A perambulation of the streets of Dublin for a few days, opens up to the stranger a new world of philanthropy. I was not prepared for the exhibition of so much benevolence on a large scale. Hospitals for the sick; institutions for the relief of poor householders, locally termed room-keepers; asylums for blind, and deaf and dumb; asylums for female domestic servants when out of place; orphan-supporting societies; missionary and other religious associations to a large amount; Sunday schools; a poor-house, supported by voluntary contributions, giving food daily to upwards of 2000 individuals;* and, lastly, certain large schools for the children of the humble classes—all served to show that benevolence, whether well or ill directed, was a conspicuous element in the social organisation. Conducted by a gentleman belonging to the town, I visited a house in Sackville Street (the great central thoroughfare of Dublin), consisting of two large mansions thrown into one, and which contained the office of a different benevolent institution in each apartment—a great cluster of offices forming the head-quarters of societies whose labours are extended all over Ireland. It would almost seem as if the religious differences of the country had stirred up an emulative spirit of philanthropy. I found gentlemen, for instance, devoting not a little of their leisure to the conducting of Sunday schools, who, if in this country, would most likely take no interest, and certainly no personal trouble, in such things. The "gentlemen of England, who live at home at ease," have no sort of notion how much time is frequently given up by their friends in Ireland, to projects for the melioration and enlightenment of the poorer order of people.

My design, however, is not to notice these efforts, but to give a general idea of what is doing in the way of educating the mass of the juvenile population of Ireland. I may begin by stating, that no people in the world are more alive to the value of education, or more capable of receiving instruction, than the Irish; with all their faults of an over-hasty inconsiderate temperament, and so forth, they are a remarkably shrewd and active-minded race, and possess a rare faculty for "uptake." Long before any of the new educational schemes were projected, there were many schools in which poor children were taught at the most insignificant cost, by a primitive order of teachers; the school-house being, perhaps, a mud-built hovel, perhaps a shed under a hedge, perhaps the lee side of a wall, and not unfrequently the only primers were the lettered grave-stones in the open churchyard; the same tablets serving, with a piece of chalk, as the only copy-books by which to give a knowledge of writing and arithmetic. I men-

tion this to show what an innate taste for learning has prevailed among even the very poorest Irish. And, unassisted by any species of endowment, or any patronage or countenance, they could not otherwise have preserved amongst them the elements of instruction. In one instance, as has been mentioned to me, such was the enthusiasm and philanthropy of a humble and poverty-struck teacher of youth, that he wandered over the country, offering to any one the boon of being taught to read, provided he would in return engage to teach other ten; the gratification of disseminating the blessings of a humble kind of education among his countrymen was his sole reward.

That a people who have shown such aptitude for literary instruction, should have been left so long utterly destitute of the means of regular education, is a fact not very creditable to those on whom the responsibility of such matters is supposed to fall. But that condition of things is past, so no more may be said about it. Thanks to the energy of the "Society for Promoting the Education of the Poor in Ireland," or Kildare Place Society, as it is usually termed, which first organised a pretty extensive system of school instruction throughout the country, and thanks to the more recent establishment of the National System of Education, the Irish are now in the fair way of receiving a proper share of moral, religious, and intellectual culture.

My first visit was to the establishment of the Kildare Place Society, which occupies two very large brick buildings, in a small square off Kildare Place, which is a street in the division of Dublin lying on the west side of the Liffey. Its situation, therefore, near the dense cluster of streets inhabited by the poor in this quarter of the town, is perfectly appropriate. At one time, as is perhaps well known, this society, which consists of a large body of influential individuals, received an annual grant of money from Parliament to carry on its operations, but that grant is now withdrawn, and the association conducts its educational schemes entirely by voluntary contributions. Notwithstanding this limitation of the means of support, which prevents it from any longer affording salaries to country teachers, the number of schools in connection with, and partly dependent on, the society, was in May last 1097. In 1816, it had only 8 schools; in 1820, it had 381; in 1824, it had 1490; in 1830, it had 1634, which was the highest number on its books; in 1834, the number was down to 1000, and is now, as stated, 1097. According to the best estimate which has been obtained, these 1097 schools contained 81,178 scholars. The annual revenue of the society is, I believe, between four and five thousand pounds, and last year the disbursements amounted to £4917, 8s. 2½d. The nature of the society's operations will be understood by a glance at a few of the payments which were made—as for example, £227 for conducting the model schools in Kildare Place, £170 on training of teachers, £825 on grants of books and school requisites to country schools, £1611 on the preparation of books and other requisites, the remainder being disbursements for inspection, and matters of a miscellaneous kind. The income is aided by school fees in the model school, and the sale of books and work. The preparation and dissemination of books suitable for school libraries, has always been a leading feature in the society's procedure. The volumes, of a small 18mo size, are about eighty in number, embracing a variety of entertaining subjects for youth. The society has since its commencement distributed 1364 libraries, comprising 127,390 volumes, and amounting in value, at reduced prices, to £3189, 10s. 2½d. There is a depository of books in one of the edifices in Kildare Place, very much resem-

bling a bookseller's shop, and from this the number of cheap books issued in the past year was 18,234, making a total since its opening of 1,636,025 volumes. Of the delight which this vast issue of innocently entertaining books must have produced among the young people of Ireland, during the last three or four and twenty years, who can give any estimate!

With these preliminary explanations in remembrance, we enter the large building which contains the model schools. These schools are contained in two very extensive and lofty apartments, that on the ground floor being for boys, and that which is above it for girls. Both seemed in a state of great efficiency, with pupils to the number of about 900—fee of each 1d. per week. Some of the classes were examined in our presence, according to the usual intellectual plan of teaching; that is, by a process of searching cross questions on the subjects of the lessons. The teachers were young men evidently skilled in this mode of tuition. I was particularly struck with the activity which was displayed in mental arithmetic. For example, the whole boys in the class were asked by us such questions as these—If a yard and three-quarters of cloth cost 7s. 6d., what will 7-8ths of a yard cost? What is the interest on £475 for a year and a half at the rate of £5 per cent. per annum? A dozen such queries were put and answered with amazing rapidity, the boy who first called out being asked to prove the accuracy of his answer, and he was generally successful. The Irish have an extraordinary faculty for both mental arithmetic and mathematical analysis. Their fondness for geometry as a branch of study is quite remarkable; and in some instances it has been carried to such a length as to exclude almost every other branch of knowledge. Hitherto the great dearth of works on geometry has been a matter of sore complaint to the poor Irish, but I was glad to learn that this has been removed by the publication of the cheap treatises with which I happen to be connected. Taking up one of these from a desk (Euclid's Elements of Plane Geometry), the master of the model school assured me—and I hope to be pardoned for feeling proud of the compliment—that the work had completely removed the difficulty which had been formerly experienced, and that the Irish were no longer debarred from pursuing their favourite branch of study.*

From the boys' school I was conducted up stairs to that of the girls, where a similar efficiency and order appeared to prevail. Under the direction of a mistress the girls were receiving lessons in the various branches of needlework, straw-plaiting, and knitting. They are taught to make and mend their own clothes, to shape and sew shirts, jackets, and other parts of male attire, also to knit and darn stockings, and patch holes in clothes in as neat a manner as possible. These exercises are conducted on a strictly methodic plan, there being a series of patterns of a small size to copy from. The book of patterns of gowns, shirts, frocks, jackets, stockings, petticoats, caps, &c., all made by the pupils, is a great curiosity in its way, each of the articles being about the length of a finger, and the whole looking like the wardrobe of a Lilliputian; copies are sent to all the schools in connection with the society, so that the girls in every district are taught to use their needle on an uniform plan. We have nothing of this kind in Scotland; where the parochial system makes no pro-

* At the period of my visit, this useful institution, which is the means of keeping the streets in a great measure clear of beggars, was in serious difficulties for lack of funds, as it depends entirely on voluntary contributions, or, in other words, the philanthropic are alone taxed for its support. The new poor-law, which will come shortly into operation, will put an end to this absurdity, by taxing all alike for the support of the necessitous.

* I allude to this as simply a statistical fact, and it may serve to throw some light on the subject, when I mention, that of the cheap edition of Euclid, published by W. and R. Chambers in their Educational Course, about as many copies are sold in Ireland as in all Great Britain. It was not till I visited Dublin that I could account for the large demand for this book among the Irish.

vision for the instruction of girls in these useful arts. I could not help remarking in this female model school of the Kildare Place Society, that there were many girls of a rank of life far above that of paupers or persons in moderately poor circumstances, and I was informed that it is no unusual thing for respectable shopkeepers to send their daughters here for education, although the charity (if I may call it such) is designed for the accommodation of the very humblest classes of society.

Having satisfied myself with respect to the Kildare Place model schools, I proceeded to make similar inquiries regarding those under the auspices of the National Board. It may be premised, that, as the Kildare Place Society from the outset insisted on the Protestant version of the Bible without note or comment being used in the schools under their superintendence, their labours, as might have been expected, proved useful almost exclusively to one portion of the people, comparatively few Catholics taking advantage of their liberality.* This gave rise, in 1831, to the establishment by the government of what has been called the National System of Education, the main feature of which is an arrangement by which the children are separated at certain times, and taught religion by their respective pastors—the necessary funds being provided by the state. By this means it was hoped that the great body of the people, and more particularly the children of the poorer class of Catholics, would at length be brought within the pale of education. I need not say how differently the plan has been regarded by various parties, both in Ireland and in Britain.

The National Board consists of nine commissioners chosen from both the Roman Catholic and Protestant bodies—the Roman Catholic and Protestant archbishops of Dublin being among the number. The commissioners receive from the public purse, and expend annually, the sum of £50,000; their estimate for the year ending March 31, 1840, is £50,357, which they propose to lay out as follows:—On training of teachers, £2,220; model schools, £390; grants towards building and establishing new schools, £12,000; salaries and gratuities to teachers, £23,000; infant schools, £220; agricultural schools, £150; inspection, £4975; books and school requisites, £4250; and general expenditure, £3152. The fee paid by each scholar is 1d. per week, the same as at the Kildare Place schools. In granting aid towards the erection of country schools, one-third at least of the expenditure upon each building must be locally provided for, and the local trustees must engage to keep the house in repair. A stock of books and school requisites is supplied gratuitously every four years to each school, and these articles are at other times sold to the schools at from a third to a half of the common selling price. The appointment of teachers rests with the local patrons and committees, but subject to the approval of the board. By the provision for training teachers in the normal school, there will in time be a due supply of these functionaries, both male and female. The commissioners have divided Ireland into twenty-five school districts, and have appointed a superintendent for each. In March 1838 (the date of the Report before me), the number of national schools was 1384, attended by 169,548 children, but 195 new schools were soon to be opened, and it was expected that they would be attended by 40,106 pupils, making a total of 209,654. Reckoning, however, the schools said to be in actual operation in March 1838, there were then, as we perceive, upwards of 169,000 children receiving a regular elementary education, at an annual cost to the state of £50,000. The commissioners, in their Report, congratulate the public on this marked success of their labours. It seems that, in 1826, the number of children attending schools in Ireland to which the state granted aid, was 69,638, while the grants amounted in the year preceding to £68,718.

The reader, I trust, will now have no difficulty in comprehending the nature or extent of this great national institution, to which I am about to introduce him. The head-quarters of the board are in Marlborough Street (a rather narrow thoroughfare behind Sackville Street), in the midst of the division of Dublin which lies on the east side of the Liffey. My first visit to the institution need not be specially described. In order to have as comprehensive an idea as possible of the nature of the system, I visited the schools several times, dropping in now and then to the different class-rooms, as I happened to have time to spare, during my residence at a hotel in the neighbourhood. The several edifices belonging to the institution are detached from each other, and stand within a square enclosure fronting to the street. Passing a large edifice

on the right, devoted to the official business of the board, and a similar structure on the left, fitted up with an upper and lower hall for normal instruction and lectures to candidate teachers on philosophical subjects, we proceed to an inner group of three edifices—one on the left being the model school for boys, that on the right the model school for girls, and that in the centre being occupied as a model infant-school. The normal institution has three professors, one master, and one assistant; the boys' school one master, one assistant, and three monitors advanced to sub-teachers; the girls' school has one mistress, and one assistant; and the infant-school one master, one mistress, and one assistant. Belonging also to the head establishment is a farm for instruction in agriculture, a few miles from Dublin, possessing one agriculturist, one gardener, and one ploughman. The candidate teachers attend the farm for practical instruction in agriculture one day in the week.

There are at present upwards of 1100 children at the model schools in Marlborough Street.* The boys' school, to which I paid most attention, appeared to be conducted by some exceedingly active and intelligent individuals, though certainly not more so than those of the similar school belonging to the Kildare Place Society; and I was in no small degree surprised and pleased to find that the instruction embraced various branches of physical science—such as the Laws of Matter and Motion, Mechanics, &c., while Geometry, as a matter of course, was a special object of study. A class of ragged urchins was at my request examined on some of the theorems in the first six books of Euclid, and the result was extremely satisfactory; I question, indeed, if our more advanced students in the best academies could have acquitted themselves better. Yet these Irish boys are children of a humble order of individuals, and pay no more than a penny a-week for their education. I likewise heard a class examined on Bible history or Scriptural knowledge, and on this subject the answers were as readily delivered as those which I had heard a few weeks before at the Norwood institution in England, when elicited by a clergyman of the established church. I was a little surprised at this exhibition, because I had always understood that no species of religious instruction was given at the National Schools. Since this, I have learned that although the Bible, in its entire form, is not used as a class-book, there is much Scriptural knowledge contained in the books sanctioned by the institution, and which it seems possess the merit of being acceptable to all classes of Christians, at least to all except the more strict and unyielding of the two leading sects. I find it stated in the regulations of the National Schools, that "one day in each week, or part of a day (independent of Sunday), is to be set apart for the religious instruction of the children, on which day such pastors, or other persons as are approved of by the parents or guardians of the children, shall have access to them for that purpose." By this provision, which is exactly conformable to the plan pursued in Holland, and by the scrupulous care which is taken to avoid the very semblance of proselytism, the National Schools have gained the good-will of nearly the whole Catholic population. But while the greater proportion of the children attending the schools are Roman Catholic, there are more Protestant children in attendance than were at the Kildare Place schools in 1826.† This, I should think, is an important fact, and would seem to imply that the National Schools are not so exclusively patronised by one party as has been represented. I found the boys' model school to comprehend pupils of both the Roman Catholic and Protestant churches. The general success of this school is such, that there is not sufficient space to accommodate the daily applications for admission, and certain apartments in the sunk story have recently been opened for classes, although never designed to be put to such a purpose.

In the girls' school, I had the satisfaction of seeing the same kind of instruction in needlework, as had pleased me so much at the Kildare Place schools, and here also are made up books of miniature specimens of male and female attire, to be sent to the female schools in the country. The infant-school, which was begun by Mr Wilderspin, has been sustained in the best state of efficiency by a young teacher and his wife. The contemplation of the rows of happy little creatures, all under a correct system of moral training, afforded a most gratifying spectacle; and in turning away from the scene, I felt impressed with the conviction that I had now seen, in practical operation, the true plan of improving, if not the whole Irish people, at least that portion whose numbers and general condition make it of the most importance to the public at large that they should be so improved.

By the united exertions of the National Board and the Kildare Place Society, it may be fairly estimated that at present nearly 300,000 children are receiving daily instruction. After making every allowance for those who may be taught privately and at other schools, there still remains an ample field for the establishment of new, and an extension of the existing, seminaries. This field, it is gratifying to reflect, is now in course of a more extended culture. National Schools are getting up in many parts of the

country; the schools of the Kildare Place Society are in active operation; Sunday schools, in spite of all obstacles, are increasing in number and usefulness; and the established church is organising a widespread system of education, strictly in connection with Scriptural knowledge. With all these aids, it will be hard if Ireland is not in time one of the best educated portions of the United Kingdom.

"ADVENTURES OF ROBIN DAY."

SUCH is the title of an amusing, though somewhat coarsely written novel, by Dr Bird, an American author rapidly becoming known to English readers. The hero, Robin Day, is a dreadful scape-grace, a young Flibbertigibbet, who gets into all sorts of mischief—at least it is called mischief, and furnishes an excuse for giving him many a sound beating and no small measure of abuse. Robin, in short, is what is usually termed a very bad boy, though, as in forty-nine out of every fifty such cases, his bad conduct is clearly traceable to the mismanagement, if not petty tyranny, of his superiors. The history of Robin's early career is worth abridging for the sake of its humour.

When an infant of only a year old, he was wrecked on the coast of New Jersey; his parents were drowned; by a lucky chance he was saved, and fell to the share of Mother Moll, a female wrecker of eminence in that part of the world. Mother Moll, who had an eye to bringing him up to her own infamous profession, which consisted of decoying vessels ashore by holding out false signals, took care to initiate him in its mysteries as he grew in stature. When he was able to run along the beach, he was sent out on dark stormy nights to regulate the performance of an old horse, whose legs were tied to cause a stumbling motion in a lantern which it carried, and thereby convey to the unhappy mariner an idea of a light in a vessel in the offing. What with cold, hunger, and blows, young Robin felt this to be a most uncomfortable employment, so that at seven years of age he was glad to be bought from his adopted mother by a character of the name of Day, whose name he subsequently took.

Robin's master or proprietor was the skipper and owner of a shallop called the Jumping Jenny, and to this he added the profession of a wrecker and smuggler. His ship's company consisted of himself and another, and when Robin was stowed on board, he was installed in the office of cook. In one respect the situation was more comfortable than that at Mother Moll's, for he now got plenty of food; but to compensate this advantage, he received a greater share of kicks; and for five years, during which he served in the Jumping Jenny, his life was a round of hopeless, cheerless misery. At length a period of relief to his troubles arrived. As he sat one day engaged in the delightful occupation of picking a gander, upon the bowsprit of the little craft, which lay at anchor, and in which he had been left alone, to make preparation for his patron's dinner, a party of youth, in a boat near by, employed themselves in pelting him with stones and oyster-shells. One of the missiles inflicted a severe wound, and, at the same time, the graceless urchin who had launched it, lost his balance and fell into the water, which was deep, with a strong current running.

"The hero of the scene (such are Robin's own words), whose disaster I regarded with sentiments of complacency and approbation, as being nothing more than he deserved for the unprovoked injury he had done me, sank to the bottom, whence in a moment he came whirling and gasping to the surface, and was swept by the tide against the sloop's cable, which he attempted to seize, but without success; for though he had hold of it for an instant, he was not able to maintain his grasp. In this state of the adventure, the little fellow was immediately under me, where I sat on the bowsprit; and as the tide swept him from the cable, he looked up to me with a countenance of such terror, and agony, and despair, mingled with imploring entreaty—though being on the point of strangling, he was neither able to speak nor to cry out—that I was suddenly struck with feelings of compassion. They were the first human emotions, I believe, that had entered my bosom for years; and such was the strength of them, that, before I knew what I was doing, I dropped into the river—gander and all—to save the poor little rascal from drowning.

Such a feat did not appear to me either very difficult or dangerous, for I could swim like a duck, and had had extraordinary experience in the art of saving life in the water; not, indeed, that I had ever performed such service for any body but myself; but, in my own case, I had almost daily occasion; for nothing was more common than for Skipper Day to take me by the nape of the neck and toss me overboard, even when on the open sea; though the mate always threw me a rope to help me on board again, except when we were becalmed or at anchor; in which cases he left me to take care of myself. In the present instance, however, as it proved, the exploit was not destined to be performed without difficulty; for, dropping down with more hurry than forecast, right before the stern, and with a force that carried me pretty deep into the water, I was swept under the shallop's bottom, which, in the effort to rise to the surface, I managed to strike with my head, with a violence that would undoubtedly have finished me, had not that noble

* The following is part of the evidence before the House of Lords, given by the Hon. and Rev. B. W. Noel, on this question:—"As a proof how little such a system can prevail, I find that, when the Kildare Place Society came to Parliament annually for the money which they wanted, after ten years of exertions, they only got 29,812 children in their schools out of half a million that ought to have been instructed; and this was at a fearful sacrifice, much greater than the board is called to make, for the religious education was often merely nominal, and the Bible was often not read. The Commissioners of Education Inquiry state that they found the reading of the Scriptures to be frequently a mere form, and, in the second place, no exposition was allowed; and, notwithstanding these fatal concessions, after all, in ten years they could only get, out of 500,000 Roman Catholic children, 29,812."—*Lords*, p. 872.

* I give this number from memory. I cannot find any number stated in the Fifth Report of the Board, lately published.

† Digest of Evidence before the Houses of Lords and Commons, 1838, p. 212.

excrecence been, in those days, of unusual thickness. The shock was, however, sufficient to stun and confound the small quantity of wits I possessed, and to such a degree that I lost my hold of the gander, which up to this moment I had clutched with instinctive care, besides which, I was swept, before I had time to recover myself, along the whole of the sloop's bottom; and this being pretty well studded with barnacles, young oysters, and the heads of old nails, I had the satisfaction of enjoying as complete and thorough a keelhauling as was ever administered to any vagabond whatever, my jacket, shirt, and back, being scratched all to pieces. Of this, however, as well as of the loss of the gander, I was for a time quite unconscious, being confused by the shock my head had suffered; and the moment I succeeded in passing the rudder, and reaching the surface, I had all my thoughts engaged in rescuing the boy, who had now sunk two or three times, and was, I doubted not, sinking for the last time; for he was quite insensible when it was my good fortune to reach and seize him by the collar.

The bateau had by this time been borne by the tide against a projecting wharf, whither I easily swam with my charge, and then giving him up to his companions, who had now, by dint of yelling, brought several men to their assistance, I took to my heels, hoping to regain the sloop before Captain Day, who had gone ashore, should return and discover my absence. My only way of getting on board was that in which I had departed, namely, by swimming; and to this I betook me, by running a little up the stream, and then leaping again into the river.

My haste, however, was vain, the worthy skipper reaching the vessel an instant before myself; and when, having clambered up by the hawser and bobstay, I succeeded in jumping on deck, I—who was in such a pickle, what with my clothes torn to shreds, and dripping with water, and the blood trickling down my face, as the reader cannot conceive—found myself confronted with my tyrant face to face. He gave me a horrible stare of surprise, took one step forward, so as to bring me within reach of his arm, and exclaimed, 'You draggle-tailed tadpole! where have you been?' which question he accompanied with a cuff on the right cheek, that tossed me a full fathom to the larboard.

'Please, sir,' said I, in as much terror as my stupidity was capable of, 'overboard, sir.'

'Overboard!' cried my master, giving me a cuff with the other hand, that sent me just as far starboard; 'what have you been doing overboard?'

'Please, sir, saving a boy's life, sir,' returned unhappy I, beginning to be conscious of the enormity of my offence.

'Saving a boy's life!' ejaculated Skipper Day, knocking me again to larboard; and here I may as well observe, that this was his usual way of conversing with me, or rather of pointing his conversation; his stops being usually but three, a cuff to the right, and a cuff to the left, which he alternated with extreme regularity, at every other speech; and a full period, used at the close, by which I was laid as flat as a flagstone. 'Saving a boy's life!' cried the skipper, boxing me as aforesaid; 'I wish all the boys were in Old Nick's side-pocket, roasting! Where's the gander?'

The gander! ay, where was the gander? The question froze my blood. I remembered the loss. By this time the gander was a mile down stream, if not already lodged, in divided morsels, in the capacious jaws of a hundred catfish.

The skipper noticed my confusion, and his face of a sudden became small, being puckered by a universal frown, that began at forehead and chin and the two ears, and tended to the centre, carrying these several parts before it, till all were blended in a knot of wrinkles scarce bigger than his nose. He stretched forth his hand, and took me by the hair, of which I had a mop half as big as my whole body; and giving his arm a slow motion to and from him, like the crank-rod, or whatever they call it, of a locomotive, just as it is getting under way, and making my head, of course, follow in the same line of traverse, thundered in my ears, 'The gander! you twin-born of a horse-mackerel! where's the gander?'

'Please, sir,' I spluttered out, in a confusion of intellects that was with me extremely customary, 'boy was overboard—jumped overboard to save him.'

'But the gander!' quoth my honest master; 'where's the gander?'

'Please, sir, jumped overboard,' I repeated; 'got under the keel; knocked head—senses out, and—and—lost it.'

The chastisement which Robin received for this mishap was the last to which he was destined from the same quarter. The father of the child whom he had rescued, a worthy and opulent physician, received him into his family, and undertook to provide for, and, if possible, humanize him; Captain Day, meanwhile, having been subjected, by the intelligent indignation of the town's people, to an infliction of keelhauling, shaving, tarring, feathering, and banishment, all in pursuance of a sentence of Lynch Law.

Dr Howard, Robin's patron, placed him at school, with the intention of introducing him honourably into life. All things might now seem to be going merry as a marriage-bell. But care, which follows all men to the fleet, follows our hero from it, and he has a dismal story to tell—though no worse, we suppose, than most others who were brought up at the same time—of the treatment he received at the hands of

the ingenuous youth, his school-fellows, who were not only very pugnacious, but very speculative withal, and ready to go to death for their theories. Richard Dare, son of a soldier of the revolution, and leader of one of the parties in the school, introduced to his mates, in a good stump harangue, the doctrine of schoolboys' rights, and illustrated it so happily by analogies drawn from the movements of 1776, as to carry all before him. No sooner said than done. Mr Burley, bear-keeper to these young hopefuls, having occasion, before long, to chastise their leader, finds, to his cost, that the revolutionary train has been but too well laid.

'I won't be trounced,' said Dickey Dare, 'except by a vote of the boys; for I go on the popular principle, and —' But Dickey had not time to finish his sentence; for Burley immediately rushed forward to seize him, which Dickey was fain to avoid by leaping over his desk to the floor, where, being closely followed, he let fly his inkstand, by which he did great damage to the head of one of his schoolmates, without, however, hurting the master, and then dropping like a log on the floor, whereby the autocrat, whose legs he dexterously seized upon, was suddenly overturned, with a shock that left him for a moment quite helpless. 'Now, fellows!—them that aint cowards, fall on!' cried the hero to his fellow conspirators, who, having been somewhat horrified by the sudden rally of the enemy, now recovered courage, and rushed upon him pell-mell; so that, when he recovered from the shock of his fall, not Gulliver himself, waking from his first nap in Lilliput, was more multitudinously over-run by the bodies, or more hopelessly secured in the coils, of his pigmy foes.

Horrible were the din and confusion that now prevailed; and horrible also, for a moment, were the struggles of the downfallen monarch, who, however, being somewhat troubled with an asthma, became, after a time, completely exhausted, and incapable of further resistance; upon which Master Dare demanded handkerchiefs to bind him securely, which being effected, this incomparable putter-down of tyrants snatched up a birchen twig, and dispensed, with uncommon coolness, a dozen thracks upon the victim's shoulders. Nor did he rest here, but, passing the rod from hand to hand, compelled every member of the new-born republic to administer, in like manner, the same number of blows, which were, in general, laid on with exceeding good will. This being accomplished, he called for three cheers; after which we all took to our heels, leaving the deposed ruler to his meditations.

The success of the insurgents was altogether beyond their hopes. It set the town people to discussing the merits of the flogging system of education, which, being now brought under consideration for the first time, was pronounced by the majority entirely unsuited to the character and genius of a republican people, whose children, it was demonstrated, ought to be brought up with the highest ideas of personal independence and honour, of freedom and equality, which the tyranny of the rod must inevitably beat out of their tender spirits. It was agreed that the academy should thenceforth be governed on republican principles—that is, that there should be no more flogging.

The scheme, however, did not work so well in practice, as it looked in principle. The first master was discouraged, and took leave in a fortnight's time. A second, who was more persevering, discovered that it was not a question of liberty, but of who should be master, and, because he might not use force, he had to terminate his sway. The third, says Robin, 'met the views of all concerned, being a very amiable, indolent personage, who agreed the more readily to adopt the republican system, as he had just brains enough to perceive it would save him a vast deal of trouble. He seemed very well content we should do as we pleased, get our lessons when we liked, and as we liked, come in and go out, laugh, talk, play, fight, or do any thing else, just as we thought proper; a degree of forbearance that won our entire love and respect, which we were accustomed to show by peppering him, whenever he was in a brown study, with potato popguns and showers of ripe elder-berries; by emptying the ink bottle on his chair, when he appeared in white trousers, and strewing it with pin caltrops when in brown; and by sundry other innocent tricks, wherewith tender juveniles delight to show their affection. These little freedoms, it is true, sometimes drove him into a passion, when he scolded at us with great energy and emphasis; but they gave him no disgust at the school, in which he might have perhaps remained the president to this day, had it not been for a discovery made by some busy bodies, which brought his administration to a close, after six months' away, and wrought somewhat of a change in public opinion on the subject of the new system.'

The discovery was, that, under the said system, learning was at a stand-still, the boys having actually advanced in nothing but mischief during all that period. The system was again brought under discussion; the minority, who had originally opposed it, repeated their denunciations; and, after another squabble, which at the time bade fair to shake even the national government (so hot, furious, political, and patriotic, were the passions it excited), our enemies prevailed, and schoolboy rights and schoolboy glory fell for ever.

It was now urged, that the best way to bring up the boys of a republic in detestation of tyrants, was to put tyrants over them during their school-days, and thwack them into a thorough appreciation of the horrors and

inconveniences of oppression. In short, it was agreed that the *ancien régime* should be restored, and the birch used as before; or, at least, so far as was necessary to help us along with our books, and keep us on our best behaviour.

But it is not easy to bend those to the yoke, who have once tasted the sweets of freedom. One teacher after another was made to know, by woful experience, what doom he merits, who would shackle the movements of the free-born soul. At length the exigency became extreme; and the trustees adopted, as usual, the policy of seeking refuge from the intolerable tyranny of many to the more tolerable tyranny of one. They committed their charge to the dominion of a Mr McGoggin, a disciplinarian who knew neither fear nor favour, and by whom peace was once more restored to the establishment. For an account of McGoggin's mode of reform, we must refer to the work itself, which will furnish many other matters for mirth to the reader.

LABOUR SONGS.

SECOND ARTICLE.

SINGING to labour is, we presume, more common on the continent than in our own grave and most reflecting country. In Germany, we should suppose that such things as labour songs must be numerous, for we find two modern poets of that country writing lyrics with reference to work, namely, Burder and Schiller. The girl's song to her spinning-wheel, by the former, is very happy. A translation of it, by Professor Tennant, has already appeared in our pages. The composition by Schiller is his *Song of the Bell*—a most extraordinary poem, all things considered, and one which has never yet been made known in this country to a degree comparable to its merits. To use the words of a work entitled *An Autumn Near the Rhine*—"The casting of a bell is in Germany an event of solemnity and rejoicing. In the neighbourhood of the Harz, and other mine districts, you read formal announcements in the newspapers from bell-founders, that at a given time and spot a casting is to take place, to which they invite all their friends. An entertainment out of doors is prepared, and held with much festivity. Schiller, in a few short stanzas forming a sort of chorus, describes the whole process of the melting, the casting, and the cooling of the bell, with a technical truth and felicity of expression, in which the sound of the sharp sonorous rhymes and expressive epithets constantly forms an echo to the sense. Between these technical processes be breaks forth into the most beautiful episodic pictures of the various scenes of life, with which the sounds of the bell are connected." We are tempted, from its connection with the present subject, to present a few passages from a very well executed translation of this celebrated song, which appeared a few years ago in a volume of poems edited by Joanna Baillie. Such parts of the episodes as we can afford room for are put within brackets, that they may be more readily distinguished from the rest:—

Fast immur'd within the earth,
Fixt by fire the clay-mould stands,
This day the Bell expects its birth:
Courage, comrades! ply your hands!
Hotly from the brow
Must the sweat-drop flow:
If by his work the master known,
Yet—Heav'n must send the blessing down.

Billets of the fire-wood take,
Every billet dry and sound;
That flame on father'd flame awakes,
And vault with fire the furnace round.
Cast the copper in.
Quick, due weight of tin,
That the Bell's temacious food,
Rightly flow in order'd mood.

[What now within the earth's deep womb
Our hands by help of fire prepare,
Shall on yon turret mark our doom,
And loudly to the world declare!
There its aerial station keeping,
Touch many an ear to latest time;
Shall mingle with the mourner's weeping,
And tune to holy choirs its chime.
All that to earth-born sons below
The changeful turns of fortune bring.
The Bell from its metallic brow
In warning sounds shall widely ring.
Lo! I see white bubbles spring:—
Well!—the molten masses flow.
Haste, ashes of the salt-wort fling.
Quick'ning the fusion deep below.
Yet, from scorias free
Must the mixture be,
That from the metal, clean and clear,
Its sound swell tuneful on the ear.]

[Hark! 'tis the birth-day's festive ringing!
It welcomes the beloved child,
Who now life's earliest way beginning,
In sleep's soft arm lies meek and mild.
As yet in time's dark lap repose,
Life's sunshine lot, and shadowy woes,
While tenderest cares of mothers born
Watch o'er her infant's golden morn.
The years like winged arrows fly:
The stripling from the female hand
Hursts into life all wild to roam;
And wandering far o'er sea and land,
Returns a stranger home.
There, in her bloom divinely fair,
An image beaming from the sky,
With blushing cheek and modest air
A virgin charms his eye.
A nameless longing melts his heart,
Far from his comrades' revels rude,
While tears involuntary start,
He strays in pathless solitude—

There, blushing, seeks alone her trace;
And if a smile his suit approve,
He seeks the prime of all the place,
The fairest flower to deck his love.]

Sweet, 'mid the tresses of the bride,
Blooms the virgin coronal,
When merry bells ring far and wide
Kind welcome to the festival.
Ah, that life's fairest festive day
Fades with the blossom of our May!
[Forth the husband must wend
To the combat of life;
Plunge in turmoil and strife.
Must plant, and must plan;
Gain get as he can.
Hazard all, all impotence,
To woe and win fortune.

Then streams, like a spring-flood, his wealth without measure,
And his granaries groan with the weight of their treasure;
And his farm-yards increase, and his mansion expands.

Now the house-wife within
Her course must begin;
Nurse, mother, and wife,
Share the troubles of life;
Discreetly severe
Rule all in her sphere;
Give each maiden employ,
Watch each troublesome boy.
With orderly care,
Keep all in repair;
And store without ceasing
Her riches increasing:

Fill her sweet-scented coffers; and, restlessly twirling,
Set each spindle a-spinning, each wheel ever whirling;
And in smooth-polish'd wardrobes range row above row,
Her woollen all radiant, her linen all snow;
And trim them, and prunk them, and fashion them ever,
And rest—never.

The father now, with deep delight,
From his proud seat's wide-seeing roof,
Sums up the wealth that feasts his sight;
The branching columns that support
The loaded barns rang'd round the court;
Granaries that with corn o'erflow,
And harvests billowing to and fro:
And deems, fond man! that, prompt on gain,
Like pillars that the globe sustain,
His house in glory shall withstand
Misfortune's rough and ruthless hand.
But—none—no mortal can detain
Fate in adamant chain.

Mischance with hurried foot advances.]

'Tis time.—Now, now begin the fusion:
The crevice now yields promise fair.
Yet, pause—nor hasten the conclusion,
Till heav'n has heard our pious pray'r.
Push the stopper out.
Saints! watch the house about.
Smoking in the handle's bow,
Shoot the waves that darkly glow.

[A city conflagration is now described—after which:]

All prosperous seems beneath the earth,
Full and kindly fill'd the mould:
But will the day that views its birth,
What crowns our toil and art behold?
If the fusion fail!—
If the mould prove frail!—
Ah! haply, while Hope's sunbeams glow,
Fate has already wrought the woe!
[From the dome,
Sad and slow,
Tolls the Bell,
The song of woe;

Its sad, its solemn strokes attend
A wand'rer to his journey's end.
Ah! 'tis the dear one—'tis the wife!
'Tis the belov'd, the loving mother!
Who by the prince of darkness borne,
From her fond husband's arms is torn—
Torn from each tender child away
She bore him in her bloom of day—
Those who had grown upon her breast,
By love—a mother's love—erect.
Ah! the household's gentle band
Is loos'd for ever—ever more;
She dwells within the shadowy land
Whose fondness hung that household o'er.
Now ceas'd her zealous occupation,
None her kindness more shall prove;
O'er that wide waste, that orphan station,
A stranger rules devoid of love.]
While the Bell is cooling, rest,
Rest from toil and trouble free;
Each, as fits his fancy best,
Sport like bird at liberty.

Break me the mould: its due employment
Now done, no more its aid we need.
Let heart and eye in full enjoyment,
On the well-formed image feed.
Swing, the hammer swing,
Till the cover spring.
When the earth the Bell releases,
The mould may split in thousand pieces.

Joy! joy to me, kind heav'n has giv'n:
Lo! like a star of golden birth,
The metal polish'd, smooth, and even,
Comes from its coverture of earth.
Lo! round its beauteous crown
Sunlike radiance thrown
And the coat of arms' gay burnish
Shall to my skill new honour furnish.
Come all! come all!
Close your ranks, in order settle;
Baptise we now the hallow'd metal:
"Concordia!"—Such her name we call.
To harmony, to heartfelt union,
It gathers in the blest communion.
Be this henceforward its vocation;
For this I watch'd o'er its creation.
That while our life goes lowly under,
The Bell 'mid yon blue heav'n's expansion,
Should soar, the neighbour of the thunder,
And border on the starry mansion.
Its voice from yon aerial height
Shall seem the music of the sphere,
That rolling lauds its Maker's might,
And leads along the crowned year:
To solemn and eternal things
Alone shall consecrate its chime,

And hourly, as it swiftly swings,
O'ertake the flying wing of time:
Shall lend to Fate its iron tongue,
Heartless itself, nor form'd to feel,
Shall follow life's mix'd scenes among,
Each turn of Fortune's fickle wheel—
And, as its echo on the gale
Dies off, though long and loud the tone,
Shall teach that all on earth shall fail,
All pass away—save God alone.
Now, with the rope's unwearied might,
From its dark womb weigh up the Bell,
That it may gain th' aerial height,
And in the realm of Echo dwell.
Draw! draw!—it swings;
Hark! hark! it rings.
Joy to this town, be heard around!
Peace unto all, the Bell's first sound!

Amongst ourselves, while songs strictly for labour scarcely exist, we are not without a few relating to trades and occupations, and to some of these we may now advert. One, of very especial merit, bears reference to the business of the fisherman, but is a great favourite amongst all other classes, on account of its genuine natural sentiment. The turn of the last stanza is affecting beyond nine-tenths of the most pathetic poetry of scholarly workmanship!

O weel may the boatie row,
And better may she speed!
And weel may the boatie row,
That wins the bairn's bread!
The boatie rows, the boatie rows,
The boatie rows indeed;
And happy be the lot of a'
That wishes her to speed!
I cuist my line in Largo Bay,
And fishes I caught nine;
There's three to boil, and three to fry,
And three to bait the line.
The boatie rows, the boatie rows,
The boatie rows indeed;
And happy be the lot of a'
That wishes her to speed!
O weel may the boatie row,
That fills a heavy creel,
And clouds us a' frae head to feet,
And buys our parritch meal.
The boatie rows, the boatie rows,
The boatie rows indeed;
And happy be the lot of a'
That wish the boatie speed.

When Sawnie, Jock, and Janetie,
Are up, and gotten lea,
They'll help to ear the boatie row,
And lighten a' our care.
The boatie rows, the boatie rows,
The boatie rows fu' weel;
And lightome be her heart that bears
The mairlain and the creel!

And when wi' age we're worn down,
And hirling round the door,
They'll row to keep us hale and warm,
As we did them before:
Then, weel may the boatie row,
That wins the bairn's bread;
And happy be the lot of a'
That wish the boat to speed!

If any one, struck by the simple beauty of this strain wish to know from whom it proceeded, the only answer that we are aware can be given to the inquiry, is, that Burns somewhere reports it to have been the composition of a Mr Ewen, of Aberdeen.

"Tarry woo," another old Scottish song, is, as might be supposed, sacred to the generation of shepherds. It is popular all over the pastoral districts of Peebles, Selkirk, and Roxburgh shires, and is somewhat remarkable for one extrinsic circumstance—namely, that it is the only song which Sir Walter Scott, with his unmusical voice and no ear, ever attempted to sing before company. He regularly sang it, about the third bowl, at an annual meeting of farmers in his neighbourhood.

Tarry woo, tarry woo,
Tarry woo is ill to spin;
Card it weel, card it weel,
Card it weel, ere ye begin.
When it's cardit, row'd, and spun,
Then the wark is haffins done;
But, when woven, dress'd, and clean,
It may be cleadin' for a queen.

How happy is the shepherd's life,
Far frae courts and free of strife!
While the gimmers bleat and bae,
And the lambskins answer nae;
No such music to his ear!
Of thief or fox he has no fear:
Sturdy kent, and collie true,
We'll defend the tarry woo.
He lives content, and envies none:
Not even a monarch on his throne,
Though he the royal sceptre aways,
Has such pleasant holidays.
Who'd be king, can any tell,
When a shepherd sings sae weel?
Sings sae weel, and pays his due
With honest heart and tarry woo.

Next, we think, to having a song relative to labour, and calculated by its sentiments to make that labour appear light, is it to have a song which thus gives the charm of poetical grace and feeling to a particular trade or occupation. We wish that every trade had such: it would tend to support in the professors of each that harmless pride in their own craft which seems to be one of the things which give them a liking to their labours. Unfortunately, very few trades have been so far favoured by the muses. We are aware of none relative to the joys and sorrows of the tailor's lot; though nothing, we should suppose, could be more delightful than to hear some eighteen of these tradesmen on one board singing a duet descriptive of all that they do and suffer. Neither have the shoemakers, or

the bakers, or the butchers, or the grocers, any appropriate ditties. The poets have here shown a most intolerable partiality, for they have given us songs without number respecting the shepherds, the ploughmen, and the millers. As to millers in particular, have we not the gentleman who lived on the Dee, and was quite indifferent to all the world, since all the world was indifferent to him? also the fine description of a miller's domestic system, written by Sir John Clerk of Pennycaik, of which we cannot refrain from presenting at least one verse—

Behind the door stand bags o' meal,
And in the ark is plenty,
And gude hard cakes his mother bakes,
And morn a sweeter dainty;
A gude fat sow, a sleeky cow,
Are standing in the byre,
And winking puss, wi' mealy mou',
Is playing round the fire.

This is part of the speech of a mother to a daughter, whom she wishes to marry a miller. In the song which ensues, we have one of the trade himself giving an account of the happiness of his condition: it is said to have been written by a Mr Charles Highmore, for Robert Doddsley, in whose play of the Miller of Mansfield it occurs:—

How happy a state does the miller possess!
Who would be no greater, nor fears be no less;
On his mill and himself he depends for support,
Which is better than servilely cringing at court.
What though he be all dusty and whiten'd does go,
The more he's bopowdered, the more like a beau;
A clown in his dress may be honest far
Than a courtier who struts in his garter and star.
Though his hands are so daubed they're not fit to be seen,
The hands of his betters are not very clean;
A palm more polite may as dirtily deal;
Gold, in handling, will stick to the fingers like meal.

And should he endeavour to keep an estate,
In this he would mimic the tools of the state;
Whose aim is alone their own coffers to fill,
As all his concern's to bring grist to his mill.
He eats when he's hungry, he drinks when he's dry,
And down when he's wearied contented does lie;
Then rises up cheerful to work and to sing:
If so happy as a miller, then who'd be a king?

To conclude, we would once more recommend to the consideration of gentlemen of poetical endowment, and at the same time philanthropic views, the possibility of their doing a good turn to their fellow-creatures by composing songs appropriate to various branches of labour, and others calculated to raise in working people a feeling of pride and pleasure in their respective crafts.

SNATCHES OF CONTINENTAL RECOLLECTIONS.

HOW THEY CURE NE'ERDOWEELS.

THE story of Jerry Guttridge, which was presented a few weeks ago in the Journal, furnished on the whole not a bad plan for "pulling up" that numerous class of beings usually known among us by the names of "ne'er-doweels," "victims," and "down-draughts." I do not certainly recommend whipping as a means for curing either habitual drunkenness or idleness, for, independently of the cruelty of such a mode of punishment, it has generally the effect of hardening instead of mollifying the evil dispositions of offenders. Ne'er-doweels must be treated very much like persons who labour under mental alienation. Their faculties and tastes are diseased. They are, in some respects, not accountable for their behaviour any more than an idiot or lunatic. As things go with us, ne'er-doweels are subject to no species of judicial control. Their friends and relatives have no power whatever to place them legally in confinement. An honest and worthy man may be worried to death with a drunken wife or a vicious good-for-nothing son, but the law offers no means of relief. We hear daily of the most distressing cases of wives and families being in a state of destitution, in consequence of husbands and fathers spending their earnings in reckless intemperance, but neither magistrates nor correctional police have any thing to say in the matter. A man may allow his family to become a burden on society, but society can only complain of the injustice. With the greatest respect for civil liberty, we cannot help thinking that there is something wrong here; and it becomes a very grave question whether, in maintaining the principle of personal freedom, we do not, in this instance at least, go a little too far, and incur evils on the other side.

In Holland, and some of the German states (perhaps in all), it is competent for the public authorities to deprive any man of his liberty, and send him to the house of correction, on a due representation of his being guilty of habitual idleness, drunkenness, or general bad behaviour. Cases of ne'er-doweelism and victimisation are consequently rare in Holland, and assuredly are not observable on the common thoroughfares, as we see them in this country. In Prussia, when a man addicts himself to habits of intemperance, and regularly misspends the earnings which should go to the maintenance of his family, the public authorities take cognisance of his conduct. He is pulled up. On being brought before a magistrate, we may suppose him to be addressed in the following

terms:—"You are here, sir, on the very serious charge of being a habitual drunkard. The wages which you earn, when it pleases your fancy to work, you regularly spend upon liquor; your wife and family are at the point of starvation; they have neither food nor fuel, and their clothing is insufficient for their necessities. This conduct is infamous, for you are a good workman, and could earn six thalers per week, on which yourself and family might live in great comfort and respectability. I say, your behaviour is intolerable; you are a public nuisance, for your example may seduce others to enter on the same career of wickedness; and in the meanwhile you are leaving your family to be a burden on honest and industrious men. But this shall continue no longer. I consign you to the correction-house, where you will be removed from all temptations to vice, and have an opportunity of working for your family, and of forming resolutions to amend your life for the future." Thus lectured on his delinquency, the ne'er-do-weel is handed to prison. He is there set to work, as far as it can be done, in the kind of employment he has been accustomed to, and a certain portion of his weekly earnings is given to his family. What may be the length of his confinement, I am not aware; most likely it varies according to the circumstances of the case, and the appearance of amendment. The object being to reclaim, not to punish, no undue harshness is employed.

During my stay in Holland, I heard of the practice of incarcerating and reclaiming ne'er-do-weels. At Rotterdam there are several apartments within the precincts of the *Dol Huis*, or lunatic asylum, which are employed for this purpose. On the representation of parents, guardians, or other relatives or friends, or by complaints for the public interest, all dissolute and abandoned characters, confirmed drunkards, whether male or female, are consigned for correction to the *Dol Huis*, while all houseless vagrants, youths who haunt the public thoroughfares, and can show no honest means of subsistence, and others in a deserted miserable condition, are taken hold of by the police, and sent off to one or other of the great industrial penitentiaries, called "home colonies," in a distant part of the country. In Amsterdam, there is a similar asylum or prison (*Maison de Travail*) for the incarceration of ne'er-do-weels of both sexes, and which is also useful as a house of refuge, or place in which work and subsistence may be had for a short period by persons in destitute circumstances.

These continental practices might not be strictly suitable in this country, but they afford a hint for something of the kind; and the subject is of such importance as to be well worthy of consideration.

POPULAR INFORMATION ON SCIENCE.

RED-COLOURED RAIN.

THE following curious and important narrative, which is extracted from "Gassendi's Life of Peirese," throws some light upon a subject which has not unfrequently excited the wonder of the ignorant, and the attention of the learned. It affords, also, a good illustration of the way in which remarkable phenomena were popularly accounted for two centuries ago:—

"Through the whole of this year (1608) nothing gave M. Peirese greater pleasure than his observations upon the *bloody rain*, said to have fallen about the beginning of July. Large drops were seen, both upon the walls of the cemetery of the greater church, which is near the walls of the city, upon the walls of the city (*Aix*, it is presumed), and likewise upon the walls of villas, hamlets, and towns, for some miles round the city. In the first place, M. Peirese went to examine the drops themselves, with which the stones were reddened, and spared no pains to obtain the means of conversing with some husbandmen beyond Lambese, who were reported to have been so astonished at the shower, as to leave their labour, and fly for safety into the neighbouring houses. This story he ascertained to be without foundation.

To the explanations offered by the philosophers, who said that the rain might come from vapours, which had been raised out of red earth, he objected that evaporated fluids do not retain their former hues, as is plainly exemplified in the colourless water distilled from red roses. Nor was he better satisfied with the opinion of the vulgar, countenanced by some of the theologians, who maintained that the appearance was produced by demons, or witches, shedding the blood of innocent babes. This he thought was a mere conjecture, scarcely reconcilable with the goodness and providence of God. In the meantime, an accident happened, which discovered to him, as he thought, the true cause of the phenomenon. He had found, some months before, a chrysalis of a remarkable size and

form, which he had enclosed in a box. He thought no more of it until, hearing a buzz within the box, he opened it, and perceived that the chrysalis had been changed into a beautiful butterfly, which immediately flew away, leaving at the bottom of the box a red drop of the size of a shilling.

As this happened about the time when the shower was supposed to have fallen, and when a vast multitude of those insects was observed fluttering through the air in every direction, he concluded that the drops in question were some kind of excrementitious matter emitted by them when they alighted upon the walls. He therefore examined the drops again, and remarked, that they were not upon the upper surfaces of stones and buildings, as they would have been if a shower of blood had fallen from the sky, but rather in cavities and holes where insects might nestle. Besides this, he took notice that they were to be seen upon the walls of those houses only which were near the fields; and not upon the more elevated parts of them, but only up to the same moderate height at which the butterflies were accustomed to flutter. In this way he explained the story, told by Gregory of Tours, of a bloody shower seen at Paris, in the time of Childbert, at different places, and upon a house in the vicinity of Senlis; and another, said to have fallen in the time of King Robert, about the end of June, the drops of which could not be washed out by means of water, when they had fallen upon flesh, garments, or stones, but might be washed out from wood; for the time there stated was the season for the butterflies, and he showed that no water could wash out these red marks from stones. After discussing these and similar arguments in the presence of much company, at the house of his friend Varius, they determined to inspect the appearance together; and as they wandered through the fields, they saw many drops upon the stones and rocks, but only in hollows, or upon sloping surfaces, and not upon those which were presented to the sky." It is perhaps only necessary to observe, that the phenomenon here described was no doubt correctly accounted for. The butterfly observed by Peirese is supposed to have been the common butterfly of our own fields. It has been observed to deposit the same red sort of fluid in England.

But although Peirese satisfactorily explained the appearance which came under his own observation, it is not to be taken for granted that all such blood-like phenomena are caused by the sloughing of insects. In the *Philosophical Journal* for 1830, there is a translation from the German of Mr Ehrenberg, of an elaborate essay, in which the author shows that the appearances which have at different times been observed in Egypt, Arabia, Siberia, and other places, are not to be attributed to one, but various causes. Beginning with the most ancient account of blood-coloured water in the books of the Jewish legislator, he succinctly notices the various descriptions of the phenomenon which are given us in the works of ancient and modern writers, ending with the red and orange-coloured snow of Captains Parry, Ross, and Scoresby, and his own observations of the blood-red waters of Siberia. From his statement it appears there is sufficient evidence for believing that rivers have flowed suddenly with red or bloody water, without any previous rain of that colour having fallen: that lakes or stagnant waters were suddenly or gradually coloured without previous blood-rain: that meteoric substances, which are usually colourless—dew, rain, snow, hail, and what are called shot-stars, fall from the air red-coloured, as blood-dew, blood-rain, and clotted blood, without the atmosphere being obscured by the red dust. And, lastly, that the atmosphere is occasionally loaded with red dust, by which the rain accidentally assumes the appearance of blood-rain, in consequence of which, rivers and stagnant waters assume a red colour. Into the author's various details we need not enter.

The blood-red colour which pools sometimes exhibit was first satisfactorily explained by Girod Chantran about the close of the last century. Observing the water of a pond to be of a brilliant red colour, it occurred to him not only to prove the colour of the water chemically, but also to observe it with the microscope. He found that the sanguine hue resulted from the presence of innumerable animalcules not visible to the naked eye. A German philosopher of the name of Weber, who had witnessed the same phenomenon, had accounted for it in the same manner a few years before the Frenchman. But previously to the investigations of either, several philosophers, among others Linnaeus, had shown that red infusoria were capable of giving that colour to water which in early times was supposed to forebode great calamities, and to throw whole districts and communities into the greatest alarm. One of the latest instances of this superstitious dread occurred in 1815, when an appearance of the above description was seen in a lake near to Lubotin, in the south of Prussia. Red, violet, or grass-green spots, were observed in the lake, about the end of harvest. In winter the ice was coloured in this manner three lines in thickness on the surface, while beneath it was colourless. The inhabitants in the neighbourhood, like the Greeks and Arabians of former times who had witnessed something of the same kind, prognosticated great misfortunes from the appearance. It fortunately happened that the celebrated chemist Klaproth was then actively engaged in his researches, and he took an opportunity of ascertaining the chemical ingredients of the colour. He

found that an albuminous vegetable matter, with a particular colouring matter very similar to indigo, caused the appearance, and concluded that these were produced by the decomposition of vegetables in harvest. The transition of colour from green to violet and red, this philosopher explained by the absorption of more or less oxygen. Thus both animals and vegetables are concerned in giving a peculiar tinge to water. Scoresby mentions, that in 1820 he observed the water of the Greenland sea striped alternately with green and blue, and that the particular colours were produced by small animalcules. The red snow seen by Captain Ross, during his northern voyage in 1818-20, excited much attention at the time, but it has now ceased to be a marvel. In Baffin's Bay he found red mountains six miles in length and six hundred feet in height, the colour of which was caused by large flakes of snow resting upon them. The colouring matter was collected, and on experiment found to be a vegetable substance; and botanists unanimously declare that it is not a decomposed dead substance, but a living vegetable organisation. How it came there, is not so easily settled; the most plausible supposition is, that these minute plants are foreign bodies wafted from another situation and deposited in the snow, &c., by the melting of which they collect in masses, and thus produce the red-coloured patches. The cases in which red atmospheric dust colours the earth as well as water, are less satisfactory, and need not be described. The blood-red waters of a Siberian lake were carefully examined by Mr Ehrenberg, and found to contain multitudes of infusoria, by the presence of which this very striking phenomenon is accounted for.

IMPRESSIONS OF A RECENT EMIGRANT TO SOUTH AUSTRALIA.

MR B—, a young married man belonging to Edinburgh, known as an upright and intelligent person to the Editors of this Journal, emigrated to South Australia in the summer of 1838, accompanied by his wife. He designed to employ a few hundred pounds of capital in sheep-farming, or any other course of life which might promise well, and for which he conceived himself fitted. In April last, after having been three months in the colony, he wrote to a friend in this city a free statement of all his impressions respecting Adelaide and its neighbourhood; and the letter has been handed to us, with permission to print some extracts from it. Our confidence in the integrity and good sense of the writer has disposed us to act upon this permission, for the benefit of the public; and we accordingly subjoin the most important passages of Mr B—'s letter. We at the same time deem it necessary to remark, with regard to such parts as are unfavourable to this new colony, that the impressions of a settler are apt to be of a disagreeable kind at first—a simple consequence of the want of the familiar comforts of the old country—and that they generally improve through time. It appears necessary that some allowance should be made on this score. The most important part of the communication is that relating to the arrangements for the purchase of land. The difficulties, competitions, and stratagems here depicted as besetting this first essential of the business of settling, seem to show the worst possible management in the Company.

After mentioning that on his arrival at Adelaide he embraced an offer from an old friend settled there, to go into partnership with him in keeping a store for the sale of goods, and that he has agreed to follow this line of business for twelve months, Mr B— goes on to say, that while he was writing, the market at Adelaide was prodigiously glutted with various kinds of goods, particularly ironmongery or hardware. Having given a few particulars of a private nature on this point, he next enters on the matter of public interest.

"To come, or not to come, that is the question; but this I cannot resolve for you. All I can do is simply to supply you with a few facts, which may assist you in forming your own opinion. I would say, let your sole reason for coming be the making, without much trouble, a comfortable livelihood and independence in the country. This can certainly be accomplished under the necessary privations attendant on such a first settlement, and with the requisite amount of cash. As to a person's happiness and comfort from other sources, ten to one but you can find them at home a thousand times more easily. Do not allow your imagination to conjure up here more beautiful skies, more fertile plains, more social happiness, than at home, or you will be disappointed. Many exaggerations and deceptions have been practised regarding the colony. As an instance, from a statement at the top of page 22 of S—'s pamphlet, any one would be led to the conclusion that gardens in the town would any where be seen producing all the fine things there enumerated; you may have an idea, then, of the disappointment which we experienced on first entering Adelaide about the middle of summer—going up the principal street, and not seeing (probably with one exception) a single green stump, scarcely a single attempt at a garden at all, and nothing better to be seen than a few sickly cabbages. I don't mean to say that the country could not produce what is stated, but it is not doing so at present, and this probably forms your first source of disappointment on coming here. Vegetables sell extravagantly high; a miserable head of cabbage will bring 3d.; a good-sized melon 3s.; onions 1s. 6d. a-pound; potatoes 6d.

a-pound, &c. Turn next to the bottom of page 16, and you will find the emigration agent in December 1836 stating that he had dug at his tent for water, and that it came in so abundantly, that he could only get down seven feet. It is true he does not state *where* his tent was when this feat was performed; but from the letter, one is (I think) almost led to the conclusion that it was in Adelaide. Now, the fact is, that *there* no water can be had but what is brought in carts from the river Torrens, as it is called (but for river you may understand rivulet, and not undervalue it); and not only is it not good, because it is taken from almost stagnant pools containing decaying vegetable matter, but for this water a family would require to pay 3s. a-week for as much as they would require, or, more correctly, the regular charge is 2s. for the fill of a porter hogshead cask. There are now a good number of wells sunk in the town, but the average depth of these is not less than seventy feet. Now, where the English agent can have dug his well, I have no idea; but certain it is, that water is to be had nowhere (at the season mentioned), unless in the neighbourhood of pools in the bed of the river. In general, water need not be expected at a depth of less than twenty or thirty feet, and the want of water is the universal complaint. As for the river Torrens, I have not been two miles up it from Adelaide; but so far as I have been, it consists of a stream of pretty deep pools, and at a mile or a mile and a half below the town is completely dry. While passing the town, the run of water would certainly not fill an ordinary furrow. I do not doubt that in winter there may be a pretty large stream, and even torrents perhaps occasionally, for the size of the bed of the river, and the appearance of its banks, give sufficient evidence of this; but, at the present season, it is no better than I have stated it. As I have already stated, there is over the country almost a complete want of water for three or four months in the year, without digging to a very considerable depth for it. This you may easily believe was another source of great disappointment to us, and affords a good illustration of the colour put upon matters here to gull the people at home. Lastly, but greatest in importance, is the difficulty of obtaining land on arrival here, a subject upon which the most false official accounts have been sent home, and which have been the source of much misery and disappointment here.

No land, to any extent, can yet be obtained unless by special surveys, and within a very short time upwards of ten have been obtained. The way this is managed is this: A district is explored and fixed upon, and a number of individuals may join in the survey; and a number of parties have thus got their land in a short time, and without much trouble. They can possess it legally before it be surveyed. They merely require to give a description of the district containing the 15,000 acres, which is sufficient in the meantime. The desire for land here at present amounts to a perfect mania. I shall give you an example. The Messrs H— had been squatting upon a fine district which they had discovered. A friend from Sydney came to spend a few days with them; he coveted the spot, and being possessed of the funds, demanded a special survey before the Messrs H— had any knowledge of the proceedings, and they were of course immediately dispossessed. But the following example will give you a still better idea of the eagerness for speculation in land here at present. An extensive merchant in town had freighted a ship to go to Port Lincoln to explore thereabouts, believing from certain information that it would be an excellent place for a survey. He thought he had slipped off very quietly, but his departure was soon known. Some people in the town had caught the mania, and resolving not to be outdone, raised the funds among themselves (ignorant of course whether the place would turn out well or not), and had a survey of Port Lincoln applied for long before the two voyagers had returned, who now discovered to their mortification that their labours had been in vain. To such a height did this mania go, that the shares in the survey, which cost L3, were selling for L30, and even L60, it is said, and this too before the information had been received as to the real value of the land. It is now believed that the land is fine, and there is said to be plenty of water, and no doubt ever existed as to its splendid harbour. At present, great numbers of people are going to it, but the excitement and puffing about it are so great, that I really cannot obtain accurate information about it. The mania for forming towns also prevails here at present. This is managed by the holders of country sections mapping them into acre or half-acre lots, and selling them for towns at the rate of L5, L6, or even L10 an acre. A number of towns at the distance of three, six, and ten miles, have thus been formed round Adelaide, but I am not aware that any houses have as yet been erected upon any of them, with the exception of one, called Hindmarsh Town (the late governor's section), about one and a half or two miles from Adelaide, on which there is a considerable number of houses, belonging chiefly to the lower classes. A fine district was lately discovered by one of the assistant commissioners, about twenty-five miles from Adelaide, having abundance of water throughout the year, being situated upon a branch of a lately discovered river, the Parra, and having a salt-water creek coming into it, navigable by boats for about three miles. A special survey was obtained, of course, and a town is being laid out, called Port Gawler, and is to be sold at L20 a half acre! The rest of the survey is to be laid out in small farms of fifty acres, on a seven years' lease, to be rented at L8 per acre, and purchasable by the party at the end of three years, if he choose, at L12 per acre. I have heard that L10 an acre has been offered and refused for the whole survey. Thus you see how easily a lucky hit may make a fortune:—here L4000 converted into L40,000 in the twinkling of an eye! The S—'s were disappointed with things generally as well as we, but particularly on account of the great difficulty of getting possession of land; so much so, that they had almost resolved to go on to Sydney and remain there for some time (provisions being so much dearer here) until they could obtain land; but the special surveys had just

then commenced, and they, through a gentleman here, heard of a very good district about twenty-five miles distant, with a considerable quantity of water in pools upon it; the land, however, was also good, and they joined with some friends and got a special survey of it. Mr S— has now got his portion ascertained, and is just removing to it. He is delighted with his purchase, for a great part of which I do not suppose he would part with for L3 per acre.

As to climate, you will see you cannot, as yet, look for my experience. We landed in the middle of summer, and it certainly was disagreeably warm, if not oppressively so, the thermometer in our wooden house standing occasionally at 110 or 112 degrees, but by night falling to 80, 70, or even 60 degrees. The heat, after all, is certainly not so oppressive as it might be expected from the height of the thermometer, and is nothing like the oppressive heat of the Brazils, which has a peculiar sickliness about it, although the thermometer may not indicate the same height as we have here. We had ample experience of this, having put in at Pernambuco for a few days. I would say, generally, that it is warmer here than the descriptions led me to expect; but with this you may enjoy the peculiar satisfaction of having, I may say, always an agreeable coolness during the night. The only objection I have to the climate is the extreme changes of temperature, generally three times a-day, increasing greatly the difficulty of escaping colds.* At present, for example, the thermometer in the morning may be about 66 degrees, 96 or 98 at mid-day, and 66, or even lower, again by night. For my own part, I have enjoyed the best health since I came, and am twice as strong I daresay as when I left home. I don't say that with the same amount of muscular exercise in the open air at home I might not have enjoyed as good health, but the grand difficulty is to get that exercise at home. Upon the whole, nothing can be objected to on the head of climate. As to noxious animals, it may almost be said that we have none of them. About the Port, and marshy places, there are numbers of mosquitoes, but none about Adelaide, unless a stray one now and then. There are snakes, of course, but I have seen none, and heard of but very few. There are great numbers of ants, but they are not found to be any real practical grievance. At first we were very much annoyed by fleas, which here exist in great numbers, apparently generated in the sand. They have almost all disappeared now, but whether they will return or not, I cannot say. I have seen one scorpion and one centipede, but one never hears of them from others, and I conclude there are not many of them. I have also seen a few pisantes, an animal not unlike an ant, but they are not worth mentioning as a source of discomfort.

The appearance of the country is very pretty even now, when almost completely bare with pasturing and burning off the grass; and in a few weeks I can easily believe what I am told, that it will be very beautiful. When a little rain has fallen, vegetation proceeds with inconceivable rapidity. The timber is in general no thicker than you would wish for useful and ornamental purposes; and in many places the country is really like a gentleman's seat, as the printed accounts state it to be.

As for wild animals, there appear to be very few. I have seen neither emu, kangaroo, duck, nor wild dog; indeed, I have seen nothing but parrots (small parrots), which exist in considerable numbers about Adelaide, but are too small to be worth killing for eating. I have seen a few parrots, but they, like the other wild animals, have fled before their civilised destroyers. I am told that during the rainy season ducks are to be found in great abundance. There are also, I believe, a good many quails; but upon the head of sporting, you need calculate nothing, as there is no sport to be had worth the exertion, within a reasonable distance of the town, at all events. Up the country, however, I believe it is a little better. Guns, therefore, you will easily believe, are at a discount; the colony is quite stocked with them; almost every emigrant brings one, or even a pair, besides the regular stock sent out for sale.

Now, on the supposition that you and friends make up your minds to come, I must add a few observations on this view of the matter. I have already stated that there exists a difficulty of getting good land by any one just come out—not exactly that good land does not exist, but that the good which is found on the regular surveys is sure to be picked up either by the preliminary section-holders, or by the friends of the surveyors, who always manage to get the first hint, and can secure a good section in this way. There is no hope for the present, therefore, of good sections being easily and soon obtained by people coming out, nor can they do so by other means than a special survey. On the supposition, therefore, that you come, the best way, I think, to proceed would be this: Having examined a tract of country, and found it suitable for all of us (for I may include myself too), we should join, and obtain a survey of it. You will see by the regulations that when such a survey is taken, a space of 15,000 acres is fixed upon, out of which, when surveyed, the 4000 acres are selected. The surveyors, however, have so much work to do, that perhaps for a few years it would not be surveyed, and thus the occupancy of the 15,000 acres would be secured. But suppose it were to be soon surveyed, the land may be so chosen that only about 4000 acres of good soil could be obtained, all beyond being fit merely for pasturage. This would secure you against any one demanding another special survey near you; and so, after all, you might still command an unlimited run of pasturage without paying a sixpence for it.

Early in April 1838, Mr R— L—, a gentleman well acquainted with pastoral affairs, and formerly employed by the South Australian Company (whose services he states he left in disgust), landed in the colony 300 ewes and 10 rams. The dropping of lambs unfortunately commenced immediately after landing, and while the ewes were suffering from the effects of the voyage, so that a considerable number were lost. The produce, however, of the flock, on the 1st June, amounted to 351

lambs. On the 1st of January last, the same ewes lambed the second time, and the produce was 306 lambs, making the increase of Mr L—'s flock as under:—

1838, May 1. Original flock—ewes and lambs	400
June 1. Increase—lambs	351
1839, Jan. 1. do. do.	306
Increase within seven months	657

Total on 13th January last 1057

The lambs of the first dropping in the colony will produce in August next, along with the imported ewes, and Mr L— calculates that his increase of lambs upon the whole flock, during that month, will amount to 540, which added to the present flock of 1057, shows an increase upon the original importation, of 400, of 1197 within little more than sixteen months.

The above statement I have taken from the South Australian Gazette of 2d March, and have every reason to believe it to be perfectly true. This will show you that the published statements as to the increase of sheep have not been exaggerated, as some people were apt to suspect. Both Wentworth and Lang, for example, state the increase of a flock of 670 at the end of the first year to be only 595. The price of the best ewes in lamb here, I may add, varies at present from L2 to L2, 10s., but the large importations must soon reduce this price. I see they are to be bought just now in Sydney for 13s. and 15s. A gentleman told me he saw sold a day or two ago a fine cow in calf for L12, and another in calf with one at her foot for L16, what would have cost upwards of L30 eight or nine months ago."

The writer concludes with some private details and the strong recommendation to his friends, that, should they decide on emigrating, and take intermediate berth on board ship, they must by all means procure a written agreement from the charterer and captain of the vessel, defining the kind and variety of accommodations they are to receive during the voyage. All persons who have proceeded to Australia as emigrants seem to concur in enforcing attention to this point, a circumstance which reflects little credit on the integrity of charterers or the humanity of captains of vessels.

In all probability we shall ere long have another letter from Mr B—, and should it contain any remarks of apparent value to intending emigrants, we shall take an opportunity of presenting them to our readers.

STORY OF ELEANOR.

[The Dublin University Magazine, as we lately mentioned, has for some time been materially improving in the quality of its contents, which, bating occasional papers written in a style of furious partisanship that nobody of course reads, are worthy of being ranked with those of any English periodical now issuing from the press. To its enterprising publishers must unquestionably be assigned the merit of bringing out and encouraging the native literary talent of Ireland; many of the articles in the Magazine are contributed by a set of clever writers whose names are as yet hardly known in Britain, but whose reputation is daily extending, and will ultimately be acknowledged in our common literature. The following little story, which we have slightly abridged, will afford a specimen of the lively style of one of these writers: it occurs as one of a series of papers, called the *Recollections of a Portrait-Painter*.]

ONE of the standing annoyances to which a portrait painter is subjected, is that of being perpetually called upon to pourtray the features of individuals, who, whilst they cannot be called positively ugly, are still so far from handsome, and so much farther from the possession of any peculiar expression, good or bad, that it is impracticable to throw any interest into their portraits, save for those who know the originals. Such has been my continual experience ever since, brush in hand, I entered the lists, where so many nobler and more gifted competitors than myself are contending for the prize of fame. And yet, paradoxical as the statement may seem, one of the most insipid portraits I ever undertook to paint was the means of procuring me more genuine pleasure than I have often found in this world of tribulation and vexation.

Miss Georgiana D— was just one of those commonplace, red and white, *unindividualised* girls whom it is a labour to talk to, or to paint, either in words or colours. She had one quality, however, which rendered her a person of much consideration in her own circle—she was rich.

Miss D— was a parlour boarder in a fashionable metropolitan school, and the painting of her portrait originated in the fancy of a rich and childless uncle in Bombay, who had the power, if he pleased, to swell the heiress's fortune to three times its present extent. To do Miss D— justice, I do not think her own vanity would have induced her to sit to me. She was too inert and sleepy to be very vain, and certainly had no innate love of the fine arts, which might have tempted her to patronise one of their votaries. Her exclamation, when she saw the picture on its completion, might have settled that question for ever—"Dear, dear! well, I dare say it is like me, though—and I am sure the lace tucker is the very same!" The background, and the rich drapery, and the flush tints, on which I had expended so much thought and care, were all as nothing to her!

Yet the painting of that portrait is connected in my mind with such sunny and happy recollections—with so much of the romance of real life, that I look back on it as one of the brightest vistas in the image of memory. Another face arises in my dream: beside that inexpressive visage—a face, of which a glimpse might put a man in good humour for a week, and even reconcile him to the task of painting a Miss D—! The face of Eleanor Armstrong, the under-teacher at Miss Toogood's seminary, always rises to my mental

* It is odd to hear a person from Scotland complaining of changeableness of climate.—Ed.]

sight, amidst the memories of that time, as one of the fairest visions that ever blessed the eyes of painter.

Miss D— had favoured me with one or two sittings, when Miss Toogood suggested that a companion might be useful in talking to her, as I ought to catch the varying expression of my sitter's countenance! I certainly did not expect that any thing under an earthquake or the laughing gas could induce the heiress to move a muscle; but as I could not decently say so, I assented, and Eleanor Armstrong was forthwith installed in her office of conversationist, and elicitor of expression, where, alas! there was none to elicit. Oh! what a face was that which beamed on me, when, on the third day of my purgatory, I entered the room set apart for my work. There was Miss D—, just as heavy and blank as usual, but beside her sat Eleanor Armstrong—the personification of living loveliness. Beautiful, very beautiful, was the under-teacher. She painted her likeness on the minds of all who looked on her, as effectually as ever the sun painted the features of a landscape in Mr Talbot's newly discovered camera obscura. But this sort of painting did not content me; I longed to paint her portrait. Had I asked permission to do so, I might, perhaps, have been refused; at any rate, such a request would naturally have drawn on the fair damsel the envy of the amiable proprietress of the establishment, of a worthy lady of a certain age, who presided over the spelling and the needlework, and of an old French governess. So I forbore the request, but not the deed. During the very frequent sittings with which I discovered it was indispensably requisite Miss D— should indulge me, I managed to transfer that lovely face to a miniature canvass, secretly placed in front of the larger one; and, copying this at home on a larger scale, assisted by memory, I managed to make a portrait so striking, that the likeness was almost startling. Poor dear Eleanor! She little guessed the nature of my employment, or of what vast importance to her future happiness that employment was to be.

The portraits were finished. Miss D—'s was to have graced the walls of Somerset House; but as the person who had undertaken to convey it to the Indian nabob left England earlier than he had intended, it was consigned to his keeping, and from that time to this I have seen and heard no more of it. The other, so secretly wrought, so fairly finished, supplied its place in the Exhibition. Fresh, and fair, and new, did that sweet face look amongst the resemblances of glowing gentlemen and smirking ladies, by which it was surrounded. Many a loudly expressed burst of admiration, many a whisper of deeper and truer delight, were elicited from the groups which crowded round that transcendent portrait; and often might be heard the murmur of disappointment, when the page in the catalogue, eagerly turned to for information, was found to contain nothing respecting the original, save the unsatisfactory words, "Portrait of a young lady."

The season was drawing to a close, and the Exhibition rooms were unusually crowded. I happened to be there, and saw with much pleasure that the gazers on my favourite picture were as numerous as ever. Amongst these there was a young man of about twenty-five years of age, of remarkably distinguished appearance, who seemed to regard it with an extraordinary degree of interest. Long did he pause before it, long after the groups around had departed, and he was left alone to survey it at leisure. He paced back and forward before it, looked at it from all points of view, and finally left the room rather quickly, with the air of a man who has formed some hasty purpose, and is determined to lose no time in executing it.

"I shall see that youth again," was the prophetic impression on my mind, and I was not mistaken. That very evening my servant announced "a gentleman on business," and on the skirts of the announcement, the glazer of the morning entered my apartment.

Long before this time my readers will have anticipated that the young man had been struck by the likeness of the picture to some one in whom he was deeply interested. Such was precisely the case. He came to me for the purpose of ascertaining the residence of the original, of whose identity he had not a moment's doubt; but it is best that I should detail the history I gathered from him, in a somewhat more connected form than it was poured out to me.

Eleanor Armstrong was the only daughter of an excellent clergyman, and distantly related, by the mother's side, to the very noble and very proud Lady Borrodaile. Left an orphan at twelve years old, and very slenderly provided for, pity or pride, or both together, induced the titled dame to extend her protection to her fair young relative, and to receive her under her own roof. This was a piece of virtue which brought with it its own reward; for if ever embodied sunshine were the inmate of an earthly dwelling, Borrodaile Park had such an inmate in the person of Eleanor. Gay, but never noisy, wise as well as witty, loving and amiable as she was beautiful, Eleanor Armstrong was as a new life and pulse to the somewhat starchy inhabitants of the gloomy old mansion. Her light foot sounded strangely pleasant as she tripped over the old oaken floors, so long used to echo nothing but the stately steps of the Lady Borrodaile and her attendants. Her sweet laugh rang like fairy music amongst the arched roofs, and in the broad, quiet corridors. Her bright face looked out like a flower with a soul in it (it is a conceit, but it is so like her)

from the dark recesses and the Gothic windows. The Lady Borrodaile felt her influence—she could not resist it; and her heart, cold and formal as was the set of its currents, could not but warm into something like attachment to the fair being who was so happy, so cheerful, and, above all, so grateful and dependent.

But if the proud and formal lady almost thawed in the presence of the sweet Eleanor, there was another heart which, naturally warm and ardent in its feelings, fired with a passion of the most enthusiastic and devoted kind, as my heroine changed from a lovely child to a lovelier woman.

Sir Philip Borrodaile was an only child, and had been left under the guardianship of his proud mother, by a very weak and very henpecked father, who died when his son was little more than an infant. Fond of power, which she had exercised with an iron hand over poor Sir Ralph, from the time of his marriage to his decease, and hating to give up her sway over any person until she should reach the extremest point to which it was possible to retain it, she had prevailed on her husband to give her a certain authority over the pecuniary resources of Sir Philip, which he could not shake off until he should have attained his twenty-fifth year.

Had he been a constant resident at Borrodaile Park, his heart might not have been less kind, but his manners might have contracted the dignified coldness of those around him, and the continued presence of his orphan cousin might have averted the event his mother dreaded; he might have loved her as a sister, and no more. But fearing the consequences of constant intercourse with one so lovely and so poor, the lady contrived that he should spend much of his time at a distance from home; and whenever he was a visitor at the Park, she never failed to expatiate largely on the horrors of *misalliances* in general, with a special clause against those which included relationship, however distant, amongst their disadvantages. Certainly for a wise woman, Lady Borrodaile did a very foolish thing, for her design was immediately seen through; and as Sir Philip was not without a spice of the spirit of contradiction in his nature, he naturally fell in love with Eleanor, with a vehemence and ardour unsurpassed in all the records of romance.

[The affection became mutual; but being discovered by Lady Borrodaile, her son was dispatched on foreign travel, and Eleanor shortly afterwards expelled from the family, and compelled to take up the employment of an under-teacher in the educational establishment of a Miss Toogood, in London. All letters sent to her from Sir Philip were intercepted, and she was at last, by the artful insertion of a paragraph in a newspaper, announcing a projected union between him and a certain Lady Honoria M—, forced to believe that she was entirely forgotten and abandoned.]

She had a long and severe illness, and for weeks small hopes were entertained that she would survive. But a sound constitution and an elastic spirit will bear up marvellously through heavy troubles, and revive again and again from bitter mental suffering. Eleanor Armstrong had a truly affectionate heart, and she had loved with all the warmth and enthusiasm of which such a one is capable; but still she was not the girl to die of love, or resolve to be miserable because she had known disappointment, especially when she remembered that the object of her attachment had proved himself unworthy of it. She rallied her pride and her spirit—called in the blessed aids of religion and reason, and in a few months the lovely under-teacher was as lovely as ever. There was, perhaps, a little more thought on her brow, a little more tenderness in her smile—but she was once more able to perform her duties with attention and energy, and her cheerful resignation and unrepining content won her the love and respect of every being near her, whose heart was not utterly sheathed in the frost of selfishness.

I do not doubt that if Sir Philip Borrodaile had crossed her path no more, she would in time have conquered the lingerings of attachment towards him which *would* sometimes rebel in her heart, and even might at some future day have practically proved that it is quite possible to love more than once. I say this *might* have happened, but the fates (in compassion to the romantic portion of my readers) had ordered otherwise, and Eleanor Armstrong was doomed to remain a heroine after the most approved fashion.

The baronet had contracted an acquaintance, while on the continent, with an English nobleman, to whose party he speedily attached himself, and with them returned to England. His mother was delighted at this accident, for the family of the aforesaid nobleman was an ancient one, and his estates large, and she allowed to herself that the Earl of V—'s only daughter might be almost a sufficiently good match for the heir of Borrodaile Park. It was at her instigation that a newspaper paragraph had insinuated the probability of such a marriage, and by her direction that the paper was placed in the way of Eleanor Armstrong. To her son she was all warmth and affection. The untruths respecting Eleanor's conduct, which she rather hinted at than expressed, were of such a nature as to lead Sir Philip to suppose that his betrothed had acted in such a manner as to place an eternal bar betwixt them. She described Eleanor's departure from her protection as entirely her own spontaneous deed, and even denied any knowledge of her residence or situation. But Sir Philip clung long and obstinately to the memory of his early love; and

it was only on the very eve of his twenty-fifth birthday that his mother extracted from him a consent to pay a long-delayed visit to the Earl of V—, and if he should find Lady Honoria still as favourably disposed towards him as she once seemed to be, to offer her his hand. For this purpose he went to London. Lady Borrodaile had no fears respecting the possibility of his meeting with Eleanor, for her obsequious *confidante*, Miss Toogood, was carefully apprised of Sir Philip's intended journey, and had orders to keep her fair inmate pretty close during his stay in town. Great was the surprise of Miss Toogood when a gentleman called at the "establishment," and demanded an instant and private interview with Miss Armstrong. Greater still was her consternation when, on entering the drawing-room half an hour afterwards in an agony of uncontrollable curiosity, the gentleman announced himself as Sir Philip Borrodaile. Greatest of all was the anger of his lady mother when she was informed of the frustration of her schemes!

A fortnight after his memorable visit to the Exhibition, Sir Philip Borrodaile kept his twenty-fifth birthday. In three months more, a bridal party stood before the altar of St George's, Hanover Square. Sir Philip Borrodaile was the bridegroom, a bishop pronounced the blessing, I gave away the bride, and that bride was Eleanor Armstrong.

The portrait which plays so conspicuous a part in this faithful narrative, still hangs in the gallery of Borrodaile Park. There are many others around it by far worthier hands than mine—pictures, for which hundreds and thousands have been refused—pictures, that have raised the envy of half the connoisseurs in Europe—but there is not one which the master so dearly prizes as that which made its *début* at Somerset House in the humble character of the "Portrait of a young lady."

LAW, THE PROJECTOR.

Now and then, in the common course of events, we find obscure men, but of enlarged conceptions, bringing themselves into notice by the mightiness of their projects, and if not attaining a high degree of honour, at least gaining no small share of permanent notoriety. John Law, who flourished at the beginning of last century, was one of these extraordinary individuals.

Law, who was the son of a goldsmith in Edinburgh, was distinguished in youth for his power of arithmetical calculation, but this might not have been of consequence in advancing his fortunes, but for an accidental circumstance. Having killed a person in a duel, he fled from Britain to France, a country much more congenial to his habits. He afterwards returned to his native country, but finding no opening for his schemes, he returned to Paris, which henceforth became the scene of his exploits. Law's genius took the direction of financiering. He had notions about national credit and paper money of the most extravagant kind. There was nothing in the way of national aggrandisement that a well-managed apparatus of paper issue could not accomplish. With these ideas in his head, he contrived, after a few years' delay, to gain the favour of the Duke of Orleans, at the time regent of France, and by that personage was permitted to set up a joint-stock bank in Paris, in May 1716. This concern was prosperous, and increased his credit as a projector. It soon appeared that the bank was but the first of a series of gigantic financial and commercial undertakings, such as had never before entered into the conception of any human being. Unquestionably, the consent of the regent to the progressive development of these plans was founded on the belief, instilled into his mind by Law, that the government of France might be freed through them of the enormous load of debt then pressing upon it, and which absorbed one half of the national revenues for the mere payment of interest.

Ample proof of the complete understanding between the regent and Law, is presented in the history of the great project which the latter set on foot, with the duke's approval, in the year following the commencement of the bank. He had long entertained the notion that a rich field for commercial enterprise was to be found in the yet uncolonised and but partially explored regions on the banks of the Mississippi, and particularly in the district of Louisiana, which, having been visited and so named by a French voyager, was held upon that footing to belong to France. An impression prevailed that this country was full of magnificent mines, and rich in all respects beyond description. Law accordingly persuaded the regent to establish a great company for the purpose of trading to this part of the world, and to give numerous privileges to the body, along with the sovereignty of Louisiana, under certain conditions preservative of the king's nominal superiority. This was the too famous Mississippi scheme. The funds of the West Indian Company, as it was called, were to consist of a capital of 100,000,000 livres, to be raised in shares of 500 livres each. And now the company repaid in part their obligations to the regent, by taking the subscriptions in government paper, or *billets d'état*, which, on account of the miserable way in which the interest was paid by the state, bore in the market at that time scarcely a fourth of their ostensible value. The consequence was, that the depreciated government paper rose to full credit with the people, who from that moment began to place implicit confidence in Law, and to thirst universally

for a share in his wonderful projects, and the profits which promised to follow from them. But before the eagerness for participating in his speculations rose to its full extent, he had incorporated with the Mississippi scheme others of even tenfold magnitude. He prevailed on the government to take his bank into its own hands, and became director-general of the establishment, under its new form of the Royal Bank. This appears to have been effected chiefly for the purpose of having the state's guarantee for an enormous issue of paper money, amounting to 1,000,000,000 of livres. In December 1718, and in May 1719, our projector got a further transfer of the charter and privileges, first of the Senegal Company, and then of the China and India Companies, out of which, in conjunction with the West Indian Company, a great "Company of the Indies" was formed, with the exclusive right of trading to the "four quarters of the world." Existing claims were of course paid by the new body. In the course of 1719, the public revenues, also, which were usually called *farms*, and had been long in the hands of contractors or farmers-general, were transferred to the management of the Company of the Indies. The Company, on their part, took upon themselves vast obligations, and one, among others, to lend the king or government the enormous sum of 15,000 millions of livres. Separate funds were raised in succession for all the company's purposes, in the shape of actions or shares, amounting to 600,000 in all, of which 200,000 were at the rate of 500 livres each; 50,000 at 550 livres; 50,000 at 1000 livres; and 300,000 at 5000 livres. To pay the interest of this enormous total, the company, it was said, had an annual income of above 80,000,000 of livres, and they at least boldly declared themselves able to pay an annual dividend of 200 livres a share.

This great company, supported by the whole credit of government, engrossing such immense sources of revenue, and possessed of such extensive property, became gradually the object of the most absorbing interest to all France. The ample profits which it seemed to promise, excited the cupidity of the people to an extraordinary extent, and a system of trafficking in shares commenced, which has no parallel in the annals of speculation or stock-jobbing. The rage for shares actually raised them to more than sixty times their original value, judging of that value by the former price of the *billets d'état*, or purchase money in the market. Almost all the original proprietors made splendid fortunes at the very outset, and the knowledge of this led to the wildest bidding on each new creation of shares. Clergy and laity, peers and plebeians, statesmen, princes, and even females of every class, were alike seized with the stock-jobbing phrensy. The negotiations for the sale and purchase of shares were at first carried on in the Rue Quinquempoix, which was besieged by such crowds, that houses, rented at 800 livres a-year, actually yielded from 6000 to 16,000 livres a-month. The eagerness of the speculators to commit bargains to writing, was such, that a hump-backed man made 150,000 livres in a few days, by letting out his hump as a writing-desk. A murder, which took place in the Rue Quinquempoix, caused the paper traffic to be transferred to the Place Vendôme. "The superb hotels of which that magnificent square (or rather octagon) consisted, not being calculated for the establishment of offices for transacting business, a number of tents were for that purpose pitched in the area. Of these, some served for the accommodation of the stock-jobbers, others were destined for places of refreshment, and a third set was occupied by gamblers playing at quadrille, and drawing lotteries of jewels. All the world flocked to this spot, ladies of the highest quality delighted to walk there of an evening, and the concourse was so great, that the famous fair of Beaucaille appeared a desert in comparison. The business was productive of so much noise and disturbance, that the Chancellor complained he was prevented from attending to the causes in the Chancery, which is situated in the Place Vendôme. Mr Law then agreed with the Prince of Carignan for the purchase of the Hotel de Soissons, at the enormous price, as is said, of 1,400,000 livres; and in the gardens belonging to that edifice, about 600 pavilions, each rated at 500 livres a-month, were disposed in regular order, beautifully interspersed with trees and fountains. To oblige the brokers to make use of them, an ordonnance was issued, prohibiting, under severe penalties, any bargain for stock to be concluded, except in one of these pavilions. Mr Law (continues his biographer) now blazed a meteor of unequalled splendour, having arrived at a pitch of power and consequence, that required a strength of intellect almost supernatural to be able to support it undazzled. He saw himself perpetually followed by, and his levee constantly crowded with, princes, dukes and peers, marshals and prelates, who all humbled themselves before his shrine with the utmost submission, while he treated them at times in a style of consummate haughtiness. The Baron de Pollnitz observes in his memoirs, that he has seen dukes and peers of France waiting in Mr Law's antechambers like the meanest subjects, and that at last there was no getting near him without feeing the Swiss porters for entrance at the gate, the lacquys for admittance into the antechamber, and the valets for the privilege of access to his presence chamber or closet."

The influence and authority of Law were rendered still more extensive by his appointment, on the 5th of

January 1720, to the office of comptroller-general of the French finances, preparatorily to which he had formally adopted the Catholic faith. In plain language, he became prime minister of the country. By this time, his operations began to be a subject of alarm to the British government, who began to court his favour in various underhand ways. There is evidence that the Prince of Wales himself sent over a confidential person to secure for him a share in the profits of the great stock-jobbing affair. The British ministry are also said to have offered, in order to propitiate Law, to bring his wife's brother, commonly called the Earl of Banbury, into the House of Lords, from which a charge of illegitimacy, brought against his father the third earl, had hitherto excluded him. Lady Catherine Law shared largely in the adulation lavished on her husband during his hour of success, and is reported to have shown much insolence to ladies of rank, speaking usually of duchesses as "the most tiresome animals in the world." Her children, a son and a daughter, might have been married into the first families in Europe, and the father, in his adversity, assumed some merit to himself for not permitting this to take place. Miss Law's hand was sought by the Prince of Tarente, and other suitors of scarcely inferior rank.

All this splendour was doomed speedily to disappear. A constant drain of the specie of the kingdom had been going on since the commencement of the speculating mania. Those who had made large fortunes in paper secured themselves by converting their wealth into gold and silver, which they either hoarded up, or sent out of the kingdom. Many of the same parties, also, filled their houses with such prodigious quantities of plate, as must have tended materially to reduce the amount of the metallic currency. The fabrication of notes, meanwhile, was proceeding at an enormous rate, upwards of 2000 millions of livres being struck off between December 1719 and May 1720. Thus the stability of the system, and the prosperity, in truth, of the country, came to depend on the maintenance of the paper credit, which the comptroller-general endeavoured to secure by a succession of arbitrary edicts, one of which declared the bank notes to be legally current at five per cent. above the specie. But in spite of all his endeavours, he and his plans began to lose credit with the French regent, chiefly through the secret influence of persons envious of the successful adventurer. His proceedings were represented as particularly detrimental, on account of the disparity of value which they created between the paper and metallic currencies. By such representations, the regent was induced to take a step which at once and for ever ruined the paper credit, and brought the whole gigantic system to the ground, with a crash which may be said to have shaken all Europe. On the 21st of May 1720, an edict was issued, announcing that "a progressive reduction of the India Company's actions, and of bank notes, was to take place from that day till the 1st of December, when the bank notes should remain fixed at one-half of their present value, and the actions at four-ninths." This edict in an instant lifted the film from the eyes of all France. The hands of the people were filled with paper, the value of which they now saw could be utterly annihilated by a word from the mouth of authority. A run commenced upon the bank, which compelled the government to post soldiers around it to prevent the very edifice from being pulled down by the infuriated applicants. Seditious libels appeared every where, attacking the regent for overturning the credit to which he himself had given existence. Alarmed by these proceedings, he hastily summoned the parliament, and revoked the fatal decree six days after its promulgation. Nothing could restore the credit of the paper money with the public. The bank was shut for a time on various pretences, but, as soon as reopened, it was again besieged by such crowds of people, that in one day (the 9th of July) twenty persons perished in the streets by suffocation. The mob also surrounded the hotel of Law, and compelled the man whom they had lately idolised, and had saluted in the streets with the *vivats* which are seldom given but to royalty, to hide himself for weeks in the houses of friends. On the mind of the projector the first symptoms of disorder are said to have produced a dreadful impression. Lord Stair describes him as being incapable of sleep, and as subject to such fits of phrensy as to be found sometimes dancing in his shirt around the chairs of his bed-room, "seemingly quite out of his wits." But he struggled hard, by tongue, pen, and act, to maintain his system, though all his efforts, as well as those of the regent, who deeply regretted the edict of the 21st of May, proved utterly fruitless. From the consequences of the delusion, France did not recover for many years. By the regent's dealings with Law, the national debt had been almost annihilated; but the creditors had been paid in paper, and when that became valueless, they were ruined by thousands. The delusion which caused this wide-spread misery presents, on the whole, a valuable lesson, being a striking example of a fallacious theory carried out to its fullest extent, and on the grandest possible scale.

Law resigned all his offices in December 1720, and retired to a country seat, which he quitted soon afterwards for Brussels, carrying with him only 800 louis d'ors, the wreck of his once magnificent fortune. This and other circumstances prove that there was a degree of disinterestedness in the views of this remarkable man, for which he has not usually received credit

from posterity. His latter days were spent in poverty, and he died at Venice in 1729, before he had completed his fifty-eighth year. Several descendants of the Law family are still living in France. One of the projector's grand-nephews arrived at high military and diplomatic distinction in the service of Napoleon and the Bourbons, and died a few years ago, a marshal and peer of France.

TASTE FOR MUSIC IN GERMANY.

There exist in Germany particular bodies of craftsmen, among the members of which music is cultivated with more than common zeal. Such is the case, for instance, in some china manufactories at Eichternach, at Metloch, on the banks of the Sarre. The miners are, in particular, distinguished by their knowledge of music. * * * What seems more surprising is, to find the art cultivated in localities entirely deprived of the means of instruction. They told us of a man who, without having ever had the least instruction in music, had learned it alone, and seemed to have fed his children with it, at an age when most children are fed on milk only. We had great desire to know him, and prolonged our journey in the Tyrol, as far as Berchtesgaden, in the neighbourhood of Salzburg.

* * * On our road to the dwelling which had been pointed out to us, we heard some Tyrolean songs, often accompanied on the *Zitter* (cittern?). At last we arrived at the cottage; it was shut up. We knocked in vain; no one answered us. The whole family, Grassl, his wife, and children, was out on the mountains, occupied in their daily work—that of finding aromatic herbs and wood. This man, who had no other means of subsistence than the sale of simples, procured with such hard labour by himself and family, had himself built, with the aid of his wife and children, the little cabin they inhabited: and at evening when they came home, bending under their burdens, they took a frugal meal, and then betook themselves to the study of music, by way of repose and diversion after the labours of the day. Grassl learned the gamut and the time-table, and fathomed the principles of art, without any other assistance than his own wonderful perseverance. Little by little he began to play on the violin, the bassoon, the clarinet, the flute, the octave flute, the trumpet, the keyed trumpet, the horn, and the trombone. Nor is that all: this naturalist in music has inoculated his children with all he knows. * * * The Queen of Bavaria, who possesses estates in this district, wished, like ourselves, to know this interesting family. She arrived, with her suite, about six o'clock in the evening. The little family had not returned from its rural labours—some were fiddling the cows, some digging up potatoes. The queen had them collected, and when they arrived, without taking time to change their clothes or clean themselves, they ranged themselves round their table; and the poor children, with earth on their hands and sweat on their foreheads, began to perform the "Bavarian Troops' March," the "Salzburg Waltz," the "Chamois Hunter's Air," some on stringed, some on wind instruments, sometimes on brass instruments only. A little boy on a chair, only five years old, played the double bass. Grassl subsequently made the tour of the continent with his family.—*Notice of Mainzer's Sketches of Music, in the Athenæum.*

MILITARY PARADE AND COSTUME.

On this subject we find the following observations in Dr Channing's Lecture on War, recently published. "Men's sensibility to the evil of war has been very much blunted by the deceptive show, the costume, the splendour in which war is arrayed. Its horrors are hidden under its dazzling dress. To the multitude, the senses are more convincing reasoners than the conscience. In youth, the period which so often receives impressions for life, we cannot detect, in the heart-stirring file and drum, the true music of war, the shriek of the newly wounded, or the faint moan of the dying. Arms glittering in the sunbeam do not remind us of bayonets dripping with blood. To one who reflects, there is something shocking in these decorations of war. If men must fight, let them wear the badges which become their craft. It would shock us to see a hangman dressed out in scarf and epaulet, and marching with merry music to the place of punishment. The soldier has a sadder work than the hangman. His office is not to dispatch occasionally a single criminal; he goes to the slaughter of thousands as free from crime as himself. The sword is worn as an ornament, and yet its use is to pierce the heart of a fellow creature. As well might the butcher parade before us his knife, or the executioner his axe or halberd. Allow war to be necessary, still it is a horrible necessity, a work to fill a good man with anguish of spirit. Shall it be turned into an occasion of pomp and merriment? To dash out men's brains, to stab them to the heart, to cover the body with gashes, to lop off the limbs, to crush men under the hoof of the war-horse, to destroy husbands and fathers, to make widows and orphans, all this may be necessary, but to attire men for this work with fantastic trappings, to surround this fearful occupation with all the circumstances of gaiety and pomp, seems as barbarous as it would be to deck a gallows, or to make a stage for dancing beneath the scaffold. I conceive that the military dress was not open to as much reproach in former times as now. It was then less dazzling, and acted less on the imagination, because it formed less an exception to the habits of the times. The dress of Europe, not many centuries ago, was fashioned very much after what may be called the harlequin style—that is, it affected strong colours and strong contrasts. This taste belongs to rude ages, and has passed away very much with the progress of civilisation. The military dress alone has escaped the reform. The military man is the only harlequin left us from ancient times. It is time that his dazzling finery were gone, that it no longer corrupted the young, that it no longer threw a pernicious glare over his terrible vocation."

INTERDICTED CONVERSATION.

ALL kinds of conversation will not suit in all places. Human life is such a blotted page, that there is scarcely any person who has not some delicate point about him, which others must forbear alluding to in his presence. Then there are prejudices and habits of thinking in all men, and it does not do to come shock upon any of these in a random conversation. Even peculiarities of professional occupation become causes for the exercise of the good old rule, to think twice before we speak once.

If a gentleman, for instance, has been so far left to himself, as old people say with us in the north, as to publish a very poor book, which is understood to have been a dead weight on the shelves of the publisher ever since, he can scarcely fail to be offended when he hears sorry attempts at authorcraft sneered at, or is told of the great conscientiousness and acumen of the review which extinguished him. The honest gentleman will say nothing at the time: it is surprising how unconscious of pen and ink he will appear. But he will writhe in his secret soul, and regard the individual who brought on the conversation with dislike ever after. If another gentleman has set up a business of some newfangled kind, and failed in it, all allusions in his presence to that business, or to newfangled projects in general, must needs be gall and wormwood to him, and are therefore to be avoided. Suppose one has made some sort of misalliance, whether in rank or age, unequal matches become from that time a forbidden subject in every company where he may chance to be. The most provoking thing is, that one may thus give offence very unknowingly, and be honoured with the most merciless reprobation without being told for what. He may cut himself off from all expectation of honour and profit in the highest quarters by some simple allusion. A jest at second marriages before a patron who has taken a third wife, may defeat the best formed hopes of promotion, or he may be cut out of a will by an unlucky remark on that frailty of well-disposed old ladies which leads them to endow their cats.

All men, it has been said, have some prejudices or habits of thinking, which it does not do to come against in conversation. How often do we see this truth illustrated in ordinary society! A mixed company is for hours quite social and happy in general conversation, when some one, forgetting the well-known caution on the subject, or carried over bounds by the feeling of the moment, speaks favourably of some public personage whom some others present detest, or condemns as a monster some statesman whom the rest regard with veneration. What a curling up instantly takes place! Or it may be that some gentleman speaks of, as an established fact, some allegation which others recognise as only a lie of his party, and then how equally certain are we to see peace and harmony rise from the table! One soon comes to learn in a free country that truth is truth only in certain companies, and may be lies and calumny every where else; and *vice versa*: and he learns to take care that his hearers pass under a certain political designation before he ventures on the simplest proposition. The number of things that it is unsafe to speak of except in one way before certain persons, is as great as that of the venerations and dislikes of mankind—which, verily, are not few. There is no safety here. There would be companies in Nero's time, in which it would have been impossible to insinuate a word on the emperor's mad wickedness, without calling up some one who made it a point of conscience to believe him a vigorous and just ruler. There are polite companies at this moment in the world, in which no one could

imply a doubt of the righteousness of slavery, without being thought all that is bad. An uncivil word spoken of a certain old gentleman, in the city called by Byron the eternal, is proverbially attested to be dangerous. It would have been necessary in Newton's time to ascertain the character of every body present, before venturing to intimate a doubt of witchcraft. In our own day there are manias that carry away men, and of which it is not right to speak slightly without some similar preparation. Were one, for example, to laugh at the absurdity of buying books, not to read, but to possess, and giving large prices for them, not on account of their absolute value, but because of their having some typographical peculiarity of no real consequence, he might be vexed to find that his very next neighbour was a member of the Roxburghe, Bannatyne, Camden, Maitland, or Abbotsford Club, or of all of them, and was notorious for once having given two hundred pounds for a collection of useless old pamphlets. In like manner, the floricultural rage might be ridiculed, when it would be afterwards learned, to the inconceivable mortification of the scoffer, he being a good-natured man, that the mild old gentleman on the opposite side of the table, who had won his heart by the kind way in which he had asked him to drink wine, was a noted rearer of dahlias, accustomed to pay a guinea every other day for some Duke of Wellington, or Earl Grey, or Grand Monarque, or other great personage, in very coarse leaves and very red petals.* You might express your surprise at the existence of such a work as the *Heartsease Magazine*, and wonder how a sufficiency of rational beings could be found in the country to support a monthly periodical, in each number of which there was to be found nothing but a print of some new pansy—some *Reine de Sheba*, *Jeremy Bentham*, or *Princess Esterhazy*—with a sheet of letter-press concerning those and other new varieties—when it might chance that a principal contributor, or the editor himself, was at your very elbow. You have your own *Dalilabs* of the imagination, and, as you wish these to be respected, so must you respect the *Dalilabs* of the imaginations of other men. The like caution is necessary as to matters of unestablished science, where it is of course natural for him who is convinced to be particularly touchy to the sneers of those whose eyes have not as yet been opened. For example, it would be very unsafe to venture in a large company on a jest at the expense of homœopathy, seeing that there might be some gentleman present who was daily in the practice of curing, by means of infinitesimal doses, people whom other doctors had dismissed as incurable. It would more particularly be unsafe, if you chanced to be, as ten to one you were, totally ignorant of every thing about homœopathy, except that its votaries can carry their whole laboratory in a needle-case. It might then perhaps depend on the mercifulness of the homœopathist, that you were not shown up in the somewhat ludicrous character of one who laughed before he understood. The same policy applies to both phrenology and zoo-magnetism: it is decidedly proper to know a little of the facts of both these supposed sciences, or of what their professors describe them to be, before indulging in any thing like a jest at them, lest there should be some one present whose veneration you have been unwittingly offending, and who, having his destructiveness thereby roused, may revenge himself with a little sport at your ignorance. Upon the whole, while it is legiti-

mate to deride all these absurdities of the philosophic world, it is quite as well to know a little about them before doing so in mixed company.

The circumstances through which individuals have passed in the course of life, and the peculiarities of their present situation, form just so many points of delicacy about them, calling for very guarded allusion on the part of their friends. One must not speak of mushroom greatness before a dignitary who a few years ago was in a poor and servile condition, nor of the poor pride of reduced gentility in the company of one who lives much like the starving hidalgo in *Guzman d'Alfarache*. It often happens that a tradesman becomes wealthy enough to live in a style equal to that of gentlemen of estate, and at the same time contrives to entertain persons of that order, not only with all desirable luxuries, but in a manner which shows himself to be possessed of the feelings and tastes of a gentleman. On such an occasion, when all have been made happy by the best of viands and of wines, and every thing is sweet, pleasant, and serene, how malapropos for some gentle guardsman or lordling, charmed for the moment into the belief that he was entertained by a real gentleman, to let slip one of the established sarcasms at tradesfolk who ape their betters! Would not, in such a case, the very Madeira blush itself into Port? The blunder would be the worse if more particular. Supposing the entertainer to have been a furnisher of human apparel, it would, we apprehend, be decidedly improper to speak of *taking measures* for any end or purpose at his table. Were he a wine-merchant, it would be quite shocking to ask where he got his claret, and what he paid for it. Had he been a shopkeeper of any kind at one part of his career, the very word shop would needs be proscribed: the mention of such a thing on such an occasion would have the effect of *Harlequin's sword*, and the elegant room with all its alimentary furnishings would disappear in an instant, leaving in its stead a scene of shelves and counters, with smirking salesmen flying about in all directions, and the host sitting in his box of a counting-room with his pen behind his ear. Things of this kind are extremely awkward. We have known them make all the after part of an evening as stiff as pasteboard, and even extend their influence up into the drawing-room: the death of all hope of future invitations was but the least of the evil. When a gentleman without taint of trade goes into the halls of one in different circumstances, he would need to be well exercised in caution. Let no witchcraft of well-furnished mahogany in one room, or of silken sofas and velvet carpets in another, for a moment make him forget what his host has been, and that the honest gentleman, in all probability, would like to forget it himself.

It is at the same time a great hardship that so much conversational ground should thus be, one way and another, staked off from general use, the result being that in mixed company there is no safety out of theatrical chit-chat, or a few remarks on the last exhibition of the works of living artists—even these topics being to a certain extent endangered by the possibility that you may have a player or a painter in the party. The talk of mixed company is thus apt to be excessively insipid, so that, at the end of a whole night of it, one feels much like a man condemned to live on gruel, to whom one mouthful of solid beef-steak would appease appetite better than whole tubs of so weak an aliment. Might there not be some polite expedient adopted to leave conversation a little more free? It is obvious that the dread of coming upon dangerous ground must often exist where the ground is quite safe. One must often be prevented by the general

* Our own good nature demands that we do not leave this jibe at the floriculturists in its native prickliness. We look upon the floricultural enthusiasm as among the most innocent of the day, and in reality sympathise a good deal in it.

caution from touching matters which, as it happens, would be an offence to nobody. Such would not be the case, if there were some means of ascertaining what *are* the delicate points of the various members of the company. This might be perhaps managed by some neat and unostentatious system of signals. For example, if all of one political party were to wear a particular pattern of neckcloth or stock, a company entirely composed of that party might in an instant become aware of the fact, and be therefore at liberty to canvass state-affairs, praise all their own leaders, and tell all their own lies, without fear of mutual offence, and thus revel for a few happy hours in their own honey or their own venom, instead of being compelled, as they otherwise might have been, to touch only on commonplaces. All kinds of persons, having delicate points in their history, habits of thinking, and occupations, might adopt appropriate devices, all of which would be sure to be respected in polite society; for, as we have heard an acute friend remark, mankind are generally so forbearing towards each other's sore points, that one may almost know if any important step he has taken be wrong, by observing that no one ever speaks of it to him.

One other expedient might be suggested, that men should endeavour to be more good-humoured and easy on such matters. The hump-backed man, who was always the first to laugh at his own deformity, and thereby became a favourite with every body, affords an excellent example. Let him who has some unhappy point in his history to look back upon, resolve to think of it, and have it by chance touched upon by others, with patience. Let contending politicians only consider that their opinions are, in nine cases out of ten, the result of a mere sentimental prepossession on both sides, and they will see the absurdity of too keenly challenging each other's views. Finally, let every one be as much disposed as possible to suppose good intention and friendly feeling in his neighbours, and he will be the less irritable when they accidentally trench upon interdicted conversation.

POPULAR INFORMATION ON SCIENCE.

HOW ROCKS ARE FORMED.

SOME of the most curious philosophical experiments of the present age have consisted in imitations, on a small scale, of operations which nature carries on upon a very grand one. A popular view of some of these cannot fail to prove interesting. We shall commence with the celebrated experiments of the late Sir James Hall, respecting the formation of limestone.

Limestone is a rock found in great abundance throughout the crust of the earth. Marble, chalk, and calcareous spar, are modifications of it. Dr Black ascertained that the process, so familiar to us all, of burning limestone, and thus making the *quick-lime* used in building and for agricultural purposes, is simply a discharging, from the original stone, of carbonic acid, which goes off in a gaseous form. Limestone he therefore made out to be the *carbonate* of lime. It was, some time after, propounded by Dr Hutton, the geologist, that limestone, in its various modifications, had been formed under the influence of the heat which he assumed to exist in the interior of the earth, while a pressure of superincumbent materials prevented the carbonic acid from flying off. This was an ingenious idea, but deficient in positive proof. The object of Sir James Hall, who was a supporter of Dr Hutton's theory of the earth, was to subject it to the test of experiment.

He commenced his experiments in 1798, at his country house of Dunglass, in Berwickshire. He took a common gun-barrel, and charging it with a quantity of chalk, or pulverised limestone, filled it up with brick-dust, and closed the muzzle by welding its lips together. He then introduced the breech into a furnace, heated to twenty-five degrees of Wedgwood's pyrometer. Many barrels, thus treated, gave way, but in others, at the conclusion of the experiment, the chalk was found *agglutinated* into a stony mass, which required the smart blow of a hammer to break it, and felt under the knife like common limestone. He afterwards changed the gun-barrels for porcelain vessels prepared on purpose, and used fusible metal for ramming, instead of brick-dust. He also took many ingenious expedients for ascertaining how much carbonic acid made its escape during the operation. When an escape to the amount of twenty per cent. took place, the contents had no appearance of stony matter; but when it was about three or four per cent., the stony character was perfect. Ultimately, by al-

lowing a little aqueous vapour to remain in the barrel, in order to counteract the expansion of the fusible metal, he succeeded in reducing the proportion of escaped gas to about a quarter of a per cent. The pounded chalk was then brought into the condition of *saline marble*, accompanied with crystallisation and other marks of fusion. One specimen formed from pounded spar was so complete as to deceive one of Sir James's workmen, who remarked that, if the marble were a little whiter, the quarry from which it was taken would be very valuable. This particular specimen afterwards fell into dust, but many other pieces, the produce of the Dunglass laboratory, resisted the air and kept their polish for years; nor do we know that these are yet otherwise than in the condition of marble.

By calculations, which cannot well be explained here, Sir James concluded that a layer of the carbonate of lime, at the bottom of a sea 1700 feet deep, would, if a due degree of heat were applied, be formed into limestone; and into a complete marble, if the depth of the sea were 3000 feet; the pressure being in the one case as 52, and in the other as 86, atmospheres.

Sir James spent seven years in his experiments, which were a hundred and fifty-six in number, and he showed in them a degree of patience, care, and philosophic ingenuity, which excited universal admiration when the result was published by the Royal Society of Edinburgh in 1806. He was considered as having proved—not exactly that our beds of limestone and marble were formed by heat under a pressure confining the carbonic acid, for nature *might* have other ways of bringing about the end, but that such at least was a mode in which the effects could be brought about. The probability that such were really the circumstances under which the strata in question were formed, is so great, that practically such is the doctrine as to their formation held by the philosophical world.

Sir James Hall afterwards made some interesting experiments with a view to ascertain the circumstances under which basaltic rock is formed by nature; but, as in these he was not the first inquirer, we pass them by, in order to notice his investigations respecting the formation of sandstone. This rock is also a very abundant one throughout the crust of the earth, forming numerous beds alternating with nearly all the other aqueous rocks. Its utility in building is well known. Sandstone is easily seen to be a composition of sand, for it may readily be pounded into that form; but the wonder is, how sand has been massed into so hard a consistence. Sir James Hall performed a series of experiments, which showed at least one way in which great layers of loose sand might be agglutinated at the bottoms of seas, so as to form strata of rock.

"In the little valley of Aikengaw, at the eastern extremity of the Lammermuir Hills,* Sir James observed the gravel which occupies its bottom, agglutinated in several places into a mass of conglomerate, very solid in the centre, but becoming gradually looser on both sides, till it passed into the state of moveable gravel. He was soon satisfied, by applying chemical tests, that the agglutination was not produced, as in some cases, by calcareous matter. A few miles lower down the valley, he found a crag of sandstone, which yields much to the action of the air, and in dry weather is covered with a white efflorescence having exactly the taste of *common salt*. Combining the two facts, Sir James inferred that sea salt might be the substance which, by serving as a cement, produced the consolidation both of the sandstone rock and the conglomerate. He immediately resolved to follow out this idea by experiment, and after many trials succeeded in forming artificial sandstones of various qualities, some of which were firm enough to be dressed by the chisel, and some have resisted exposure to the elements for years.

In his first experiments he put into a large crucible a quantity of dry salt, and a quantity of loose sand; the whole being heated from below, the salt ascended in fumes through the sand, and converted it into a solid stone. The fumes of the salt seemed to act as a flux on the silicious matter of the sand, and, in fact, to serve a purpose exactly analogous to what they do in glazing potters' ware.

Sir James's object, however, was to illustrate the

Huttonian formation of rocks at the bottom of the sea; and he wished to show that the presence of a body of water above the sand, even at a moderate temperature, was not incompatible with the necessary degree of heat, nor the success of the experiment. He filled an iron crucible, eighteen inches high, to the brim with sand and strong brine, the water rising three inches above the sand. An empty gun-barrel, closed at the lower end, was sunk amidst the sand to within an inch of the bottom of the crucible, that by looking in at the upper and open end of the barrel, the temperature of the saline mass at different heights might be seen. The crucible was exposed to a strong heat, fresh brine being constantly added as it boiled off; and it was distinctly seen, by means of the gun-barrel, that while the sand at the bottom became red hot, the water at the top was merely in a state of moderate ebullition. After remaining in the fire for some hours, it was suffered to cool, and when examined, it was found that the sand at the bottom had concreted into a solid cake of most perfect sandstone, while the part above, which was still drenched with brine, remained permanently loose.

Sir James used black lead crucibles at first, but found that the action of the brine upon them impeded the success of the experiment. He found also that the process succeeded with common sea water instead of brine, only it was necessary to continue the operation for three weeks, always introducing new supplies of water as it boiled off, till a sufficient quantity of salt was accumulated. The substitution of a strong brine, containing one-third of its weight of salt, merely shortened the process without altering the result. He observed, too, that the longer the operation was continued, the more solid and durable was the sandstone produced; and hence, as nature has an indefinite command of time in her processes, we see why her products should be so much more perfect than those formed in our laboratories. The presence of the water above was so far from being inconsistent with a due degree of heat below, that by supplying fresh brine in sufficient quantity, it was found possible to keep it at a moderate temperature at the top, while the sandstone below was at a full red heat.

Common sand was the substance used in Sir James's earlier experiments, but he afterwards found that pounded quartz or gravel could be agglutinated into a solid body by the same method. For the sake of negative evidence, the process was repeated with *fresh water*, keeping every other circumstance the same; but not the slightest approach to consolidation was produced.

His theory of the process is as follows:—The first action of the heat on the sand drenched with brine is, to drive off the water from the lower portion of the mass, and to convert the salt and sand into a dry cake, which, if taken out and immersed in water, would crumble down. The application of the heat being continued, the cake becomes red hot, the salt is converted into vapour or fumes, which mix intimately with the sand, and causing a partial fusion of the contiguous particles (as in the glazing of potters' ware), produces an agglutination.

Sir James proceeded a step farther in his imitation of the processes employed by nature. Sandstones are often less or more tinged or streaked with colours, and the colouring matter is generally metallic. A little oxide of iron (in powder) was therefore mixed with the salt, and this being put into a crucible with quartzose sand, it was found that the fumes of the salt bore up the metallic oxide along with them, and the cake of sandstone produced was curiously stained with iron."

Basalt had been the subject of similar experiment so early as 1804. The general character of this rock is well known. It is one of those of igneous or volcanic origin—is generally of a blackish colour, and always of a very hard consistence, being composed mainly of two ingredients, felspar and augite, with titaniferous iron—and, finally, it is often of a columnar structure—that is, disposed in masses as of pillars closely joined together. The island of Staffa, one of the Hebrides, is a mass of rock, a mile and a half in circumference, consisting of three beds more or less horizontal, of which the central is a range of nearly upright columns of basalt, in which several caves have been formed by the action of the waves. Another notable specimen of the basaltic formation is presented in the Giants' Causeway, on the northern coast of Ireland. "This," to quote the description of a philosophical traveller,* "is a sort of promontory or jettye,

* We employ an abridgement, which appeared in the Scotsman newspaper, July 11, 1827, of a paper in the Transactions of the Royal Society of Edinburgh, in which Sir James detailed his experiments.

* Pictet, in his Voyage en Angleterre, &c. Geneva, 1802.

which slopes very gradually down to the sea, and terminates in a point, against which the waves dash with great violence. This jetty forms the left point of a semicircular bay, surrounded on all sides by a steep and lofty coast, which displays, in all its extent, the finest specimens of basaltic phenomena—nothing is to be seen, on every hand, but groups of columns in an upright position. The Giants' Causeway, properly so called, is itself one of these groups, but so much lower than the rest, that the tops of the pillars are seen naked a little way above the level of the sea. The uniform appearance of the upper end of these innumerable columns makes it seem at a little distance like a pavement of polygonal [many-cornered] stones. Upon a nearer approach, they are found not to be altogether on the same level; and in walking along the causeway, one is obliged to step continually up and down, as if on the steps of a stair. All the pillars are nearly in perfect contact with each other, without the interposition of any other substance. There is no great variety in their sizes; the common diameter is from twelve to fifteen inches. The number of their angles is not uniform; there are some with eight, and some with four; but the most common form is hexagonal [six-cornered]. The description is completed by the statement, that the columns are divided into blocks, or prisms, like the pillars composed of a succession of stones in ordinary masonry; but in this case each block has an angular projection at the top, fitting into a corresponding hollow in the stone next above—these projections and hollows generally occupying the whole joining surfaces, except about an inch-breadth.

These objects are the wonders of their respective countries. The country people will not believe that they have not been the work of some superior class of mortals, so like are they to human handiwork. The poet speaks of the cave of Fingal in Staffa as a temple reared by nature, to shame the miniature works of pigmy men; and even the philosopher has surveyed them in despair of ever ascertaining the mode of their construction. Yet this secret of nature has yielded in the long-run to the persevering ingenuity of her children. About 1804, Mr Gregory Watt fused seven hundred-weight of an amorphous or unshaped basalt named Rowley Rag; the fire was maintained for six hours, and the mass was then suffered to cool very gradually, so that eight days elapsed before it was removed from the furnace. The experimenter found in it spheroids, or flattish globular masses, in some cases extending to a diameter of two inches. When two of these came in contact, they did not melt into each other; they kept distinct, but pressed against each other, and formed plane sides, just as soap bubbles may be observed to do when they press together. When several spheroids met, they formed prisms, or acquired plane sides all round. Where the centres of a great number of these spheroids were at equal distances from each other, it was calculated by Mr Watt, that, in spreading out and meeting each other, they must necessarily form six-sided figures. Where the centres were at unequal distances, it was not less clear that figures of other shapes must be formed. Mr Watt further supposed that, if these spheroids were resisted below, but not above, they would extend upwards, till they met some counteracting cause, and thus form columns. The divisions or jointings of some basaltic columns is here a difficulty; but Mr Watt endeavoured to get over it, by pointing to a series of concentric fractures in the interior of his spheroids: he supposed that the division into blocks might be owing to the same law of crystallisation which produced that appearance. Thus what was once thought one of the most mysterious of all nature's operations was so far mimicked in a chemist's workshop, as to lead to a nearly certain knowledge of how the operation took place in nature's own greater laboratory. Staffa, the Giants' Causeway, and other well-known basalts, must have once been fused masses, which assumed their columnar structure as a simple consequence of the manner in which they were cooled.

More recently, crystals like those found in rocks have been formed by Bequerell and Mitcherlich, foreign mineralogists, by means of electricity acting upon a solution containing the ingredients; and Mr Crosse of Somersetshire has, by means of the same power, acting with small force, but during a considerable space of time, exactly simulated a process going on in the Quantock Hills, where water percolating through limestone forms calcareous spar. The latter gentleman has also made crystals of silver, chalcodony, and quartz, out of various solutions.*

Experiments like these are chiefly of value for the illustration they give to a very interesting and instructive truth which lies at the bottom of all philosophy, namely, the invariableness of the laws of nature, whether they act upon a large or a small scale. A sheet of rock, extending perhaps underneath some large district of country, and a quantity only sufficient to fill the breech of a gun-barrel, take their form and character under precisely identical circumstances. A few hundred-weights of basalt exemplifies in a common furnace those mighty workings which, countless ages ago, produced a Staffa and a Giants' Causeway. So also did the falling of an apple in a Lincolnshire garden suggest to the pregnant mind of Newton the secret of planetary movements. Nature has no daintiness: she forms a globe fit to sustain millions after millions

of breathing beings, and spherifies the dew-drop which only reflects a miniature of the hawthorn blossom, with the same silence and serenity. The interference of man's busy mind to direct her movements offends her not, and she makes no distinction of persons. She is as ready to obey the call of the simplest child as to act on her own majestic will. She will act in the laboratory of the nameless mechanic, as well as in the bosoms of her own magnificent oceans.

STORY OF MARTIN GUERRE.

[FROM THE CAUSES CELEBRES.]

MARTIN GUERRE, a native of Biscay, was married in the month of January 1539 to Bertrande de Rols, with whom he lived for many succeeding years at the village of Artigues, in the diocese of Rieux, in Upper Languedoc. The condition of Martin Guerre was that of a small farmer, and the property possessed by him and his wife was very considerable for people of their rank in life. Married at a very early age, they were not blessed with children until the tenth year of their union, when a son was born, to whom was given the name of Sanxi Guerre. Shortly after this event, Martin Guerre had the misfortune to quarrel with his wife's father or uncle, and in consequence took the resolution of leaving Artigues for a time. He seems to have found a wandering life agreeable to his disposition, as he never showed himself again at his home for many long years, nor were any tidings of him received all the while by his family.

This unjustifiable conduct of a husband and father led to strange consequences. Upwards of eight years after Martin Guerre's absence, a man presented himself at Artigues, declared himself to be Martin Guerre, and was at once recognised as such by the four sisters of the absentee, by his uncle, by the parents and relatives of his wife, and by the wife herself. Not the slightest suspicion of imposture was entertained by any one, as the self-named Martin Guerre was found perfectly acquainted with a thousand little matters, both domestic and otherwise, which none, it seemed, but the original actor in them could possibly have known. The marks and scars, also, which had characterised Martin Guerre's countenance and person, were all apparent in his representative. Accordingly, the latter was received with joy by the wife and all her connections, and assumed the place which he was supposed to have vacated eight years before. Bertrande de Rols (or Guerre) had in times past shown the strongest attachment to her husband, and her conduct in his absence was irreproachable. She now lived for three years in perfect concord and happiness with him who personated her husband, and bore two children to him, only one of whom survived for any length of time.

This state of tranquillity first received a shock through an accidental discovery made by Pierre Guerre, the uncle of Martin. A stranger, passing through Artigues, expressed the utmost surprise on hearing it said that Martin Guerre was living with his wife and family, and unhesitatingly declared that there must be imposture in the case, as he himself had recently seen Martin Guerre in Flanders, and had been told by him that he had a wife and child in Languedoc, but did not intend to return home till a certain relation was dead. The stranger moreover stated, that the real Martin Guerre had lost a leg at the battle of St Laurent, before Saint Quentin. The traveller's statement was heard by Pierre Guerre, and appeared to him so clear and distinct, that he began to entertain suspicions, which speedily spread from him to the relatives of Martin's wife. A number of little circumstances, all tending to strengthen the notion of imposture, were now gradually noticed by the uncle and friends, and at length they finally became so assured of the justice of their fears as to adopt the resolution of publicly punishing the villain who had so grossly deceived them. But they found very great difficulty in persuading the wife of Martin Guerre that the man with whom she had lived peacefully for three years was not her true husband. At length, however, the poor woman was brought to something like a conviction of the sad truth, and was induced to take steps for prosecuting the actor in this strange deception, who was taken into custody to wait his trial.

On a day appointed, the prisoner was brought into court, where the chief criminal judge of Rieux sat as president, and where an immense crowd of people had assembled to watch the issue of a case which had already excited the deepest interest. Numerous wit-

nesses were present to support the one or the other side. Out of nearly one hundred and fifty persons examined, between thirty and forty gave evidence in favour of the accused, deposing that they believed him to be the real Martin Guerre, and referring to many circumstantial proofs in support of their belief. On the other hand, a still greater body of witnesses declared their impression that the prisoner was not Martin Guerre. Who the pannel really was, was announced by various of these witnesses, but in particular by Carbon Barreau, who recognised the accused as his nephew, by name *Arnaud du Tilh*, a native of Sagias in Languedoc. The old man, Carbon Barreau, while acknowledging his nephew, wept for the disgrace he had brought on the family. While such testimonies were given by the witnesses for and against the prisoner, there was a third body of witnesses, more numerous than either of the others, who declared that the resemblance to Martin Guerre puzzled them so much as to render them totally unable to tell whether the accused was that individual or not.

Much weight, comparatively, was of course laid on the evidence given by the relatives of Martin Guerre. Strange to say, these relatives were as much at variance as others. His four sisters unhesitatingly and unequivocally declared their belief that the prisoner was their brother, and none else, and by this opinion they held to the last. The uncle of Martin, again, and the wife's relations, maintained the opposite side of the question. As for the wife, whether from weakness or distress of mind, her evidence was not productive of much light in the matter. What she did say weighed in the prisoner's favour, as, on his being tested afterwards, it was found that he knew all the little secrets of her wedded life as well as she herself did. He told of private occurrences of old date, that tallied in every point with her private revelations on examination. When the prisoner himself was asked to speak in his defence, he entered without the slightest embarrassment on a long narration, calculated to prove his claims to the character he had assumed. He began with ascribing avaricious motives to Pierre Guerre, as the cause of that person's animosity. He then related every particular step of his career, from his birth to his departure from home; and those who best knew Martin Guerre declared that all the incidents related had occurred to him to their certain knowledge. The prisoner described his marriage with particular minuteness, mentioning the name and even the dress of every important individual then and there present, as well as many other minute points connected with the ceremony. Notwithstanding these striking statements of the prisoner, and notwithstanding the doubts of the witnesses, the criminal judge of Rieux conceived the charge to be *proven*, and pronounced the prisoner guilty.

But this only led to new investigations. The prisoner appealed to the parliament of Toulouse, and by its orders inquiries were entered upon of a still more searching kind than formerly. To show how great were the difficulties in which this case was involved, it is only necessary to state a few of the facts that came out on both sides. Against the prisoner, it was averred that Martin Guerre was a taller man, and darker in hue; and that he had slender limbs, stooping shoulders, and a hanging under lip, whereas the prisoner had stout limbs, an upright person, and no particular mark about his lips. The shoemaker who had made shoes for the true Martin Guerre, also declared that the feet of the latter were of the twelfth size, while the accused person's were of the ninth. Martin Guerre, it was also proved, was skilled in wrestling and other sports, at which the prisoner could do nothing. Moreover, Martin Guerre, being a Biscayan, was thoroughly acquainted with the Basque tongue, of which the other knew only a word or two. These are specimens of the proofs against the prisoner. The opposite evidence seems almost equally strong, and this may be said of the personal resemblances in particular. A cicatrix above the right eye, the mark of an ulcer on the face, a drop of extravasated blood on the left eye, two peculiar teeth, a split nail on one of the fore-fingers, three warts on the right hand, and one on the little finger—all of these marks were on Martin Guerre, and all of them on the accused! Other witnesses in the prisoner's favour deposed to his having alluded to circumstances which had passed privately between them and Martin Guerre, ten, twelve, and fifteen years before. Above all, the bridesmaids of Bertrande de Rols declared that the prisoner had minutely described incidents which proved him to be no other than the man who was bridegroom on that occasion.

Such were among the difficulties surrounding this question. The confident bearing of the accused added to the general perplexity, as he on every occasion assumed the part of an injured and persecuted man. He even made a solemn public appeal to the wife of Martin Guerre, declaring that, as she believed in his identity or otherwise, he was willing to be held guilty or innocent. But the wife would not take an oath on either side, although she said that, under the circumstances, she could trust in nothing that *he* (the prisoner) could say.

Things were in this state of incertitude, when the real Martin Guerre, who had been fruitlessly sought for, appeared suddenly on the field, "as if (says Gayot de Pitaval, in the *Causes Celebres*) he had dropped from the skies." The judges ordered him into confinement before he had seen his relations or any one

* See Journal, No. 277.

who was concerned in the cause. Martin Guerre, as had been stated by the traveller, was without one of his limbs, and had a wooden substitute. When privately interrogated upon some known facts in Martin Guerre's life, he answered freely and correctly, but did not give so many proofs of his identity as the prisoner had done under the like examination. Arnaud du Tilh and the lame Martin Guerre were then confronted with one another. Each treated the other as an impostor; but the first-mentioned of the two displayed far most confidence, and scornfully declared that he would consent to be hanged if he did not prove the whole to be a machination of Pierre Guerre, and the man with the wooden leg to be but a creature of his. The latter seemed to lose his presence of mind at the sight of the other's consummate boldness and effrontery. The judges were yet quite at a loss, but they resolved upon assembling all the relations of Martin Guerre, and all the principal witnesses in the case, with the view of leaving it to their decision on beholding both parties together.

Accordingly, all the summoned parties made their appearance at an appointed day. The eldest of the four sisters so often mentioned was the first to enter the court, where the rival Martins already were, and her testimony was almost decisive. It will be remembered that she and her sisters were the most influential witnesses in favour of the impostor. Now, however, when her eye fell on the lame man, she sprang to him and embraced him with tears, exclaiming to the judges, "Behold my brother, Martin Guerre! I confess the error into which this abominable traitor," pointing to du Tilh, "has led me, and in which he has kept me for so long a time, as well as others." Martin Guerre mingled his tears with those of his sister, as he received and returned her embraces. The other sisters also recognised their brother at once, as did all the witnesses, in short, who had been most obstinate in favour of Arnaud du Tilh. As usually happens in cases of the closest resemblance of person, the confronting of the parties at once dispelled the illusion which had memory only to depend on. After other recognitions, Bertrande de Rols, the wife, was called into court. No sooner had she cast her eye timidly on the lame stranger, than the spell was at once broken in her case also. She became strongly agitated, trembling like an aspen leaf, and weeping abundantly. Then she ran to embrace her husband's feet, and besought his pardon for the fault which the artifices of a wretch had led her to commit. She entreated him to remember that his four sisters and others had been deceived also, and reminded him that her very love for him had its influence in causing her to be misled. She declared that such was her grief and shame when the impostor was discovered, that she prayed for death, and, but for the commands of God, would herself have put an end to her days. "The touching air (says Gayot de Pitaval) with which Bertrande de Rols spoke, her tears, and her beauty, which was still great, the expression of agony spread over her visage, pleaded eloquently for her." But her husband, who had appeared so sensible to the tokens of affection coming from his sisters, appeared insensible to those of his wife. He told her that she ought to have known her real husband from all others, although the whole world had been deceived; and he had the cruelty further to say to her, that he looked upon her as the cause of all the disgrace and wretchedness resulting from this affair. The judge checked Martin Guerre for this conduct to his wife, which came with an ill grace from the lips of a man who had deserted his family for so many years, and who was the true cause of all the mischief, by thus leaving them at the mercy of the designing. Moreover, had not Martin Guerre made revelations to the impostor Arnaud du Tilh, respecting his family affairs, his wife never could have been deceived as she had been. Such considerations, nevertheless, could not overcome the angry feelings of Martin Guerre, when he met his wife in court. But as we firmly believe in the wife's innocence, from an attentive consideration of all the minutiae of the case, we have pleasure in recording that the last words of the original narrative on this point are, "Time only caused Martin to change his sentiments." The court of Toulouse, also, took into consideration the question whether Bertrande de Rols was or was not an accomplice of Arnaud du Tilh, and decided unanimously in favour of her innocence.

The communications of Martin Guerre to Arnaud du Tilh have been alluded to as the chief source of the latter's ability to accomplish his imposture. Du Tilh spent two years in the other's company in the military service, and was his intimate friend and confidant. On returning from the wars alone, he was mistaken for Martin Guerre by several acquaintances of that person, and this first suggested to him the idea of establishing himself comfortably in life by personating Martin Guerre, and becoming master of his property. Before attempting this, however, he secretly made himself acquainted with every possible particular, relative to the family and history of the man whose name he was about to assume. This step over, he boldly presented himself, and the issue was as we have seen. All these things Arnaud du Tilh confessed, after being sentenced to death for his crime. Previous to execution, he was doomed to walk through the street of Artigues with his head and feet bare, a halter round his neck, and a lighted torch in his hand. As he performed this part of his sentence, having latterly become penitent, he besought pardon of Martin Guerre

and his wife, the persons whom he had most injured. In front of their house he was hanged—a retributive compliment of the law which they would most probably have been willing to dispense with. September 1560 was the date of this execution.

RECOLLECTIONS OF ENGLISH CHURCH-YARDS.

BY AN AMERICAN.

Few things have interested me more, in my rambles about the world, and especially in the old countries, than the visits I have made to churchyards. In this country, the traveller, however much his mind may be so disposed, can depend but little on such sources of enjoyment or edification. It is a sad fault of us Americans, that, for the most part, we neglect the dead. We are inclined, generally, I know, to disparage external appearances. We have a contempt for ceremonies. We are a hard, practical people, absorbed in business, surrounded by circumstances which accustom us to the livelier kinds of excitement, educated and impelled in every way to undervalue and lose sight of what may be called the graces of civilisation. These peculiarities, the evidence and influence of which are plainly perceptible throughout every department of action and sphere of life among us, are to be accounted for easily enough; no explanation need be given of them here. Nor will the reader require to be reminded of the better qualities with which, in the usual order of things, and as a matter almost of moral necessity, they are commonly connected. Still, however, the feeling in question—the want of feeling I am tempted to call it—must be set down against us as a "fault." Undeniable at least it is, that one of the most attractive and prepossessing of all the minor virtues of a community—the gentler graces I have spoken of as neglected by ourselves—is a thoughtful and tender care for the departed.

Here surely we are powerfully called on to borrow a leaf from the Old World's journal. Who that has roamed over those countries, in any thing like a leisurely way, or at all as a traveller should, whom aught animates beyond this restless, rankling, eternal thirst for business and lucre, but has a memory richly stored for the rest of his lifetime, even out of the churchyards alone—a memory, ay, and a heart too, stored with loveliest images of thought—with feelings that are a ceaseless fountain to refresh the soul—with pictures of sweet, sequestered scenes, reposing in the mind's meditations, all beautiful as in nature itself, sunny and still as the little lakes of the hills, haunting and soothing one's spirit evermore. England, most of all, is full of these resources. Every where the kind of churchyards I refer to are to be found; old, venerable, moss-mantled, in every way picturesque, yet greenly and freshly rural—the very homes of meditation. There is a hearty homeliness in the English character, with all its faults, which delights in these outward observances of affectionate respect for the dead. If the "old countrymen" are not remarkable for a quick sensibility, there is, nevertheless, a permanent and steady ardour in their temperament, which "wears well." Among no people are instances of persevering fidelity in friendship between the living more numerous; and it is the same feeling, the same substantial, homely, hearty character, which, in equal proportion, manifests itself in a thousand most touching though simple forms of association between the departed generation and those who survive through all the humblest hamlets of the land. I dwell, daily, with a pleasure which I cannot express, on the remembrances of these sacred scenes. Not of the "dim and mighty minsters of old time" alone I think, whose

very light
Streams with a colouring of heroic days
In every ray;
nor of
rich fretted roofs,
And the wrought cornals of summer leaves,
Joy and vine, and many a sculptured rose
Binding the slender columns, whose light shafts
Cluster like stems in corn sheaves;

nor of
The crimson gloom from banners thrown;

nor
Forms, in pale proud slumber carved,
Of warriors on their tombs, where jewelled crowns
On the flushed brows of conquerors have been set,
And the high anthems of old victories
Have made the dust give echoes!

These are rich indeed with an interest of their own, but they do not deeply touch the heart. Grave lessons are to be learned from them, but, as the poet adds, too frequently they are but memories and monuments of power and pride,

that long ago,
Like dim processions of a dream, have sunk
In twilight depths away.

These we behold with wondering awe, it may be with a solemn admiration; yet these very feelings but stand in the way of deeper ones. We see too much—too much of man and his observances. Crowds of merely historical associations engross the mind. The imagination and the memory are excited to the prejudice of the heart. No! give me the churchyards of the common people and the poor; the expressions of a nature which deems itself unobserved; the simplicity of a genuine feeling, obscured with whatever rudeness or ignorance. Give me the lone places,

"where there is nothing to be seen" but stones, and sods, and trees, and chequered turf,

The temple twilight of the gloom profound,
The dew-cup of the frail anemone,
The reed by every wandering whisper thrilled.

Where but in such a spot, and in a country full of such, could genius itself have ever penned the "Elegy?" Who but an English poet could have been its author?—one who had pondered from childhood in scenes like those he describes in that immortal poem, and who had laid the dust of his own mother "where heaves the turf in many a mouldering heap!" From what other source than a "mountain churchyard" could spring the spirit of "Easter Day," so sublimely cheerful, so divinely true? It was the *graces* that appealed to the poetess; to them she uttered her appeal:—

And you, ye graves! upon whose turf I stand,
Girt with the slumber of the hamlet's dead,
Time, with a soft and reconciling hand,
The covering mantle of bright moss hath spread
O'er every narrow bed:
But not by time, and not by nature sown
Was the celestial seed, whence round you peace hath grown:
Christ hath arisen! Oh, not one cherished head
Hath, 'midst the flowery sods, been pillowed here
Without a hope (however the heart hath bled
In its vain yearnings o'er the unconscious bier),
A hope, upspringing clear
From those majestic tidings of the morn,
Which lit the living way to all of woman born.
Thou hast wept mournfully, Oh human love!
E'en on this greensward; night hath heard thy cry,
Heart-stricken one! thy precious soul above,
Night, and the hills, which sent forth no reply
Unto thine agony!
But He who wept like thee, thy Lord, thy guide,
Christ hath arisen, Oh love! thy tears shall all be dried.
Dark must have been the gushing of those tears,
Heavy the unsleeping phantom of the tomb,
On thine impassioned soul, in elder years,
When, burdened with the mystery of its doom,
Mortality's thick gloom
Hung o'er the sunny world, and with the breath
Of the triumphant rose came blending thoughts of death
By thee, sad Love, and by thy sister, Fear,
Then was the ideal robe of beauty wrought
To veil that haunting shadow, still too near,
Still ruling secretly the conqueror's thought,
And, where the board was fraught
With wine and myrtles in the summer bower,
Felt, e'en when disavowed, a presence and a power.
But that dark night is closed; and o'er the dead,
Here, where the gleamy primrose tufts have blown,
And where the mountain-beath a couch has spread,
And settling oft on some grey-lettered stone,
The red-breast warbles lone;
And the wild bee's deep, drowsy murmurs pass
Like a low thrill of harp-strings through the grass.
Here, 'midst the chambers of the Christian's sleep,
If e'er death's gulf may look with trusting eye,
For hope sits dove-like on the gloomy deep,
And the green hills wherein these valleys lie
Seem all one sanctuary
Of holiest thought; nor needs their fresh, bright sod,
Turf, wreath, or shrine, for tombs all dedicate to God.

I remember a spot among the Cumberland hills that might have inspired even poetry like this. It was the little church (and churchyard) of Borrowdale; the smallest building of its class in England, it is said. Mr Wordsworth, who lives in the neighbourhood, said it was "no bigger than a cottage;" and thus, indeed, it seemed, when, at the end of a long ramble, I found it so nestled away in the niche of a hill-side, so buried and wrapped in shade and solitude, that it was difficult to realise how even the narrow space within its walls should ever be filled by human worshippers. Another such picture the pedestrian may have to think of, who, sauntering along the hedge-lined byways of the lovely Isle of Wight, suddenly stays his steps, unconsciously, to gaze over into the sweet, small garden of graves, clustering all round the humble, but exquisite, church of St Lawrence; some of them, on the upper side of the mountain slope, nearly as high as the moss-grown roof of the building, over which one sees, from the road-side, a glimpse of the lonely sea, spread out at the base of the mountain. Nothing can exceed the beauty of the proportions of this ancient edifice, miniature as it is. The slope of the hill it is set on is so steep, that the road just mentioned is cut into it like a groove. On the upper side, a cliff towers up over one's head, almost perpendicularly, some hundred feet, yet every where, from the moisture of the climate, and the richness of the soil that still clings to the rocks, mantled with a soft, silky robe of the sweetest verdure the eye ever saw, brightly spotted with clusters of flowers, and small shrubs flourishing out from the crevices, and sometimes laden with vines. Below the church, the scene grows wilder. The hill-side shows, far up from the water-mark, traces of the fierce power of the element which sleeps now so quietly at its feet. Huge sea-stained points of crags peer out grimly on every side; the vegetation is withered, and disappears as we wind farther down by the dizzy footpath the egg-hunters have trodden; and now breaks out upon us, in its full volume, that terrible thunder of the surge of even these slumbering waves. But it is a thunder that comes only in mellowed music to him who saunters, as I did, through the noiseless avenues of the little sanctuary in the niche of the hill-side above. Many a time I stayed my steps to listen to this murmur, as, borne on the gusts of the "sweet sea air sweet and strange," it swelled and fell at intervals, like spirit voices whispering to those who lay beneath. No! not to them. There is the "dull, cold ear," that will not hear. To me, to all who visit this blessed temple, this sacred ground, to us, to us they speak. They tell us of the history below us, and of the destiny before.

They mind us well of the life we are living; ah! better still of that we have *not* lived, where there is no more "moaning of the sea."

It was in this churchyard I noticed a humble heap piled over the remains of one whose annals, as the modest marble at its head recorded them, touched my heart. It was a young, beautiful girl. She came to this neighbourhood, I think, from Wales, probably for the restoration of health. But, alas! nor herb, nor sea-air, nor care of relative or friend, could save her; no, not the yearning tenderness, or breaking heart of him who loved her best, and who weeps now over the untimely tale I read! To him she had been long betrothed, and trusting still in that dear deceiving hope which never leaves us, and which the poor perishing consumptive and her kindred cling to so fondly, till life's light goes quite out: in this hope the marriage day was appointed. Preparations, even, were made for it. On that day she died; and here she is buried, as in her last murmurs she asked that she might be, in her bridal dress! Peace be to her ashes! she "sleeps well" in the churchyard of St Lawrence!

Not very far, but very different from this, is the precinct of the grey old church of Chale, which stands in the immediate neighbourhood of a tremendous precipice, on the brink of the sea, called Blackgang Chine. Deep under this awful barrier, a small snug cove runs in, making what the islanders entitle Chale Bay; in itself a wild and yet pleasing and generally tranquil spot, bordered by a curved beach of shining sand, and enlivened by tiny streamlets, trickling from the verge of the huge rocks above. A man who hated his own race, but yet loved nature, would choose a nook at the base of the Chine for his dwelling. No stranger, at least, would disturb him; for if he did not pass by the edge of the cliff, in the wayside, as he probably would, without knowing it, he would shudder and start back from the sight; there is something threatening, appalling, in the lonely sublimity, and even in the intense, strange solitude of the place. But, ah! if he knew, as I do, its history! Four times, if not more, since my brief acquaintance with this charming island began, have gallant ships gone down, in storm and surge, in this fatal cove.

I learned the history of one of these hapless companies from the marbles of the churchyard of Chale. There they were buried, with the sad solemnities suited to such an occasion, and with all the tenderness needed to soothe *their* hearts who were watching now so eagerly for the return of a long-expected ship. What a picture of human life—what a passage of human history it is! "sermons," indeed, "in stones!" Six of the passengers were of one affectionate family; a gallant naval officer, coming home from a long service, with his wife, a babe, and three elder and beautiful daughters. The brother of this lady had been expecting them daily. He was one of the first on the island to be informed of their coming, and of *how* they had come, and to behold a spectacle which I will not describe!

Let us hasten from the churchyard of Chale. The name is a knell in my memory.

A glance at the burial-place of the United Brethren at Ballymahon in Ireland may be a relief to the reader. It is another of the spots one would choose for his bones to lie in—for, say what we will, there is a *choice*; and the thought of it is no indifferent matter to us while we live, however little the fact itself may concern us or others in future time. The Moravians believe so, at least they appreciate, justly too, the moral influence, the religious science, of a burial-ground. They do not deem it either decent to leave it neglected, or necessary to make it frightful. The little village, which I visited one Sabbath morning, is embosomed in trees, and surrounded with the famed emerald verdure of the country on every side; divided into a small harmonious arrangement of shaded streets, that, but for the neat rows of cottages, and regular beds of flowers on either hand, look more like natural lanes: "remote from cities," in a word; serene, peaceful, beautiful as a "thought of Paradise." I attended service in the little church, and afterwards walked through the churchyard, which lies on the table-land of a gentle green swell behind it, skirted with flourishing and flowery hedges, and spotted over, in hollow and heap, with checks of a mellow September sunshine, sifted through the branches of leaning trees. I need not describe the scene in detail. The customs of this sect in the care of their dead are known to all. How truly are they delineated in Montgomery's lines on the graves of the Patriarchs:—

A scene sequestered from the haunts of men,
The loveliest nook of all that lovely glen,
Where weary pilgrims found their last repose.
The little heaps were ranged in comely rows.
With walks between, by friends and kindred trod,
Who drest with duteous hands each hallowed sod.
No sculptured monument was taught to breathe,
His praises whom the worm devoured beneath.
The high, the low, the mighty, and the fair,
Equal in death were undistinguished there.
Yet not a hillock mouldered near that spot,
By one disowned, or by all forgot.
To some warm heart the poorest dust was near,
From some kind eye the meaneast claimed a tear.
And off the living, by affection led,
Were wont to walk in spirit with their dead,
Where no dark cypress cast a dolorous gleam,
No blighting yew shed poison o'er the tomb.
But white and red, with intermingling flowers,
The graves looked beautiful in sun and showers.
Green myrtles fenced them, and beyond that bound
Ran the clear rill, with ever murmuring sound.
'Twas not a scene for grief to nourish care,
It breathed of hope, it moved the heart to prayer.

Yes, and it fills us with hope, it moves us to prayer, even to think of such a spot. What quietness, what beauty of visible nature, what harmony of rural sounds, what soothing emblems, in a word, of precious and glorious spiritual speculations, and what stirring yet soothing monitors to Christian philosophy and to holy emotion, were mingled with all the more customary and palpable minutiae of the scene! Would that *my* dust, too, might lie at last in some such "churchyard of the patriarchs!" Oh! leave me not to the noisomeness of a burial in the city; I like not the thought. Let the birds sing over me, if they will, and the green grass spring in the sunshine, and the violet and primrose flourish and glow in its midst. I would have the place no terror, at least, to those in whose kind memory I still might live; I would have it to console and cheer; to rouse, gently, to solemn but not gloomy meditation. The poorest village in the land, with all its rude obscurity, might easily be rich enough for this—richer than countless wealth can make the more than deadly dwelling-place of him whose bones are shelved away in the dull clayey churchyards of most large cities. The poorest village may be far abler than the most opulent metropolis to give what is here desired, for nature, and the love of it, are all it needs.*

INDIAN ANECDOTES.

A CURIOUS anecdote was cited in one of our late numbers from "Forbes's Oriental Memoirs," and occasion was then taken to mention the high merits of this work, which was first published a good many years ago. A new edition appeared in 1834, under the superintendence of the author's only daughter, the Countess de Montalembert, and we take the liberty of again making an extract or two from the ample store of entertaining anecdotes which this publication contains.

In various passages of his Memoirs, Mr Forbes notices the ordeal trials, of which nine different kinds are practised by the Hindoos, and which the British authorities are compelled in some cases to sanction. The trials are often successful in detecting guilt, and that in so striking a manner, that it is only by calling to mind the slight-of-hand dexterity of the Hindoos, and the potent influence of imagination, that we can explain some of the cases of this nature. "Residing in a family in Surat (says Mr Forbes), my sister lost a gold watch, on which she set a particular value. Several modes of divination were practised to discover the thief; one was similar to that used among the ancient Chaldeans and Egyptians, and perhaps not unlike the cup of divination belonging to the viceroy of Egypt found among the shepherds of Canaan. On this occasion the name of every person in the house was placed in a separate ball of paste or wax, and thrown into a vessel of water. One only swam on the surface; the rest fell to the bottom, and there remained. On opening the floating ball, it contained the name of an unsuspected female, who immediately confessed she had stolen and secreted the watch. Supposing this to be like other Asiatic juggles, I thought little about it; but afterwards, at Baroche, I attended minutely to an ordeal in which myself, and my head gardener Harabhy, were more immediately concerned.

On removing from our country house at Baroche to Surat, we packed up most of our things, and placed them in the front verandah. An iron chest was, for greater security, deposited in an inner room, near that where the family slept: we saw it there when we retired to rest, and in the morning it was missing. The contents being valuable, and the time of our departure near, we used every means to discover so extraordinary a robbery, in which, from the weight of the chest, three or four persons must have been concerned. Promises and threatenings were of no avail; the delinquents were concealed. I suspected an individual, but not knowing how he could have accomplished the robbery, I remained silent. The public officers belonging to the court of Adawlet not being able to discover the robber, at the earnest solicitations of all our servants, Hindoos, Mahomedans, and Parsees, we had recourse to divination by balls in water, and our own names were included with the rest. On forming a circle round the vase, I observed the man I suspected to change colour and become a little agitated; no other person remarked it, until, on the balls being immersed in water, one only rose to the surface; his confusion was then evident; still more so when, on opening the ball, it contained the name of Harabhy. This person had lived with us several years as head gardener, without our having any reason to suspect his honesty; he positively *denied* the robbery, and we had no other proof than the ordeal, which, although fully satisfactory to all the Indians, was not so to us. They requested that neither Harabhy nor any other person might leave the spot until we had gone through the rice ordeal; to this we submitted, though by no means palatable to Harabhy. He reluctantly complied, and with all the rest of us put a few grains of unboiled rice into his mouth; it was previously intimated that from the mouth of the innocent, after mastication, it would come out a milky liquid, from the guilty a dry powder. We were all of the milky party except Harabhy; mingling with the saliva, it became a white fluid with

us; with him it remained a dry powder, notwithstanding a number of fruitless efforts to liquify it. He was compelled thus to spit it out; his complexion changed from a rich brown to a livid blue, his lips quivered, and his altered countenance plainly indicated guilt; he would make no confession, and on this evidence we could only put him in confinement under the court of Adawlet, until we obtained further proof. The next day a little slave boy, whom I afterwards brought to England, discovered the bent iron hasp of the plate-chest just appearing out of the steep bank of the Nerbudda, at the end of our garden, about twenty feet above the river, and as much below the summit of the cliff; there we found the chest, buried in the earth. The robbers had attempted to wrench it open, and the clasps fastened by padlocks had given way; but the lock occasioning greater difficulty, they waited for a more favourable opportunity. When the culprit found the chest had been recovered and restored to the owners, and that he had no chance of benefiting by its contents, he confessed that in concert with three other men he had carried it off in the night while our people were asleep, and was in hopes we should have departed without finding it. Profane history abounds with similar ordeals; the bitter water of chastity, and many similar trials in the sacred page, prove their prevalence among the Jews."

Ancient writers give an account of a tree of India, which grows to a marvellous size, sometimes covering a circumference of five acres, and capable of sheltering ten thousand men under its branches. This is no fable. The tree alluded to is the *banian*, one of which is in itself a grove. "They are continually increasing in size, and, contrary to most other animal and vegetable productions, seem to be exempted from decay; for every branch from the main body throws out its own roots, at first in small tender fibres, several yards from the ground, which continually grow thicker, until, by a gradual descent, they reach its surface, where, striking in, they increase to a large trunk, and become a parent tree, throwing out new branches from the top. These in time suspend their roots, and, receiving nourishment from the earth, swell into new trunks. A banian tree, with many trunks, forms the most beautiful walks, vistas, and cool recesses, that can be imagined. I have spent many delightful days, with large parties on rural excursions, under one tree supposed by some persons to be that described by Nearchus, the admiral of Alexander the Great. High floods have at various times swept away a considerable part of this extraordinary tree; but what still remains is near two thousand feet in circumference, measured round the principal stems; the overhanging branches, not yet struck down, cover a much larger space; and under it grow a number of eu-tard-apple and other fruit-trees. The large trunks of this single tree amount to three hundred and fifty, and the smaller ones exceed three thousand; each of these is constantly sending forth branches and hanging roots, to form other trunks, and become the parents of a future progeny. This magnificent pavilion affords a shelter to all travellers, particularly to the religious tribes of Hindoos, and is generally filled with a variety of birds, snakes, and monkeys; the latter have often diverted me with their antic tricks, especially in their parental affection for their young off-spring, by teaching them to select their food, and to leap from bough to bough. On a shooting party under this tree, one of my friends killed a female monkey, and carried it to his tent, which was soon surrounded by forty or fifty of the tribe, who, making a great noise, advanced to it in a menacing posture. On presenting his fowling-piece, they retreated, and appeared irresolute; but one, who, from his age and station in the van, seemed the head of the troop, stood his ground, chattering and menacing in a furious manner; nor could any efforts less cruel than firing drive him off. He at length approached the tent door, when, finding his threatenings were of no avail, he began a lamentable moaning, and, by every token of grief and supplication, seemed to beg the body of the deceased. On this, it was given to him. With tender sorrow he took it up in his arms, embraced it with conjugal affection, and carried it off with a sort of triumph to his expecting comrades. The artless behaviour of this poor animal wrought so powerfully on the sportsmen, that they resolved never more to level a gun at one of the monkey race." Under this same banian tree a great chief of the district used frequently to encamp on his excursions in a magnificent style, having a saloon, dining-room, drawing-room, bed-chambers, bath, kitchen, and other accommodations, all in separate tents, while his carriages, camels, horses, guards, and attendants, were all sheltered under its "wilderness of shade." Indeed, during the march of an army it has been known to give a covering to *seven thousand* men, without any inconvenient budding.

Mr Forbes gives many curious particulars relative to the birds and beasts of Hindostan. The secretary-bird, a large fowl about three feet high, is extremely useful in destroying snakes, which, strange to say, are usually swallowed alive by it, yet, though of a most poisonous nature, appear to be incapable of injuring the coats of the stomach with their fangs. "An English gentleman, being out on a shooting excursion, killed a secretary-bird, which he carried home with the intention of having an accurate drawing made of it. He threw it on the floor of the balcony near the house, where, after it had remained some time, and been examined and tossed about, one of the company observed the head of a large

*The above is a contribution from Mr B. B. Thatcher of Boston, editor of "the Boston Book," and author of "Indian Biography."

snake pushing open the bill, out of which it speedily crawled in perfect vigour, and free from any injury. On the supposition that others might still be in the stomach, the bird was suspended by the legs, and presently a second made its appearance, as large and as lively as the first. The bird was afterwards opened, when the stomach was found to contain seven dead snakes, with a half-digested mass of lizards, scorpions, scolopendras, centipedes, and beetles." This passage is quoted by Mr Forbes from another traveller.

"A beautiful bird of Hindostan, the *baya*, forms its nest in a very ingenious manner, by long grass woven together in the shape of a bottle, with the neck hanging downwards, and suspended by the other end to the extremity of a flexible branch, the more effectually to secure the eggs and young brood from serpents, monkeys, squirrels (their most deadly enemy), and from birds of prey. These nests contain several apartments, appropriated to different purposes; in one the hen performs the office of incubation; another, consisting of a little thatched roof, and covering a perch, without a bottom, is occupied by the male, who with his chirping cheers the female during her maternal duties. The Hindoos are very fond of these birds, which they teach to fetch and carry; and at the time when young women resort to the public fountains, their lovers instruct the *baya* to pluck the tica, or golden ornament, from the forehead of their favourite, and bring it to their expecting master."

COUNTRY LENDING LIBRARIES.

AMONG the various symptoms of improvement which are at present observable in Ireland, not the least gratifying is that of the establishment of cheap lending libraries for the industrious classes in different parts of the country. As auxiliaries to a general system of juvenile instruction, they cannot but prove of considerable benefit to society. The establishment of these libraries is simply one of the results of an improved kind of education. First comes the school, and then the library: the one is a natural sequence of the other. In this and some other respects, the course of social advancement in Ireland resembles that of Scotland; the only difference being, that that of Scotland began somewhat earlier. It is now about sixty years since book clubs, farmers' reading societies, shepherds' monthly meetings, and such like humble institutions, were established in the more advanced of our rural districts, and unquestionably with benefit to their members. We never heard of a single instance in which they were perverted from their legitimate object of a cheering and innocent means of mental recreation, and it cannot be doubted that in many instances they have created a taste for literature, productive of the best individual and public results.

Burns, it will be recollected, while still unknown as a poet, was chiefly instrumental in setting on foot a society for mental recreation at Tarbolton, in 1780, and afterwards a book club at Mauchline, which was the means of awakening a taste for reading in the district. Burns's account of the "Rise, Proceedings, and Regulations of the Bachelors' Club at Tarbolton" (see his *Life* by Currie), is exceedingly characteristic, and commences with the following preamble:—

"Of birth or blood we do not boast,
Nor gentry does our club afford;
But ploughmen and mechanics we,
In Nature's simple dress record."

"As the great end of human society is to become wiser and better, this ought therefore to be the principal view of every man in every station of life. But as experience has taught us that such studies as inform the head and mend the heart, when long continued, are apt to exhaust the faculties of the mind, it has been found proper to relieve and unbend the mind by some employment or another, that may be agreeable enough to keep its powers in exercise, but at the same time not so serious as to exhaust them. But super-added to this, by far the greater part of mankind are under the necessity of earning the sustenance of human life by the labour of their bodies, whereby not only the faculties of the mind, but the nerves and sinews of the body, are so fatigued, that it is absolutely necessary to have recourse to some amusement or diversion, to relieve the wearied man worn down with the necessary labours of life.

"As the best of things, however, have been perverted to the worst of purposes, so, under the pretence of amusement and diversion, men have plunged into all the madness of riot and dissipation; and instead of attending to the grand design of human life, they have begun with extravagance and folly, and ended with guilt and wretchedness. Impressed with these considerations, we, the following lads in the parish of Tarbolton, namely, Hugh Reid, Robert Burns, Gil-

bert Burns, Alexander Brown, Walter Mitchell, Thomas Wright, and William McGavin, resolved, for our mutual entertainment, to unite ourselves into a club or society, under such rules and regulations, that, while we should forget our cares and labours in mirth and diversion, we might not transgress the bounds of innocence and decorum; and after agreeing on these and some other regulations, we held our first meeting at Tarbolton, in the house of John Richard, upon the evening of the 11th of November 1780, commonly called Hallowe'en."

The book club at Mauchline, which, as we have said, succeeded this first attempt, was established on a wider basis, and with considerably more advantage to the district. The first work purchased for the use of the members was the *Mirror*, by Mackenzie, the separate numbers of which were at that time recently collected and published in volumes. After it, followed a number of other works, chiefly of the same nature, and among these the *Lounger*. It is far from improbable that these works of polite literature were a means of polishing the mind of Burns, and causing him to write with that exact taste which is so surprising in most of his productions.

Since the era of Burns, the number of all kinds of book clubs, itinerating libraries, and literary societies, has greatly increased in all parts of Scotland; the increase has taken place principally within the last twenty years, during which period a considerable number of libraries have been established in connection with the religious dissenting bodies for the use of the respective congregations. These, with Sunday school libraries for young people, the libraries belonging to societies of artisans in the large towns, and the ordinary circulating libraries which are to be found in all the principal seats of population, have brought the means of literary recreation within the reach of almost every one. The expense at which books may be obtained for perusal from most of these country libraries is so small, that it can afford no reasonable plea to any for abstaining from the luxury. We may give an idea of the constitution of one of these useful societies. The members or subscribers are admitted by ballot or vote; the library is the property of the entire body of subscribers, and cannot be alienated without the consent of the whole members; the subscriptions, by which alone, in most instances, the library is supported, are seldom higher than from one shilling to one shilling and sixpence a quarter; the library is kept in the house of the schoolmaster, or some other individual zealous in the cause (not in a public-house), and he is allowed a trifle annually for his trouble in taking in and giving out the books. The general management of the concern is in the hands of a committee of five or six members, with a secretary and treasurer, appointed by the subscribers at their stated meetings. The appointment of these functionaries is usually the most difficult and delicate business which is to be performed. Generally speaking, no book club can prosper unless it possess an active and intelligent secretary, for on him devolves nearly the whole trouble and responsibility. He should be a person already possessing some knowledge of books, and aware where they are to be most advantageously purchased. It is a serious error, however, to give a discretionary power either to the committee or the secretary to make choice of the books to be added. We have known flourishing institutions ruined by this fatal concession in their regulations. The best plan is to keep a blank paper book at the library, in which each member when he pleases may note down the name of any work which he thinks it desirable should be added; at the meetings of the subscribers all such entries are submitted to them, and the selection made by vote. It is only where the funds can afford it, or when the economising of time is an object, that the secretary or committee should be invested with a certain power of adding works as they are published.

Such are commonly the chief arrangements in the organisation of parish libraries and book clubs in the rural districts of Scotland. The choice of books offered for the perusal of the members is generally pretty extensive and various, the collection consisting of numerous standard, or at least respectable, works of philosophy, theology, fiction, voyages, travels, biography, and other branches of literature, including some of the best periodicals of the day. The main difficulty experienced in the conducting of these libraries has been the sustaining of a sufficient degree of interest and novelty, to keep the subscribers together. After the first two or three years, they

usually begin to complain that they have read the library out, and, consequently, the institution is apt to languish and go down. To avert this calamity, we beg to suggest that the library should be periodically thinned, by selling its less available works, and devoting the proceeds to the purchase of fresh productions. The late Mr Samuel Brown of Haddington introduced the plan of itinerating libraries, by which different districts exchanged their stocks of books with each other.* But this requires a more wide organisation and system of management than can be brought into operation in ordinary cases. The probability of parish libraries languishing from the cause we have assigned, is fortunately diminishing every day. So many of the most approved works in all departments of literature, both native and translated, are now issued in a cheap form, that a country lending library, possessing but very slender funds, may add a few novelties almost every week—certainly with the greatest ease every month. This circumstance alone will prevent many book clubs from languishing, and we should hope will likewise furnish a reason for establishing libraries in places where they have not yet been attempted. By a judicious outlay of money, nearly as many popular works may now be had for *shillings*, as could have been procured a few years ago for *pounds*.

Our chief object in the present paper has been to call the attention of persons in rural districts and country villages to the utility of small lending libraries, for there are many hundreds of parishes in the United Kingdom, where, till the present moment, nothing of the kind has been thought of. In this as in most other cases, all that is needed is one or two active and liberal-minded men to set the required establishment agoing, and to support it for a time by their countenance and advice. There are few districts where such individuals are not to be found, and we feel assured that they could not be more useful in their sphere than by taking a part in so good a work. In Ireland, as we have already mentioned, village and district libraries are commencing in various quarters, principally through the encouragement of resident gentlemen, but also because the people are now better educated than formerly, and are therefore prepared for literary recreation and improvement. For the purpose of showing what is doing in this respect in Ireland, and of inciting others to follow the example, we copy the following announcement from a public placard, which lately appeared on the walls of one of the Irish country towns:—

"**Cheap Lending Library for the Industrious Classes.**
On the 1st of —, a Lending Library will be opened in W—. The object of the library is to create a taste for useful and instructive reading, to give an impulse to the labours of the schoolroom and the workshop, and adopt every means to improve the learning, confirm the industry, and call forth the intelligence, of the working-classes.

To make this object effectual, the books will be such as will be most calculated to direct the habits and tastes of those for whose benefit and instruction the library has been formed. As it is chiefly through books that intercourse with superior minds can be enjoyed, those written by right-minded and strong-minded men, and which meet the peculiar wants, the natural thirst of the mind, and therefore awaken interest and rivet thought, will gain the preference.

The multiplication of books, and their distribution through all conditions of society, being one of the most interesting features of the times, regard will be had to the means of the working-classes, in order to render this distribution as general as possible. At the small expense of one penny a-week, a man may now possess himself of the reading of the most precious treasures of English literature, comprising history, biography, travels, and miscellaneous works on science, mechanics, &c. Books, once confined to a few by their costliness, are now accessible to the multitude; and instead of depending on rumour or vague conversation for most of their knowledge and objects of thought, the industrious classes may now learn to study and reflect alone, to determine for themselves what shall engage their minds, and to call to their aid the knowledge, original views, and reasonings of men of all countries and ages, and in this way produce a change of habits highly favourable to their own improvement. The diffusion of these silent teachers, books, through the whole community, will work greater effects than machinery or legislation. The culture which they will spread, whilst an unspeakable good to the individual as a source of amusement, a defence against intemperance, and as opening up to him subjects of thought and reflection, will also become a blessing to society.

The terms for the library are as follow:—For yearly subscribers, 4s. 4d.; half yearly subscribers, 2s. 6d.; quarterly subscribers, 1s. 6d.

Rules of the library.—1st. Subscriptions to be paid in advance at the time of subscribing, and at the commencement of every subsequent term.

2d. If a subscriber, through any cause whatever, detain a book or books beyond the time subscribed for, the subscription will continue open, and must be paid till the books are returned.

3d. If a book be written in, torn, or damaged, while in the possession of a subscriber, that book, or the set, if part of one, must be paid for at the cost price.

4th. If a subscriber lend a book to a non-subscriber,

* See Chambers's Journal, No. 17.

he forfeits his subscription; nor will a transfer of books from one subscriber to another be allowed.

5th. For the general convenience and accommodation of subscribers, every work will be accompanied by a notice, limiting a reasonable time for reading it, to which the strictest attention must be paid.

6th. If a book be not returned on the day appointed, the subscriber shall pay a fine of 1d. for every day the book shall be detained; and if not returned within fourteen days after the day fixed for its return, application shall be made to the subscriber for the same; and if it be not then returned, the subscriber shall pay the value thereof, or of the set to which it belongs.—For further information, application to be made to ———.

We wish this establishment all the success which it, like every similar institution, so eminently deserves.

SKETCHES OF SUPERSTITIONS.

GREEK SUPERSTITIONS.

MANKIND have in all ages been prone to the most lamentable superstitions. The enlightened nations of antiquity were no more exempted from them than the most ignorant. The Jews, as we are repeatedly informed in Scripture, could with difficulty be restrained from idolatrous and superstitious practices, and confined to the worship and service of the only true God. This remarkable tendency of the Hebrew nation was in all likelihood caused by their sojourn for the space of four hundred years among the Egyptians, whose whole system of religion was a mass of idolatrous observance. They had a number of ideal gods to whom they erected temples of prodigious size and architectural splendour; the principal of these deities were Osiris and Isis, which are thought to have been typical of the sun and moon. But they also offered worship to various animals, as the ox or bull (hence the golden calf of the Hebrews), to which they gave the name of Apis; the dog, the wolf, the hawk, the ibis or stork, the cat, and other creatures; they likewise paid adoration to the Nile, personifying it in the crocodile, to which temples were erected, and priests set apart for its service. The Egyptians, notwithstanding their learning, also believed in dreams, lucky and unlucky days, on-ens, charms, and magic. In a word, they were grossly superstitious, and seem to have had but a feeble conception, if any, of the laws which regulate the ordinary phenomena of nature.

The absurdities of Egyptian superstition formed a basis for what followed in Greece and Rome. The colonisation of the Grecian states occurred about the period that Moses led forth the Jewish host from the land of the Pharaohs (1490 years before Christ), and Egypt at that period was at the height of its civilisation and its superstition. The mythology and superstitions observances of the Greeks deserve to be particularly noticed, both as a matter of amusement and instruction. In the first place, they had no idea of an omnipresent and omnipotent God, the creator and ruler of the universe. Their notions of divinity, like those of other pagans, were grovelling and contemptible. The gods whom they adored were imagined to have been at one period rulers or heroes on earth, and still had their habitation somewhere within the Grecian territory, or at no great distance from it. It may be premised that we should have known little of this monstrous system of belief but for the numerous allusions to the gods, their character and pursuits, in the works of the Greek and Roman poets, and also the various sculptured figures and representations which have been brought to light in modern times. Of the innumerable imaginary beings who were thus held in religious reverence, Jupiter was the chief. According to the stories told of him, Jupiter was the son of Saturn, a god who had been compelled by a powerful and tyrannical brother, named Titan, to promise that he would destroy all his male children. This promise Saturn for some time fulfilled, by devouring his sons as soon as they were born; but, at last, Rhea, his wife, contrived to conceal the birth of Jupiter, Neptune, and Pluto, who thus escaped the fate of their brethren. On discovering that Saturn had male offspring alive in contravention of his engagement, Titan deposed him from his authority, and cast him into prison. But Jupiter, having grown up to manhood, overcame Titan in turn, and restored Saturn to his throne. These vicissitudes, it is to be observed, and others that befell the early divinities, were the result of the decrees of Fate; a power over which the heathen gods are represented as having had no control. Notwithstanding this filial conduct of Jupiter, he afterwards quarrelled with his father, whom he de-throned and chased into Italy, where Saturn is said to

have passed his time in a quiet and useful manner, occupied solely in teaching the rude inhabitants to cultivate and improve the soil. He was afterwards known (under the name of Chronos) as the god of Time, and was usually represented under the figure of an old man holding in one hand a scythe, and in the other a serpent with its tail in its mouth, in allusion to the destructive influence of time, and the endless succession of the seasons. The rule of Saturn in Italy was productive of so much happiness, that the period ever afterwards was called the Golden Age. After Saturn had been driven into exile, his three sons divided his dominions amongst them. Jupiter reserved to himself the sovereignty of the heavens and the earth, Neptune obtained the empire of the sea, and Pluto received as his share the sceptre of the infernal regions. Jupiter did not, however, enjoy unmolested his supreme dignity, for the offspring of Titan, a race of terrible giants, set the new deity at defiance, and by piling the mountains named Pelion and Ossa on the top of one another, endeavoured to ascend into heaven to pluck him from his throne. The gods, in great alarm, fled from their divine abode on Mount Olympus into Egypt, where they concealed their true character, by assuming the forms of various animals; but Jupiter, assisted by Hercules, at last succeeded in destroying the giants, and re-asserting his sovereign sway. Jupiter is always represented on a throne, with thunderbolts in his right hand, and an eagle by his side.

Jupiter took in marriage his sister Juno, who is described as a beautiful but ill-tempered goddess, and is usually depicted as seated in a chariot drawn by two peacocks. Neptune, the brother of Jupiter, and god of the ocean, is painted as a half-naked man, of majestic figure, with a crown on his head, and a trident or three-pronged fork in his hand, drawn in a car over the sea by water-horses. Pluto, the remaining brother of Jupiter, and god of the infernal regions, was painted by the Greeks as seated on a throne with his wife Proserpine by his side, and the three-headed dog Cerberus before him. Nine of the most important of the deities were considered as the children of Jupiter. Apollo was the god of music, poetry, painting, and medicine: he is represented as a young man, of great elegance of person, with a bow in his hand, and a quiver of arrows at his back. Mars, the god of war, is drawn as an armed man in a car, with an inferior female deity, named Bellona, by his side. Bacchus was the god of wine, and was usually represented as a young man, with a cup in one hand, and a spear called a thyrsus in the other. His name has given rise to many phrases in our language, expressive of circumstances connected with drinking. Mercury was the messenger of Jupiter, and the god of oratory, of merchandise, and of thieving. He was represented as a youth flying along the air, with wings at his cap and heels, and a peculiar wand called a caduceus in his hand. Minerva, the goddess of wisdom, was painted as a female of severe aspect, armed on the head and breast, and bearing a spear and shield, while an owl sits by her side. Venus, the goddess of beauty and love, was depicted as a handsome woman, in undress. Diana, the goddess of hunting and of chastity, appeared as a beautiful female, with bow and arrow in her hands, buskins on her limbs, and a crescent on her forehead. Hebe, the goddess of youth, took the form of a blooming young girl, and was said to bear the cup of Jupiter. Another of the children of Jupiter was Vulcan, who, being of ungainly form, and disagreeable in the eyes of his father, was cruelly thrust by him out of heaven, so that he fell on the isle of Lesbos, and, breaking a limb, was lame ever after. On earth Vulcan employed himself as an artificer in iron, and hence he has been assumed as the patron of blacksmiths. Jupiter is said to have employed him in fabricating his thunderbolts. The gay goddess Venus is represented as married to this homely deity, to whom she occasioned much uneasiness by the levity of her conduct. The workshop of Vulcan was believed to be underneath the burning mountain Ætna, in Sicily; and the term *volcano* is derived from that circumstance.

Besides the other attributes and avocations of Apollo, he was the deity of the Sun, having the task confided to him of guiding that luminary in its diurnal course through the heavens. His sister, Diana, had a similar charge over the moon. Apollo, or Phebus, as he was also named, had a son called Phaethon, who, being, like many other young people, self-confident and rash, took advantage of the indulgent disposition of his father to obtain from him the charge of the chariot of the sun for one day. But Phaethon had not travelled far on his journey up the heavens, when his fiery steeds became unmanageable, and, running away with the sun, they descended so close to the earth, that that body was set on fire. Jupiter perceived what had happened, and fearing that the whole universe would be consumed, he struck Phaethon dead with a thunderbolt; then, after a good deal of trouble, he extinguished the dangerous conflagration, and set the sun once more on its usual course. Notwithstanding Apollo's care of the sun, that luminary, on its rising, was the special charge of Aurora, who was called the goddess of the morning or dawn—hence the common flowery expression, "the beams of Aurora rising in the east, tipping the distant hills with their golden hues." None of the heathen deities is more frequently referred to than Cupid, the god of love. He was the son of Venus, and bore the aspect of a beautiful boy.

He had a pair of wings, and was furnished with a bow and a quiver of arrows, which he shot into the hearts of those whom he wished to inflame with the tender passion over which he had control. So great was his power, that he could tame the most ferocious animals, and break in pieces the thunderbolts of Jupiter himself.

There was a number of divinities of minor importance. Hymen was the god of marriage, and was represented with a crown of flowers on his head, and a lighted torch in his hand. Æolus was the god of the winds, which he kept confined in caverns, except at such times as he chose to let them loose upon the world. Pan was the god of the country. He was flat-nosed and horned, and he had legs, feet, and a tail, resembling those of a goat. His favourite haunt was the vales of Arcadia, where he attracted the shepherds around him in admiration by the sweet sounds of his rustic pipe. Ceres was the goddess of agriculture, and had a beautiful daughter, named Proserpine, who was carried off by Pluto while she was gathering flowers on the plains of Sicily, and installed as the queen of the infernal regions. Ceres, in despair at the loss of her daughter, and uncertain as to her fate, lighted a torch at Mount Ætna, and sought for her over the whole earth. In the course of her wanderings she arrived in Attica, and finding its inhabitants ignorant of husbandry, furnished them with grain, and taught them how to cultivate their fields. She at the same time instituted the secret religious ceremonies at Eleusis, which were afterwards known by the name of the *Eleusinian Mysteries*. Ceres then continued her search for her daughter, and at length obtained information of what had happened to her. She immediately ascended to heaven, and demanded redress from Jupiter, who promised to compel Pluto to restore Proserpine, provided she had eaten nothing since her descent into hell. On inquiry, it was ascertained that she had eaten some pomegranates, so that her return to the upper world was, according to the laws of the infernal regions, impracticable. But Jupiter, compassionating her disconsolate parent, ordained that Proserpine should divide her time between her mother and her husband, residing six months with each, alternately. Astræa was the goddess of justice, and during the golden age, when men were virtuous and happy, she dwelt, like many other deities, on earth; but after the world became wicked, she bade it a sorrowful farewell, and, ascending to heaven, was transformed into the sign of the zodiac which is named *Virgo*, or the Virgin. Themis was the goddess of law, and, after the departure of Astræa, she had also to sustain, as well as she was able, the character of the goddess of justice. We see in this, as in some other fables, no small degree of meaning.

Inexorable destiny, which governs all things, was personified by three sisters, called the *Fates*, who represented the Past, the Present, and the Future. They were poetically described as constantly employed in spinning the thread of human life. One held the distaff, another span, and the third cut the thread when it had reached its appointed length. To the decrees of these stern sisters even Jupiter himself was obliged to bend, and his thunders, which affrighted all the other divinities, were heard by them undisturbed. The *Furies* were also three in number, and to them belonged the task of punishing the guilty both on earth and in hell. Instead of hair, their heads were covered with serpents, and their looks were fierce and terrible. Each of the sister-furies waved a torch in one hand, while the other wielded a scourge. The latter instrument inflicted remorseless punishment on those who had incurred the anger of the gods. Wars, famine, and pestilence—the penalty of vice and crime—proceeded from these dread sisters, and *Grief*, *Terror*, and *Madness*, were painted as their inseparable followers. These avengers of guilt form a striking contrast to another sisterly trio, to whom the ancients gave the name of the *Graces*. The *Graces* were named Aglaia, Thalia, and Euphrosyne, and their aspect and attributes corresponded with the common name they bore. They were the daughters of Bacchus and Venus, and were usually represented as unattired, and linked in each other's arms. The nine *Muses* were named Thalia, Melpomene, Calliope, Clio, Erato, Euterpe, Polyhymnia, Terpsichore, and Urania. They were the patronesses of literature and the fine arts, and resided on Parnassus, a lofty mountain in the district of Phocis. Thalia presided over comedy; Melpomene over tragedy; Erato over amatory poetry; Polyhymnia over lyric poetry; Calliope over heroic or epic poetry and eloquence; Clio over history; Euterpe over music; Terpsichore over dancing; and Urania over the study of astronomy.

There was a class of demi-gods, who filled imaginary places in every corner both of earth and sea. The shady groves and flowery vales were peopled by Dryads or wood-nymphs, and Satyrs, a species of rural deities, who, like Pan, had the horns, legs, and feet of a goat. Mountains and streams possessed their guardian-gods and goddesses, and every fountain had its Naiad or water-nymph. The lively imagination of the Greeks made them consider the thunder as the voice of Jupiter; the soft breezes of summer wore to them the movement of the wing of Æolus; the echo of the forest was the voice of a goddess, and the gentle murmur of the streamlet sounded as the tones of its presiding deity. In short, whatever sound or sight in nature charmed their fancy, the Greeks ascribed the pleasure to the agency of unseen, but beautiful and

immortal, beings. Even the meanest things and offices had their presiding deities; there was a goddess of common sewers and sinks. Beyond this it would be impossible to go.

Whether the deities of the Greeks were of superior or inferior importance, they were believed to mingle invisibly in the affairs of mortals, and frequently to lend their assistance in the promotion of schemes of vice and villany. They were animated by envy, malice, and all the evil passions to which men are subject, and they did not hesitate to adopt any measures, however base, to gratify their nefarious purposes. Even Jupiter, the king of heaven, is described as having acted a very profligate part. A belief in immortality, and of a future state of rewards and punishments, formed a part of the Greek religion. Immortality was figured in their temples by a butterfly (called *Psyche*), that animal, by its transformations, being, as they thought, typical of the changes which the human being must undergo. They imagined, that, after death, the souls of men descended to the shores of a dismal and pestilential stream, called the *Styx*, where Charon, a grim-looking personage, acted as ferryman, and rowed the spirits of the dead across the melancholy river, the boundary of the dominions of Pluto. To obtain a passage in Charon's boat, it was necessary that the deceased should have been buried. Those who were drowned at sea, or who were in any other manner deprived of the customary rites of sepulture, were compelled to wander about on the banks of the *Styx* for a hundred years, before being permitted to cross it. After quitting the vessel of Charon, the trembling shades advanced to the palace of Pluto, the gate of which was guarded by a monstrous dog, named Cerberus, which had three heads, and a body covered with snakes instead of hair. They then appeared before Minos, Rhadamanthus, and Acanthus, the three judges of the infernal regions, by whom the wicked were condemned to torments, and the good rewarded with heavenly pleasures.

Tartarus, the place of punishment, was the abode of darkness and horror. There *Tantalus*, for a vile crime done in life, remained perpetually surrounded with water, which fled from his lips whenever he attempted to quench his burning thirst, while over his head hung branches laden with the most inviting fruits, which shrunk from his grasp as often as he stretched out his hand to pluck them. There also was *Ixion* bound with serpents to the rim of a wheel, which, constantly revolving, allowed no cessation of his agonies. Another variety of punishment was allotted to *Sisyphus*, who was condemned to the endless task of rolling a huge stone up the side of a steep mountain, which he had no sooner accomplished than it rolled down again to its former place. On one side criminals were writhing under the merciless lash of the avenging furies, and on another were to be seen wretches surrounded with unquenchable flames. Elysium, the abode of the blessed, was a region of surpassing loveliness and pleasure. Groves of the richest verdure, and streams of silvery clearness, were to be met with on every side. The air was pure, serene, and temperate; the birds continually warbled in the woods, and a brighter light than that of the sun was diffused throughout that happy land. No cares nor sorrow could disturb its inhabitants, who spent their time in the enjoyment of those pleasures they had loved on earth, or in admiring the wisdom and power of the gods.

The Greeks were pre-eminently an imaginative people, and, accordingly, both their mythology and their religious rites were calculated rather to amuse the fancy than to interest or improve the understanding. Their public worship was altogether ceremonial. In magnificent temples they invoked and offered sacrifices to the gods, and the solemn festivals of their religion consisted of pompous processions, public games, dramatic entertainments, feasting, and masquerading. To these were added, in the worship of Bacchus, drunkenness, indecency, uproar, and every species of licentiousness. It was no business of the priests to inculcate lessons of morality; the only doctrine taught by them was, that the gods demanded slavish adulation, and an outward show of reverence from their worshippers, who would be rewarded with the divine favour in proportion to the abundance and costliness of their offerings. Besides the public services of religion, there were certain secret rites, performed only by the initiated, in honour of particular divinities. The most remarkable of these mystical observances were the feasts celebrated at Eleusis, in Attica, in honour of the goddess Ceres. They were called, by way of eminence, the *Mysteries*; and all who were initiated in them, were bound by the most solemn oaths never to reveal them. The Athenians alone were admissible to the Eleusinian rites, and they were very careful to avail themselves of their peculiar privilege, believing that those who died without initiation would be condemned to wallow for ever in mud and filth in the infernal regions. The penalty of death was denounced against all who should divulge these mysteries, or who should witness them without being regularly initiated; but, notwithstanding the rigorous manner in which this law was enforced, sufficient disclosures have been made concerning them, to prove that they consisted principally of such mystical ceremonies, and optical delusions, as were fitted to excite the superstitious veneration and dread of the bewildered votaries. Processions, gymnastic contests, music, and dancing, constituted an indispensable part

of this religious festival, as of others, and the nocturnal orgies of the devotees were scarcely less extravagant and immoral than those of the Bacchanals.

The gods were supposed to communicate with men, and to reveal the secrets of futurity by means of oracles, several of which existed in various parts of Greece. An account of these oracles, and other parts of the Greek, as well as the Roman, superstition, will form the subject of another sketch.

A MAIL-COACH ADVENTURE OF CHARLES MATHEWS.

THE following anecdote occurs in Mrs Mathews's delightful Memoirs of her late husband, of which the second couple of volumes are just published:—"Mr Mathews, on his way homewards from the north, just after the assizes, on entering the mail was fortunate enough to find only two gentlemen, who, being seated opposite to each other, left him the fourth seat for his legs. * * * The passengers were very agreeable men; one, a Scotchman—always a wife card. At the close of the evening the latter encased his head and throat in an enormous fold of white linen, and then sank back to sleep, looking like the veiled prophet; while the other, an Englishman, was characteristically satisfied with a 'comfortable.' * * * Just as the trio had sunk into their first forgetfulness, they were awakened by the sudden stoppage of the vehicle, a light at the door of an inn, and a party of rough discordant voices, bidding, however, a cordial farewell to a large, bearded, and ominous-looking stranger, who, in a broad Yorkshire dialect, wished his companions 'a good night,' reminding them that he had paid his share of the reckoning. To the great discomfiture of our three insides, the door of the mail was opened, and the fourth passenger invited by the guard to enter without further loss of time. Since the three gentlemen had 'dropped off,' the weather had suddenly changed from frost to snow. A heavy sleet had fallen, and the man I have mentioned quitted the open air, and entered the coach with, appropriately enough, a frieze coat on, powdered all over by the snow. * * * All were disconcerted at this intrusion, and sufficiently chilled and disturbed to be in a very ill-humour with the odious fourth. They, however, seemed tacitly to agree not to speak to the new comer, but endeavour to regain their before happy unconsciousness. They had not, however, been spending a jovial evening, as he had whose 'absence' they would have 'doated upon.' He was in any thing but a sleeping mood; and after a few minutes' rustling about, in order to settle himself, treading upon my husband's toes, elbowing his neighbour, without begging pardon for his so doing, &c. (all which was received with a sullen silence), he asked, in a voice which sounded like thunder to the sleepers, while he held the pull of the window in one hand, 'Company! oop or down?' Answer made they none. Again he inquired, still dubious of what might be 'agreeable,' and desirous to prove himself a polished gentleman, 'Company! oop or down?' Still receiving no answer, a smothered oath bespoke his disgust at such uncourteous return for his polite consideration for his fellow-passengers; and, with some exasperation of tone, he repeated aloud, 'I say, Company—oop or—down?' Still not a word; and with another exclamation, he allowed 't'window' to remain down. It was clear to the half-perceptions of the drowsy travellers that he of the frieze coat had laid in enough spirit to keep him from chilliness, and they hoped the potency of his precaution would soon make him unconscious, as they were disposed to be. But, no! he continued restless and talkative. All at once, however, a

"Change came o'er the spirit of his dream;"

he, it appeared, for the first time, perceived the alteration in the weather. His excitement at the door of the little inn, where he had left his friends, had caused him totally to overlook the snow which then fell upon him; and he saw it now with a degree of stupid wonder, and exclaimed, in audible soliloquy, 'Eh!—what's this? whoigh! the whole country's covered wi' snow!—eh! it's awful. Company!—wake up and see t' snow!—eh! they're all asleep. Whoigh, it's wonderful and awful! What a night!—what a night! Eh! God preserve all poor mariners on the western coast this night!' Then roaring out once more, with increased vehemence of tone, 'Company! wake oop, I say, and see t'night!' * * * In this manner did he go on, until the patience of the English gentleman was tired out, and he at length spoke: 'I wish, sir, you'd show some feeling for us, and hold your tongue. We were all asleep when you came in, and you have done nothing but talk and disturb us ever since. You're a positive nuisance.' 'Eh!' said he of the frieze coat; 'I loike that, indeed! Aw've as much right here, I reckon, as others—aw've paid my fare, har'n't I?' said he (his voice rising as he remembered his claims to consideration). 'Aw'm a respectable man—my name's John Luckie—I owes nobody onything. I pays king's taxes—I'm a respectable mon, I say. Aw help to support church and state.' On he went, with all the senseless swagger of cup valour and self-laudation, till he of the 'comfortable' again grumbled out his anger. Again the huge drover (for such he was) thundered forth his rights and summed up his title to respect: 'Eh! whoigh! what have I done? I coom'd into t' coich loike a gentleman, didn't I? I was civil, wasn't I? I said, Company, oop or down? But none o' ye had the politeness to answer: ye were not loike gentlemen!!!' * * * At length his sense of oppression became so strong, that his independence reached its climax, and he boldly declared that he would not hold his tongue, or be quiet—no, not though Baron Hullock, or the great Mr Brougham (or, as he pronounced the name, Mr Bruffem), himself was in t' coich.' My husband, who found all tendency to sleep broken up by this obstreperous fellow, now conceived a desire to amuse himself with his fellow-passenger. Just, therefore, as John Luckie's last declaration was uttered, Mr Mathews leant forward to him, and in a half whisper said, with affected caution, 'Hush! you are not aware,

but you have been speaking all this time to Baron Hullock himself!' The drover seemed to quail under this intimation. 'Whoigh! you don't say so?' 'Fact, I assure you; and the opposite to him is Lady Hullock!' (The Scotchman in the white drapery over his head began to titter at this.) 'Whoigh! you don't tell me that! Eh! what shall I do? Art thou sure?' 'I am indeed,' said Mr Mathews; 'they are Baron and Lady Hullock, and I am Mr Brougham.' 'Eh!' roared the man in a tone of actual terror, 'let me go! let me go! (struggling to open the coach door), let me go! I'm no company for sitch gentlefolks; aw've no book-larning; I'm no but John Luckie. Let me get out—here, guard! Stop! stop! I won't roide here any longer!' The guard was insensible to this, and on went the coach, and still John Luckie struggled; and in his rough and clumsy movements a little of my husband's ventriloquy proved a useful auxiliary to urge his welcome departure; and a child suddenly cried out as if hurt. 'Eh! what, is there a bairn i' t' coich too? Eh! my Lord Baron, pray forgive me; I meant no offence. My name's John Luckie. Aw'm a respectable mon, pays king's taxes. I said, Company, oop or down? I meant to be civil. Eh! my Lady Hullock, I hope I've not hurt thy bairn.' The child's cries now increased. 'Eh! ma poor bairn, where art thee? What moost I do! Guard! stop and let me out! Eh! what a night! Guard! I'm not fit company for Baron Hullock and Mr Bruffem, I know. Let me out, I say!' At last his voice at the window reached the higher powers, and the coach stopped, and as soon out rolled this porpoise of a man, who again begging the baron and his lady to overlook his inadvertency, and asking pardon of 'Mr Bruffem,' he was with some difficulty hoisted upon the top of the mail, and off it drove. The two inside gentlemen (who had been trying to stifle their amusement) now laughed outright, and thanking Mr Mathews for his device, they all three recomposed themselves, now and then catching by the wind a broken phrase from John Luckie, as he gave vent to his feelings to the coachman and guard—'Baron Hullock'—'Respectable mon'—'Bairn'—'Oop or down'—'My Lady Hullock'—'Mr Bruffem'—'Church and State,' &c.; all which must have puzzled his listeners without, who doubtless attributed his account to the quantity of rum-toddy which they might suppose had filled his brain with such unreal mockeries."

THE MARQUESS OF WELLESLEY.

The Earl of Mornington, father of the Marquess Wellesley and of the Duke of Wellington, died several thousand pounds in debt. By virtue of a peculiar law, his property was inherited by his eldest son, the Marquess Wellesley, without being liable for the payment of his debts. The Marquess, nevertheless, from a conscientious spirit, resolved to discharge all these debts, before he should allow himself fully to enjoy the family property. He lived for a few years with rigid economy, and thus saved enough of money to pay every farthing which his father had owed. Among the creditors of the deceased earl, was one who applied for the payment of £150. The young lord, upon examination, found that it had been transferred by a poor old man, to whom it was originally due, to the present possessor, for the small sum of £50. "I will deal justly with you," said his lordship, "but I will do no more. Here are the fifty pounds you paid for the bond, and legal interest for the time it has been in your possession." The holder, knowing that he could not strictly claim a single shilling, was content with not losing any thing. But the noble lord, who thus gave an early proof of that honour and integrity which he afterwards displayed largely in offices of the highest trust, did not stop here; he sought out the original holder of the bill, and, finding him poor, paid him the whole sum, with a large arrear of interest.—*Moral Class-Book.*

VACCINATION.

The author of a paper on this subject, in the Medical Gazette, suggests that in the event of small-pox breaking out epidemically in a town or village, isolated or cut off from communication with other towns and villages by any imaginable cause, and that the disease was raging fearfully around, whilst the prophylactic (vaccine fluid) had entirely died out of use and disappeared, in such a case all that would be necessary to stay the plague would be simply to take the variolous matter (the purulent matter of the disease) from off a patient, who might even be dying of the disease, and inoculate a cow upon any of the mucous surfaces, and thenceforth obtain a plentiful supply of genuine preventive vaccine lymph.

VICE A LEVELLER.

Any one of the laws of society once trodden under foot, it is vain to think of claiming the benefit of the rest. One mesh in the net let fall, the whole unravels. Where the opinion of the world has been disdained, the world repays in kind; and he who disdained it becomes a "faria," beyond the pale of social arrangements. For him, man's respect, rank, distance, the distinctions of education, fortune, exist no longer. Oh! vice is a merciless leveller.—*Pictures of the French.*

HOW TO ENFORCE SILENCE.

The officers of the Scotch criminal courts create disturbance by calling "Silence!" to the auditory. In Cork they manage the matter better; they write "Silence" in large letters on a piece of pasteboard, stick it into the cleft end of a long white rod, and wave it in the face of any one whose voice is heard rising above a whisper. If this does not produce quiescence, the admonition is enforced by a rap on the head with the rod.—*Phrenological Journal.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row; and sold by all booksellers and newsmen.—Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

SATURDAY, NOVEMBER 23, 1839.

PRICE THREE HALFPENCE.

A PEEP AT THE STAFFORDSHIRE POTTERIES.

SOME of the greatest distinctions amongst the people of this country arise from the trades and consequent habits of different districts. The weaving and cotton-spinning swains of Lancashire, the miners of Derbyshire and Cornwall, the mechanics of Sheffield and Birmingham, the carpet-weavers of Kidderminster and ribbon-weavers of Coventry, the potters of Staffordshire, the keelmen of Newcastle-on-Tyne, the colliers of that neighbourhood, the shepherds of the North and the shepherds of the South Downs, the agricultural peasantry, each and all have their own peculiar characteristics of personal aspect, language, tastes, and tone of mind, which it would be worth while to trace out and record. It would have the good effect of making the different districts better acquainted with each other, and would present features that would surprise many who imagine themselves pretty familiar with the population of their native land. We will answer for it that there are few who have any accurate or lively idea of that singular district which furnishes us with the earthenware we are daily using, from the common red flower-pot to the most superb table services of porcelain, from the child's plaything of a deer or a lamb resting under a highly verdurous crockery tree, to the richest ornaments for the mantelpiece, or chaste and beautiful copies of the Portland or Barberini vase. Who has a knowledge of this district? Who is aware that it covers with its houses and factories a tract of ten miles in length, three or four in width, and that in it a population of upwards of 70,000 persons is totally engaged in making pots, that cooks and scullions all over the world may enjoy the breaking of them? Such, however, is the reputed extent and population of the Staffordshire Potteries.

The general aspect of the Potteries is striking. The great extent of workmen's houses, street after street, all of one size and character, has a singular effect on the stranger. From the vicinity to the moorlands and to the Peak of Derbyshire, the country in which the Potteries are situated is diversified with long ridges of considerable elevation, and intervening valleys, and to those who travel through it by night, presents a remarkable appearance. The whole region appears one of mingled light and darkness. Lights are seen scattered all over a great extent in every direction—some burning steadily, others huge flitting flames, as if vomited from the numerous mouths of furnaces or pits on fire. Some are far below you, some glare aloft as in mountainous holds. The darkness exaggerates the apparent heights and depths at which these flames appear, and you imagine yourself in a much more rugged and wild region than you really are. Daylight undeceives you in this respect, but yet reveals scenery that to the greater number of passengers is strange and new. They see a country which in its natural features is pleasing, bold to a certain degree, and picturesque to a still greater. There is the infant Trent, a small stream winding down from its source in the moorlands towards the lovely grounds of Trentham, the seat of the Duke of Sutherland, through a fine expanded and winding valley, beyond which rises the heathy heads of moorland hills towards Leek. Among and between the pottery towns are scattered well-cultivated fields, and the houses of the wealthy potters, in sweet situations, and enveloped in noble trees; but the towns themselves are strange enough. As you overlook them from some height, they appear huge stretches of conglomerated brick houses, chiefly of one size and kind, interspersed with, here and there, a much larger one, with great square manufactories; with tall engine chimnies vomiting black volumes of

smoke, and with tall conical erections, much like those of glass manufactories, which are the pot-hovels in which they bake their wares in ovens or furnaces. As you advance, new characteristics present themselves at every step. Except just in the centre of each town—for, to use the lofty language of an historian of the Potteries, they are a *catenation* of several towns, though the dwellings of one reach pretty near to those of the other, as Lane-End, Lane-Delph, Stoke, Shelton, Hanley, Burslem, Tunstall, &c.—you see no good shops, or houses which indicate a middle class, such as, in fact, the majority of common towns are composed of. There are, generally speaking, but two classes of houses as of people—the thousands of those of the working order, and the fine massy and palace-like abodes of the wealthy employers. In the outskirts, and particularly about Lane-End, you find an odd jumble of houses, gardens, yards, heaps of cinders and scoria from the works, clay-pits, clay-heaps, roads made of broken pots, blacking and soda-water bottles that perished prematurely, not being able to bear "the furnace of affliction," and so are cast out "to be trodden under foot of man;" garden walls partly raised of banks of black earth crumbling down again, partly an attempt at a post-and-rail, with some dead gorse thrust under it; but more especially by piles of seggars, that is, a yellowish-looking sort of stone pot, having much the aspect of a bushel measure, in which they bake their pottery ware. Many of these seggars are piled up also into walls of sheds and pig-sties. The prospects which you get as you march along, particularly between one town and another, consist chiefly of coal-pits, and huge steam-engines to clear them of water, clay-pits, brick yards, ironstone mines, and new roads making and hollows levelling with the inexhaustible material of the place, fragments of stoneware.

As you proceed, you find, in the dirtiest places, troops of dirty children, and, if it be during working hours, you will see few people besides. You pass large factory after factory, which are generally built round a quadrangle with a great archway of approach for people and waggons. There you see a chaos of crates and casks in the quadrangle; and in the windows of the factory next the street, earthenware of all sorts piled up, cups, saucers, mugs, jugs, teapots, mustard-pots, inkstands, pyramids, and basins, painted dishes and beautifully enamelled china dishes and covers, and, ever and anon, a giant jug, filling half a window with its bulk, and fit only to hold the beer of a Brobdingnag monarch. In smaller factories, and house-windows, you see similar displays of wares of a common stamp; copper-lustre jugs, and tea-things, as they call them, of tawdry colouring and coarse quality, and heaps of figures of dogs, cats, mice, men, sheep, goats, horses, cows, &c., &c., all painted in glaring tints laid plentifully on; painted pot marbles, and drinking-mugs for Anne, and Charlotte, and William, with their names upon them in letters of pink or purple, or, where the mugs are of porcelain, in letters of gold.

While you are thus advancing, and making your observations, you will generally find your feet on a good footpath, paved with the flat sides of a darkish sort of brick; but, ever and anon, you will also find your soles crunching and grinding on others, composed of the fragments of cockspsurs, stilt, and triangles, or, in other words, of little white sticks of pot, which they put between their wares in the furnace, to prevent them from running together. You pass the large and handsome mansions of the master-potters, standing amid the ocean of dwellings of their workmen. You meet huge barrels on wheels, white with the overflow-

ing of their contents, which is slip, or the material for earthenware in a liquid state as it comes from the mills where it is ground; and at the hour of leaving the factories for meals, or for the night, out pour and swarm about you men in long white aprons, all whitened themselves as if they had been working amongst pipe-clay, young women in troops, and boys without number. All this time imagine yourself marching beneath great clouds of smoke, and breathing various vapours of arsenic, muriatic acid, sulphur, and spirits of tar, and you will have some *taste* and *smell*, as well as view, of the Potteries; and, notwithstanding all which, they are as healthy as any manufacturing district whatever.

Such is a tolerable picture of the external aspect of the Potteries, but it would be very imperfect still, if we did not point out all the large chapels that are scattered throughout the whole region, and the plastering of huge placard on placard on almost every blank wall, and at every street corner, giving you notice of—plays, and horse riders, and raffles! No: but of sermons upon sermons; sermons here, sermons there, sermons every where! There are sermons for the opening of schools and chapels, sermons for aiding the infirmity, for Sunday schools and infant schools, announcements of missionary meetings and temperance meetings, and, perhaps, for political meetings also, for it is difficult to say whether the spirit of religion or politics flourishes most in the district.

The Potteries are, in fact, one of the strongholds of dissent and democracy. Nine-tenths of the population are dissenters. The towns have sprung up rapidly, and, comparatively, in a few years, and the inhabitants naturally associate themselves with popular opinions both in government and religion. They do not belong to the ancient times, nor therefore to the ancient order of things. They seem to have as little natural alliance with aristocratic interests and establishments of religion as America itself. This people, indeed, are a busy swarm, that seem to have sprung out of the ground on which they tread, and claim as much right to mould their own opinions as to mould their own pottery. The men have always been noted for the freedom of their opinions, as well as for the roughness of their manners. But in this latter respect they are daily improving. Nearly twenty years ago, we have seen some things there which made us stare. We have seen a whole mob, men, women, and children, collect round a couple of young Quaker ladies, and follow them along the streets in perfect wonder at their costume; and we have seen a great potter walk straight through a group of ladies, on the footpath, in his white apron and dusty clothes, instead of stepping off the path; and all that with the most perfect air of innocent simplicity, as if it were the most proper and polite thing in the world. We also remarked at that time that scarcely a dog was kept by the workmen but it was a bull-dog; a pretty clear indication of their prevailing tastes. But their chapels and schools, temperance societies, and literary societies, and mechanics' institutions, have produced their natural effects, and there is no reason to believe that the population of the Potteries is behind the population of other manufacturing districts in manners or morals. Were it otherwise, indeed, a world of social and religious exertion would have been made in vain. It is not to be supposed that such men as the Wedgwoods, the Spodes, the Ridgways, the Meighs, &c. &c., men who not only have acquired princely fortunes there, but have laboured to diffuse the influence of their intelligence and good taste around them with indefatigable activity, should have worked to no purpose. Nay, the air of growing cleanliness

and comfort, the increase of more elegant shops, of banks, and covered markets, are of themselves evidence of increased refinement, and therefore of knowledge. One proof of the growth of knowledge we could not help smiling at the other day. We had noticed some years ago that a public-house with the sign of a leopard was always called the Spotted Cat; nobody knew it by any other name; but now, such is the advance of natural history, that, as if to eradicate the name of spotted cat for ever, the figure of the beast is dashed out by the painter's brush, and the words, The Leopard, painted in large letters, in its stead.

As in most populous districts, the Methodists have here done much to improve and reform the mass. John Wesley planted his church here, and his disciples, under the various names of Wesleyans, New and Primitive Methodists, are numerous. The New Methodists have in Shelton one of the largest chapels they have in the kingdom. The very Christian names abounding here seem to imply that there has long been in the people a great veneration for the Scriptures. In no part of the country do the names of the Old Testament so much prevail. We verily believe that a complete catalogue of the population would present a majority of such names. Every other name that you meet is Moses, or Aaron, Elisha, Daniel, or Job. This peculiarity may be seen in the names of almost all the potters of eminence. It is Josiah and Aaron Wedgwood, Josiah Spode, Enoch Wood and Aaron Wood, Jacob Warburton, Elijah Mayer, Ephraim Chatterley, Joshua Heath, Enoch Booth, Ephraim Hobson, Job Meigh, &c. &c. Fenton the poet, who was from Fenton in the Potteries, was *Elijah Fenton*.

But if the potters have been fond of ancient and patriarchal names, they have been equally fond of modern improvements and discoveries in their art; and when we recollect that little more than a century ago the Potteries were mere villages, their wares rude, their names almost unknown in the country, and now behold the beauty and variety of their articles, which they send to every part of the world, not excepting China itself; when we see the vast population here employed and maintained in comfort, the wealth which has been accumulated, and the noble warehouses full of earthenware of every description, we must feel that there is no part of England in which the spirit and enterprise of the nation have been more conspicuous.

THE TWIN CHIEFS—A TALE OF THE SABINE.*

THE river Sabine is the boundary between the United States and Texas. It empties itself into the Sabine Bay, which opens into the Gulf of Mexico, and is surrounded by low marshy lands, which form an extensive uninhabitable district, the haunt of innumerable flocks of swans, wild geese, ducks, pelicans, cranes, and every species of water fowl. At the mouth of the bay, as the traveller enters from the gulf, the sides of the river have their bottom covered with mud several feet deep, rendering it dangerous to attempt to land, although it is the only part where any bluff offers a landing-place; it may be accomplished, however, at high water, in small flat-bottomed skiffs. Here you have an extensive view of swamp, covered with coarse grass and rushes, unbroken by woodland of any description. The tide flows over it, and it would require a coat of mail to venture on an investigation of its peculiarities, for the mosquitos are insufferable; and after in vain attempting to battle them off from your face and hands, you return to your boat covered as thickly as if a swarm of bees had settled on you, nor will you find common cloth garments a sufficient protection against them.

About a hundred miles up the river, there is a small Indian village, where the remnants of a large tribe have settled. They date the commencement of their fall from the first arrival of the white man, and will tell you that their race have become degenerate in every respect since that period. They have diminished in their size, as well as numbers. They were strong as the hard oak, erect as the cypress, as numerous as the leaves of the forest; now they are weak as women, bent like old age, and few as the stars at summer's twilight. They were a race of warriors, who set even the Camanches at defiance, and whose ancestors slept in their graves unmolested; they are no longer fit for

war, and the crow follows the white man's ploughshare, croaking with delight as it devours the worms that have fattened on the dead bodies of their forefathers.

Dilka, the chief's wife, had twin sons, who were so equal in their skill, and so equally beloved, that at their father's death it was difficult to determine which should succeed him; nor were they willing to submit to the decision of their tribe, but each declined in favour of his brother. It was therefore decided that they should act together with equal authority—an arrangement which was rendered highly advantageous from the great number of their people—both in war and peace. Their hunting-grounds extended from the sea coast to the Rocky Mountains, and the feasts of Dilka's sons were whispered by their foes with dread—were sung by the friendly tribes with praise. They were seldom seen apart, unless their duty required it, nor was an angry word ever known to have passed between them; when they practised with the bow together, none would express more delight or warmer eulogies than the defeated brother.

It would be useless for me to make any comment on the perfect symmetry of the form in which nature had moulded these sons of the forest. But it was a sight truly beautiful to see them standing alone beneath some lofty pine, offering up their thoughts to the great spirit. One day, when they had descended with a party to fish at the lower part of the river, where the lake was visible, they saw a white object afloat upon its bosom, and long they stood gazing as it increased in size. It was unlike a bird, or any thing they had seen before. The blast of surprise was given from the horn of the buffalo, and party after party came hurrying down the river in their canoes, gathering around their chiefs with the spear, the war-club, tomahawk, and bow. A thrilling anxiety filled the bosoms of all, as their attention was drawn to the object. Not a word was spoken; and as the vessel approached, for it was a schooner, they prepared for an attack, readily perceiving that, although the thing was not alive, there were living beings on it. Overtures of peace were offered by the strangers, who came with glittering presents in their hands. The gaudy display of red and yellow cloth, of blankets, beads, and gilded ornaments, attracted the notice of the less wary, who, with uncontrollable delight, disguised their well-proportioned limbs in useless trumpery, strutting with vain conceit. Hitherto the deer-skin, prepared by themselves, and much better calculated for their pursuits, much more durable too, had sufficed. Their friendly visitors brought them the luxuries of their own country, but they also at the same time brought their vices. The chiefs became friendly with the captain, returned his presents a hundred-fold, visited his wigwam of the big waters, displayed their own exploits, and saw with wonder the sailors spring from rope to rope; lost their natural courage at the sound of the fusée, and felt the condescension in one to them possessing the power of a god becoming familiar with them. They tasted their different preparations of food, and cooked for them the buffalo and venison, which they do in a peculiar manner. They likewise tasted the sweet wines and ardent spirits. At first, like children, they refused the draught, but soon they yielded to persuasion and example. They tasted, and their love of it increased with what they took. Next came drunkenness, and all the wild insanity of the maniac. Then followed, as the fatal draught was more eagerly consumed, strange nausea, desperate confusion, and an unmanly cry as the earth seemed receding, whirling, sinking beneath them. At length nature relieved the stomach of its unwholesome burthen, and sound senseless sleep came on. How could the wary Indian now protect himself against a foe? The morning came, and with it, as they awoke, a parching thirst, a nervous dread, a cowardice they never yet had felt, a dejected spirit, and a downcast look—a combination, too, of such miseries as make the very heart shudder within the breast—such as no single one, nor all the natural diseases, if combined, ever could produce. The captain, well accustomed to such feelings, soon gave them relief, by inducing them to take fresh stimulants; thus establishing, as a habit, what perhaps would never have of itself returned, a constant desire for intoxicating drinks. In such times as these, the brothers would begin to feel a jealousy if the captain did not bestow his favours and attention equally on them. It was then that selfishness overcame the nobler feelings of the heart. They were

induced, not with any ill intent, but to amuse their friends, to try their strength against each other, and a severe trial it was. Two such athletic forms, so equally matched in strength and skill, could not well contend without great danger. A fist-fight between two boys is not likely to prove of a very serious nature, while one blow from the puglist will readily terminate the life of his opponent; and in this instance both were severely hurt, without any decision being possible as to their superiority. Formerly, the regret of each would have been that he had hurt the other; now, this feeling was reversed. They struggled against each other as if they had been struggling against a deadly foe. And when, at length exhausted, they joined their friends; the glass went round again and again, until the same mad feeling rendered their passions ungovernable. Each boasted of his superiority over the other, and many attempts they made to get together, but were separated by the captain, who tried to reconcile them in vain, until they became helpless from excess.

The vessel left them, having previously disposed of all the wine and spirits they could spare, or rather were willing to part with, together with a fusée, some ammunition, and several trifling things. The greater number of the Indians had been sent up to their head quarters with the different presents as they were made to them, and the chieftains, after parting with the white men reluctantly, commenced the indulgence of their dissipation. One soon fell from his seat senseless, from taking larger draughts, now that they were alone, and without the restraint imposed by the presence of strangers. The other became by degrees more furious as he drank. He called up every point of their previous contention, declared that the tribe should have but one chief as they had but one gun, that he was stronger and braver than his brother, that he could beat him; and in this manner working himself into a frenzy, at last fell upon his brother as he lay helpless, and murdered him, lacerating his throat dreadfully with a knife which he had received from the captain. This was effected before any interference could be offered by those around, who fled instantly from fear on seeing it accomplished, and runners started to communicate the fact to the elders. The rapidity with which they travel, and the distance they can go at one journey, are almost incredible. After the perpetration of his crime, the chieftain rose and drank deeply from a jug of pure rum that stood near him. Then observing that all the Indians had left him, he tried to blow his horn; this he found himself unable to do; he shouted, he tried to raise the warwhoop, but the echo from the opposite bank mocked his vain attempt. Taking his gun and as much spirits with him as he could carry, he wandered he knew not where.

The elders of the tribe were appalled at such dreadful tidings, for the prophet, an ingenious man, as all the Indian prophets are, seeing the strong attachment between the brothers, prophesied that their tribe should never be overcome until the twin chiefs quarrelled. A council was immediately called, and set off to the place where the murder was committed. They found the body, but the murderer was nowhere to be seen; and while some were sent in search of him, others set themselves to decide upon his punishment. They had laws for almost every offence, but they always considered twins as sacred; and for any one to have killed a twin, the most severe punishment they could invent was inflicted. But this was a still greater crime, and of a more revolting nature, besides betraying his tribe to the enemy, for they looked upon the prophecy as certain. After two days the council broke up; the criminal had been discovered and brought in.

He was found sitting amongst the rushes with a haggard countenance, his eyes bloodshot and swollen; the mud and water covered his legs, the gun and vessel of spirits lay beside him. He was singing, shouting, and throwing his arms about in a wild distracted manner; the blood of his victim had dried upon his breast and shoulder. As they approached him, he pointed the gun at them; it had been too long in the water, and would not go off; he threw it down, and erecting himself with difficulty, commenced giving his orders in a tone of authority. Seeing no one inclined to obey him, he stooped down, took up the vessel, and was in the act of finishing its contents, when he was in a moment surrounded and secured. They dragged him to the spot where his murdered brother lay, but he had become by this time insensible; the sentence of the council was nevertheless put into immediate exe-

* This tale has been prepared for our columns by an individual familiar with the country and people described in it.—Ed.

caution. The trunk of a large tree was fixed deep in the earth, on the very spot where the murder was committed; to this he was fastened naked, with the dead body of his victim bound to his side; his arm around its waist, its hand upon his heart, their heads secured cheek to cheek; and thus, for four-and-twenty days, he was condemned to be kept. Not a single thing was allowed to be removed from the place, nor any alterations more than were necessary to put the trunk in the ground. Two sentinels were placed to watch him, in such a position that he could not see them, and these were twice in the day to give him water. For many hours he remained unconscious of his situation; nor was it until, from the burning sunbeams falling on his head, his fever increased, and the salivary glands, exhausted by the poisonous liquor, which caused the stomach to require an extra quantity in its own defence, refused to yield one single drop to moisten his parched tongue and throat, that he opened his eyes in search of water, asking for it at the same time; finding himself confined, he struggled to be set at liberty, and called on his brother to assist him. The water was held to his lips; and, as it refreshed him, while looking down, his eye fell upon the ghastly wound that rested on his shoulder. The truth with all its horrors burst upon him. The violent struggle that he made against his bonds forced the blood from his nostrils; no cry of terror could escape his lips, and the next moment he fainted. When he recovered, the effects of intoxication had completely ceased, and he sent forth loud cries for assistance; shout after shout rang through the air, until his voice became feeble and hoarse; he could not move his eye from the horrid spectacle, but kept it involuntarily fixed on it, like one who watches the movements of a foe while standing face to face with him. The turkey buzzards now hovered over them, attracted by the smell of the dead body; and, oh! how he welcomed their appearance! They, like all other carrion birds, commence with the eye, and it would indeed be a blessing for him to lose his sight. Just as the welcome bird was venturing near, an invidious arrow pierced its body, and it fell near enough to them to be a warning to others. The lake that brought the cause of all this tragic scene, lay smooth and wide before him: what heavy curses fell from his lips against the white man! Had the captain been chained there instead of his brother, he could have borne it with delight. Again his eye fell on his victim, and another loud, long, piercing, straining scream was followed by the wild laugh of an idiot; then came tears and fiendish execrations, convulsive shudders, and spasmodic gasps for breath, mixed with hysterical sobs, as he struggled in vain; the body moving as he moved, the hand pressing more closely on his heart the more he strove to liberate himself, while the wound, as the body decayed, became distended more and more from his violent efforts.

Three days had he remained in this situation, when the sentinels, who had already tasted the pernicious beverage, were unable longer to withstand the temptation, for every thing had been left as it was when the murder was committed. The war-cry had gone through the land, and the remainder of the tribe had left the spot; the sentinels, to whose integrity the whole nation might have been entrusted, had been tainted by the vices, subsequent to the abuse of the luxuries of life; they broached the spirits, and soon became intoxicated; in this state they liberated the criminal, and fell immediately beneath his hand.

In the following year, about the same season, when the sky was beautifully clear, the weather mild, the surface of the lake but gently ruffled by the golden ripple that came dancing from the west, the white sails of the schooner were seen gracefully spread, reflecting from their concave form the red rays of the evening sun as she approached her former moorings. This is strange, thought the captain, as they drew near; very strange. He had been watching for the smoke from their fires, which had directed him on a former occasion, but now no smoke was visible. We surely were expected, he muttered to himself.

He was expected.

When the vessel was brought to anchor, seeing no canoes come out to welcome him, he conceived the Indians to have changed their fishing ground to some other spot, and determined to go on shore to ascertain if any traces of them might be left. He took two men and the mate with him in the boat, and, landing at the accustomed place, proceeded to the camp. He saw, to his astonishment, every thing as he had left it, but the trunk of the dead tree in the centre. As he approached nearer, he discovered a skeleton fastened to it so as to be swinging to and fro in the breeze; two other skeletons lay upon the ground, beside which sat a tall grey-headed Indian. In his hand he held part of a raw fish, which he was devouring, without apparently noticing their approach. His eye was glassy and wild. When the captain spoke, he made no answer, nor even turned his gaze away from some object on which it seemed fixed. But when the captain approached within a couple of yards, at one bound the Indian sprang upon him with the cry of a hyæna, and fixing his teeth and fingers firm in his throat, forced him to the ground. In vain the men tried to remove his hold; it was the iron grasp of death. When they did succeed in tearing them apart, both were dead, and the men discovered in the features of the grey-headed Indian their once friendly chief, who seemed to have prolonged a miserable life, merely sustained by an Indian's revenge.

Other traders soon contrived to visit the village of the tribe in the interior, and to introduce, with other luxuries of civilisation, the use of ardent spirits. The ancient and virtuous habits of the Indians were now depraved; they were unable to compete with their enemies, returned from their hunting expeditions in disgrace, and, as their feeble remnant now tell you, THEIR NATION IS NO MORE.

ANIMAL COTTON.

In an age when fine loaves of bread are manufactured from sawdust, and superior wine from rhubarb and turnips, it is surprising that but little advantage has been taken of the natural production of an insect very common and much dreaded in the West Indies, the Capada worm or insect fly-carrier. It is a deadly enemy to the indigo and capada plantations, sometimes destroying whole fields in a night; a circumstance which gave rise to a saying once current in the western hemisphere, that the planters of indigo go to bed rich, and rise in the morning beggars. Attention has been turned more to the most efficient methods of destroying the animal, than to turning it to some useful purpose. Yet this might easily be done, for in a certain state it produces a substance which appears to be equal, if not superior, to the finest silk or cotton. It is of the most dazzling whiteness and the greatest purity, answering the purpose of lint in the hospitals of the negroes, when silk and vegetable cotton serve only to inflame wounds, by the asperities of their filaments. We abridge an account of it from Burt's "Observations on the Curiosities of Nature," a very bad title for an ingenious book.

The capada worm, or insect fly-carrier, is produced, like the silk-worm, from the eggs which its mother scatters every where, after she has undergone her metamorphosis into a white butterfly. It begins to live at the end of July, and at its birth is arrayed in a robe of the most brilliant and variegated colours. When on the point of undergoing its metamorphosis in August, it throws off this superb livery, and puts on another of an admirable sea-green hue. This fundamental colour reflects all its various shades, according to the different undulations of the animal, and the different accidents of light; but this new decoration announces the approach of a period when it is doomed to undergo great tortures. It is immediately assailed by a swarm of ichneumon flies, one of which inserts itself into each of the pores of its body, not an opening being left unoccupied. All its struggles to get free of its tormentors are in vain. These flies, which are so small that they can only be studied by the microscope, drive their stings into the skin of their victim, over the whole extent of its back and sides. Afterwards, and all at the same moment, they slip their eggs into the bottom of the wounds which they have inflicted. No sooner is this operation performed, than the ichneumon flies disappear, and the patient remains for an hour in a drowsy and even motionless state, out of which it awakens to feed with its former voracity. It then appears much larger, and its size increases every day. Its green colour assumes a deeper hue, and the tints produced by the reflection of the light are more strongly marked. About a fortnight after the worm has been encumbered with this factitious pregnancy, the prospect of a numerous progeny begins to be apparent. By the aid of a microscope the eggs may be seen hatching in the body of the animal; and as they are all produced at the same instant, a single glance reveals the capada worm covered with a living robe of ichneumon flies. They issue from every pore, all the body being covered with them, only the top of the head appearing bare. Its colour then changes to dirty white, and the little worms assume a black appearance to the eye, although their true colour is a deep brown. This operation lasts about an hour, and it is followed by another, which is not much more protracted, but still more singular.

Immediately that the ichneumon worms are hatched, without quitting the spot where they separate themselves from the eggs, they yield a liquid gum, which becomes solid on exposure to the air. At the same time, and by a simultaneous motion, they elevate themselves on their lower extremities, shake their heads and one half of their bodies, and swing themselves in every direction. And now they commence a very curious operation. Each of these animalcules works himself a small and almost imperceptible cocoon in the shape of an egg, in which he wraps himself up. The formation of these cocoons occupies only about two hours, and myriads of them being crowded close together, form a white robe, with which the capada worm appears elegantly and comfortably clothed; but while they are thus busily arraying him in his new attire, he remains apparently unconscious of their assiduousness—he is then in a state of insect paralysis. As soon as this covering has been completed, and the little artists who wove it have retired to their cells, the worm endeavours to rid himself of his officious guests, and of the robe which contains them, but he does not succeed in the attempt without the greatest efforts. At length he contrives to get rid of the encumbrance; but instead of his former fat and shining appearance, he presents all the decrepitude of extreme old age. He is flaccid and dull; his skin is

wrinkled and dirty; and, in short, symptoms of approaching dissolution begin to show themselves. He still makes a desperate attempt to gnaw a few leaves, but he no longer devours them with that voracity which indicates a vigorous constitution. Shortly afterwards he passes into the state of a chrysalis, and in giving life to thousands of eggs, he relinquishes his own. The cotton produced in this remarkable manner may be used without any preparatory process, as soon as the flies have quitted the cocoons, which is generally eight or ten days after their seclusion. Indeed, there is no need for the precautions which the silk-worm requires, the robe which covers the fly-carrier being worked every where so perfectly well, and in such abundance, that in less than two hours the quantity of one hundred punts has been collected. This highly interesting animal certainly deserves some attention, for we are not aware that any has been given to it, except in so far as its destruction was concerned. We know not that experiments have been made to weave this silky substance into a wearable tissue, but if the description which we have given above be correct (and there is no reason to doubt but it is), there seems no obstacle to its being used for this purpose.

We may here notice a singular fact, established by Dr Mitchell of New York, that vegetable fungi grow on the bodies of living insects. He states that these vegetable productions are not peculiar to one insect, but are to be found on the bodies of the wasp, sphynx, and others; that the bodies of insects nourish more than one species of vegetable fungi; that some of these parasitical plants begin their work of annoyance, like the larvæ of the ichneumon, in the body of the living insect, and continue it till the animal is killed by its destructive operations; that these mixed associations of vegetable with animal life are not prone to rapid putrefaction, but remain long enough to be collected by naturalists, and become the objects of scientific investigation. Dr Mitchell seems to be of opinion that vegetable fungi, in attaching to the insect class of animals, perform an important purpose in the economy of nature, by preventing the inordinate increase of such animals.

REPORT OF BIRTHS, MARRIAGES, AND DEATHS IN ENGLAND.

THE First Annual Report of the Registrar-General of Births, Marriages, and Deaths, recently published, contains a mass of statistical information of the most valuable kind, and which is destined to become more valuable by comparison with similar statistics relating to subsequent years, which the Registrar-General will be enabled henceforth to furnish annually. As this Report, in its present shape, is not likely to come within the reach of many of the readers of the Journal, we beg leave to string together a few extracts from it.

It appears that the total number of marriages solemnised in England, according to the rites of the established church, during the year ending June 30, 1838, is 107,201; and the number solemnised during the same period, not according to the rites of the established church, is 4280; making the total number of marriages which have taken place in England, during the year, to be 111,481. Out of this number there were 5575 males and 16,563 females married below the age of twenty-one years.

The number of births registered in England and Wales during the year ending June 30, 1838, is 399,712, namely, 204,863 males, and 194,849 females. The number of deaths registered, during the same period, is 335,956, namely, 170,965 males, and 164,991 females.

The following Table shows the proportion out of 1000 registered deaths which have occurred at various ages during the year in England and Wales:—

Ages.	Males.	Females.	Total.
Under 1 year	234.66	193.72	214.64
1 and 2	127.17	128.85	128
3 — 4	47.57	49.47	48.51
5 — 9	45.89	46.27	46.07
10 — 14	24.57	27.3	25.91
15 — 19	30.96	37.48	34.16
20 — 24	39.02	43.5	41.22
25 — 29	35	39.97	37.44
30 — 34	33.05	37.42	35.2
35 — 39	32.38	34.25	33.3
40 — 44	32.91	32.69	32.8
45 — 49	32.6	30.65	31.64
50 — 54	32.12	30.8	31.47
55 — 59	33.54	31.42	32.5
60 — 64	40.51	40.64	40.57
65 — 69	41.05	41.83	41.43
70 — 74	42.95	44.95	43.93
75 — 80	40.3	43.46	41.85
80 — 84	30.48	34.89	32.63
85 — 90	16.97	20.86	18.88
90 and upwards	6.26	9.51	7.86

In allusion to the value of this table, the Registrar-General says, "In the abstract of deaths (the registration of which even for this first year has been effected with signal success) I have entered into more minute

details exhibiting enumerations of the deaths of persons of each sex at every successive year of age. Such details are of acknowledged value, as data for determining the laws of mortality, as bases for calculations materially affecting the interests of millions. Tables exhibiting the proportion of deaths at every successive year of age are among the most important materials from which are deduced the true principles on which should be founded the systems of life-annuities and of life-insurance, and the rules of friendly societies established for the use of the poorer classes."

Besides the above abstract of deaths for the whole of England and Wales, the Registrar-General has contrived, by dividing the kingdom into twenty-five divisions, to exhibit the difference which prevails in the proportions in different parts of the kingdom, and to compare town with country—agricultural districts with manufacturing and mining districts—the hilly with the low and level—the maritime with the inland—the eastern and northern with the western and southern parts. "Nor (says he) are these divisions matters of merely curious speculation, but may be made the source of important benefits, especially to the poorer classes. It was stated in evidence before the Committee on Parochial Registration in 1833, by the Actuary of the National Debt Office, that the extent of difference which then existed was utterly unknown; that tables for the use of the poor, in reference to sickness and mortality, and in reference to the regulation of their friendly societies, could not then be constructed for two districts differing in character, from the want of such information as an improved system would afford; and that if two societies of poor men residing in districts of a totally different character were, at the same time, to apply for tables to guide them in preserving their societies solvent, he 'should be under the necessity of giving the same tables to both, though knowing perfectly that the rates which were adequate in one case were inadequate in the other.'" All this information, however valuable and important as it unquestionably is, is but a subordinate result of the national system of registering births, marriages, and deaths, lately come into operation in England—the great and primary object of that system being henceforward to collect information as to the date and every other circumstance connected with the birth, marriage, and death of every individual in England and Wales, and to deposit and preserve such information, in a systematic manner, in one central office in London, where, at all times, and under proper regulations, it will be easily accessible to all classes of the people.

We shall, in conclusion, briefly describe to our readers the method adopted by the Registrar-General for registering births, marriages, and deaths. He has divided the kingdom into districts, to each of which he has assigned a superintendent-registrar, and one or more registrars. Under the Poor-Law Amendment Act, the whole of England and Wales has now nearly been formed into distinct unions for the administration of relief to the poor; and these divisions of the country for parochial purposes have generally been found convenient for the purpose of registration likewise. Generally speaking, the clerks of those poor-law unions, who are for the most part solicitors and men of respectability, have been appointed to the office of superintendent-registrar of births, marriages, and deaths, for their respective unions, as have also the relieving officers of those unions been appointed the registrars, who act under the direction of the superintendent-registrars. These local registrars are required to inform themselves carefully of every birth and death which shall happen within their respective districts. It is left to their discretion to employ such lawful means of procuring this information as may to them appear best. Having received intelligence of a birth or death, the registrar proceeds to the house where it has occurred, and enters it in a register-book kept for that purpose. Every registrar is required, quarterly, to make and deliver to the superintendent-registrar of his district a true copy of all the entries of births and deaths registered by him in the register-book of births and of deaths, upon blank forms furnished to him for that purpose, which copies, after having been examined and compared by the superintendent-registrar with the register-books, and certified by him, are transmitted by post to the Registrar-General in London. The process which these certified copies undergo in London is thus described by the Registrar-General: "The duties performed under my more immediate direction upon the receipt of the certified copies, after the termination of each quarter, at the general registrar-office, are, 1st, the examination; 2d, the arrangement; 3d, the formation of alphabetical indices; and, 4th, the compilation of abstracts (to which last we have already alluded)."

1. After such preliminary arrangement as shall prevent the confusion and intermixture of papers, each leaf of the certified copies, and each entry thereon, is subjected to a strict examination. If any erasure, interpolation, informality, omission, or error, or defect of any kind, is thereby detected in any entry, it is immediately noted, with a reference to the entry, in a form furnished for that purpose; and all such defects as require explanation, or may at any future time cast doubt on any matter recorded in the register, are made the subjects of immediate inquiry: a letter is addressed to the person who registered the defective entry, and his explanatory reply is preserved in the office, ready to be referred to in the event of

explanation being deemed requisite at any future period.

2. After the examination of the certified copies of a quarter of a year, the leaves are arranged, pagged, and bound in volumes, for preservation and reference, regard being had in such arrangement to locality, so that entries registered in the same district shall never be far apart, and those which belong to the same county shall, with few exceptions, be found in the same volume. * * * The certified copies so arranged and bound are kept deposited in fire-proof cases.

3. A separate alphabetical index is made for reference to the births of each quarter, another for the marriages, another for the deaths, being twelve separate indices for reference to the births, marriages, and deaths of the whole year, containing for the first year of registration, ending June 30th, 1838, 958,630 entries. The alphabetical arrangement is that of surnames, and it is carried out even to the last letter of each word; and where the surname recurs often, the alphabetical arrangement has been extended to the name also. * * *

I need not enlarge upon the advantages derivable from the facilities afforded by such indices. Obviously desirable as it is that important records like the certified copies of registers of births, marriages, and deaths, should be placed in one central public repository, the advantage of such accumulation would be comparatively slight, if easy reference to any of the millions of entries which will be collected in a few years were not afforded by a systematic arrangement, and a complete method of alphabetical indexing. The immense saving of time, labour, and expense, which is thereby effected, cannot be appreciated by a mere comparison with those cases in which (the place of the register of baptism, burial, or marriage, under the old system, being known and accessible) little trouble was incurred in obtaining a copy of the entry required. But it must be remembered, that cases have occurred where the register of a baptism, burial, or marriage, being required for legal purposes, no person living has been able to state in which of all the parishes in the kingdom the baptism, burial, or marriage, had been registered, or whether it had been registered at all. * * * In such a case, with no indication but the surname sought, and the probable period of the birth, marriage, or death, the search, which previously was a hopeless task, may, with respect to entries in the new registers, be accomplished in a few minutes."

The old parochial system of registration in England was in many respects exceedingly defective. In the first place, the registers kept by the parochial clergy were registers of baptisms and burials only, and furnished no evidence whatever of the precise time of the birth or death of an individual. They were also, for the most part, kept in a careless manner, and in numberless instances they were found materially obliterated or destroyed. Mr Matthews, a barrister, in his evidence on this subject before the Parochial Registration Committee in 1833, said, at the last York assizes he happened to be present upon the trial of the cause of "Doe and Hungate," a case of considerable notoriety in that county, where a large estate was at stake; and upon Mr Sergeant Jones stating that an obliteration appeared in a register which was produced, Mr Justice Alderson, who tried the cause, observed, "Are you surprised at that, brother Jones? I am not at all surprised. I have had much experience, and I never saw a parish registry book in my life that was not falsified in one way or other; and I do not believe there is one that is not."

The expense and delay, too, consequent upon procuring the certificate of a birth, marriage, or death, in cases where the parish where the event occurred was not known, were enormous, and formed not the least of the evils of the old system. In such cases a search has frequently been abandoned as fruitless, after having been made in half the parishes of England.

All these objections, however, will now, for the future at least, be completely removed by the operation of the new system of registration.

In concluding this notice, we would wish to impress upon the English readers of the Journal the necessity and propriety of their affording every facility in their power to the local registrars in the work of registration, for we are aware that some degree of prejudice towards the measure exists in England, and that some persons have carried this feeling to so great an extent as to refuse the necessary information when called upon by the registrar; an offence which the law has made a misdemeanour, punishable with a pecuniary fine. There cannot be the slightest doubt that it is the interest of all classes, more or less, that such important events as the births, marriages, and deaths of the population, should be correctly registered and preserved; and we are wholly at a loss to conceive on what grounds any individual can refuse to comply with the provisions of a law which has in view objects of such national benefit and importance, more especially as he can fulfil those provisions at no expense, and at the most trifling amount of trouble possible. We indeed regard the English people as highly favoured by the establishment of such an efficient system of registration amongst them. Scotland has nothing of the kind. Nobody can tell how many children are born, how many persons are married, or how many die, annually in Scotland. There are, of course, parish books, but these are on a most imperfect scale. Of births no note is taken, and only such persons as please, register baptisms. There is a

register of proclamations of regular marriages, but no corresponding record of the solemnisation of these marriages, except at the pleasure of the parties. Of irregular marriages, no note whatever is taken. We verily believe that not above one in ten of the marriages which take place in Scotland could be legally proved, except by litigation before a supreme court, in which collateral evidence might possibly be produced. A register of burials is kept at every burying ground, but no register of deaths. Thus, in Scotland, the whole matter of registration may be considered as on the worst possible footing

THE TWO PICTURES.

[This simple little piece is from the pen of our esteemed friend Mrs Anna Maria Hall, and is contributed by her to the ART-UNION, in which she appears to be a regular writer. The Art-Union is perhaps not so well known in Scotland as it should be. It is a monthly paper, in the form of the Literary Gazette or Athenæum, but devoted exclusively to subjects connected with the fine arts, including notices of exhibitions of pictures, lives of artists, hints on taste, criticisms on elegant engravings, and enriched, as we have said, with light agreeable articles from Mrs Hall, whose accomplished husband is, we believe, its conductor.]

It is impossible to avoid loving Mistress Janet MacAvoy—when you know her; I do not mean when you merely see her. But those who delight in things aged—in old furniture, in tapestry, in books with dim bindings, very ancient, very moth-eaten, very imperfect, and if they were perfect, not particularly full of value—any one delighting in "such like," not exactly for the sake of what they are, but what they were, or obtained credit for being, would "take" immediately to Mistress Janet MacAvoy.

As a well-preserved specimen of what Scottish ladies—far removed from Edinburgh—were some sixty years ago, Mistress Janet is perfection—as such, your antiquary would woo her at once. The blue satin brocade she displayed to us, last Thursday evening, when she came to see my "two pictures," as she called them, would have stood alone, if the little, pale, formal gentlewoman to whom it gave a local habitation, had crumbled from beneath its folds into dust; her black silk mittens were drawn up so as to meet the deep point lace ruffles, which certainly tempt one to "covet and desire;" the little foot was encased in a high-heeled shoe; the apron was of India muslin, flounced with embroidery; a white folded kerchief showed "pigeon crew fashion" beneath the distinct folds of a black mode cloak, garnished with such lace!—but the head—it was as fine a study as an artist could desire of the antique: Mistress Janet MacAvoy's pure white hair was drawn up from her high narrow forehead over a something—I really do not know what to call it—a roller, I suppose; and this was surmounted by a cap—point lace again—and lappets; so that the dear little lady's head, taken from the chin to the top bow on the top of the muslin monument, measured fairly, would certainly be about half the length of her natural figure. Her eyes are keen, blue, and severe, with a dropping of the lid—a cautious dropping, such as I have seldom noted except in the Scottish countenance; yet theirs is the severity which a virtuous action would disarm, and a vicious one sharpen into living arrows. Her nose is little and pointed; it could impale a foe and defend a friend; the lines about the mouth are hard when the mouth is shut, but when she speaks to, or of, those she likes, the hardness melts altogether away, and her smile is such an outbreak of sunshine, that the winter of her face is completely forgotten. I delight in her smile—it is apart from her other features—they do not answer it, and yet it hallows them; not even an old bachelor in a fit of the gout, who, I take it, must be the most unhappy and unmanageable of the whole animal creation, could withstand the sweet influence of that dear old lady's smile. And then, though she is sarcastic enough at times, there is something sure to come out that tells you her heart has the humanities all alive about it. She does not parade her charities; but the prayers of many a widow and many an orphan have borne her over the billows of a troubled life, when others would have been overwhelmed. She says she hates children; and yet you frequently find her surrounded by them in the back parlour of her pretty house, cutting great pieces of a large plum-cake, which seems endowed with a perpetual existence in her corner-cupboard. If she hears a tale of woe, her little eyes go wink, wink, and the tears that follow would pursue a proper course, did not the high cheek-bones send them any way rather than the ordinary one; but whenever her tears flow, her money follows; nor does she, as coarse-minded people sometimes do, think that money only can raise the bruised reed; she enriches gold by the delicacy with which it is presented. She seems, and I do believe is, ashamed

that people she considers better than herself should want assistance; and after the performance of a very benevolent action, she is as mysterious and as shy as a young leveret, and shuts herself up for a day or two, as if to exclude observation. I need not add, that Mistress Janet MacAvoy has never had what a French lady would call "the necessary appendage" of a husband. Some people hint, that in early life she was "disappointed in love;" but as this, I believe, is generally the case with those who love in "early life" (by which interesting term young ladies mean from fourteen to seventeen), I do not think there is any thing in the circumstance worth recording.

Mistress Janet MacAvoy never speaks of the tender passion; but certainly the only class of men she appears to dislike in reality are old bachelors; her nose grows as pointed as a fine Whitechapel sharp at the mention of an old bachelor. Once an old bachelor offered his arm to take her down to dinner—she gave him such a look! and sailed off in her brocade with no other assistance than that which her slender limbs afforded.

She came to London to take charge of the domestic arrangements of a nephew who had lost his wife, and was left with five young children; there was no probability of his marrying again, for he was poor and in ill health; however, it was enough for Mistress Janet that he was in distress, and the son of her sister, and so she quitted the very neighbourhood, immortalised by having given birth to Robert Burns. She came, never having breathed air that did not approach her with perfume over the "heath-clad hills," to the thick, murky neighbourhood of Fleet Street—in what may be called her old age did she come to endure the turmoil and bustle of a poor citizen's house, who had no claim of personal affection upon her, and from whom she had never heard till he was in trouble—still, was he not of her blood? was he not her sister's child? was he not poor? did he not want "some ane mair canny than himsel'?" to look after his "hame and his bairns!" and was it na a blessin' frae the Almighty for an auld woman to be usefu'?

Mistress Janet has been more than useful: her purse is open, her heart benevolent, her judgment clear; and notwithstanding her peculiarities, her grand nieces and nephews love and venerate the source of their many comforts: this is extraordinary, for oddities are seldom valued as their virtues deserve. Still Mistress Janet is sometimes glad to escape from the living cataract of Fleet Street—to our "Rosery," and come out to us at Old Brompton—as she always says, to breathe fresh air and gather flowers. I like to see her moving methodically along our gravel walks, noticing every new addition to our flower-beds, and saluting all her old favourites with a word of recognition. She sits under the great mulberry tree, as if she were one of those dames of the olden time—whom Mr Nash has of late so happily portrayed—and looks something like the ancient shepherdess of my grandmother's embroidery, for she wears gay colours, and has a *penchant* for roses under her bonnet. But Mistress Janet's chief delight is in our engravings; she will wander over a picture, if the story be pathetically told; that is, the tears will course each other down her cheeks, though she makes no moan. But I never saw her so sensibly affected as by the sight of the "two pictures," as she calls them—when she saw Allan's portraits of SCOTT and BURNS; she fixed her eyes for a length of time on that of the "PEASANT POET." I saw the tears were coming. She had known him—had taken him by the hand—had talked with his "Jean"—possessed, too, a scrap of his handwriting, and has repeated to me ballad after ballad from his immortal pen in the "simmer gloamin'," and in that low, soft, Scottish accent which, to my thinking, adds music to the verse; and yet she turned away without a word—looked out of the window—stooped to pat my little hound, and then, when abundant time had elapsed to forget an ordinary subject, she exclaimed—"It's himsel'—his vera sel'—as I have heard he sat in his father's cottage, composing that wonderfu' and holy poem, 'The Cotter's Saturday Night!' I canna say I ever saw him so i' the clouds like, wi' his pen in his hand, and that weight o' holy thought aboon his brow; he was aye glad o' company, an' I was a braw lassie in thae days, and it was mair natural that he was ready wi' his clavers than his poetry. Weel!" she continued, putting on her spectacles to enable her the better to peruse the details of the picture, which are so beautifully made out that I never saw a Scottish person look upon them without delight; there is the Bible—the pride of the cottage—a few books, not too many, for they might have interrupted the poet's study of the glorious volume of nature, from which came both his knowledge and his inspiration—his broad tartan bonnet, the hilt of his old gran'sire's claymore, the empty luggie and wooden bowl, marking the frugal fare of him who deserved

"The glorious privilege of being independent!"

"Weel," she said, "it is Robert Burns, looking, as he did, mair like a gentleman's gamekeeper than a common farmer—like ane who somehow had conversed wi' beauty and goodness; it wasna weel done tho', o' Maister Allan, to mak Robbie turn his back on the family Bible, for though, puir laddie, he often forgot,

he ne'er disrespected, its words. And there is his dog—his ain dog Luath, his

'Gash and faithfu' tyke,'

at his foot, and weel he looks—but ah, dear me! a painter can only paint the face wi' ae meanin' on it! but his *natur*, his rale *natur*, ye maun gae to his poetry for *that*—there's nae pure *natur* without poetry—it's jist the voice o' *natur*—poetry is the voice o' *natur*, the same as the sang o' yon throistle is its voice—baith hae the same teacher," and she commenced singing, as if to herself, the tender ballad of "My Nannie O!"—giving me, as I glanced from one to the other of these national pictures, time to think on the fate of the two greatest of the many great men Scotland has produced, and to calculate which of the two would live the longest in our nation's memory. I do not think I am able to decide—inclining sometimes to one, sometimes to the other; just now, my feelings are with Burns; his warm and genuine poetry is graven on my heart; and so, indeed, are these stories of the "Northern Wizard," those Scottish stories—especially the "Heart of Mid-Lothian"—so noble in virtue, that if there were nothing else preserved of his composing, it is an all-sufficient monument; but Burns depicted in a song what filled Scott's volume; in many cases their object was the same; but the novelist diffused what the poet concentrated—blessings on them both! for greatly do they contribute to our happiness, though their two pictures make me sad. Burns, whose whole nature was as the essence of immortality—who can read, as I have done, only this morning, his appeal for *five pounds* to one of his oldest friends, and not feel a thrill of horror, that within a month of his death poverty should have so gnashed its bitter teeth and fastened them on his heart. Then there is Scott in his splendid library, surrounded by the tokens of his taste and genius—the vase on the table, Lord Byron's gift—the keys of the Old Tolbooth of Edinburgh hanging by the window—the ancient border bogle—the sporan or purse of Rob Roy—the bust of Shakespeare—the pistol of Claverhouse—a brace of pistols that had been grasped by the hand of Napoleon—the Celtic shield and broadsword—the stately Maids, who contrasts well with Burns's "faithfu' tyke." And yet how sad it is to think that, well born—rich—powerful in fortune and in genius—he died worse than broken-hearted! Must such of necessity be the fate of those who are gifted above others with the distinctive power of genius? Must the vase be broken, the perfume spilled? Must the heart be crushed—the spirit bowed? Alas! such are sad questions—to which fearful answers must be often given.

Yes, I dearly love those two prints; they are among the most cherished of my household gods; they are painted and engraved by Scottish artists; the honoured names of Allan and Burnett are upon them; and how happily the one has been seconded by the other! If the engraver had refined away the strong and striking character the painter has given to both, if he had laboured, as some do, to sacrifice force to delicacy, he would have committed an outrage upon the memory of his country's truest patriots. Shall I not speak for thousands when I thank him for the bold and manly style in which his admirable engravings have been executed? And may I not express a hope that no Scottish house—that few homes where Scott is loved and Burns is worshipped—are without these admirable aids to a true relish and comprehension of the men and of their works?

But I am forgetting my honoured friend.

"Ye are lookin' at Sir Walter," said Mistress Janet, peering into the picture. "I thought myself the greatest woman in Scotland for three whole days, after I had the honour to shake hands wi' him; his kindness went right to the heart, and I couldna mak up my mind which I lo'd best, himsel' or his books, until I read his life."

"And what then, Mistress Janet?"

"What then—why, I thanked God that mine wad never be worth the writin'," she replied, taking a pinch of snuff. "And yet I'll no be sure but the first fault was, that, not content wi' being the greatest man in the world, he wanted to be the greatest nobleman. Ah! it is a great pity he was no content wi' God's whole treasury."

I could not but echo his countrywoman's regret, and felt more strongly than ever, that, for all his want of five pounds, Robert Burns enjoyed more than Sir Walter Scott—

"The glorious privilege of being independent."

These two pictures, commemorating in so striking a manner the relative positions of their subjects, are of all-powerful eloquence—to men of letters their lesson is stern and true—the over-grasping of the one, the thoughtlessness of the other, were both fatal. We think upon these gifted men before the commencement of their real trials—the mighty applause of thousands rings in our ears. The whole civilised world bowed at the shrine of Abbotsford. Every lip in the three kingdoms has uttered the songs of Burns; and yet the one, in his shackled magnificence, the other, in his cottage poverty—with the trumpet of fame still blasting, as if in mockery, at their distress—both died—broken-hearted. It surely cannot be that genius, like beauty, is a "dangerous" gift; that the mind, soaring, even in the swathings of mortality, nearer and nearer heaven, must be plunged back into the

mire of earth. I cannot think that God would give the eagle its pinion only to exercise His power in crushing it to atoms; it is man's improper ambition or perverse wilfulness that soils his greatness, and causes fools to exclaim against the destiny of genius.

SKETCHES OF SUPERSTITIONS.

GREEK SUPERSTITIONS CONTINUED—ORACLES, SACRIFICES, OMENS.

THE Greeks believed in the possibility of foretelling future events. The wisest among them were in this respect not more advanced in intelligence than those ignorant beings in the present day who put faith in fortune-tellers. The practice of divining what would be the result of important enterprises, was connected with the religion of the country, and therefore countenanced and supported by the state. In all matters of importance, the desired knowledge of futurity was sought for from certain oracles, or, as we should now call them, fortune-telling establishments. By far the most celebrated of the Grecian oracles was that of Apollo at Delphi, a city built on the slopes of Mount Parnassus, in Phocia. At a very remote period it had been discovered, that, from a deep cavern in the side of that mountain, an intoxicating vapour issued, the effect of which was so powerful as to throw into convulsions both men and cattle. The rude inhabitants of the surrounding district, unable to account for this phenomenon, conceived that it must be produced by supernatural agency, and regarded the incoherent ravings of those who had inhaled the noxious vapour as prophecies uttered under the inspiration of some god. As the stupefying exhalation ascended out of the ground, it was at first conjectured that the newly discovered oracle must be that of the very ancient goddess, *Earth*, but Neptune was afterwards associated with this divinity, as an auxiliary agent in the mystery. Finally, the whole credit of the oracle was transferred to Apollo. A temple was soon built on the hallowed spot, and a priestess, named the *Pythones*, was appointed, whose office it was to inhale, at stated intervals, the prophetic vapour. To enable her to do so without the risk of falling into the cavern, as several persons had previously done, a seat, called a tripod, from its having three feet, was erected for her accommodation, directly over the mouth of the chasm. Still, however, the *Pythones* held an office which was neither safe nor agreeable. The convulsions into which she was thrown by the unwholesome vapours of the cavern, were in some instances so violent as to cause immediate death, and were at all times so painful that force was often necessary to bring the official to the prophetic seat. The unconnected words which the *Pythones* screamed out in her madness, were arranged into sentences by the attendant priests, who could easily place them in such an order, and fill up the breaks in such a way, as to make them express whatever was most suitable to the interests of the *shrine*, which was the main object. Lest the oracle should be brought into discredit, care was, in general, taken to couch the response in language so obscure and enigmatical, that, whatever course events should take, the prediction might not be falsified, or rather might appear to be verified. It may be observed that, in the course of time, the plan of simulating convulsions was most probably adopted by the chief agent in these impositions.

The fame of the Delphic oracle soon became very extensive, and no enterprise of importance was undertaken in any part of Greece, or of its numerous colonies in the islands and along the coasts of the *Ægean* and *Mediterranean* seas, without a consultation of the *Pythones*. The presents received from those who resorted to it for counsel, not a few of whom were princes or influential and wealthy leaders, formed a source of great and permanent revenue to the institution, and not only afforded the officiating priests a comfortable maintenance, but furnished also the means of erecting a splendid temple instead of the rude edifice which had been originally constructed. The high veneration in which the Delphic oracle was held, gave its directors a large share of influence in public affairs; an influence which they sometimes exerted in a most commendable manner, in sanctioning and furthering the schemes of the statesmen, legislators, and warriors, who undertook to improve the political systems, reform the laws and manners, or defend the liberties, of Greece. Like the Olympian Festival, it also formed a bond of union among the numerous independent communities of Greece, and, by lending the authority of the gods to measures of general utility, often repressed petty jealousies and quarrels, and excited all to study the common welfare. Even when the rest of Greece was vexed by civil war, the chosen territory of Apollo was undisturbed by the din of arms; and the security which it enjoyed, on account of its sacred character, caused Delphi to become a place of deposit for much of the wealth of the states.

It is understood that the Greeks derived their superstitious belief in oracles, as they did many of their arts, from the Egyptians. In the deserts of Lybia, in a direction west from Lower Egypt, was situated the temple of Jupiter-Ammon, one of the most magnificent structures in the world, and celebrated for the oracular responses of its imaginary deity. Alexander, on the occasion of his conquest of Egypt, paid a visit of ceremony to this famed oracle, and consulted it respecting the fortunes of his family. Romans, as well as Greeks, revered this distant

fortune-telling establishment. After the battle of Pharsalia, Labrenus besought Cato to consult so celebrated an oracle, but that great man, who seems to have possessed sentiments of more exalted piety than his countrymen, made the following memorable reply:—"On what account, Labrenus, would you have me consult Jupiter? Shall I ask him whether it be better to lose life than liberty? Whether life be a real good? We have within us, Labrenus, an oracle that can answer all these questions. Nothing happens but by the order of God. Let us not require of Him to repeat to us what he has sufficiently engraved on our hearts. Truth has not withdrawn into these deserts; it is not engraven on the sands of Lybia. The abode of God is in heaven, in the earth, in the sea, and in virtuous hearts. God speaks to us by all that we see, by all that surrounds us. Let the inconstant, and those that are subject to waver according to events, have recourse to oracles. For my part, I find in nature every thing that can inspire the most constant resolution. The coward, as well as the brave, cannot escape death. Jupiter can tell us no more."

The oracles of Greece, like those every where else, in time fell into disrepute; their predictions were laughed at, and exposed as either equivocal or false; and, finally, as the light of Christianity spread over the Roman provinces, they became altogether dumb.

While the oracles continued to act the part of public and accredited prophets, there were various other means of looking into futurity, and procuring tokens of good or bad fortune. Of these, the most remarkable were certain signs or marks in the intestines of victims, slain as sacrifices at the altars. The mode of sacrificing is worthy of explanation. Bulls, goats, sheep, pigeons, cocks, and other creatures, were immolated to the gods of the country. Sometimes there was a hecatomb or sacrifice of a hundred animals at a time, to appease the manes or restless spirits of the deceased. A notion prevailed that the animals to be sacrificed would show signs of satisfaction on being brought to the altars, if the gods to whom they were offered felt pleased with the oblation. On bringing forward a bull or goat, the officiating priest drew a knife from the forehead to the tail, at which, if the victim struggled, it was rejected as not acceptable to the gods; but if it stood quietly at the altar, then they thought the gods were pleased with it; yet a bare non-resistance was not thought sufficient, unless it gave its assent, by a gracious nod; or to try if it would nod, they poured water or barley into its ear. We should imagine that these tests seldom failed in making the animal plunge with its head. Being satisfied with the sign, the priest proceeded to pour wine, and sometimes fruits or frankincense, between the horns of the victim, and afterwards struck it down and bled it to death. Great dexterity was requisite in striking down and bleeding a victim, for if it did not fall at once upon the ground, or stamped or kicked, or struggled to be loose, or did not bleed freely, or seemed to die with pain, it was thought unacceptable to the gods; all these being unlucky omens. To the celestial gods, sacrifices were made in the morning about sunrise; but to the deities of the lower regions, who were supposed to hate the light of day, they were made at midnight. It was customary on some occasions to dance round the altars whilst they sang the sacred hymns, which consisted of three stanzas or parts. The first of these parts, called *strophe*, was sung in turning from east to west; the other, named *antistrophe*, in returning from west to east; then they stood before the altar, and sang the *epode*, which was the last part of the song.

The sacrifice being ended, the priest had his share, and another portion was given as a due to the magistrates; the remainder was usually carried home by the offering party, for the sake of good luck and the preservation of health. Sometimes portions were sent as presents to absent friends. Important ceremonies of this kind were terminated with feasts, and these were concluded by the whole party adjourning to the temple of Jupiter or some other god, and there pouring out a libation of wine at the altar.

Besides the sacrifices, there were also other sorts of presents offered by the Greeks to their gods, either to pacify them when angry, or to obtain some future benefit, or as a grateful acknowledgment of some past favour. These consisted of crowns and garlands, garments, cups of gold, or any other thing that conduced to the ornament or the enriching of the temples. When any person changed his employment or way of life, it was customary to dedicate the instruments belonging to it, as a grateful commemoration of the divine favour and protection. Thus, a fisherman dedicated his nets to the nymphs of the sea; shepherds hung up pipes to Pan or some other of the country deities; and a lady, decayed with age, dedicated her mirror to Venus.

Divination by inspection of the intestines of the animals slain as sacrifices, was a business of a very grave kind, calling for the most earnest attention on the part of its professors. If there were any appearance of disease or injury, or any discoloration in the entrails, if the liver was dry, or if the heart palpitated, or was shrivelled, the sacrifice was unpropitious, and bad luck was to attend the proposed enterprise; if the gall was large and ready to burst, there were to be bloody wars or fights. The death of Alexander was foretold because his victim's liver had no lobes. On the day that Pyrrhus was slain at Argos, his death was prognosticated by the heads of

the sacrifices, which, being cut off, lay licking their own blood. It was also a very unlucky omen when the fire applied to the victim did not ascend calmly and in a straight line, or when the smoke curled and spread abroad. There was also a mode of divination by dreaming. Its professors threw themselves at will into a trance, during which, it was pretended, they visited in spirit the celestial regions, whence they returned with supernatural knowledge. In Athens a professed dreamer was kept at the public expense.

Divination by watching the motions and cries of birds was a superstition of great antiquity. It was observed that certain kinds of these animals disappeared in flights at particular seasons, and again returned, in a manner equally mysterious and incomprehensible, to their wonted haunts. In the present day, we know that such migrations take place from quite a natural cause—the instinctive desire of the animals to seek a climate conformable to their wants. But it was no part of the Greek, or, we may add, the Roman, philosophy, to attribute any event whatever to proximate natural causes; the meaning of every thing was sought for in the supernatural. The periodical flight and temporary absence of birds was therefore a phenomenon which served to invest these creatures with something like a supernatural character. When the birds left the land towards the approach of winter, to seek warmer skies, they were believed to retire from our earthly sphere, and to visit the heavenly regions, there to enter into communication with the gods, and receive from them a knowledge of future events. As birds could not disclose their information by language, it was customary to watch their flight, and also to kill them, for the sake of omens. If an eagle wheeled in its flight, or flew upwards, or perched on the ground, or if a flock of smaller birds settled on a temple, or was seen flying in a particular manner or direction, *something*, either good or evil, was betokened. There were also lucky and unlucky birds. Both Aristotle and Pliny, two great men of antiquity, reckoned vultures to be very unlucky, because they were generally seen before any great slaughter. Owls were, for the most part, looked upon as unlucky birds, but at Athens were omens of victory and success, being sacred to Minerva, the peculiar tutelary goddess of that city. The dove was thought to be lucky; so also was the swan, especially to mariners, being an omen of fair weather. Ravens were believed to receive a power of portending future events from Apollo. When they appeared about an army, it was a bad omen; if they came croaking upon the right hand, it was a tolerably good omen; if on the left, a very bad one; the appearance and chattering of magpies were unlucky omens. When Alexander entered Babylon, and Cicero fled from Anthony, their deaths were foretold by the noise of ravens. Pliny affirms that the worst omens were given by these birds when they made a harsh sort of noise, rattling in their throats, as if they were choked. Cocks were also accounted prophetic, especially in matters of war, for they were sacred to Mars, and were usually sacrificed to him, and pictured with him. The crowing of cocks was an auspicious omen, and presaged the victory of Themistocles over the Persians; in memory whereof, he instituted an annual feast, which was celebrated with exhibitions of fighting-cocks in the theatre. It was thought to be a token of a dreadful judgment, if a hen was heard to crow.

The superstitious beliefs of the Greeks and Romans were without number. Bees, ants, and various reptiles and beasts, were imagined to have the power of giving omens of good or bad fortune. Before Pompey's defeat, a swarm of bees settled upon the altar. This was a dreadful omen. Yet bees were not unlucky in all circumstances. When Plato was an infant in the cradle, bees are said to have come and sat upon his lips, whereupon the augurs foretold that he should be famous for sweetness of language and delightful eloquence. The death of Cimón, a Greek warrior, was presaged by a swarm of ants, which, on the occasion of a sacrifice, crept in a cluster round his great toe. Toads were accounted lucky omens. Snakes were likewise ominous, as appears by the serpent mentioned in Homer's *Iliad*, which devoured a brood of nine sparrows, and was interpreted to signify that the siege of Troy should continue nine whole years. To meet a boar was reckoned very unlucky. When a hare appeared to an army in time of war, it signified defeat and running away; the flight of Xerxes's army was predicted by a hare.

The phenomena of the atmosphere and planetary bodies were likewise a fertile source of superstitious delusions. The appearance of comets, and also eclipses, were ominous of great public disasters, it being the general belief that they were special signs made by the gods to warn mankind of approaching troubles. Nicias, the Athenian general, being surrounded on every side by his enemies, was struck with such consternation by an eclipse of the moon, that he commanded his soldiers to lay down their arms, and so with a numerous army tamely yielded himself up to slaughter. Lightning and thunder were lucky or unlucky according to the point from which they proceeded. If seen or heard on the right hand, they were believed to be good omens, and if on the left, the reverse. Both lightning and its accompanying thunder were supposed to proceed from Jupiter, and were the most awful tokens of his pleasure or displeasure. It was a common belief that danger from lightning might be averted by hissing or whistling to it. When a thunder-storm commenced, all

Athens fell to whistling. At Rome, places struck by lightning were held sacred, and enclosed from ordinary use. Not a wind could blow, but it was attributed to Æolus; not a meteor could appear in the sky, but was imagined to be ominous of some approaching event or good or evil. When two meteors appeared together, they were supposed to be torches held out by Castor and Polux to light the mariner to port, and to forebode good weather; but if a third meteor happened to appear, it was declared to be Helena with a fiery dart chasing away Castor and Polux, and portended storms, shipwrecks, and disasters. Among a people so superstitious as the Greeks and Romans, it will readily be conceived that earthquakes were ominous of signal national evils. These agitations of the ground, now traced to simple natural causes, were attributed to Neptune, and to avert his fury, sacrifices were made at his altars, and he was sung to in loud and fulsome psalms. When the ground was rent and laid open by earthquakes, the fears of the people, of the highest as well as the lowest rank, exceeded all bounds, and the subterranean deity was believed to be so wrathful, that nothing short of the most valuable offerings thrown into the gap would appease his anger. Thus, Midas, king of Phrygia, on one occasion cast valuable jewels, and also his own son, into a gap caused by an earthquake; and when a gulf opened from a similar cause in Rome, Curtius leaped into it on horseback, as a voluntary sacrifice to Neptune, who was supposed to be gratified with the offering, for the gulf immediately closed upon and swallowed its heroic victim. In these superstitious beliefs and observances we see a lamentable proof of the follies to which even a refined people may be exposed, if ignorant of the laws of nature.

THE GOVERNMENT CLERK.

[From "Heads of the French," now publishing.]

In France there are as many varieties of Clerks as naturalists ascribe to the *Lepidoptera*; but notwithstanding the thousand shades of difference, there are amongst them, to the keen and careful observer, great points of resemblance and striking analogies; in whatever grade of administrative department they may be engaged, they have all in view one single object, one fixed idea, one common destiny.

Let us explain in a few words the routine of the Clerk's life. At thirty, having a salary of eighteen hundred francs a-year, he marries an heiress with an income of six or eight hundred more; he takes a lodging, which must not cost him more than four hundred francs, at the farther extremity of the Marais, or in one of the suburbs of Paris. He walks every day five miles to go to his office, and there fill up registers, copy letters, sort and arrange heaps of papers, deliver game-licences, passports, receipts, and warrants—or, again, to register those who arrive and those who depart; to make out the conscription-lists; to plan a bridge for this town, a school for the other, and a cavalry-barrack for a third; to circulate the thoughts and stories originating in Paris over France and Europe; from his leather arm-chair, to keep a vigilant watch on the motions of such a gambler or such a criminal, or the progress of such a conspiracy, and what not besides. Others must have an eye on the thirty-eight thousand French boroughs, to ascertain and provide for their wants, their wishes, their opinions, or all that relates to politics, trade, the public good, religion, morals, the preservation of health, and a thousand other things. Such are the Clerk's multifarious duties six hours of six days of the week. Sunday comes, on which day he does not rise till ten, and shaves much later than usual. Towards three he quits his dull suburb, and starts with his wife for Paris, where they walk two hours for an appetite, and dine for two francs at Richefeu's, on *perdreux aux choux*, a *salade de homard*, a *sole au gratin*, with a *meringue à la crème* for a dessert. After dinner they go in summer to the Champs Elysées, and in winter to Musard's Concert. At half-past ten they walk home, where they scarcely arrive before midnight—the poor wife almost dead with fatigue—and thus ends the day.

The class of unmarried Clerks is much more numerous than that of the married. "What is the use of marrying?" say they: "if we marry for love, what misery not to be able to offer to the woman of our choice the thousand amusements, the charming nothings, the jewels, ribbons, and flowers, which go for so much to constitute female happiness! If, on the contrary, we marry, like too many others, merely for convenience, why thrust ourselves, without any compensation whatever, into the homest nest of nurses, doctors, and dress-makers' and milliners' bills? Let us try if it be not possible to live otherwise." Thus, alas! it is from poverty that the greater number doom themselves to celibacy, and, perhaps, are thus even more unhappy than those of their brethren who have ventured on matrimony. It is true that the single Clerk is free, and proud of his liberty till he is forty. He dines at the table-d'hôte at thirty-two sous, frequents the public walks, concerts, theatres, *balles champêtres*, and otherwise, and is occasionally animated by the fleeting excitement of an adventurous existence. But gradually the scene changes; his hair turns grey, he numbers forty-five winters, and the age of illusions passes away, never to return. Concerts, balls, and plays, amuse him no longer. What is to be done? To what innocent passion can he devote himself? How must he fill up his long summer mornings, his interminable winter evenings? Important questions these! Dining at table-d'hôte is moreover become insufferable to him. He can no longer endure to meet each day new faces, which he may never see again. Then, if he compare the flavourless soup, and

the harmless liquids in which swim the meats at his table d'hôte, with the delicious dishes and sauces so exquisitely prepared in private families, what a difference suggests itself to his mind! From this time a great change takes place in the single Clerk's life; he renounces the world, its amusements, its brilliant assemblies, to study a science, or devote himself to some quiet mania. He takes either to ornithology or numismatics, collects minerals, classes butterflies or shells, stuffs to the best of his abilities all his neighbours' dead canary birds, and subscribes to five or six illustrated editions. He ends by engaging a housekeeper, takes his meals at home, and settles down for life as comfortably as he can.

There are shades in the varieties of Clerks, which to dwell upon would be useless, their designation being a sufficient description. Such are the idler, who contrives to work only an hour a-day; the plodder, who is scrupulous of losing an instant; the *mulâtre imaginaire*, who for thirty years fancies himself threatened with serious illness, expecting which he solicits frequent leaves of absence, and is bled and takes medicine regularly every fortnight; the joker, who is always propounding riddles and playing tricks; the flatterer, who is sometimes nicknamed by his fellow-clerks "the Spy," &c. &c. The Pluralist demands a sketch to himself.

The hours of business in a public office are usually from ten to four o'clock. As long as the Clerk remains unmarried, he sleeps or otherwise idles away the eighteen hours' leisure afforded him by government; but when he marries, and children bring poverty, he tries to make the best possible use of his spare time. Then, indeed, his life is the most laborious and varied imaginable. It is hardly six o'clock, when he is already up and copying deeds and abstracts for solicitors; he colours prints, gives lessons in drawing, or on the French horn, or perhaps writes articles for the pictorial magazines, or scribbles novels or compilations at fifty francs a volume, according to his intelligence or inclination. From ten till four he is at his office. His dinner over, at six he betakes himself to some theatre on the Boulevard, to play the bassoon; or, if he is no musician, he employs his evening in keeping the books of some tailor, grocer, or any other shopkeeper in his neighbourhood. Such is his daily existence till eleven o'clock. Poor victim to marriage!—what industry!—what self-denial! Setting these aside—thanks to his unremitting exertion for seventeen hours per diem—the pluralist Clerk succeeds in providing food and clothing for his wife and children, and adds eight or nine hundred francs to his Government salary of fifteen hundred.

[The Government Clerk at length retires from the desk.] He has served thirty years: the period for his retirement has arrived; but, alas! here again are new grievances and fresh disappointment. In his youth, the Clerk is ever pining for the day when he shall retire, break his chain, recover his liberty, his independence, his freedom of speech, &c. When the time really arrives, his language is no longer the same. He resembles the Woodman in the presence of Death, in the fable. "What, already!" cries he. "What tyrannical injustice! I have scarcely begun to reap the fruit of my labour, and now I am dismissed; and with the stroke of a pen goes the one-half of my income! I who took so much pleasure in framing reports, auditing accounts, writing dispatches, &c. What is to become of me?" The Clerk then invariably forgets that there was a time when he was indignant that the old should bar the road to the young. However, retire he must, willingly or unwillingly, in spite of all appeal; and if his children are all provided for, and there is nothing to keep him in Paris, he usually retires to some small town in its immediate vicinity, and not unfrequently lives till he is eighty—happy when his savings have enabled him to purchase an acre of land, and subscribe, conjointly with the mayor of the place, to the oldest of the opposition newspapers.

There are some sad exceptions to this resignation and longevity. "Have you heard the news?" says sometimes one of the clerks, as he mends his pen, to his comrades in the office. "Have you heard the news of old A—, our pensioned head clerk?"

"No. What of him?"

"You know that he retired to the environs of Chantilly, at the entrance of a charming village, surrounded by magnificent vegetation; but it was the verdure of his papers, not that of the fields, that he cared for, poor man! As soon as he had ceased to see them about him, his health began to decline; he lingered six months; he who used to be so contented and happy in his office! His spirits entirely forsook him; a slow disease gradually undermined his health, and wore his body to a shadow."

"And how is he now?"

"Very well: he died yesterday!"

VAN DIEMEN'S LAND.

WE gather the following scraps of information respecting the condition of Van Diemen's Land, from an official return drawn up by the colonial secretary to the government, for the years 1836-7-8, and published in the Hobart Town Courier, May 31, 1839.

From No. 1 in the return, it appears that the fixed revenue of the colony has increased from L.91,320 in 1835, to L.98,081 in 1838, although in the interval there has been a decrease of L.18,000 on the annual revenue from spirit duties. "The reduction of the price of labour, and the improvement in the moral and civilised habits of the lower classes, have induced the use of the more cheap and wholesome beverage of beer, which of course must also have displaced the use of spirits." The number of licences to publicans and wholesale dealers in spirits has been considerably diminished.

The annual expenditure of the colony has correspondingly increased from L.103,027 in 1835, to L.138,681 in 1838; much of this increase, however, is caused by the colony now bearing the cost for the

police establishment, formerly paid by the home government.

"From No. 4 it will be seen that the number of vessels entered inwards, and cleared outwards, in 1835, was inwards, vessels 229, tonnage 56,833; outwards, vessels 225, tonnage 53,560; whereas, in 1838, they had increased respectively, to inwards, vessels 370, tonnage 64,454; outwards 369, tonnage 63,392; being an increase of 61 per cent. on the vessels inwards, and 64 per cent. on those outwards.

No. 5 shows that the imports for the three years have increased 20 per cent., and the very pleasing fact, that the exports for the same period have increased at the astonishing rate of 81 per cent., or from L.320,679 in 1835, to L.581,475 in 1838. The imports are more than L.15 for every individual on the island. This great increase in our trade is no doubt in some measure attributable to the establishment of the two new colonies of Southern Australia and Port Philip, which has given a fresh stimulus to commerce."

The exports have likewise greatly increased. Of wool, "the exports have increased from 8000 bales in 1835, value L.142,921, to nearly 11,000 bales in 1838, value L.171,599. The oil has likewise increased from 2154 tons, value L.51,398, to 4801 tons, value L.121,270, or more than double, and the whalebone from 132 tons, value L.10,698, to 187 tons, value L.15,807.

From No. 6 your excellency will perceive that the increase in the number of vessels and tonnage belonging to the colony has even more than kept pace with the great advancement of our commerce. The vessels have increased 42 per cent. in the three years, the tonnage 90 per cent., from which it is evident that more distant trade is now undertaken by our merchants than formerly.

Return No. 7 shows that ship-building is likely to prove another source of colonial industry. The number of vessels built in 1835 was 5, with a tonnage of 382, while in 1838, 10 vessels were built, tonnage 1267; a very great and rapid increase.

No. 8 gives a return of the number of grants of land, and of the number of acres granted, for the three years. From No. 9, which your excellency will observe contains the number of acres of crown land sold during the three years, and the average price per acre, it will be perceived that the average has been 8s. 5½d. per acre, the highest average being that of 1836, when it was 9s. 9½d. per acre, having annually decreased since that period.

From Nos. 10 and 11 it appears that the number of acres in crop has increased from 87,283 to 108,000, or nearly 24 per cent. The number of horses has increased at the rate of 49 per cent., and that of sheep from 824,256 in 1835, to 1,214,455.

Return No. 17 is a comparative account of the population, showing that it has increased from 40,283 in 1835, to 45,846 in 1838, or nearly 14 per cent.; and it is satisfactory to see, that while the male population has increased only about 13 per cent., the number of females has increased nearly 21 per cent., and that of free females more than 25 per cent.

The next returns show the number of inquests held on persons who have died, directly or indirectly, from drunkenness, from the year 1830 to the end of March 1838, and your excellency will be gratified on observing, that the year 1837 exhibits a marked decrease when compared with that of 1836; and if we may judge of the year 1838 from the returns of the first quarter, the decrease is still greater, and is yet more remarkable among the bond than the free.

From return No. 19, which gives a comparative account of the rates of wages, it will be perceived that the wages have fallen, though slightly, during the three years, at the average rate of above sixpence per diem.

The next return, that of manufactories and trades, shows a progressive increase in almost every branch, some of which I would more especially particularise. In 1835, the number of mills driven by water and wind was 47; it is now 51: and in place of one driven by steam, we have now three. The number of breweries, cooperages, candle manufactories, engineers, sail-makers, and shipwrights, has also greatly increased. This increase is in a great measure accounted for by return 21*, which shows that the number of miles of metalled roads in the colony has, during the three years, been very nearly doubled. Prior to 1836, there were only 68 miles so metalled; there are now more than 110: of these 110 miles, 97 are on McAdam's plan, and 13 on that of Telford. The number of bridges erected during the above period is 9; and that of culverts 274,893,000 cubic yards of excavation, and 757,000 cubic yards of embankment, have also been formed. The cross roads have also been improved, and better lines adopted."

The post-office system has been considerably extended. In Hobart Town there are now three deliveries in the day by the twopenny post, and the number of letters has increased, during the four years in question, from 9689 to 16,095. The number of places of public worship in the colony has increased from 18 to 32, and of sittings from 8369 to 14,000, and this does not include temporary buildings, or those which contain less than 100 sittings.

The number of actions at law is decreasing annually. Crimes against person and property have likewise decreased. During the three years ending in December 1835, there were 37 executions; during the three years ending December 1838, the number of executions was only 15. In 1838 there had been only three. "I need not here enlarge (concludes the writer

of the return), yet I would mention that the morals of the convicts have improved, the number sent up for good behaviour in 1835 being 286; whereas, in 1838, it was 439, or 1 in 2 nearly. The number of deaths has decreased from 1 in 34 to 1 in 58. The general health of the settlement is also much better."

LOCOMOTIVE POWER APPLIED TO CANAL TRANSIT.

It is, we suppose, generally known that the principal obstacle to the use of steam-engines on board canal-boats, is the injury done to the banks by the action of the water from the motion of the paddles. This, it appears, cannot be overcome, and consequently canal-boats are still dragged by horses on the old plan. An attempt, however, has lately been made in Scotland to introduce the use of steam-power for inland navigation, by means of a railway and locomotive tug along the line of the Forth and Clyde Canal. The following accounts of the experiments are from the Edinburgh newspapers:—

FIRST EXPERIMENT.—"This, which was of a novel nature, was conducted by Mr John Macneil, civil engineer, and consulting engineer to the Canal Company. It is well known that the haulage of boats on this canal has hitherto been performed by horses; the rates of speed being, for the heavy sloops, brigs, &c., in the London, Dundee, and other trades, about 1½ to 2 miles per hour, when drawn by two or five horses, according to the state of the weather; and for the swift or passenger boats between 8 and 9 miles per hour, on an average, when drawn by two horses. The object of the experiment was to ascertain the possibility of using locomotive steam power to draw the boats, instead of horses. Accordingly, a single line of rails, upon blocks, like an ordinary railway, was laid down for a considerable space along the canal banks, near Lock 16; and a locomotive engine and tender, built by Mr William Dodds, having been brought down the canal and set on the rails on the morning of the 21st, Mr Macneil, Mr Johnston, the canal director, and several engineers and gentlemen, being present, the experiment commenced by attaching to the engine the towing-line of the first passenger-boat that made its appearance, and which contained upwards of ninety passengers, with their luggage. There was a trifling delay in disengaging the horses, and tying the line to the engine, but this was amply compensated when the 'Victoria' briskly set off, and almost immediately gained a speed of 17½ miles per hour, which she kept up round two curves, and until the termination of the rails made it necessary to stop, amid the cheers of the delighted passengers. This experiment was repeated, during the course of the day, with each passenger-boat as it came on the railed space, and with equal success each time. On one occasion a towing-rope, which was much decayed, got foul of a curb-stone and broke, but without causing the slightest inconvenience, except about one minute's delay. The engine employed being intended only for a slow trade, was not calculated to go at greater speed than eighteen miles per hour; but it was the opinion of all present, that, with proper passenger locomotives, a speed might be obtained equal to that upon the best railways, few of the latter possessing the advantage secured by the canal bank of a perfect level throughout. The nature of the motion was highly gratifying to all the passengers, being more uniform, steady, and smooth, than when the boats were drawn by horses. Several of the heavy (masted) were also taken in tow during the two days of trial, at the rates of 3, 3½, 4, and 5 miles per hour; and, on one occasion, two loaded sloops, and a large waggon-boat, were together attached to the engine, and hauled with ease at the rate of 2½ miles per hour, whilst only one-fourth of the steam was allowed to pass the throttle valve. The foregoing statements render palpably apparent the immense advantages which might be gained by this new adaptation of steam-power—a great economy of haulage expenses, as one engine might draw at least six sloops, which now would require from 18 to 24 horses, and, if necessary, at double the present speed; and a proportional increase of the present traffic on the canal, which might be reasonably expected. Passengers would increase in a great proportion, when attracted by economy and speed of transport. The Union Canal from Edinburgh to Falkirk might be traversed in 2 hours, and the Forth and Clyde Canal from Falkirk to Glasgow in 1½ instead of 4 hours and 3½, as at present, and this by only assuming 16 miles per hour, though more might easily be performed, as the experiments have shown."

SUBSEQUENT EXPERIMENT.—"The locomotive employed on this occasion was the 'Victoria,' the same engine that had been employed in the former trial. By her were towed both the passenger boats, and the larger vessels of the Canal trade, under a variety of conditions. Some of the most remarkable results were as follow:—

With a passenger boat laden with passengers (an average load), a rate of twenty miles per hour was attained, and it was evident that the only limit to the speed was that of the power of the engine. The following eight trading vessels were arranged in a line, attached to each other, and the first to the locomotive:—

	Tons	Actual Load.	Draught of Water.
Register.	Tons.	Fect.	Inches.
Thetis, Grangemouth	66	35	8 0
Alert, Leith	41	67	8 9
Union, Kirkcaldy	48	65	8 6
Thistle, Alloa	51	18	6 0
Dainty Davy	30	47	7 10
London Packet	81	70	8 10
Star (Scow)	0	40	4 0
Prince (luggage boat)	0	22	4 6
	317	364	

For the haulage of this amount of tonnage, at the usual rate of 14 mile per hour, about twenty horses are employed, under the most favourable circumstances. The Victoria towed it, with about one-fourth only of her steam-power, at a rate of 2½ miles per hour. The case

with which she did this justified the opinion of several spectators, qualified to judge, that double this amount of tonnage might have been mastered by her with very little or any diminution of her speed.

The wave produced by the motion of the large vessels at the rate they were towed, was of the ordinary size and character; that of the rapid boats, though large, was by no means so formidable as to create any fear that it would be an obstacle to the adoption of this mode of conveyance. In one of the latter experiments, four passenger-boats were towed in a line, and the volume of the waves was evidently broken up into numberless smaller waves, spreading over the whole surface of the canal, and resembling a great ripple. The reverse of this occurred when two passenger-boats were lashed together abreast as a twin-boat; the wave then extended in a fine regular glassy swell from the boats to the shores. These effects point out the fact, that the form, magnitude, position, &c., of the wave, are all susceptible of modification. As little is to be apprehended from curves, of whatever character. In the railway upon which the engine travelled, there was a curve of double flexure, the radius of part of which was less than a third of a mile. No sensible retardation in her speed was produced by it, nor was any disposition observed, even in the most rapid transits, to run off the rails. To prevent the latter effect occurring from the resistance of the vessels towed, the outer rail was laid a little lower in level than the inner one, so as to give the engine a slight tendency to descend towards the outward rail. This also prevents, in a certain degree, the over-turning of the engine by a strong pull.

During the whole of the several series of experiments, not a single fact occurred to check the expectation that this union of the railway and the canal will, wherever practicable, take the precedence of every other, in point of combined convenience, safety, rapidity, and economy."

RECOLLECTIONS OF CALCUTTA, BY AN OFFICER.

THE Fort of Calcutta is one of the most splendid and convenient military establishments to be found in any quarter of the globe. It is very spacious, and, like the Tower of London, resembles a small town rather than a mere citadel, consisting of various streets and squares adapted for different purposes. On all sides it is guarded by a high and strongly built rampart, which is surrounded by a broad fosse, over which are placed drawbridges, leading to the principal gateways. On our first arrival here, after due admiration of the noble fortress itself, I was particularly amused by observing a tribe of extraordinary looking birds of the crane species, called Adjutants, which are quite domestic, but of a strange unsightly appearance, and which stand erect, like the penguin, in military fashion, rank and file, remaining as silent, motionless, and orderly, as a regiment drawn up on parade. These curious creatures are so well drilled, and so well practised in soldierly habits, that they never move the body, nor even the head, to the left or right as you pass by them, but seem fixed as statues, and are generally to be seen surrounding the green square enclosure in front of the barracks, where they remain in a state of ruminative apathy under the full blaze of the mid-day sun, until the soldier's dinner-drum begins to beat. Then are they all in motion in an instant, scampering off in double-quick time to the men's barracks, where a scene of great drollery usually ensues. They are most ravenous creatures, and provided with an enormously long and formidable bill, as well as with a large capacious bag, which hangs down from their throat to their long lanky legs. These curious birds, after all, though by no means an ornament to the fort, are as useful as they are amusing, being literally and truly its scavengers. They carry off all the offal and refuse thrown out about its precincts, and to them, and a host of assistant crows, who also frequent the locality, the inmates are indebted for the admirable cleanliness, and consequently much of the healthiness, of the place. These crows live on good terms, for the most part, with the adjutants; but sometimes one of the latter species is provoked out of its apathy by some mischievous encroachment on the part of the lesser birds, and gulps down the offending crow in an instant, feathers, bones, beak, claws, and all. This is a feat which the adjutant can execute with the greatest ease.

The fort is often the scene of animated festivity, from the presence of native jugglers, renowned for their surprising skill and dexterity. The performances of these people have been so often described, that I shall only advert to one piece of jugglery which was practised upon myself, and which is curious from bearing a strong resemblance to the feats recorded in sacred history as having been performed by the Egyptian magicians. Indeed, as it is well known that the Hindoo tricks have been handed down from the most distant ages, from father to son, there is little wonder that such a similarity should exist. The particular trick alluded to consisted in the apparent conversion of a small brass coin into a snake. The juggler gave me the coin to hold, and then seated himself, about five yards from me, on a small rug, from which he never attempted to move during the whole performance. I showed the coin to several persons who were close beside me on a form in front of the juggler. At a sign from him, I not only grasped the coin firmly in my right hand, but, covering that hand with equal tightness with my left, I enclosed

them both as firmly as I could between my knees. Of course I was positively certain that the small coin was within my fists. The juggler then began a sort of incantation, accompanied by a monotonous and discordant kind of recitative, and repeating the words "Ram Sammee" during some minutes. He then suddenly stopped, and, still keeping his seat, made a quick motion with his right hand, as if throwing something at me, and giving at the same time a puff with his mouth. At that instant I felt my hands suddenly distend, and become partly open, while I experienced a sensation as if a cold ball of dough, or some such soft substance, was now between my palms. I started to my feet in astonishment, and also to the astonishment of others, and unclenching my fists, found there no coin, but, to my horror, a young living make—a cobra-di-capello—folded roundly up. I threw it instantly to the ground, as if already bit by the deadly reptile, which began immediately to crawl along the ground, to the amazement and alarm of all present. But the juggler now got up, caught hold of the snake, and displayed its length, which was nearly two feet. He then took it cautiously by the tail, and, opening his own mouth to its utmost width, let the head of the snake drop into it, and commenced deliberately to swallow the animal, till the end of the tail only was visible; then, making a sudden gulp, the whole of the snake was apparently swallowed. After this the juggler came up to the spectators, and opening his mouth wide, permitted us to look into his throat; but no snake or snake-tail was to be seen. It was seemingly down his throat altogether.

During the remainder of the performances, we never saw this snake again, nor did the juggler profess his ability to make it re-appear. But he performed another snake-trick which surprised us much. He took from a bag another living cobra-di-capello, and walking into the centre of the room, enclosed it in his hands, in a folded state. He waved or shook them for some time in this condition, and then opened his fists, when, behold! the large cobra was gone, and in its place were several small ones, which fell on the floor, and began to move about.

ANTI-BACCHANALIAN SONGS.

No. I.

PLEASURE IN SOBRIETY.

Man little thinks
That while he drinks,
And quaffs the flowing bowl,
He breeds dull care,
Creates despair
In future for his soul.
Man little knows,
When thus he throws
His sorrow to the wind,
He sows a seed,
Will only breed
More deep in memory's mind.
Then leave your wine,
Though 'tis divine,
Enjoy a sober smile;
It has no smart,
But cheers the heart,
And lasts a longer while.

LITTLE CHILDREN.

[BY MARY HOWITT.]

Sporting through the forest wide;
Playing by the water side;
Wandering o'er the heathed fells;
Down within the woodland dells;
All among the mountains wild;
Dwelleth many a little child!
In the baron's hall of pride;
By the poor man's dull fireside;
'Mid the mighty, 'mid the mean;
Little children may be seen!
Like the flowers that spring up fair,
Bright and countless every where!
In the fair isles of the main;
In the desert's lone domain;
In the savage mountain glen;
Among the tribes of swarthy men;
Wheresoever a foot hath gone;
Wheresoever the sun hath shone
On a league of peopled ground;
Little children may be found!
Blessings on them! They, in me,
Move a kindly sympathy!
With their wishes, hopes, and fears;
With their laughter and their tears;
With their wonder so intense,
And their small experience!
Little children, not alone
On the wide earth are ye known;
'Mid its labours and its cares;
'Mid its sufferings and its snarcs.
Free from sorrow, free from strife,
In the world of love and life,
Where no sinful thing hath trod
In the presence of our God!
Spotless, blameless, glorified,
Little children, ye abide!

A HARD CASE.

An American paper contains the following brief but serious complaint:—

"One of our subscribers has stopped his paper, because we refused to insert an obituary, two columns in length, of a child of his which died at the age of two months. We should have had no objection to have published a short obituary of the infant, but what would our other readers have said to two mortal columns?"

It was, doubtless, a most unreasonable thing to request the insertion of so voluminous an obituary of a child, which only reached the innocent age of a couple of months; and the fact of the father stopping his paper, because it was refused, only shows with what queer customers our Yankee brethren of the press have to deal. We are sorry, however, after all, that our friend of the broad sheet, on the other side of the Atlantic, did not, as a matter of curiosity, publish this two-column obituary; and we beg to give the father of the infant deceased due notice, should this meet his eye, that if he only send the obituary to us, we shall take care that it graces the columns of some of our metropolitan journals. What we are curious to know is, where or how this exemplary parent possessed himself of materials respecting his infant, out of which he could spin two newspaper columns. We had thought the first two months of infancy were not particularly prolific of epochs or vicissitudes, from which an obituary might be manufactured. It is pretty clear, one would think, that at that tender age, the babe, though free from the vices of after-life, could not have been overstocked with the positive virtues. What then, in the name of wonder, could this Yankee parent have had to say about his "little cherub," that would have filled two columns. It may have been a "dear babe," as all babes are; and it may moreover have been devotedly attached to "nurse" and to "papa;" but then these are such commonplace affairs in the annals of babyship, that we cannot conceive on what ground this affectionate father thought them worthy of particular mention in the case of his child. We wish we had not seen the above paragraph: it has inspired in us a consuming curiosity to see the two columns of infantine biography. The best memoir ever written of any philosopher, statesman, or warrior, would not, to our minds, prove half so attractive. —*Grant's Walks and Wanderings.*

WORKING COLLIER.

We could almost wish that fate had destined us to be "working colliers." In that case we should have had some hopes of eventually attaining to wealth, if not to fame. As poor magazine editors, we have not the most slender prospect of either. The individual referred to in the following paragraph, may bless his stars that he was made a working collier, instead of the editor of a journal. Had he filled the latter situation, he never could have had the good luck which is in reserve for him; for no one ever yet heard of an editor establishing his claim to property of "immense annual value;" nor of triennial or septennial value either. But let the paragraph alluded to tell its own story:—

"A working collier, hitherto in very distressed circumstances, has recently established his claim as heir to property of immense annual value, near Ashby, in Leicestershire."

This is the eleventh or twelfth "working collier," who, if the papers may be credited, has had similar good fortune within the last six months. In all the other instances, if we remember rightly, there was a peerage or some great title associated with the "immense property." We are surprised to miss this pleasant-sounding appendage in the present instance. Probably it may be the next thing to which this "working collier" may establish his claim. What lucky rascals these underground gentry are! It is right, however, to add, that however clearly they establish their claims to immense property, distinguished titles, &c., in the columns of public journals, they do not succeed, in one case out of a thousand, in establishing their claims in a court of law. It is the latter consideration alone that prevents us from throwing ourselves into a coal-mine at once.—*Grant's Walks and Wanderings.*

AN EXECUTIONER'S LETTER.

THE following letter will be deemed a great curiosity. It is a true copy of a letter addressed not long ago to the under-sheriff of a northern Irish county, by a man who acts as executioner in several Ulster counties, but whose trade, it appears, has suffered greatly of late, in consequence of the greater obedience to law in the sister isle, or the greater leniency of those entrusted with its execution:—

O— Goal.

Dear Mr W— Sir Excuse my freedom Sir iye am sorry that I have to Explain to your honour that traid and harvest and slaughter of every Degree has Left me but still Lives in hopes of a Change for the better Sir if traid had been Good with me this time back my Clothing would not have been so bad but still Lives in hopes Sir as iye am at Present Cut Down to the Lowest Ebb for want of business if you have any old wairing Aperel Past you iye hope you will not forget me and also with a little Change to Cary me on as iye main to leave the Prison this Evening or to morow morning Master David Sir iye hope we will have it in our Power yett to draw up thes Bad times for if you show me the object never fear iye will show you traid Sir iye most humbly hope you will Conider me at the Present and the first harvest I will make a return What ever your Honour thinks of Doing with me have the Goodness to Explain it to mr Crowford and he will Deliver it to me.

Sir iye Conclude with my Concear wishes for your seasty and welfair yours truly to command

LITERARY FORMULAS.

IF a barbarian of good natural understanding were introduced into this country, and put through an extensive course of reading in its modern miscellaneous literature, he would probably be not a little surprised at some of the features of that literature, which we daily pass over as matters of course. For example, it would appear to him very strange that almost every novel should contain some two or three persons of excessively wicked character, and about an equal number who are nearly faultless; while, to make the wonder still greater, the virtues and the vices invariably go in association with certain peculiarities of personal appearance, professional occupation, and even relationship. Thus the best looking young lady and young gentleman are always paragons of moral goodness—dull a little, perhaps, but always very good. There is always an ill-looking (perhaps deformed) fellow, who entertains the most atrocious designs against some one, in which, however, he is entirely baulked. If this gentleman be uncle to any body, he is sure to be the worse for it; and this must appear the more wonderful, as the consideration is apt to arise that, if he be uncle to some one, he may be, or have been, nephew to some body else, who ought to have brought him up. Fathers generally are very harsh, and mammas very absurd and designing; that is to say, when they are mammas of some standing, for if they be young mammas, they are the most delightful creatures in the world, being then angels of maternal tenderness. Men are always sad wretches, unless they be old and grey, in which case they are sometimes amiable and interesting. A baron, especially if his castle be in a forest, is sure to be a detestable monster; but a young nobleman who hunts, is generally a very tolerable person. If there be any person about a family mansion who is dependent, an orphan, and of the feminine gender, mark that person—she must be all that is amiable. The eldest son will be extremely apt to fall in love with her, and then she will be persecuted by all except the old housekeeper. In the long-run she is sure to triumph. P.S. A young orphan lady in such a dependent situation is invariably pretty: hence all the mischief. These things, we say, would astonish an acute barbarian, who, even in his limited intercourse with the world, would probably have remarked that goodness and wickedness are not limited to human beings of any denomination, or relation in life, or place in the social scale. The mystery would be in some degree explained to him, when he was informed that these were mere fashions or formulas observed by writers of fiction.

If our barbarian were to spend a few years in the country, and nevertheless maintain all the original simplicity of his mind, he would also be surprised, as he went on reading, to observe how the literary republic is always finding out something that is excessively wrong, and excessively to be sympathised with, and very much to be declaimed about—that is to say, for a certain time, but which by and bye falls entirely out of notice, as if the thing had either ceased to be, or been completely corrected—neither of which events, however, ever takes place. Thus, for example, we have had many ingenious persons tormenting themselves for some years past, respecting the condition of the poor in the English workhouses, which they have convinced themselves is the most wretched imaginable, though, if they would only be at the trouble to step into any one workhouse, they would find the inmates in the enjoyment of rather more than the amount of food which the best physiologists deem necessary for health, and that of a nutritious kind, prepared with all due care. Workhouses are to be found scattered

thickly enough over England, and there is no objection any where to their being inspected. Yet, instead of going into them, or into any one of them, to ascertain the real state of the case, these gentlemen go on year after year bemoaning the supposed hard fate of the poor, and launching forth their indignation at those persons who are actually doing all they can to make that fate tolerable. We would have our barbarian friend not to be surprised if he were to find that these clamorous philanthropists never give themselves the least personal concern about any poor person, and systematically practise a breeches-pocket-buttoning policy against the whole generation of mendicants. There would be nothing to wonder at in that, for their declamations about workhouses are merely a matter of fashion, in which there is no real feeling concerned. They have only got hold of an idea, of which they think that something can be made. The public has a vague impression that there is something very horrible about a workhouse, and that the guardians and overseers of all workhouses must be tyrants. This is the way in which they are always represented in fiction, just as German barons living in forests are always villains. In such an industrious nation, few can inquire for themselves, so as to correct these vague notions originally impressed by fiction. The clamorous philanthropist, therefore, finds the miseries of the workhouse a good subject, and determines to improve it to the utmost. It is brought forward in all shapes and forms—that of the truth alone excepted. Sometimes we have the pining woes of starved and stunted childhood, and sometimes the tearless hardships of withered old age. The young are innocent and interesting, the old are excellent people, who have seen better days, and practised every virtue. Such they are by a sort of prescriptive right vested in the very relation they hold towards the rest of society. The whole picture is affecting in the extreme, and every body wonders that such things should be allowed to exist. Here we have the touchstone of the matter. How should such things be in a civilised land? Quite so. It would be very wonderful if they were so. But the simple fact is, that such things are not, and therefore do not need to be tolerated. They exist only in the imagination of a set of sentimentalists, real or affected, who find they can have something to say which will obtain attention, if they write upon this subject in the particular way described, and who would write in any way upon any subject, if only sure of an audience. The only remedy ever found for such awful tyrannies and lamentable miseries, is when the public begins to be tired of the subject, or some other thing equally awful and lamentable can be got up to take its place. The instantaneousness of the reforms thus apparently achieved is beyond all admiration.

The condition of the people who work in factories is another subject on which our supposed barbarian would find a strange difference between the reality and the favourite kind of description. Were he to inspect an ordinary cotton-mill in Manchester, he would find a great number of people of both sexes, all neatly dressed, engaged in a work so light as to seem a kind of amusement, enjoying the advantage of being in a well-ventilated and moderately warm room, and not in general working for a greater length of time every day than is consistent with good health. He would see as neat-looking young women as any village maidens in the country, and learn from their masters that they are in general not less careful about their behaviour. He would find boys and girls engaged in work, and thus doing a good deal to promote the comfort of their parents. The whole scene would be pleasing for its very regularity. In many such works

he would find the persons employed to be decidedly better off than the generality of working-people. He might also ascertain from statistical returns, patent to every one, and forming an evidence perfectly incontrovertible, that there is less crime in manufacturing than in rural districts. But when he turned from the actual scene, or from the scarcely less faithful portraiture of statistics, to the pages of the class of writers already pointed out, how very different a view would be presented! In the very first place, the younger workers would be represented as stunted—not half the size that children ought to be, though it happens to have been ascertained by fair experiment that "factory children," as they are called, are just about the same weight and stature with other children. Our philanthropist never peruses statistics, and in all probability detests them. The working-rooms would be represented as the scene of constant faintings from exhaustion and starvation, though perhaps that incident is in reality a rare one, and chiefly takes place amongst women in certain predisposing circumstances. The workers would be represented at meal-hours as creeping slowly and dully to food which they had lost all appetite for, though in fact there are few more jocund or lively scenes than that of a factory dismissing for a meal. Then, somehow, when young people begin their attendance at mills, it is sure to be an excessively dark, cold, drizzly morning in the month of January. The wind howls, and the bitter sleet dashes against the window pane. "The child rises, and, with its scanty covering pulled about it, descends shivering to the street. Poor little wench! her blood is frozen under her very finger-nails [the most likely place for it to freeze, we should think]. Her foot, too (for her shoes have been patched past further patching, and yawn in half a dozen places), is galled with a nasty chilblain, and she limps most painfully. Her father, bound to the same factory, lifts her upon his back, and, checking an oath, groans from between his teeth. The girl is nine years old; and half-clad, in a desolating January morning, is carried—through cold and darkness carried—to work!" This is actually the description given, by a very clever man, in a recent work, of a child's first going to a factory. Another dexterous writer for amusement has thought it worth while to spin the fiction into a long book, designed apparently for the amiable purpose of holding up the class of manufacturers to the ridicule and execration of their fellow-countrymen, and thus truly making our community a house divided against itself, these same manufacturers being, in fact, speaking generally, an ingenious, industrious, and humane class of men, elevated in many instances by their own merit from a humble origin, and whose wealth-creating powers are acknowledged to have been the chief means of keeping Britain afloat under a pressure of difficulties which must have otherwise made her the prey of a foreign spoiler. But the whole is only a similar delusion to that which prepares us to expect a creditor in fiction to be hard-hearted, and a debtor a worthy but unfortunate fellow. The manufacturer is looked on as necessarily a severe task-master, the workman as a poor servile drudge, whom the master uses in any way he pleases; the one as a grasping money-maker, the other as a poor wretch who asks only bread. Whereas the real state of the case is, that the two parties make a fair bargain according to the market rate of labour; that the workman is as independent as the master, and has as keen a sense of his own interests; and that, so far from being indifferent about the welfare of his labourers if he only can squeeze the desired work out of them, the master has every where sought for and adopted expedients for rendering the business healthy, and promoting the

moral and physical weal of those employed by him. The writers adverted to never take the least pains to ascertain such things. They do not need to care for truth. Their whole object is to write for a certain formula of popular belief which they think will "pay." The class whom they address live in drawing-rooms, and personally know nothing of factories; they therefore run no risk of detection there.* But it would be amusing to see a Birmingham workman, who often has green peas before his master, reading a work in which he was described as a poor stunted forlorn wretch, who never, from morn to eve of life, knew a single comfort—or a stout Dundee lass hearing herself described as a poor shred of humanity, doomed to linger out a miserable and degraded life, when she knows that her nine shillings a-week place her in food, clothes, and even independence, above most of her labouring compeers in that or any other district.

A sharp eye may detect a few other formulas of sentimentalism rising at present in the literary world, but among a class of writers whose ideas are generally of a philosophical cast, and whose aims, at least, are manifestly good. By these writers the commercial spirit is condemned as one altogether selfish, and to this are traced many evils supposed to be afflicting the commonwealth. All is struggle and scramble; the old social ties are no more. A general uneasiness pervades the mercantile classes: hard necessity pushes them on behind: at the same time, the ambition of high living draws them on before, and there is a general extravagance, or living above income. Now, the fact is, though the commercial spirit has reference to personal advantages, that those who entertain it are benevolent as any other class of the community, and perhaps more so than most, their anxiety for their own provision not necessarily precluding a regard to the claims of their fellow-creatures. The general effect of commerce upon the mind of a people, instead of being unfavourable, has always been remarked to be the reverse: wherever commerce prevails, there is generally to be found liberality of mind in proportion. It may be that many mercantile persons apply too industriously, and injure their health; but this error is apart from the evil pointed out. As to all being a struggle and a scramble, it may in like manner be pointed out that, where competition seems to run highest, great amity prevails among individuals. It is only in narrow scenes, where there is little business, that the feeling of competition becomes a bitter one. The feeling of uneasiness said to prevail among the mercantile classes is probably only that sense of uncertainty as to prospects, inseparable from all except an absolutely independent condition, and which is unquestionably useful, in as far as it gives a constant motive to exertion. The notion of a general extravagance we believe to be not less visionary. No doubt, we occasionally find individuals, who, from over-hasty ambition, have exceeded their means; but this is just the occasional exception of evil from a thing upon the whole good. Were there not a general wish to attain a higher point in the social scale, we should see nothing but stagnation and inactivity, where now we see the reverse. The wish or ambition is not only excusable, but laudable; and to it in a great measure are we indebted for the superiority which our country now exhibits over the regions where habits and classes are in eternal fixity. The notion of a general system of living above means is obviously absurd, for the thing is as impossible in nature, as for more rain to fall from the sky than the sun has raised from the sea. These are also, then, as we take it, literary formulas, though probably not set forward with any intention of deceiving.

And how long, inquires our sensible barbarian, may we expect to see this difference kept up between the

realities of obvious things, and the way they are spoken of and described in literature? "As long, good sir, as it is easier to write than to inquire, easier to lament supposed woes than to relieve real ones, and as long as the article truth shall not be in particular request amongst the bulk of readers."

WALKS OUT OF TOWN.

BY HUGH MILLAR,

AUTHOR OF THE TRADITIONAL HISTORY OF CROMARTY.

No. III.

I HAD passed the three first milestones after leaving Forres, when the clouds began to lour on every side of me, as if earth and sky were coming together, and the rain to descend in torrents. The great forest of Darnaway looked shaggy and brown through the haze, as if greeting the heavens with a scowl as angry as their own; and a low, long wreath of vapour went creeping over the higher lands to the left, like a huge snake. On the right, the *locule* of Shakspeare's witch scene, half moor, half bog, with the old ruinous castle of Inshoch standing sentry over it, seemed ever and anon to lessen its area as the heavily laden clouds broke over its farther edge like waves of the sea; and the intervening morass—black and dismal at all times—grew still blacker and more dismal with every fitful thickening of the haze and the rain. And then, how the furze waved to the wind, and the few scattered trees groaned and creaked! The thunder and the witches were alone wanting.

I passed on, and the storm gradually sank. The evening, however, was dark and damp, and more melancholy than even the day, and I was thoroughly wet, and somewhat fatigued to boot. I could not, however, help turning a little out of my way to pause for a few minutes amid the ruins of the old farm-house of Minitarf, just as I had paused in the middle of the storm to fill my mind with the sublimities of the Har-moor, and do homage to the genius of Shakspeare. But why at Minitarf? Who is not acquainted with the legend of the "Heath near Forres"—who knows any thing of the history of the Farm-House? Both stories, however, are characteristic of the very different ages to which they belong; and the moral of the humbler story is at once the more general in its application, and the more obvious of the two.

Isabel Rose, the gudewife of Minitarf, was a native of Easter-Ross, and having lost both her parents in infancy, she had passed the first eighteen years of her life with a married sister on the hill of Nigg. She had been famed for her beauty, and for being the toast of three parishes; and of all her lovers, and few could reckon on more, she had been lucky enough to lose her heart to one of the best—a piece of good fortune nearly as rare as the first prize in a showman's raffle. The favoured suitor was a handsome young farmer of the province of Moray—a person somewhat less shrewd, perhaps, than many of his countrymen, but inflexibly honest, and perseveringly industrious; and as he was a namesake of her own, she became his wife and the mistress of Minitarf, and remained Isabel Rose as before. The wife became a mother—the mother of two boys. Years passed by; the little drama of her life, like one of the dramas of antiquity, had scarce any change of circumstance, and no shifting of scenes; and her two sons grew up to maturity, as unlike one another in character as if they had not been born to the same parents, nor brought up under the same roof.

John, the elder son, was cautious and sensible, and of great kindness of disposition. There was nothing bright or striking about him, but he united to his father's integrity and firmness of purpose much more than his father's shrewdness, and there was a homely massiveness in the character that procured him respect. He was of a mechanical turn; and making choice of the profession of a house-carpenter—for he was as little ambitious as may be—he removed to Glasgow, where his steadiness and skill recommended him to the various contractors of the place, until in the course of years he became, a good deal to his own surprise, a contractor himself. Sandy, the younger son, was volatile and unsettled, and impatient of labour and restraint, and yet no piece of good fortune could have surprised Sandy. He had somehow come to the conclusion that he was born to be a gentleman, and took rank accordingly, by being as little useful and dressing as showily as he could. His principles were of a more conventional cast than those of his brother, and his heart less warm; still, however, there was no positive vice in the character; and as he was decidedly cleverer and a

great deal more genteel, his mother could not help sharing with him in the hope that he was born to be the gentleman of the family; a hope which, of course, was not lessened when she saw him bound apprentice in his seventeenth year to a draper in a neighbouring town.

Sandy's master was what is termed a clever man of business; one of those smart fellows who want only honesty, and that soundness of judgment which seems its natural accompaniment, to make headway in the world. He had already threaded his way through the difficulties of three highly respectable failures; he had thrice paid his debts at the rate of fifteen shillings per pound, and had thus realised on each occasion a profit of twenty-five per cent. on the whole. And yet, from some inexplicable cause, he was not making more money than traders much less fertile in expedient than himself. His ordinary gains were perhaps the less considerable, from the circumstance, that men came to deal with him as completely on their guard as if they had come to fight with him, and though a match for any single individual, he was somehow no match for every body, even though, after the manner of Captain Bobadil's opponents, they came only one at a time. His scheme, too, of occasionally suspending his payments had this disadvantage, that the oftener it was resorted to, the risk became greater and the gain less.

The shop of such a person could not be other than a rare school of ingenuity—a place of shifts and expedients, and where, according to the favourite phrase of its master, things were done in a business-like manner; and Sandy Rose was no very backward pupil. There are ingenious young men who are a great deal too apt to confound the idea of talent itself with the knavish exercise of it, and who, seeing nothing very knowing in simple honesty, exert their ingenuity in the opposite tract, rather out of a desire of doing clever things than from any very decided bias to knavery; and Sandy Rose was unfortunately one of the number. It is undoubtedly an ingenious thing to get the possession of a neighbour's money without running the risk of stealing it, and there can be no question that it requires more of talent to overreach another than to be overreached oneself. The three years of Sandy's apprenticeship came to their close, and with the assistance of his father, who in a long course of patient industry had succeeded in saving a few hundred pounds, he opened shop for himself in one of the principal streets of the town.

Sandy's shop, or warehouse, as he had termed it, for the latter name was deemed the more respectable of the two, was decidedly the most showy in the street. He dealt largely in fancy goods, and no other kind in the "soft way" show equally well in a window. True, the risk was greater, for among the ordinary chances of loss he had to reckon on the continual changes of fashion; but then, from the same cause, the profits were greater too, and Sandy had a decided turn for the more adventurous walks of his profession. Nothing so respectable as a large stock in trade; the profits of a thousand pounds are necessarily greater than the profits of five hundred. And so, what between the ready money advanced to him by his father, and the degree of credit which the money procured him, Sandy succeeded in rendering his stock a large one. He had omitted only two circumstances in his calculation—the proportion which one's stock should bear to one's capital, and the proportion which it should bear to the trade of the place in which one has settled. When once fairly behind his counter, however, no shop-keeper could be more attentive to his customers, or the appearance of his shop; and all allowed that Sandy Rose was a clever man of business. He wrote and figured with such amazing facility, and made such dashes at the end of every word! He was so indefatigable in his assertions, too, that he made it a rule in every case to assert under prime cost! He was, besides, so amazingly active—a squirrel in its cage was but a type of Sandy! He was, withal, so beautifully genteel! His finest cloths did not look half so well on his shelves as they did on his dapper little person; and it was clear, from his every-day appearance, that he was one of his own best customers.

Sandy's first half year of business convinced him that a large stock in trade may resemble a showy equipage in more points than one: it may look as respectable in its way, but then it may cost as much. Bills were now falling due almost every week, and after paying away the money saved during the earlier months, the every-day custom of the shop proved too little to meet the every-day demand. Fortunately, however, there were banks in the country—"more banks than one;" and his old master was

* The ignorance of one class respecting the condition of another in this country, is very remarkable. A friend of ours once heard a district of Manchester, which is chiefly occupied by the working men, described by ladies and gentlemen in that town as extremely wretched, and not even safe for a stranger to pass through. He had the courage to go and use his own eyes, when he found that the dwellings were generally comfortable, and the people to all appearance decent. He went and went again to that district, at various hours of the day, and always found every thing quiet. Notions in the same degree erroneous probably exist in every large city respecting the occupants of certain districts. Popular notions, in general, are apt long to survive any basis of fact which they originally had. There is a disagreeable disease, supposed by the lower orders in England to be particularly prevalent in Scotland: what prevalence it may have had ages ago, we cannot tell; but it is a curious fact that, though we have spent all the years of our life in Scotland, we never once saw a person known to be afflicted with that disease.

content to lend him the use of his name, simply on the condition of being accommodated with Sandy's name in turn. Bill, therefore, was met by bill, and the paper of one bank pitted against the paper of another; and as Sandy was known to have started in trade with a few hundreds, there was no demur for the first twelvemonth or so on the part of the bankers. They then, however, began to demand indorsements, and to hint that the farmer, his father, was a highly respectable man. Sandy expressed his astonishment that any such security should be deemed necessary; his old master expressed his astonishment too; nothing could be more unbusiness-like, he said; but the bankers, who were quite accustomed to the astonishment of all their more doubtful customers, were inflexible notwithstanding, and the old man's name was procured. The indorsement was quite a matter of course, he was told; a thing "neither here nor there;" but necessary just for form's sake; and from that day forward all the accommodation bills of Sandy and his master bore the name of the simple-minded old man.

I have said that Sandy was one of the most indefatigable of shopkeepers. It was but for the first few months, however, when all was smooth water and easy sailing; in a few months more, when the tide had begun to set in against him, he became much less attentive. Some of his fancy goods were becoming old-fashioned, and in consequence unsaleable, and his stock, large at first, was continuing large still. What between the price of stamps, too, the rate of discount, and the expense of travelling to the several banks in which he did business, he found that the profits of his trade were more than balanced by the expenditure. Sandy's heart, therefore, began to fail him; and, setting himself to seek amusement elsewhere than behind his counter, he got a smart young lad to take charge of the shop in his absence; and as it could not add very materially to the inevitable expense, he provided himself with a horse. He was now every day on the road doing business as his own traveller. He rode twenty miles at a time to secure a five shilling order, or crave payment of a five shilling debt. He attended every horse-race and fox-hunt in the country, and paid the king's duty for a half-starved greyhound: Sandy was happy outside his shop, and his lad was thriving within. Matters went on in this train for so long as two years, and the hapless shopkeeper began to perceive that the few hundreds advanced him by his father had totally disappeared in the time, and to wonder what had become of them. Still, however, his stock in trade, though somewhat less showy than at first, was nearly equal in value to one-third his liabilities; the other two-thirds were debts incurred by his old master; and at worst there lay no other obstacle between him and a highly respectable settlement with his creditors than the unlucky indorsements of his father. He rose, however, one morning to learn that his master had absconded during the night, leaving the shop key under the door sill; in a few days after, Sandy had absconded too; and his poor father, who had paid all his debts till now, and had taken a pride in paying them, found that his unfortunate indorsements had involved him in irretrievable ruin. Bankruptcy was a very different matter to the rigidly honest old man from what it was to either Sandy or his master.

For the first few days after the shock, he went wandering about his fields, muttering ceaselessly to himself, and wringing his hands. His whole faculties seemed locked up in a feeling of bewilderment and terror, and every packet of letters which the postman brought him—letters urging the claims of angry creditors, or intimating the dishonour of bills—added to his distress. His son was in hiding no one knew where; and though it was perhaps well that he should have kept out of the way at such a time, poor Isabel could not help feeling that it was unkind. He might surely be able to do something, she thought, to lighten the distress of which he had been so entirely the cause, were it but to tell them what course yet remained for them to pursue. It was in vain that, almost broken-hearted herself, she strove by soothing the old man to restore him to himself: he remained melancholy and abstracted as at first, as if the suddenness of his ruin had deprived him of his faculties. He hardly ever spoke, took scarce any food during the day, and scarce any sleep during the night; and, finally, taking to his bed, he died after a few days' illness—died literally of mental anguish. On the evening after the interment, his son John Rose, the carpenter, arrived from Glasgow, and found his mother sitting alone in the farmhouse, wholly overwhelmed with grief for the loss of her husband, and the utter ruin which she saw closing around her.

Their meeting was a sad one; but after the widow's first burst of sorrow was over, her son strove to comfort her, and in part succeeded. She might yet look forward, he said, to better days. He was in rather easy circumstances, employing about half a dozen workmen, and at times finding occasion for more. And though he could not well be absent from them, he would remain with her until he saw how far it was possible to wind up his father's affairs, and she would then go with him, and find what he trusted she should deem a comfortable home in Glasgow. Isabel was soothed by his kindness; but it did not escape the anxious eye of the mother, that her son, at one time so robust and strong, had grown thin, and pale, and hollow-eyed, like a person in the latter stages of consumption, and that, though he seemed anxious to ap-

pear otherwise, he was evidently much exhausted by his journey. He rallied, however, on the following day. The sale of his father's effects was coming on in about a week; and as the farm-house at such a time could be no comfortable home for the widow, he brought her with him across the firth to her sister's in Nigg, and then returned to Minitarf.

Rather more than a week passed, and Isabel's nephew, a person not very unlike her elder son, who managed the farm for his mother, was seated beside his aunt, striving as he best could to dissipate the melancholy which he saw prey on her spirits, when a young man, bespattered with travel, and apparently much fatigued, entered the apartment. Isabel started from her seat, and clasping her hands with a fearful presentiment of some overwhelming calamity, tumultuously inquired of him what had happened at Minitarf! He stood speechless for a few seconds as if overcome by some fearful emotion, and then bursting into tears, "Your son John," he said, "died this morning." The poor woman fainted away.

"For the two last days of the sale," said the messenger, "there was a marked alteration in John's manner and appearance. There was a something so fixed-like in his expression, and so mournful in his way of looking at things; and then his face was deadly pale, and he took scarce any food. It was evident that the misfortunes of his family preyed deeply on his mind. Yester evening," continued the lad, "he complained for the first time of being unwell, and retired to bed before the usual hour. The two servant-maids rose early in the morning to prepare for leaving the place, and were surprised, on entering the 'ha,' to find him sitting in the great arm-chair fronting the fire. His countenance had changed during the night; he looked much older, and very like his father; and he was so weak that he could hardly sit up in the chair. The girls would have called for assistance, but he forbade them. 'My watch,' he said, 'hangs over my pillow; go tell me what o'clock it is.' It was just twenty minutes past four. 'Well,' said he, when they had told him, 'it is the last hour to me! there is a crook in my lot; but it is the doing of God, not of man.' And, leaning back in the chair, he never spoke more." The messenger had seen the corpse laid on the bed, and wrapped up in a winding-sheet, before setting out on his melancholy journey. Need I say aught of the feelings of Isabel! The farmer and his mother strove to persuade her to remain with them till at least after the funeral, but she would not; she would go and take one last look of her son, she said; of her only son—for the other was a murderer. Early, therefore, on the following morning, the farmer hired a small yawl to bring her across the firth, and, taking his place in the stern beside her, the boatmen bent them to their oars, and the bill of Nigg soon lessened behind them.

After clearing the bay, however, their progress was much impeded by adverse currents; there came on a chill drizzling rain, and the wind, which was evidently rising, began, after veering about oftener than once, to blow right ahead, and to raise a short tumbling sea. Grief of itself is cold and comfortless, and the widow, wrapped up in her cloak, sat shivering in the bottom of the yawl, drenched by the rain and the spray. But she thought of only her son and her husband. The boatmen toiled incessantly till evening; and when night came on, dark and boisterous, they were still two long miles from their landing-place—the effluence of the Nairn. Directly across the mouth of the river there runs a low dangerous bar, and as they approached, they could hear the roaring of the breakers above all the hoarse sighings of the wind, and the dash of the lesser waves that were bursting around them. "There," said the farmer, as his eye caught a few faint lights that seemed twinkling along the beach; "there is the town of Nairn right abreast of us; but has not the tide fallen too low for our attempting the bar?" The boatmen replied in the negative, and in a minute after they were among the breakers. For a single instant the skiff seemed riding on the crest of an immense wave, which came rolling from the open sea, and which, as it folded over and burst into foam, dashed her forward like an arrow from the string. She sank, however, as it receded, till her keel grated against the bar beneath. Another huge wave came rolling behind, and, curling its white head like the former, rushed over her stern, filling her at once to the gunwale, and at the same instant propelling her into the deep water within. The farmer sprang from his seat, and raising his aunt to the hinder thwart, and charging her to hold fast, he shouted to the boatmen to turn the boat's head to the shore. In a few minutes after, they had landed.

Poor Isabel, well nigh insensible—for grief and terror, added to cold and fatigue, had prostrated all her energies, bodily and mental—was carried to the town, and lodged in the house of an acquaintance. When morning came, she was unable to leave her bed. The farmer, therefore, had to set out for Minitarf alone; on his return, he found her in the delirium of a fever, from which she never recovered. Her younger son was seen in the West Indies ten years after, a miserable slave-driver, with a broken constitution and an unquiet mind. And there he died—no one caring where or how. I am not fond of melancholy stories; but "to purge the heart by pity and terror" is the true end of tragedy—an end which the gorgeous creations of the poets are not better suited

to accomplish than the domestic tragedies which we see every day acting around us. It is well, too, to note how immensely the folly and knavery of mankind add to the amount of human suffering, and how, according to the wise saying of the Preacher, "One sinner destroyeth much good."

SPECIMENS OF THE ENGLISH SONNET WRITERS.

Scorn not the sonnet; critic, you have frowned,
Mindless of its just honours; with this key
Shakspeare unlocked his heart; the melody
Of this small lute gave ease to Petrarch's wound;
A thousand times this pipe did Tasos sound;
With it Camdens soothed an exile's grief;
The sonnet glittered, a gay myrtle leaf
Amid the cypress with which Dante crowned
His visionary brow; a glow-worm lamp
It cheered mild Spenser, called from Faery-land
To struggle through dark ways; and when a damp
Fell round the path of Milton, in his hand
The thing became a trumpet, whence he blew
Soul-animating strains—alas, too few!

WORDSWORTH.

We have here, in the language of its great modern master, at once a beautiful specimen of the little poem called the sonnet, and some outline of its history. It may be described as a form of poetical composition, limited to fourteen ten-syllable lines, containing in the best models from four to six rhymes, and marked by great closeness of thought and diction. Practised originally by Dante, Petrarch, and others of those who revived letters in southern Europe, it found its way to England in the sixteenth century, when the works of the Italian poets first became popular amongst us.

The first writer of English sonnets was the Earl of Surrey, a graceful anatomy poet of the reign of Henry VIII., whose works, after a long interval of obscurity, have of late years again been brought a good deal under notice. His compositions of this kind, and indeed most of what he ever wrote, were the breathings of an ardent but apparently unrequited affection, which he bore for a lady named by him Geraldine, supposed to have been Lady Elizabeth Fitzgerald, daughter of the Earl of Kildare, and second cousin of the Princesses Mary and Elizabeth, with whom she was educated at Hunsdon House. Our first example of the sonnet shall be his lordship's account of this lady:—

From Tuscan came my lady's worthy race;
Fair Florence was, sometime, her ancient seat;
The western isle, whose pleasant shore doth face
Wild Camber's cliffs, did give her lively heat.
Foster'd she was with milk of Irish breast;
Her sire an earl; her dame of princes' blood;
From tender years, in Britain she doth rest,
With king's child, where she tasteth costly food.
Honsdon did first present her to mine eye;
Bright is her hue, and Geraldine she hight;
Hampton me taught to wish her first for mine,
And Windsor, alas, doth chase me from her sight!
Her beauty of kind; her virtues from above;
Happy is he that can obtain her love.

The compositions of this noble poet are all in that style of affected distress, under the pains of love and disdain, which has been long abandoned by English poets; yet there is something about it which, if not poetry in the best sense of the word, is at least very elegant, and very remote from vulgar associations. We give another specimen:—

The sweet season, that bud and bloom forth brings,
With green hath clad the hill and eke the vale;
The nightingale, with feathers new, she sings;
The turtle, too, her mate hath told her tale;
Summer is come, for every spray forth springs;
The hart hath hung his old head on the pale;
The buck in brake his winter coat he flings;
The fishes fit with new repaired scale;
The adder all her slough away she flings;
The swift swallow pursueth the flies small,
The busy bee her honey now she brings;
Winter is worn, that was the flowers' vale,
And thus I sit among these pleasant things,
Each care decays, and yet my sorrow springs.

There is more poetry in some parts of Surrey's life than in most of his verse. He proceeded upon the tour of Europe, in chivalric guise, every where proclaiming the unparalleled charms of his mistress Geraldine; and challenging any knight to depreciate or deny them. Passing some time at the court of the Emperor of Germany, he became acquainted with the magician Cornelius Agrippa, who showed him, in a mirror of glass, a living image of Geraldine, reclining on a couch, sick, and reading one of his sonnets by a waxen taper. His imagination was heated anew by the sight, and he hastened to Florence, the original seat of the ancestors of the lady. On his arrival there he published a defiance against any person who should presume to dispute the superiority of her beauty. A challenger appeared; the Duke of Tuscany permitted a combat to take place; and Surrey came off victor. When he returned to England, he was universally admitted to be the most polite lover, the most learned nobleman, and the most accomplished gentleman of his age. Yet all this did not save him from the jealousy of his sovereign, who caused him to be beheaded on Tower-hill, January 19, 1546-7.

Wyatt, a contemporary of Surrey, also cultivated the sonnet, and it was adopted as a form of composition by the accomplished Sir Philip Sydney, who, both in his mind and in his history, a good deal resembled the chivalric lover of Geraldine. From him we quote a sonnet to the Moon, the first, as far as we are aware, of the many poems which have been addressed by English bards to that planet:—

With how sad steps, O Moon, thou climb'st the skies,
How silently and with how woe a face!

What! may it be, that, even in heavenly place,
That busy Archer his sharp arrows tries?
Sure, if that long-with-love-acquainted eyes
Can judge of love, thou feel'st a lover's case;
I read it in thy looks: thy languished grace,
To me that feel the like, thy state describes.
Then, even of fellowship, O Moon, tell me—
Is constant love deemed there but want of wit?
Are beauties there as proud as here they be?
Do they above love to be loved, and yet
Those lovers scorn whom that love doth possess?
Do they call virtue there ungratefulness?

Spenser appears to have delighted in this form of poetry, if we are to judge by the many specimens of it—no fewer than eighty-eight—which he has sent down to us. These things he well calls his *Amoretti*: they are all of them expressions of his love for his mistress, and almost all characterised by the same peculiarities which mark the similar productions of Surrey. The eternal complaints of these old rhymers as to the iciness and cruelty of their innamoratas are incomprehensible, for we never hear of any such things from modern poets. Is human nature thus far changed, or is there only a change in the fashion of the poet's thoughts? It is only, we suspect, a literary formula. Spenser's sonnets are full of these complaints; yet their rich poetical diction reconciles us to all drawbacks. We give one of the pieces most free from affected feeling, and most remarkable for beautiful language, being, however, only a version of a well-known thought of Horace:—

Fresh Spring, the herald of love's mighty king,
In whose coat armour richly are displayed
All sorts of flowers which on earth do spring,
In goodly colours gloriously arrayed;
Go to my love, where she is careless laid,
Yet in her winter's bower not well awake,
Tell her the joyous time will not be stayed,
Unless she do him by the forelock take:
Bid her, therefore, herself soon ready make,
To wait on Love, amid his lovely crew,
Where every one that misseth then her mark
Shall be by him amerced in penance due.
Make haste, therefore, sweet love! whilst it is prime,
For none can call again the passed time.

Wordsworth has spoken of the sonnet in our motto as "the key with which Shakspeare unlocked his heart." He alludes to what has been made clearly out within the last few years, that, in his long series of sonnets, the wondrous bard of Avon gave a revelation of his inmost feelings, first, respecting some unhappy passion, and secondly, respecting his position in society, as a despised player and furnisher of dramatic pieces for his own stage. Shakspeare's sonnets are the moanings of a most noble nature, at issue with fortune and the common run of the world's feelings.

Alas, 'tis true, I have gone here and there,
And made myself a motley to the view,
Gord mine own thoughts, sold cheap what is most dear,
Made old offences of affections new.
Most true it is, that I have look'd on truth
Askance and strangely; but, by all above,
These blenches gave my heart another youth,
And worse essays prov'd thee my best love.
Now all is done, save what shall have no end:
Mine appetite I never more will grind
On newer proof, to try an older friend,
A God in love, to whom I am confin'd.
Then give me welcome, next my heaven's best,
E'en to thy pure and most most loving breast.
No longer mourn for me when I am dead,
Than you shall hear the surly sullen bell
Give warning to the world that I am fled
From this vile world, with vilest worms to dwell:
Nay, if you read this line, remember not
The hand that writ it: for I love you so,
That I in your sweet thoughts would be forgot,
If thinking on me then should make you woe.
O if (I say) you look upon this verse,
When I perhaps am compounded am with clay,
Do not so much as my poor name rehearse,
But let your love even with my life decay:
Lest the wise world should look into your moan,
And mock you with me after I am gone.
Oh, lest the world should task you to recite
What merit liv'd in me, that you should love
After my death, dear love, forget me quite,
For you in me can nothing worthy prove;
Unless you would devise some virtuous lie,
To do more for me than mine own desert,
And hang more praise upon deceased I,
Than niggard truth would willingly impart:
Oh, lest your true love may seem false in this,
That you for love speak well of me untrue,
My name be buried where my body lies,
And live no more to shame nor me nor you.
For I am 'sham'd by that which I bring forth,
And so should you, to love things nothing worth.
That time of year thou may'st in me behold
When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold,
Be ruin'd choirs, where late the sweet birds sang.
In me thou seest the twilight of such day,
As after sun-set fadeth in the west,
Which by and by black night doth take away,
Death's second self, that seals up all in rest.
In me thou seest the glowing of such fire,
That on the ashes of his youth doth lie,
As the death-bed whereon it must expire,
Consum'd with that which it was nourish'd by.
This thou perceiv'st, which makes thy love more strong,
To love that well which thou must leave ere long.

One more beautiful specimen, less composed of personal feeling:—

Oh, how much more doth beauty beauteous seem,
By that sweet ornament which truth doth give!
The rose looks fair, but fairer we deem
For that sweet odour which doth in it live.
The cæker-blooms have full as deep a dye
As the perfum'd tincture of the roses,
Hang on such thorns and play as wantonly
When summer's breath their masked buds discloses:
But for their virtue only is their show,
They live unwoo'd and unrespected fade;

* Match, or lover.

Die to themselves. Sweet roses do not so;
Of their sweet deaths are sweetest odours made:
And so of you, beauteous and lovely youth,
When that shall fade, my verse distills your truth.

William Drummond, the Scottish contemporary and friend of Shakspeare, has left us many sonnets, conceived in a style of refined sentiment, and constructed in the most approved form of this kind of composition. With two specimens we complete the present section of our paper:—

Sleep, silence, child, sweet father of soft rest,
Prince whose approach peace to all mortals brings,
Indifferent host to shepherds and to kings,
Sole comforter of minds which are oppress;
Lo, by thy charming rod all breathing things
Lie slumbering, with forgetfulness possess;
And yet o'er me to spread thy drowsy wings
Thou spar'st (alas!) who cannot be thy guest.
Since I am thine, O come, but with that face
To inward light which thou art wont to show,
With fain'd solace ease a true-felt woe;
Or if, deaf god, thou do deny that grace,
Come as thou wilt, and what thou wilt bequeath:
I long to kiss the image of my death.

DRUMMOND TO HIS LUTE.

My lute, be as thou wert when thou didst grow
With thy green mother in some shady grove,
When melodious winds but made thee move,
And birds their ravages did on thee bestow.
Since that dear voice which did thy sounds approve,
Which went in such harmonious strains to flow,
Is left from earth to tune the spheres above,
What art thou but a harbinger of woe?
Thy pleasing notes be pleasing notes no more,
But orphan wailings to the fainting ear,
Each stroke a sigh, each sound draws forth a tear,
For which he silent as in woods before:
Or if that any hand to touch thee deign,
Like widow'd turtle still her loss complain.

SKETCHES OF SUPERSTITIONS.

GREEK SUPERSTITIONS CONCLUDED—HOUSEHOLD GODS • —ÆSCULAPIAN MYSTERIES—THE SORTES.

It will have been observed from the preceding sketches, that neither the Greeks nor Romans, two of the most refined nations of antiquity, had any just idea of the operations or works of nature, as arising from a train of immutable laws established and supported by an all-wise Providence for the government of the universe. In this respect they stood exactly on a parallel with those uneducated persons of the present day who believe that the winds can be raised by incantation, and that bodily illnesses are an effect of the evil eye. The Greeks and Romans, however, excelled the ignorant of modern times in their delusions, for they had formed a regular code of superstition, which was applicable to every circumstance, event, or condition, either in nature or art. Never, perhaps, was there such a laboured and complex mass of superstition, never such a complete bewilderment of the human faculties, as that which latterly existed in Rome, and all to account for what could be explained by an appeal to the most simple laws of nature.

In those days of mental hallucination, occupying many centuries of the world's history, the human being was handed over from deity to deity from the moment he came into life, and before he had seen the light, till he was at last consigned to the grave or the funeral pile. According to the improved and extended mythology of the Romans, Deverra presided over his destiny before birth, Janus and Ops helped him into the world, Egeria took care of the mother while in labour, Lucina watched over his cradle, Vegetanus had the charge of him when he cried, Rumina was his guardian when he suckled, Edura presided over his food, and Stelinus instructed him in walking. As he grew in stature, he came successively under the charge of gods and goddesses who watched over his youth and manhood. When he married, both he and his bride became the peculiar charge of five different deities. And when he died, his funeral was duly presided over by Libitina, the deity of burial ceremonies. Besides all this, every meal in the day, every kind of apparel, every transaction of business or amusement, every distinct part of the body had its tutelary deity, on whom the blame fell if any thing was amiss. The enormity of the superstition is overpowering; yet all that we have related as respects the belief in ideal gods, oracles, dreamers, sacrifices, omens from birds and entrails of beasts, also omens from natural phenomena, formed scarcely a moiety of the superstitious delusions of this ancient people.

Their belief in omens and divination of future events seems to have been absolutely boundless. Any perturbation of mind was supposed to be ominous of evil, but the evil was greatly aggravated if a number of persons at the same time felt an unaccountable emotion of dread. When such was the case, the fears were ascribed to the wicked influence of the god Pan, and hence the common phrase *panic*, or *panic fears*. A dread of approaching evil was also felt if the left eyelid quivered, or the left ear rang; the quivering of the right eyelid, or ringing of the right ear, portended good. The latter is a superstition which has come down to our own day. Moles or other marks on the person meant something of importance, and were carefully noted. All kinds of internal pains or emotions were likewise the subject of superstitious dread, and a book was written to explain the precise extent of evil of which they were the premonitory warnings. No sudden involuntary motion in body or mind was so much the object of remark as sneezing.

* Warbling, from *Ramage*, French.

Both Greeks and Romans of the highest rank paid extraordinary attention to sneezing. A sneeze was accounted fortunate or unfortunate, according to the manner or period in which it occurred. When Xenophon was persuading his soldiers to encounter the enemy, some one sneezed, and it was accounted so dangerous an omen, that public prayers were appointed to expiate it. To sneeze between midnight and the following noon was lucky, but to sneeze between noon and midnight was unlucky. Aristotle talks very gravely on the difference between sneezing during these two periods of the day. If, in undertaking any business, two or four sneezes happened, it was a lucky omen, and gave encouragement to proceed; if more than four, the omen was neither good nor bad; if one or three, it was unlucky. If two persons were deliberating about any business, and both of them chanced to sneeze together, the omen was prosperous.*

The falling of any object in the temples, the slamming of doors, the cracking of furniture, unexpected gusts of wind or deluges, a black dog coming into a house, the appearing of a snake on the house top, the spilling of salt, water, honey, or wine, a sudden silence, the putting on of the left side of the garment first, were all unlucky omens. Augustus Cæsar one day put on his left shoe first, and a mutiny of his soldiers immediately after broke out; of course the mutiny was foretold by the omen, or was a consequence of it. To use certain words by accident was ominous. It was lucky to begin undertakings and speeches with the name of Jupiter, or some other god. Xenophon recommends this practice. There were also lucky and unlucky days, and some days were lucky for one kind of business, but not for another. Augustus Cæsar, who is usually called the greatest of the Roman emperors, and in whose time learning was at its climax, would not perform certain duties on particular days, in this respect not being more intelligent than the most ignorant peasant of the present age. It was no uncommon thing to postpone an important public meeting because a weasel or a mouse was seen to cross the path. Thus, the fisherman in our own day, who will not put to sea because he has met a woman with a pair of particularly broad thumbs, is not more justly a subject of ridicule than the grave legislators of Athens eighteen hundred years ago.

All bodily ailments, as will naturally be supposed, were ascribed by the Greeks to the malignity of some of the presiding deities; the idea of an illness being caused by physical derangement was totally out of the question. Being in this manner made ill by a god, it was presumed they could get well only by appealing to another god, who would beat the enemy from his position. Æsculapius was generally esteemed the god of healing, or of medicine, and was appealed to on most occasions of illness. According to the Greek writers, Æsculapius was the son of Apollo, and studied medicine under a supernatural instructor in the form of a centaur; being very successful in his cures, Pluto became alarmed for the diminution of his customers in the nether regions, and complaining to Jupiter, the doctor was killed by a thunderbolt. Such is the fable told by the Greeks of Æsculapius and his genealogy. The true source of the Æsculapian superstition was in Egypt, where a symbol, consisting of the figure of a man, with a dog's head, carrying a pole with serpents twisted round it, was periodically exhibited to mark the recession of the Nile. This symbol of preservation was called *Æscalph*, from *Æsh* signifying man, and *calph* dog, and hence the sonorous Greek term *Æsculapius*. The Æsculapius of the Grecian mythology was ministered to by a numerous body of priests, who offered sacrifices to him in his temples, and communicated his prescriptions for medicines and modes of cure to the attending worshippers. These priests, according to all accounts, were a set of worthless impostors. They pretended that Æsculapius only made known his prescriptions through the medium of dreams, or visions, and that to enjoy these oracular communications, it was necessary to pass the night, or even several nights and days at a time, in perfect darkness, in one of the chambers of the temple. Those who were disinclined to perform this trying ceremony, employed the priests to dream and receive responses for them, and paid them accordingly for their trouble. Crowds of sick persons repaired to the great temple of Æsculapius at Epidaurus, and to another at Cos, to seek relief in these ridiculous mummeries; and as the priests were able to work successfully on their imaginations, or to prescribe the use of some suitable kind of medicine for their ailments, the number of cures performed at both places was very great. With the hope of bespeaking the favour of the oracle, the afflicted brought votive offerings of great value, which were hung on the walls round the altar, and there remained a certain length of time before they became the perquisite of the officiating priests. The pillars, likewise, were inscribed with narrations of the wonderful cures which had been already performed, accompanied with the oracularly delivered prescriptions of the god. A few of these votive tablets, discovered amidst the ruins of fallen edifices, have come down to the present day. We copy the four following from the work of an intelligent author:†

1. "In these latter days, a certain blind man, by name Caius, had this oracle vouchsafed to him—'that

* Potter's *Archæologia Græca*, to which we are indebted for a number of particulars in these articles.

† Thaumaturgia, or Elucidations of the Marvellous; by an Oxonian. London, Churton, 1835.

he should draw near to the altar after the manner of one who could see; then walk from right to left, lay the five fingers of his right hand on the altar, then raise up his hand and place it on his eyes.' And behold! the multitude saw the blind man open his eyes, and they rejoiced that such splendid miracles should signalise the reign of our Emperor Antoninus."

2. "To Lucius, who was so wasted away by pains in his side, that all doubted of his recovery, the god gave this response:—'Approach thou the altar; take ashes from it, mix them up with wine, and then lay thyself on thy sore side.' And the man recovered, and openly returned thanks to the god, amidst the congratulations of the people."

3. "To Julian, who spitted blood, and was given over by every one, the god granted this response:—'Draw near, take pine-apples from off the altar, and eat them with wine for three days.' And the man got well, and came and gave thanks in the presence of the people."

4. "A blind soldier, Valerius Asper by name, received this answer from the god:—that he should mix the blood of a white cock with milk, make an eye ointment therewith, and rub his eyes with it for three days.' And lo! the blind recovered his sight, and came, and publicly gave thanks to the god."

The magistrates of Greece and Rome sanctioned and applauded these absurdities. We do not read of a single philosopher, or man of learning, condemning them. Socrates, who was unquestionably the most enlightened moralist of his time, requested at his death that a cock should be sacrificed to Æsculapius. When we find so great a man sanctioning by his express orders such a gross superstition, we can easily conceive how widely the delusion was spread among the people.

A belief in the magical powers of amulets formed a superstition nearly allied to that of the Æsculapian mysteries, and had been imported into Greece from Egypt and Persia, two countries fertile in occult science. Certain herbs were supposed to possess the power of charms, and were hung round the neck or concealed in some ornament about the person, for the purpose of repelling contagion, or curing malignant maladies. Small pieces of bone, made into rings and other articles, were believed to have a similar magical effect. This delusive reverence for amulets or talismans, will, however, form the subject of a separate article, and we therefore pass on to the consideration of a superstition fully more peculiar to the Greeks and Romans, namely, that of divination by *sortes*, or lots. The practice of casting lots, to determine intricate questions, was of remote antiquity, having been in use in the oldest eastern nations before it made its appearance in Greece. The divination was performed in many different ways. One consisted in erecting two sticks on the ground, and determining the question by the direction, left or right, in which they fell. This ancient practice, which resembled our tossing of a halfpenny, was resorted to by the Israelites, who, for it, and other follies, were justly reproved: "My people ask counsel of their stocks, and their staff declareth unto them."—Hosea, iv. 12. Among both the Greeks and Romans, lots were cast by dice or by inscribed pebbles, but more commonly by verses, which were drawn from a jug, or by the chance opening of a poem. Appeals to Homer, or the *Sortes Homerice*, formed the more respectable mode of divination by lot. The Iliad was opened, and the first lines to which the eye was directed, told the fortune or answered the desire of the questioner. Virgil was the accredited Roman oracle for this kind of divination. Sometimes single letters or words were written, and put into an urn; after being well shaken, they were poured out on the ground, and any sentences that could be made from the promiscuous heap, were believed to be oracular or prophetic; this was called the *Sortes Prenestinae*. Another kind of *sortes* consisted in rushing along the street with a handful of verses on small tablets, and bidding the first boy that was met with to draw one; if the tablet or scrap so drawn contained words agreeing with the previous conception half formed in the mind, it was taken as an infallible advice or prophecy, and followed accordingly. The early Christians were not exempted from these vain delusions. In matters of difficulty and doubt, they dipped their hand into the sacred books, or into the Psalter, and sought for direction and assistance according to the principle pursued in the *Sortes Virgilianæ*. St Augustine, in his epistle to Januarius, sanctions the practice, if performed for spiritual ends. The superstition survived the middle ages, and was in some degree fashionable and in force in the seventeenth century, when all other appeals of a magical nature had been given up as unwarrantable. The occasional truthfulness of the responses helped to sustain the credit of the superstition. A striking instance of random truth in one of these prophetic sorts occurred to Charles I. Having in the course of his troubles retired to Oxford, he was taken one day by Lord Falkland to see the public library, and was there shown among other books a Virgil finely printed and exquisitely bound. Lord Falkland, to amuse the king, proposed that he should make trial of his fortune by the *Sortes Virgilianæ*. Charles consented, and opening the book, the passage that struck his eye was that part of Dido's imprecation against Æneas:—

"Oppress'd with numbers in the unequal field,
His men discouraged, and himself expell'd;
Let him for succour sue from place to place,
Torn from his subjects and his son's embrace."

The king being somewhat concerned at this untoward prophecy, his companion, to relieve his mind, and hoping to fall on some passage bearing no allusion to either his own or his master's condition, opened the book, and the following passage was disclosed:—

"O Pallas! thou hast fail'd thy plighted word.
To fight with caution, not to tempt the sword,
I warn'd thee, but in vain: for well I knew
What perils youthful ardour would pursue;
That boiling blood would carry thee too far,
Young as thou wert in dangers, and to war.
O cursed essay of arms, disastrous doom,
Prelude of bloody fields, and fights to come!"

This unfortunate attempt at fortune-telling disconcerted both Charles and his attendant, and was remembered afterwards, when Falkland fell at the battle of Newberry, and the king had perished on the scaffold. Had the fate of both been otherwise, we should, of course, never have heard of the prophecy.

Prying into futurity by either the *Sortes Virgilianæ* or *Sortes Biblicæ*, is now, we believe, unknown. The superstition is extinct. We have, it is true, seen the Bible opened for the profane purpose of telling a fortune, but with no serious dependence on the result; and the practice being now utterly exploded, is not likely ever again to come into vogue.

WOMEN IN AMERICA.

In the North American states, women occupy a position in society very different from that which females of any class are accustomed to in this country. Among us, women are treated with delicacy and consideration, but always as if they were rational beings; they are neither depressed to the condition of inferiors, nor exalted to that of goddesses: besides, for the attentions and general respect shown towards them, it is expected that they will act with considerate politeness in return, so that by their affability and agreeableness of manners they may command the esteem as well as the admiration of all who approach them.

In America, the position of women, as we say, is entirely different. There, they seem to be viewed as a kind of superior beings—something more than mortal. All their caprices must be listened to with deference, all their whims satisfied, even though among strangers, and for all the attentions shown towards them, it is not expected that they should offer any thanks or show any condescension in return. American women are, in fact, spoiled children; they can do as they like, and the men are their slaves. This remarkable condition of things is noticed by almost every traveller. Mr Grund, in his late work, "Aristocracy in America," thus speaks of it.

"American ladies occupy, from mere courtesy, a rank in society which is not only opposed to that which they hold in private life and in their own families, but which is actually incompatible with the exercise of discretion on the part of the gentlemen. 'The ladies must be waited upon;' 'the ladies must be helped;' 'the ladies must be put into the carriage;' 'the ladies must be taken out of the carriage;' 'the ladies must have their shoe-strings tied;' 'the ladies must have their India-rubber shoes put on;' 'the ladies must be wrapped up in shawls;' 'the ladies must be led up stairs and down stairs;' 'the ladies must have their candles lit for them when they go to bed.' On every occasion they are treated as poor helpless creatures, who rather excite the pity than the admiration of men; and as the services they require are numerous, just in proportion to the scarcity of hired servants, the gentlemen are obliged to officiate in their stead."

"The American gentlemen," he continues, "approach women with the most indubitable consciousness of their own inferiority, and, either from modesty or prudence, seldom open their lips except to affirm what has been said by the ladies. One is always reminded of poor Candide's honest prayer, '*Hélas! madame: je répondrai comme vous voudrez*' [Alas, madam, I will answer just as you wish]. I have seen one of the most distinguished old gentlemen in the United States, one who held the highest rank in the gift of the American people, and whose learning and knowledge on most subjects rendered him a most pleasing and entertaining companion of men, betray as little self-possession in the presence of women as if he had been making his *début* in society, and this too in the house of one of his most intimate friends."

This excessive awkwardness in the men, to which even the most distinguished of the race make no exception, must be owing to something radically wrong in the composition of American society, which places men as well as women in a false position. The conviction of this fact must force itself on the mind of every impartial observer who has had an opportunity of making himself familiar with the customs and manners of the higher classes. There appears to be a singular mixture of respect and want of sincerity on the part of the men with regard to the women, produced, I believe, by the unnatural position which the latter hold wherever they are brought into contact with the former."

Miss Sedgwick notices this remarkable trait in the position and manners of her countrywomen. In one of her late productions, "Means and Ends," she makes the following observations:—"The most striking and prevailing defect in the manners of Americans is, I believe, a want of courtesy. This has probably arisen from the general equality of rights, condition, and education. And it arises in part from that *mauvaise honte*, or shyness, characteristic of our English ancestors, from whom we inherit it. A little reflection and moral cul-

tivation would soon remedy this defect. What do I mean by *courtesy*, and how is the want of it shown, do you ask? A few winters since, a well-bred young foreigner came to the interior, and took lodgings at a village inn, for the purpose of learning the English language. To facilitate its acquisition, he generally preferred remaining in the receiving-room of the tavern, where travellers were passing in and out. His writing-table was placed before the fire. When the women came shivering in from a long, dreary drive in the stage-coach, he moved his table to the coldest corner of the room, mended the fire, drew chairs near it, and, if they brought in foot-stoves or blocks, he found the best place to heat them. He then returned to his own uncomfortable seat, and pursued his writing or reading."

The women profited by his civilities, without appearing to notice them. During the whole winter he never received one word of acknowledgment—not one 'Thank you, sir,' or, 'You are very kind, sir,' or, what would have seemed inevitable, 'Pray, don't take that cold seat, sir.' What was the polished stranger's inference? Certainly, that the Americans were a most discourteous, if not a cold-hearted people."

Cold-hearted we are not. These women were probably generally impressed with the young man's attentions—one of them, I know, in relating her travelling experience at her own fire-side at night, said, she 'never should forget a young man at the tavern in S—. She thought she should have died with the cold before she got there; and when she went in, he moved away from the fire, and gave her the rocking-chair—hung her cloak over the back of another, and warmed her block for her, and did everything just as if he had been her own son!' And yet this good woman had not indicated in her manners to the young man that she even saw him. Here there was no expression of the real feeling, no *courtesy*.

I have often seen men in steam-boats, in stage-coaches, in churches, and other public meetings, rise and give their seats to women, and the women seat themselves quietly, without a look or word of acknowledgment. And so with a thousand other attentions which are rendered, and are received without any return. Avoid such discourtesy, my young friends—it is not only displeasing, but unjust. We actually owe some return for such civilities, and a courteous acceptance is, in most cases, the only one that can be made. These little chance courtesies are smiles on the face of manners, and smiles are like sunshine—we can scarcely have too much of either."

STAGE-COACH JOURNEY TO THE TOURNAMENT.

[The following is from a lively account of the Eglington tournament, in the November number of Tait's Magazine. It seems to us creditable to this work, considering the well-known severity of its politics, that it should take a pleasant view of the late beautiful and most interesting spectacle presented in Ayrshire, when so many other very wise journalists have seen fit to treat it with ridicule.]

* * * We left our home, with a merry friend, one fine morning, a few days previous to that fixed for the commencement of the tournament, in order to take our departure by the coach. Arriving at the office in Prince's Street a little before the hour at which it should have started, we were astonished at the immense pile of luggage which we saw heaped on the street, in order to be packed upon the carriage. When Mr Croal, the coach proprietor, came up, he was so much appalled by the sight, that, apologising for the delay which he must inevitably occasion, he informed us that he must send back the coach to the yard, and get out a stronger one, that might be more certainly able to bear such a load without risk of breaking down. When this more potent vehicle arrived, any impatience that might have been excited in us by the delay, was subdued by the interest which we could not help taking in the ingenuity which the coachman and his assistants displayed in packing and piling the various articles in and upon it; till I, and my companion, and two officers of our acquaintance, who had all of us placed ourselves comfortably on the hinder seats, could no longer see those in front, even when we stood up to try to do so. We felt some comfort in thinking that the superior construction of coaches, now-a-days, admits of this being done with more safety than was formerly the case. Besides all the ordinary kinds of trunks, portmanteaus, band-boxes, and carpet-bags, which are usually attendant upon a coach full of passengers inside and outside, there were innumerable white deal boxes of all manner of shapes and sizes. Most of these were ingeniously suspended like sausages, on strings all around the carriage; and, to crown all, on the very top was perched a wicker cage, containing a great, long-legged, large-bodied, awkward-looking pair of Chittagong fowls, belonging to a curried Indian, who had a seat in the interior. The cock not only seemed to know that he was going to the tournament, as well as other people, but to think that he was to be triumphant there; for, much to the amusement of all who beheld him, and especially to the great entertainment of the idlers who were looking on in the street, he crowed away so loudly that he brought some of the sleepy citizens of Prince's Street, in their nightcaps, from their beds to their windows, to wonder at so unwonted a summons. Such was the appearance of the coach after its packing was completed, that no one could have well guessed that it really was any such four-wheeled vehicle, if he had seen it creeping along the road thus burdened and smothered up."

At length we found ourselves in motion, and we began to beguile the way with chat and cigars. Our facetious

friend, who had lately lost two valuable silk umbrellas, by their having been stolen from him one after the other, had been just boasting to us of a brand new cotton one which he had bought, on the principle that no one would think any thing so common worth the purloining. This umbrella he had laid down on the uppermost box of a string of those that hung behind the back seat, and were thus most marvellously built downwards, till they nearly touched the road. As we were journeying on, one of the officers began to sniff up his nose, and to wonder where the smell of burning and of smoke was proceeding from. We all became immediately sensible of it. The alarm spread among us, when, suddenly, the other officer, who sat with his face to the rear, roared out to our friend, "Good heavens, sir, your umbrella is on fire!" and there, to be sure, it was, blazing up like a volcano, not only to the manifest peril of the box on which it lay, and on which the fire had already caught hold, but of all the boxes of the string, yea, even to the risk of the coach itself. The confusion and the bustle amongst us of the rearward of the coach, to get the fire extinguished, was indescribable. One gentleman, who we believe to have been a bailie of a town, or in some way connected with the police, began to vociferate for the fire-engines; whilst another, who, we have reason to think, was a reporter, took out his pen, paper, and ink-horn, and began, with the philosophy of a stoic, to note down the circumstances attending the progress of the conflagration, altogether forgetful that, if it went on, he and his record must perish together. The fowls, who looked down upon us, fluttered and screamed, and more than one of us shouted; but the intervening pile of luggage on the roof, which left us as "*Britannos toto orbe divisos*," together with the noise of the coach, shut out both the scene and the cries from those who were sitting in front, unconscious of our danger. At last, after various ineffectual attempts to extinguish the flames, our friend bethought himself of rubbing the blazing umbrella against the wet wheel; and he thus most fortunately succeeded in subduing the conflagration, but not until the deal box on which the umbrella had lain had been nearly burned through, nor until each section of the parapluie itself displayed a huge square window between the whalebone spars, that gave it the most ludicrous effect. After thanking our stars that we had not been all consumed, and thinking how much surprise the coachman, and those with him, would have manifested on arriving at the next stage, if they had found that the tail of the coach, and all upon it, had been burned off, we began to inquire into the cause, and found that the accident must have been owing to a stray piece of ignited German tinder having found its way into the folds of the umbrella. The adventure, then, furnished us with much merriment at the expense of our friend's parapluie; and when an occasional shower compelled him to hoist the uncouth-looking instrument, it furnished no less entertainment to the population of the different villages we passed through, where every one had turned out to look at the various coaches and carriages that were, even thus long before the day fixed, passing through, laden with guests bound to the tournament.

We had no sooner got fairly into Ayrshire, than we became much interested in the many pretty young persons whom we found anxiously waiting by the wayside for the coming up of the coach. We do not mean those nice-looking servant-girls who are generally pretty numerously planted at the different hedge inns and half-way houses, who come out, conscious of the power of their own charms, with what we call in Scotland—and our Scottish poet, Allan Ramsay, too, calls—"a *thieveless errand*," that is, *Anglicè*, a pretended errand, to inquire for some parcel, which "the mistress," either truly or falsely, did or did not expect; and all this for the purpose of having a leer or a joke with the coachman, or with any pleasant fellow of an outside who may be disposed to enjoy a fractional part of half a minute's small flirtation with her. No! We mean something very different from all this: we mean handsome, well-dressed young ladies, married and spinsters, who, *all along of the tournament*, were found by the wayside—some on foot, and others in carriages—some attended by husbands, some by fathers, and some by brothers—and who were anxiously waiting at the lodge or gate of every gentleman's seat we passed, and at the embouchures of many of the bye-roads which led to gentlemen's seats, and who all of them opened in succession, as the coach drove up towards them, in eager and clamorous inquiries after their boxes.

"Oh, coachman! coachman! have you a box from Mr Blackwood's for me?" cried one.

"Coachman! coachman! my box from Madame Meyer!" cried another.

"Haven't you a box from Madame Devy for me?" modestly vociferated a third.

"You've got a box from Maclellan and Sproat, have you not?" shouted another.

"Mademoiselle Cercletron's box, addressed to me, coachman," authoritatively demanded another.

"A box from Miss Witherspoon for the two Misses —? I'm sure you have it, coachman," lisped out two sisters at once, each with a great emphasis on the word *sure*; whilst the brother, a manifest dandy, twirled a pair of mustachios, and said, "I say, coachee, have the goodness to hand down my box from the Albion Cloth Company—it is of the last importance."

"No sitch boxes here!" replied coachee.

The exclamations of the two ladies and the gentleman being in soprano, contre-alto, and a sort of a kind of bass, made what musicians would call a splendid crash. It is beyond the power of mere types, without the aid of musical notes, to give any idea of it. But before we could well catch the tune, coachee was off. The coach appeared to us to be a sort of lottery-wheel, so far as these good people were concerned; some were sent home from it filled with wretched disappointment and despair, and we imagined the dreadful night they were doomed to spend; whilst others, who had all the luck, were rendered supremely blessed by the arrival of their boxes, and could so little contain their joy, that they clapped their hands, and danced upon the very road; and we

thought that we saw among them some, whose impatience seemed to be so great, that we doubted not they would stop, ere they were half way up the avenue, to open the precious box, that they might have one peep, *en passant*, at the splendid fancy dress which it contained.

PROCESS OF EARTHENWARE MANUFACTURE.*

CURIOUS and attractive as are many of our manual arts, there is none that has delighted us more than this. Without stopping to consider the various steps and discoveries by which potting has arrived at its present degree of excellence, let us take a hasty view of the manner in which a lump of clay becomes an elegant and a valuable piece of porcelain. Chemistry has done much: unwearied activity, untiring ambition, unsleeping desire of gain, unquenchable thirst of discovery, and love of art, have done more; lucky accident has had its share of co-operation; experience, enterprise, accumulating capital, have added their force; and skilful division of employment has crowned all, and made the creation of even a tea-saucer a process of beauty and a work of social pleasure. The walk through a china-factory is like the walk through a well-organised school. In every room is going on the peculiar task of that room; and all, as under the surveillance of one presiding mind, are co-operating harmoniously to one end. There is nothing which pleases us so much in this manufacture as its cleanliness, and apparent healthiness. Deleterious articles, unquestionably, are extensively employed; but, judging from the appearance of the workmen, they do not seem, in the mode in which they are applied, to produce much harmful consequence. The very men who work in the clay in its most early stages seem merely smeared with a little flour, and all the stages thenceforward are comparatively clean. There is an air of ease and comfort in the whole process, and a freshness of atmosphere so different from that of a cotton factory, that make it very agreeable to notice. It is cheering, too, to see so many boys and young women employed, especially the latter, for whom suitable occupation is, in general, so great a need. But from these general advantages let us pass to one particular object.

To witness the very beginning of the process of potting, we should go to the flint-mills and rooms for preparing the clays. Here the principal materials for the body or paste of which the earthenware is made, are calcined and broken down as may be required, and ground in water into the finest creamy smoothness; the whole is made to pass through the finest wire, lawn, and silk sieves, and the required ingredients and proportions are then mixed by the potter according to his taste or skill. In the knowledge and manipulation of these prime ingredients, of course, exists the relative success of the potter. We need not particularise these ingredients; the principal of them are flint, and a fine kind of clay, as well as cawk (sulphate of barytes), a heavy stone found in the Derbyshire hills, bones, gritstone, felspar, &c. These are, more or less, used according to the particular kind of ware required; and it is a singular fact, that with the exception of grit and some clays, scarcely one of the principal substances is found in this district. The chief clays come from Dorsetshire, Cornwall, and Devon, flints from the southern counties, &c. The grand requisites which appear to have fixed the manufacture to this district, are the abundance of coal, and the marl of which the saggars, or cases, are made. This marl is a dirty-looking substance, which you see dug up and lying about, to expose it to the weather, from which it derives great advantage; and without these saggars, or safeguards, there could be no good potting, for their office is so far to resist the action of the fire, and the action of the chemical agents which they have to contain, as to prevent the fracture and the fusion of the pottery.

The composition for the paste or body of the earthenware being then prepared in a liquid state, it is put into the slip-kiln, and boiled down to the proper consistency. Formerly this was done in the open air, in what were called sun-kilns, a sort of open reservoir lined with flags, in which the clay was well agitated, or *blunged*, as the potters called it, with water put through a sieve, and suffered to run into a kind of vat, where it was gradually evaporated by the sun to the proper consistency. Some of these sun-kilns may yet be seen in potteries of coarse earthenware; but the slip-kilns now in general use are a sort of oblong troughs with fire-tile bottoms, under which a flue passes, and its flame rapidly evaporates the mixture, which, being carefully stirred, is soon reduced to the consistency of dough. This dough, like the dough for bread, is then made to pass through a certain fermentation. This is effected by laying it in lumps for some months in a damp cellar, when it is taken out and kneaded, pulled, or passed through a machine to reduce it to the closest and most perfect consistency. It is trodden down by naked feet, and finally sloped, slabbed, and slapped. It is sloped, because it is cut with a wire into slopes or wedges, which are banged one on another; it is slabbed, because it is banged down upon a slab; and it is slapped, because a great part of the operation consists in slapping with the open hand.

* A sequel to the article on "the Potteries" in last number.

Here, then, you see men and boys, each with a great lump of clay, which he lifts up and bangs down with great force on a slab, generally of plaster. He then, with a wire, cuts it in two, and lifting up one part, throws it down fiercely on the other; he then slaps it all over with his hands, takes up the whole again, and dashes it down again; cuts it, slaps, and so torments it, for a long time, ever and anon scooping a little out of it with his finger-end to see if it will do. This sloping, slapping, or slabbing, is to render the dough thoroughly compact; for if any little bubbles of air remained in it, the ware would in the furnace blister and be ruined.

When these lumps of dough are thoroughly slabbed, they are ready for the *thrower*, and are cut into pieces proportioned to the size of the articles he is about to make. He takes one of these pieces, and dabs it down upon what is called the wheel-block, being a block of wood fastened on the top of a perpendicular spindle, which being turned by means of a band and a large wheel, much in the way, no doubt, of the potter's wheel mentioned in the Bible, the lump of clay spins round. The man seats himself astride of a bench close beside it, and moulding the ductile clay with his hands, which he now and then dips in water near him, it resolves itself, as by magic, into the shape required—a plate, a cup, a saucer, or a jug. It is evident that the article thus produced can only be round and plain. If it is to be of an oval or a varied shape, it cannot be made on the wheel; it must be made in a mould. The *thrower* cuts off the vessel from the block with a fine hop wire, and it is carried away to the drying stove. Here it is dried till it acquires what the potters term the *green state*, a state of particular toughness; and then it is taken to the *turner*. Enter the next room. There are the *turners* working away in a row at their lathes. The lathe resembles the thrower's machine to the general eye; it has the vertical block on which to fix the vessel, and the wheel. Boys, or women, turn the wheels, and the turners, fixing the vessels to the blocks by means of a little of the liquid called *slip*, turn them with iron tools, just as turners turn articles of wood or iron. But these vessels have got neither spouts, handles, nor knobs, on their lids. To get these, they are sent into another room to the *stonkers*, or *furnishers*, persons who furnish handles by forcing the clay paste by a sort of press through a hole, from which it descends in a long soft stick. This stick is cut into lengths, and bent into handles, or pressed in moulds to the required shape. Spouts, knobs, raised ornaments, &c., are similarly made, and stuck upon the vessels with slip, smoothing the joints with a wet sponge. These *stonkers*, or *furnishers*, having dismissed the articles in a completed state, they are carried to the stove-room, where they are dried to the degree necessary before going into the kiln.

But before we proceed to the kiln, we must have a look at the *pressers*, the *casters*, and the *stilt-makers*. We have seen that all articles of oblong and varied forms, such as dishes, jugs of particular patterns, cups of fancy shapes, ornaments, &c., cannot be thrown and turned; they must be made in moulds. These moulds are made of plaster of Paris. These moulds are in two parts. To make a dish, a piece of paste is rolled out as a cook would roll out *her* paste for a pie-crust. It is laid upon one half of the mould, which is to form the concave side or face of the dish, and the other half, which forms the back of the dish, is pressed upon it. The upper half of the mould being then removed, the work is smoothed with a wet sponge, and the other half of the mould removed also; and the face being likewise smoothed with the sponge, the dish is carried to the drying stove. Some dishes, however, are formed by laying the rolled-out paste on the half of the mould for the front, and working down the back of the dish with a piece of wood, cut to the proper shape, and called a profile. Handles, spouts, knobs, and ornaments, are also formed by moulds; though the latter are more commonly, as well as many vessels altogether, formed by *casting*, that is, by pouring the slip into plaster moulds, which absorb the moisture from a certain quantity of the slip, thereby converting it into a paste of sufficient thickness for the vessel required; the mould is then opened, and the article removed, to be put together by the finishers.

When all these articles are ready for the furnace, they are carefully placed in the saggars. But here it is necessary to have certain little pieces of baked sticks of pottery, called *cockspurs*, stils, and triangles, to place between the articles, to prevent them all adhering together in the furnace, or kiln. These are all prepared ready. As you have gone through the rooms, you have seen women and boys, at a sort of tables, rolling out the clay paste, cutting it with knives into long strips of less than half an inch square, and cutting them again transversely into lengths of a few inches. Some of these they mould in their fingers into triangular sticks with a cocked-up point; others into figures pretty much of the shape of the letter Y; others in cubes; others, again, into triangular lumps, with three downward points, and one upright central one. These are called stils, triangles, and the last description cockspurs. All these are used to place in the saggars between the different kinds of articles as they are burnt in the kiln. The marks of the cockspurs may be readily seen by any one on the margin of plates and dishes.

Seeing little boys very nimbly mending these cockspurs, I had the curiosity to inquire what they were paid for making them, and was answered, a halfpenny

a gross! that is, twelve dozens for a halfpenny; at which they would earn sixpence a-day, or three shillings a-week; or, in other words, 1728 for sixpence, 10,368 in the week for three shillings! I remarked that these boys would not build fine houses and factories out of their profits, when a wealthy manufacturer assured me that he was once such a boy, and made cockspurs for still less wages.

The ware being placed in the saggars, the saggars are then piled in the furnace, one on the other, in tall columns, and the joints between the top and bottom of each sagger are daubed up with clay, to keep out any smoke. These furnaces are built under the tall conical sheds called howells, or more commonly hovels; the use of which is to keep off winds and irregular draughts, which would occasion the heat of the furnace to differ on different sides, and so spoil the ware. It is the business of the *fircmen* to attend to the baking. The ware when it comes out is as white as snow, and in that state is called *biscuit ware*. This has next to be sorted, the perfect from the imperfect; and another class of operatives, generally young women, with a sort of chisel knock off all roughnesses, bits of adhering stilt, and the marks of the points of the cockspurs. It is then handed over to the printers. The process of printing the earthenware is a very neat and interesting one. The designs are engraven on copper plates. On one of these plates, made hot, the printer spreads his colours, mixed with a strong oil varnish; removes all but what fills the engraved lines with his pallet-knife; cleans his plate as in other copper-plate printing; and lays upon it a kind of tissue-paper, dipped in soap-water. He passes it through his press, takes off the paper, and hands it to a woman. She cuts the paper with scissors, and applies it on the biscuit ware, as the pattern requires, and rubs it down firmly with the end of a roll of flannel. The plate, or other article printed, is, after a certain interval, dipped in water; the paper is removed with a sponge, and the impression wanted remains on the ware. The oily matter from the paint being evaporated, the article is handed over to the dipper, who dips it into a liquid glaze; and it is finally returned to the furnace once more, and comes out with the glaze liquified, and bright and hard as glass.

This, as it regards earthenware, and a great deal of porcelain, is the main process; but the fine specimens of porcelain, after receiving one glaze, pass to the enamellers. These are chiefly young women, whom you find in numbers sitting in their rooms, painting and gilding in all the patterns we see on china. Their colours are metallic oxides mixed with fusible materials, and rendered sufficiently dilute with spirits of turpentine and spirits of tar; and, after passing through the furnace, come out fixed into the body of the glaze, but their substance is easily to be felt in passing the finger over them. They have yet to pass through the hands of the *burnishers*, another set of young women, who, with pieces of hema-tile, or, as more commonly termed, bloodstone, rub over all the gold till it is perfectly bright.

Such are the great and leading processes in the production of our earthenware and china. There are other minute proceedings which tend to its perfection, but which cannot be detailed in a paper of this kind, such as colouring stoneware by the blowing-pot and worming-pot; the tracing of prints upon the glaze instead of under it, and the mode of applying the lustres. It may also be stated that machinery is applied to the preparation of flints and clays; in some factories to the working of the lathes, and in a few instances to the transferring of the prints; but it will be seen that the greater portion of the processes are entirely manual, much to the advantage of this numerous body of operatives. Indeed, for extent of space and population, and for the immense quantity of goods made, there is nothing like the Staffordshire Potteries in Europe; nor, except it may be in China, in the world.

A LESSON IN GOOD HUMOUR.

IN a number of the New York Mirror for January last, we are presented with a rather clever sketch of a character in real life, Jeremiah Cary by name, who in all his fortunes and misfortunes exhibited the picture of a happy and contented man.

Jerry's countenance was plainness to the fullest extent. "Never mind," said Jerry, "I shall not be troubled by the petticoats. My face is my regis." In ninety-nine cases out of a hundred, such a conclusion would have been correct, but Jerry was fated to stumble over the solitary exception; inasmuch as a young and rather handsome heiress, forgetting his defects of phiz, and seeing only his contented disposition and intellectual worth, fell in love with him one day, and he, very good-naturedly reciprocating the compliment, married her.

Proceeding home in a carriage from the church where the union had just been performed, the vehicle upset, spilled the bride and bride's-maid, and broke a leg of the bridegroom.

It was, especially, Jerry *apropos*—to break a limb upon such an occasion, and Jerry had as much reason to repine at the accident as any one, similarly situated, could have, but he bore it with his usual good nature.

"Ah!" said he, one day in the last quarter of his damaged honeymoon, in answer to an expression of regret, endearment, and sympathy, which had escaped his interesting spouse, "tis all for the best, Susy! I desired a little in-door life. Besides, but for this accident, my love, business would not have allowed me so much of

your company. So, ha! ha! upon my word I look upon it as one of the most fortunate events of my life. I do indeed!"

Susan's first child was, unfortunately, born blind. "Not so very unfortunate, after all!" said Jerry. "It might have been worse. Let us thank an omniscient Providence that the dear little fellow is not club-footed. Surgery may perhaps remedy his sight; and if it can't, why—why, after all, the faculty of seeing is so often abused—so often a curse to its possessor! It changed Lot's wife to a lump of salt, you know!"

Such is Jeremiah's philosophy; and for all trials, great or small, he makes it applicable.

His wife broke a pitcher—a costly one.

"Dear me! what a pity!" said she, provoked at her own carelessness.

"Not a whit!" responded Jerry. "I never liked that pitcher. Such an awkward handle! I'll get another."

His chimney-pots were contrary. There are few who can keep their patience in smoky rooms; Jeremiah, however, after fully ascertaining that with his house the nuisance was incurable, forthwith began to extol the virtues of smoke, and it was not until after he had sold his bacon-making residence, and purchased an abode more conducive to comfort, that he would allow that smoke was not an indispensable necessary to civilised life.

His little blind boy withered and died, like a sunless rose, ere he could lisp "father!" Susan had been a second time a mother, but her love for her first-born burned brightest, for to the pure flame of maternal love was added interest for the darkness which shrouded his vision like a continual night. Even so was the poor boy endeared to the heart of his father. Sad indeed, then, was the ceremony with which the little sufferer was consigned to the grave, where all are blind alike.

They returned to their dwelling. The prattle of the sightless one no longer greeted their foot-fall—all seemed cheerless and desolate to Susan, and sitting down, she hid her face in her hands and wept. The heart of Jeremiah was sad, but not to abandonment, like that of his wife. He opened the Bible given him by his mother on her death-bed, and, drawing his chair near to Susan, read aloud that beautiful chapter wherein our Saviour asks for little children to be brought unto him, "for of such is the kingdom of heaven."

When he had concluded, he closed the book, and clasped the hand of his wife affectionately within his own.

"Susan," said he, and his voice sounded like gentle music in her ears, "let us not murmur. God is just—is merciful. If he had lived, it would only have been to grope through the world. Now he is in heaven, where to all, all is light. Let us deserve to meet him there."

Only a few years afterwards Jeremiah was reduced to comparative poverty. The bulk of his property had been invested in the stock of the bank, which failed, unable to pay a shilling on a dollar. Thus compelled to dispose of his expensive establishment, change his style of living altogether, and, with his wife and four children, take to "short commons," his spirits did not desert him.

Said Jerry, "Never mind!" two words which he never failed to throw at the teeth of every mishap which he encountered; "never mind! I like variety. I'm tired of riding in a carriage. I once broke my leg in one. Walking is an exercise that I need very much. Come, come, this is not so bad an affair after all—it will test the value of my friends. Besides, now, I can *earn* the bread we eat. Ah! it will be a labour of love, and that enriches the soul! I can almost say that I am glad this accident has happened. I can, indeed!"

Let no one think that our patient friend's philosophy is the apathy of the *stoic*. It arises from no lack of sensitive and acute feelings, but from a benevolent determination to make the best of every thing. This is the secret of his contentment under a load of mishaps and reverses. Ever striving to render all around him happy, he is a sterling friend; never repining at the decrees of Providence, he is a true Christian.

SCENE IN THE MANAGER'S ROOM.

"(A knock at the door:—) 'Come in; what is it?' cried the manager. 'Can you see Mr Fatton?' 'What Mr Fatton?' 'The master of the supernumeraries.' 'Send him in. Now, Fatton, what is the matter? Make haste, for I am busy.' 'Sir, there is a strike with the children in the theatre.' 'So there ought to be, Mr Fatton, if you did your duty properly, and kept a birch rod.' 'Yes, sir; but all their fathers and mothers come on me and threaten to punch my head; now, you know it is not my fault.' 'Well, what is the strike, as you call it?' 'The girls who are to fly in the new ballet won't have the wires affixed to them, unless they are raised to eighteenth-pence a-night: their mothers won't let them endanger their lives under that sum! Now, sir, we should be in a great scrape at night, if this were to happen; worse than we were in at the other house, with the boys in the storm.' 'What was that, Fatton?' 'Didn't you hear that, sir? Oh, there were sixty boys, who stood on the stage under a very large canvass, painted to represent the sea. Now, these boys were placed alternately, and were to rise and fall, first gradually, and then violently, to represent the motion of the waves in a storm; and in the first three nights of the piece it had a powerful effect; but after that, the manager reduced the water-rate, that is to say, he lowered the salary of each wavo to sixpence per night. The boys took their places under the canvass sea; and when the prompter gave the signal for the storm, the water was stagnant; instead of the ship striking, it was the waves that struck. The sub-manager, in a fury, inquired the cause, when the principal billow said, 'We won't move a peg unless you pay us a shilling a-night, for it wears out our corduroys so.' 'Well, Fatton, promise the girls the eighteenth-pence; but I will be even with them; I will keep them dangling in the sky-borders in a thorough draught all the night. Tell them so.'—(Exit Fatton.)—*Heads of the People.*

STATE OF THE EGYPTIAN PEOPLE.

WE lately presented a playful and pleasing account of Mehemet Ali, the wondrous viceroy of Egypt, from Dr Bowring's "Minor Morals." We need not say how many such notices of Mehemet Ali have appeared of late years in the works of British travellers. If we are to believe a new journal, entitled "The European," of which we have seen an able first number (being a more universal kind of Literary Gazette or Athenæum, at the price of sixpence), the picture has a different side, which British observers are not apt to see, but which, if generally known, would forbid the utterance of another soft or respectful word respecting this extraordinary ruler. The writer in the European, whose immediate object is to notice some late papers by Prince Pückler Muskau, respecting Egypt, represents himself as one who has seen what he speaks of; and if such be the case, and he be at all a faithful observer, we must say that his statements form one of the most striking portraits of widespread misery as a result of despotic government, which have ever met our eyes. We extract some portions of it:—

"Egypt was never more miserable than at the present moment. . . . Mehemet Ali would give up his game for lost, if his subjects had once a good coat to their backs, a shilling in their pockets, and enough to eat for dinner. He knows how difficult it is for a ruler to press the inhabitants of such a fertile tract as the valley of the Nile, down to the level of the poverty required by a Turkish government, and to keep them from ever emerging from it; and he holds that it is impossible for the most refined and ingenious tax-gatherer to plunder them thoroughly. To a certain extent he is right. Such is the exemplary patience and long sufferance of the Fellahs (the native Egyptians), that even whilst smarting from blows, and languishing, naked and hungry, in a land of fertility and abundance, they will be heard to exclaim, with an expression of hope and confidence, 'Leave us for three years master of the Nile, and we will pay the Miri, and soon be rich again.' Mehemet has an extraordinary source of plunder which is not easily exhausted. Under his predecessors, the Mamelukes, the people, notwithstanding their capricious and unceasing oppression, contrived to amass considerable sums of money, which, according to an old custom, were consigned to the ground, and often not dug up, until, at the death of the possessor, they were dragged to light, divided, and instantly reinterred; on occasion of a sudden catastrophe, they were not unfrequently altogether lost sight of. The discovery of these treasures, whether lost, or still owned by some of the Fellahs, is one of the principal cares of the present governor of Egypt. He has agents in every village, whose eyes, ears, and hands, are all active in tracing out the secret savings of his subjects, which, when discovered, are instantly officially denounced to the government. It not unfrequently happens that a Fellah who has been plundered, betrays out of envy his neighbour, who has hitherto been so fortunate as to elude research. The aid of the *bastinado* is then called in to render the discovery complete, and every thing that is found is of course confiscated for the benefit of the government and its worthy agents. It happened not very long ago, that the authorities were erroneously informed that two Fellahs had dug up in their field a pitcher full of gold, which they had divided between them. The accused denied the fact, and for this impertinence each of them received in the court of the palace five hundred blows on the soles of his feet, so severe that the nails came off, and that their toes were reduced to mangled shreds. After this the poor creatures were carried before the priest, in whose presence they had to swear, according to the ritual of their church, that they had found no money on their land. . . . In the valley of the Nile, under his [Mehemet's] paternal government, the population has decreased a million! It has been calculated that in France one in thirty of the inhabitants lives on the budget; but in Egypt not less than one-sixth of the population are employed in the administration, and live on the sweat of the rest. It is the grand aim of these respectable individuals to push the fertility of the country as rapidly as possible to a point, where it can be made available by their rapacity, and to work the peasant to the utmost stretch of his powers. The ground which the Nile every year renews cannot be exhausted, but its tiller, taxed beyond the capabilities of nature, must at length faint and perish. The absence of all pity, of every feeling of humanity, of every natural tie between sovereign and subject, is the proper character of the Turkish government of Egypt. Of course, Mehemet Ali has to pay well his confederates in his tyrannical career. Let me describe the kind of life they must be suffered to lead to ensure the continuance of the system. As an example, may be taken Sherif Pacha, who was formerly minister of the interior, and governor of Upper Egypt. In the first capacity, he drew annually from the public treasury, like all his colleagues, more than a million of francs. For his governorship he had 150,000 more. This was his regular income; but he managed, *per fas et nefas* [by foul and fair means], to extract as much again as this from the pockets of his subjects. He passed, nevertheless, in comparison with his predecessor, and with many other high officials, for a very moderate and reasonable man. His court at Siut was royal; his harem was especially rich in beauties, both black and white; there was no end to his feasts and festivals; and his slaves and servants were innumerable. The whole province, with the lives and fortunes of all its inhabitants, was unreservedly placed at his disposal. He ruled by his nod the army of officials under him, and all their servants and servants' servants; of his stewardship he had no account to render, if he only sent recruits, gold, and provisions to Cairo, the instant he received the order. As he was accountable only to his sovereign, so his subordinate officials were accountable only to him, and each Egyptian official in his little sphere, be it only a

miserable village, is as uncontrolled a despot as the lord of the entire province. They all steal and squander; all squeeze, torment, beat, and plunder the unprotected peasantry, in order to live as dissolutely as possible amongst low villains and female slaves, and at the same time to hoard up something for the future.

But has the mass of the people supported this state of things without murmuring, and with unceasing patience? Far from it. During the first twelve years of Mehemet Ali's government, revolts were continually breaking out, as, in different parts of the country, the bitterness of oppression goaded the people to madness. The hirelings by whose aid the pacha overthrew the Mamelukes, remained under arms throughout Egypt, to complete the conquest for their master. The banks of the Nile are infested with these vagrant military bands, who pass the whole year under tents, and have always some of their horses saddled, in order in an instant to be able to suppress every attempt at opposition. Who can tell the crowds of Fellahs who have fallen in the last thirty years in partial insurrections? Though some of the statements current in the country may be exaggerated, still there is no doubt that the population of entire parishes has been exterminated, that in the Nile villages not a weapon is now to be met with, and that the possibility of combating oppression no longer exists. Egypt is like a country held by a foreign army, and every single village may be said to be in a state of permanent siege. Flight is the only resource left to the miserable inhabitants.

But where to fly from the tyranny of Mehemet Ali? Egypt is only a long oasis in an interminable waste of sand. As long as Palestine was free, the peasants of the Delta, like the children of Israel of old, had at least one prospect of escape, and in a short time not less than 10,000 fugitive Fellahs colonised a portion of Galilee. It was these deserts in which the late misunderstandings between Egypt and Turkey originated. Now the valley of the Nile is completely closed like the cavern of Polyphemos, and fate seems to have leagued itself with the oppressor against the pent-up race of Fellahs, unless the present oriental crisis terminate in their relief. 'When will the Inglis (English), when will the Frenki (French), come to put an end to our insupportable sufferings?' is a question which the European must repeatedly hear on the journey between Cairo and Wadi-halfa. The Egyptians know that the Christians, though they are not of the faithful, still do not envy the peasant his coarse food and scanty raiment. Prince Pückler, it is true, had no time to attend to such questions; he was always seated by the side of his princely patron, smoking out of the same pipe, and feasting on the fat of the land. In Monfalut, the very palace where the prince is quite sentimental in his feelings of respect and affection towards the pacha, because the latter 'turned round and took him so graciously, seductively, and irresistibly by the arm,' the writer of this article was but a few years ago the witness of a scene, which caused in him very different feelings to those here produced by the pressure of a satrap's hand. From seven villages in the neighbourhood, the inhabitants had all fled in the night into the Lybian desert, because they could no longer bear up against labour, hunger, exaction, and despair, combined. Their draught-cattle, ploughs, and other agricultural instruments, had already been taken from them to satisfy the demands of the tax-gatherer. Clothes, furniture, and provisions, they had already none, and still without these they were expected to till their ground, and pour fresh sums into the exchequer. Although the Egyptian peasants know that the large and frequented oases to the east are under the power of Mehemet Ali, they still hope to find somewhere in the expanse of sand, an island with wells and palm-trees as yet unreached by their oppressor, where they may find refuge from his persecution. Only a short time, however, elapsed before the fugitives were pursued and overtaken by a band of the vagrant military above alluded to. I myself saw several divisions of them driven into the court-yard of the house of the Nasir of Monfalut. They were all bare-foot; the women only had a few rags round the waist; the men and boys were quite naked; some few only had a small linen cap pressed close to the head. But who shall depict the misery expressed on the countenances of these unfortunate beings? After having been fed with bread, and locked up in the yard all night like cattle, they were whipped back again the next morning to their deserted huts, to recommence their daily tasks, which were now as a punishment made heavier than before. If any observation is made by a foreigner on these tortures and hardships, the reply is, that it is true the people have much to endure, and much to pay; but that such treatment is quite good enough for a race so ignoble and so inferior to their conquerors as that of the Fellahs. Has the German Prince ever seen how canals are dug or cleaned in Egypt? Men, women, and children, when wanted for this purpose, are driven together from the neighbouring villages, or perhaps from out the entire district, and are made to work by the whip, from morning till evening, without tools, food, or pay. The work is not done as in the west, slowly and regularly, but in violent haste. In palm-baskets or rags the poor wretches carry away the earth as it is thrown up, and are kept in a perpetual run by the sticks of their task-masters; for the Turk never thinks that enough is being done, and a Fellah, he says, can never have too many blows. The panting women and the little children run to and fro in silence, with the palm-branches on their shoulders, and with the fear of the whip before their eyes, which, however, drivers, placed at certain intervals, regularly apply to their backs with mechanical indifference, whether they lag behind or not. To such an extent are carried, especially in Upper Egypt, the cruelty of the tyrant and the patience of the slave, that Fellahs, unprovided with even the coarsest food, are sometimes seen to perish from hunger, fatigue, and ill treatment, under the walls of a magazine well stored with provisions. The idea never occurs to a corpulent Turk, that a Fellah can be in want of nourishment. It is very probable that the pacha does not himself order

these atrocities to be committed; but he does nothing to prevent them, which is all the same for the people. There is no reason to doubt the accuracy of an assertion commonly made in Egypt, that two-thirds of the deaths which occur annually in the valley of the Nile, have their origin either in hunger or ill usage.

Who believes that on such elements as exist in Egypt a permanent empire can be founded? The spirit of the age will no longer tolerate a dominion exercised by slave-drivers. Even the long-suffering people of the east are tired, and their doctrine of fatality has lost its power of reconciling them to oppression. The worst lot that can be reserved to Egypt is the continuance of the tyranny of Mehemet Ali—a tyranny which scorches and destroys, like the sirocco of the African desert."

RAILROAD versus STAGE-COACH TRAVELLING.

THERE is no country in the world where stage-coaches are so well "appointed" as they are in Great Britain, in the matters of speed, safety, regularity, and comfort; but these merits are growing old-fashioned, and steam-carriages are the popular wonder, as well they may be. Without, therefore, intending disrespect to the old vehicles, which have carried us so long, so fast, and so far, it may be useful to point out some of the more obvious circumstances of advantage pertaining to the road steamers, as at present managed. In the first place, on going to the booking-office in connection with the coach, after weathering a dousing rain, we are sometimes greeted with the very unpleasant response, "no room inside, ma'am;" or gentlemen, after panting a mile in the middle of one of the dog-days, learn that "every outside place is taken." This never happens at the railway station—there is always room—be the passengers ten, fifty, or five hundred, it matters not—all are booked—all get the best places! In starting the railroad trains, there are none of those terrific piles of luggage which often render many of the coaches so frightfully and dangerously top-heavy. A passenger, who must often be reasonably alarmed at the loading of a coach, sees or hears packages of almost any number, weight, or bulk, placed on the rail-road carriage, without the slightest apprehension; and then, in taking your places, there is no competition for the "box seat," or the "front seat," no clambering over dirty wheels, exhorting your shins on sharp irons, until, wedged amidst piles of luggage, your seat is taken on the lofty unsheltered platform, round which numerous legs hang dangling like a dozen brace of black and white grouse. To be sure, the roof of a coach is sometimes pleasant enough on a fine summer's day, with a fine country on either hand, and a good road below; and even when it rains, if you happen to have an umbrella, and if your neighbour, being without, should happen to be good-natured enough to endure the drip upon his neck, all may be tolerable, though any thing but comfortable; but in the rail-road carriage there are no outside places; every passenger is sheltered, whether the poor woman that pays sixpence to ride six miles, or the rich man that pays one pound to ride an hundred. And then, what a mechanical miracle is railway speed! How the train, whatever its length, does bowl along! what a "hish" on passing a bridge, or another set of carriages. How the objects on each side flit by—how the colts, calves, and sheep, scamper off in surprise—how the cottagers come to their doors, and the husbandmen pause in their work, to gaze and wonder! And yet, amidst all this astounding speed, there is no plying of the whip, no tugging at the reins, no cruelty to horses. And who, possessed of any sensibility, can witness the turgid reins, the lathering skin, and the frothing mouth of the generous steeds, without some misgiving as to man's right so to use—or rather abuse God's creatures? The locomotive steam-engine, indeed, as if it were a thing of life, does sometimes pant and snort in grand style; but animal sensibility is not present—the bones here are iron and brass—the circulating fluids are water and vapour—the tireless tendons are rods of steel. Here no hair-brained passenger is allowed to urge the driver on to hazard the lives or limbs of his companions; the engineer is the sole judge of fast or slow—he never for a moment either listens to bad advice, or lends the rein to an amateur driver. But it will be said a wheel may fly off or break. What then? It is true the leaping out of a linch-pin, or the smashing of a fellow, must lead to the upsetting of a coach—but a railroad carriage can afford to lose one or two wheels, and nothing serious be the matter. At any rate, the boiler may burst, and then terrible would be the consequences! But who ever heard of a railroad boiler bursting? No one: the fact is, the boiler cannot burst. As any person may presently satisfy himself, from an inspection of the construction of one—it will be found to be formed in the middle of a series of tubes, any of which bursting would cause a pretty buzz in the casing—but nothing more. But assuredly sometimes, after all, terrific accidents occur. So they do: but under what circumstances? Why, in nearly all instances, from the negligence of individuals who ought to have kept out of danger. If a person chooses to place himself in the way of a passing train, he will be as certainly run down by a train of steam-carriages as by a stage-coach, plus the velocity and numbers of the former. But bating cases of this kind, nothing is more remarkable in the history of steam travelling, than the small amount of injury to life or limb which has been sustained: the instances of fatality arising solely not from any cause peculiar to the steam-machinery as such, are few indeed, or rather none at all—for it is very remarkable, that, as yet, not one person has been killed by any accident arising from the nature of this kind of locomotion exclusively. In the last place, may be mentioned the comfort arising from the regulation, that no fees are given to servants. To commercial travellers, indeed, who have been wont to "rule the roast" on stage-coaches, pretty much as they rule it in the inn kitchen, and many of whom, from the scale of their allowed expenses, can afford, and from the attention they often exact should be expected, to pay for extra service, the fees in question were commonly

little thought of; but it was far otherwise with casual travellers, especially females. By such persons, therefore, forming as they now do by railroad trains the bulk of the ordinary complement of passengers, the sensible and equitable arrangement which places all who have paid the same fare on the same footing, as to attention and comfort, is hailed with admiration and gratitude.—*Sheffield Mercury.*

A WEDDING AT SEA.

A CORRESPONDENT of the New England Review gives the following sketch of an interesting scene which occurred on board the ship in which he sailed from America:—"A novel circumstance took place, while on our passage, which I must relate. There was a Mr H. on board, who was formerly a merchant in Massachusetts, since in Connecticut, and late of New York. He was a kind, open-hearted fellow, full of fun, and withal very intelligent as well as handsome. His age was twenty-seven. He came on board an entire stranger to us all, but as we made it a point to have but one family on board, and as we soon discovered his amiable qualities, he very soon made a welcome member. On our sixth day he came to me, and inquired the name and circumstances of an elderly gentleman passenger, who was accompanied by his daughter, with whom Mr H. seemed deeply smitten. For my own part, I could see nothing exceedingly attractive about Miss J., save that she was very agreeable in her manners, and highly intelligent. I informed him, and, at his request, gave him a formal introduction, which terminated in the following manner:—Soon after the introduction, it became evident that a mutual liking and affection existed between Mr H. and Miss J., who, from their open expressions of fondness, began to attract the attention of all, and the admiration of many of the passengers. They were frequently observed in their close conversations, and a game of whist was scarcely ever played in which they were not partners. On the second Sunday of our passage, we solicited the Rev. Mr G., who was on his way to Italy, to preach a sermon. By the politeness of the captain, a large awning was spread over us, seats were prepared, and a congregation of 76 persons, including the steerage passengers and sailors, was collected to participate in the religious exercises. A small desk was formed into a pulpit, and a choir was formed by 'going into a committee of the whole.' The text was read and the sermon delivered, of which I need not speak. At the conclusion of the sermon, our minister rose and read the following card, which lay on the desk:—William Benet H., Esq., of New York, intends marriage with Miss Maria Louisa J. We were more surprised at the novelty of the thing than the fact itself, and, indeed, such was the feeling created by the sudden and unexpected announcement made, that we all forgot the serious impressions made on our minds by the minister, in our hearty and vociferous congratulations of the happy pair. But it did not end here. A proposition was made to the parties to have the affair consummated that evening, which was cheerfully acceded to by them, to the great pleasure of all on board. Accordingly, things were arranged in order, the best state-room was given up to them, and every one felt gay and happy as the hour approached which should witness the consummation of their nuptial vows. The evening was calm and delightful; not a sail fluttered in the breeze, not a voice was heard, not the least stir or bustle about the deck, and the moon looked down in loveliness on that tranquil scene. At noon, every soul gathered to the temple which had been erected for religious worship, and in less than fifteen minutes the marriage ceremony was performed by our worthy minister, who made a few remarks, and closed with prayer. The scene was truly as sublime as romantic. The fair bride came out, dressed in a robe of pure white satin, leaning on the arm of her lover, bound to the altar, and heard her marriage vow pronounced where, only an hour or two before, she had uttered her vows to God. Many a tear of joy stole down the cheeks of those who looked on, and not a care cast the shadow of its wing across that scene of triumph, love, and bliss. The novelty of this affair had thrown us all into an excitement, and nothing was to be talked of but weddings, wedding parties, marriages at sea, love, honeymoon, &c., &c., and I was at times half tempted to make a similar proposition myself to the queen-like Miss C., if for nothing else but the purpose of having the joke pass round."

CURE OF DRUNKENNESS.

A man in Maryland, notoriously addicted to this vice, hearing an uproar in his kitchen one evening, had the curiosity to step without noise to the door, to know what was the matter, when he beheld his servants indulging in the most unbounded roar of laughter at a couple of his negro boys, who were mimicking himself in his drunken fits; showing how he reeled and staggered, how he looked and nodded, and hiccupped and tumbled. The picture which these children of nature drew of him, and which had filled the rest with so much merriment, struck him so forcibly, that he became a perfectly sober man, to the unspeakable joy of his wife and children.—*Anatomy of Drunkenness.*

REASON FOR MENTAL CULTIVATION.

It was said, with truth, by Charles the Twelfth, of Sweden, that he who was ignorant of the arithmetical art was but half a man. With how much greater force may a similar expression be applied to him who carries to his grave the neglected and unprofitable seeds of faculties, which it depended on himself to have reared to maturity, and of which the fruits bring accessions to human happiness—more precious than all the gratifications which power or wealth can command.—*Dugald Stewart.*

PRICE THREE HALFPENCE.

SINGLE SISTERS.

BY MARY HOWITT.

I AM very fond of fairy tales, and I like none better than that old-fashioned one of Cinderella. Even children, who never read the moral of fables, whether in prose or verse, feel the moral of this; the good providence which, in the guise of the fairy-godmother, sent forth the pumpkin coach and the six harnessed mice to convey the despised and maltreated weak one to enjoy pleasures which her persecutors had forbidden her. There is a deep moral in it; hope to the hopeless, joy to the joyless; the white healing wings of a good angel hovering over us when our hearts are shorn to the very quick by unkindness or neglect. The gist of every fairy tale is the triumph of the weak over the strong; an overruling principle of justice and mercy, which will in the end set all things right, and so far they are full of truth. But there is another peculiarity of this delightful old literature, which is cruelly unjust. Take the beginning of any one of them, and you have it on the very threshold of the story—"There was, once upon a time, a woman, and she had three daughters; the elder was crooked and ugly, and proud and envious;" so was also the second, but in a less degree; upon the youngest, on the contrary, is lavished every virtue, and every endowment of person and mind; she is beautiful as the lily of June; humble, and patient, and gentle. She is subjected to every conceivable ignominy; she is the servant of her ill-favoured seniors; she washes in water, while they wash in wine; she wears hempen garments, while they are clothed as princesses; she is made to perform the most menial household work, while they career about in coaches covered with gold and silver. Such is the established distribution of virtues and vices in every fairy-tale family. In real life, the reverse of this is often much nearer the truth. Elder sisters, and especially those who remain single, are oftener concentrations of the virtues; and herein is it that our dear old fairy tales are so grievously in error.

I remember, when a child, revelling in that nursery literature, bound up in thin square tomes gilded on the outside, and decorated with compartments of embossed orange and purple and vermillion, as bright as the very gems of Aladdin's palace, types and symbols of the fairy tale within—I remember even then being conscious how false this allotment of virtues and vices was, for our own fireside gave the lie to it. Who was it that read with an untiring patience evening after evening, and morning after morning, the very fairy tales which all commemorated a cross, ungentle, elder sister? Who was it that laid aside her own book or work to dress the doll, or draw the picture, or cut the paper figures, or play at fox and goose, but that same gentle and patient and loving elder sister? And it was ever so. The younger ones grew up taller and fairer, and with divers endowments of grace and beauty; each with his or her peculiar talent or characteristic; this one was musical, that was a genius in painting; that was metaphysical, and this was a wit. All were self-engrossed, and each was more or less selfish, inasmuch as each was seeking for admiration even at the expense of the others; but Letitia, or Letty, as she was always called, darker complexioned, shorter of person, with no one master-faculty of mind, with no showy accomplishment, was the same indefatigable, loving, helping being that she had ever been. She was as the axle of the wheel; all centred in her; but, individually, all diverged farther and farther apart from each other.

Letty was predestined to be an old maid; to be the single sister of the family. "Miss —," every body said, "never will be married; she is an old maid alto-

gether; she is unlike the rest of the family; she might not belong to them!" And so it was. Letty was decidedly plain; the family had improved in good looks as it increased in numbers. It often is so in large families. Many causes conspire to make the early lot and life of the eldest child frequently less happy, less favoured, than those of its successors. Perhaps the parents are in less prosperous circumstances, and its early childhood has experienced privations which the others never knew; perhaps, entrusted to a young nurse, whose only recommendation was the serving for small wages, the little creature gets a fall, which distorts the spine or dislocates the hip, or, perhaps, left for five minutes by the mother, while she performed some needful household duty, sets fire to its pinafore, and carries to womanhood, and thence to the grave, a frightful token of suffering and agony, which almost checks the sympathy it ought to excite. Perhaps the parents, as is not unfrequently the case, indulged certain crotchets of infantine education; like John Wesley's parents, perhaps, they taught the new-born pilgrim of life to cry softly, and to dread the rod even before it knew its mother's face; perhaps it was put under a stated and unnatural regimen; perhaps, like a little Indian, strapped to a board; perhaps hardly swaddled at all; for it is incredible what experiments of training are tried upon first children, especially by parents who reckon themselves philosophical. God help all first children! They may be decked out in laboriously embroidered garments, for every young mother is prodigal of needlework for her first born; but what avails this to the little victim of fantastic systems or of ignorant mismanagement! Parents often themselves look back with astonishment, if not with remorse, upon their first essays in infant training, and may trace many an infirmity of temper in their first born, many a physical weakness or lasting deformity, to their own absurd notions or mere want of experience.

Whether our parents had philosophised or experimentalised upon our eldest sister, I know not; but certain it is, she was dissimilar to the rest of the family in many respects; much plainer in person, as I have said, and gifted with no showy faculties, but eminent in patience and disinterested affection. This part of the system, if system indeed there had been in Letty's early education, had proved decidedly successful.

Letty, however, was one of those destined by common consent to live and die in a state of single blessedness. With a heart capable of the most entire devotion, she was destined only to see one after another of her more attractively endowed sisters wooed and wedded. First one, and then another, went off, and all the gossips of the little town averred that Mr —'s daughters were marrying exceedingly well; still Letty remained to rejoice in the joy of others, rather than to anticipate joy for herself. How was it that no amiable man, requiring chiefly in his wife every virtue which could grace a woman, never sought the hand of sister Letty! Many a plainer woman had married, and many a less intellectual one; and every day dozens without one tithe of her goodness of heart had been selected to become the angel of some sweet home. But Letty was still passed over! The truth is soon told: Letty was destined to live and die a single sister.

But let it not be said that such as she are useless members of society. From the days of my earliest remembrance, when she read us the pleasant fairy tale, giving in her homely practice the delightful proof that elder sisters might be the very kindest and most self-forgetting of human beings, spite of all that was written to the contrary; from the very Saturday night, when she undertook to wash the younger ones with

her own soft hands, that we might not be flayed with the nursery-maid's flannel, nor be blinded with soap rubbed into our eyes, and which, spite of company, or books, or summer-evening walks, she performed till we had all outgrown Saturday-night lavations; from the time when she called her young school-going brothers to her pillow each morning, and went through declension and conjugation, and all the perplexities of multiplication table, clearing away difficulties, and seeming to give to each bewildered brain the faculties of retention and comprehension; from those days forward, when she helped to dress her younger and more aspiring sisters for the parties in which they, not she, were to figure; when she helped to make the bridal garments, as each successively married off; and then as she assumed the new character of aunt, and spent many a guinea on the cap and frock and dainty little bonnet for each new-comer, for which there was still a warm nook in her warm capacious heart; from all those days, and their duties, to the time when she became mistress in her father's house, and was, as it were, eyes to the blind, and feet to the lame, reading for hours to the old man, not boots of her choice but of his, and walking out, with slow, gentle steps, literally supporting his, whenever the sunshine was warm enough to tempt him abroad: through all these years of duties, nobly performed, and of self-renunciation, could it be said that Letty, though a single sister, was an useless member of society? No such thing. Letty has done more to make virtue lovely, to diffuse happiness, and to decrease suffering and sorrow, than many wise or rich men, or even than many wives and mothers.

It is among the most vulgar of errors to consider women useless because they are single. Only look round your acquaintance—who is the one universally useful, the one applied to in every time of difficulty and trial? The single sister of the family.

Again, let us take our own Letty as an example. Say nothing of her virtues as a neighbour to the poor—her quiet, unostentatious benevolence—her weekly pensioners among the old, and her protégés among the young—but let us see what place of comparative usefulness she holds among those of her own family. John and his wife would take a trip up the Rhine; the season is propitious; it is determined upon as soon as thought of—for Letty will come and take charge of the children. Mary's two eldest children have had the whooping-cough, and change of air is needed for them. "Oh, send them to aunt Letty," is the immediate resource; "she will take care of them!" "Aunt Letty is coming down for the christening," say Tom's seven children to one of their nursery-maids; "and she will bring me a top," exclaims one; "and me a ringing omnibus," says another. "She will bring me a great doll," says one little damsel, "and will cut us apple-swans and little pippin-mice! We shall have such fun when aunt Letty comes!" Again, George's wife is thought to be consumptive, and a winter in Devonshire is recommended. George cannot accompany her for the whole time, but Letty can. To be sure, Letty is at every body's service; no one thinks of consulting whether she would like it; they are as sure as that to-morrow will come that Letty will not fail them whether she likes it or not.

But now let us suppose, for such things will happen sometimes, that, after all, sister Letty herself has an offer; an offer every way unexceptionable; one that promises her the happiness she abundantly deserves. How does the news of it affect all that kindred which she has so faithfully and devotedly served all her life long? We may readily know, for common human nature only grows more selfish as it is more indulged.

"Only think!" says Mrs John to her husband, "how ridiculous of Letty thinking of being married at her time of life. There's an end to our trip up the Rhine!"

"I think, after living single so many years, she might have chosen a more convenient time for marrying than just now, when my poor children have the whooping-cough," says Mary; "but that's just the way with old maids: they always do something or other foolish at last!"

"I don't know what I shall do with all my seven children," says Mrs Tom, "if Letty really marries; for you know it is such a convenience to have an unmarried female in the family, because their time is of no value. Then there was in fact no occasion for Letty to marry, so comfortable as she was, always with some one or other of us. As for ourselves, it was quite an amusement for her to be here, where there were so many children, for really Letty managed so delightfully with children; but these old maids, you know, have nothing to try their tempers—it's so different with married women! I am sure it is a thousand pities that Letty ever thought of marrying!"

"She does not care what becomes of me!" says Mrs George, raising herself in her easy chair, after she had read the letter that announced sister Letty's intended marriage, and forgetting how Letty had given up her own last winter in London, to pass three months at Brighton with this same indulged and peevish invalid; "but really people are so selfish; or one might have expected she would have postponed her marriage to the spring, had it only been out of consideration to me."

Poor sister Letty, she had been too useful by half! Of those four married women who had so long availed themselves of her unwearying self-forgetfulness, and who looked with envious eyes on the prospect of happiness opening before her, not one had been so actively and widely useful, so meekly benevolent, as Letty, though she had lived for nearly fifty years a despised single sister.

ASCENT OF THE PIC DU MIDI.

[The following letter is the composition of an English gentleman residing at Bagneres de Bigorre, in the south of France. The adventure which it describes took place last July.]

* * It has occurred to me that you might wish to hear of my adventurous journey to the Pic du Midi, one of the highest mountains of the Pyrenean range. The party consisted of the Countess of C—, the Count de V—, and myself. We left Bagneres at eight o'clock in the evening, and reached the village of Gripe at eleven. The windows of the small inn command an interesting view of the valley of the Adour, and the mountains overhanging it, and which we had made a previous excursion to visit. At midnight we mounted our horses to commence the ascent of the celebrated Pic du Midi, which is between eleven and twelve thousand feet above the level of the sea. There was not a cloud in the heavens, and the stars shone so brilliantly in this pure atmosphere, that we had sufficient light to guide us over the narrow and precipitous path, though not more than to enable us to distinguish the outlines of the mountains which surrounded us. I am not sure, however, if this uncertain light, aided by the dashing of the three cataracts, did not rather enhance the effect of the scene, by leaving so much to the imagination. The waterfalls are formed by the river Adour, which rises in the Pic du Midi, and after passing through Bagneres, Jarbes, and Pau, empties itself into the sea at Bayonne. The sound of these immense masses of water was very imposing in the stillness of the night. After a rapid ascent of an hour, we reached a small plain, on which were scattered a few miserable shepherd's huts, which they dignify by the name of the village of Tremesaigne. On leaving this we entered upon a gorge, through which the ascent was so steep, and the path so rugged, that we were compelled to dismount, and scramble up as well as we could; and this was difficult enough, as the mountains on each side cast their shadows over the path, and prevented our seeing where we were about to place our feet—water, rolling stones, and boggy ground, alternately receiving them. This difficulty surmounted, we again took to the saddle, and in half an hour reached another plain, on which there was one solitary hut. This place rejoices in the name of Areze, so called from a giant said once to have inhabited these regions. The sound of our horses' feet attracted the attention of the shepherd's dogs, who, fourteen in number, saluted us with their deep-toned mouths, which, with the noise of the cascades falling in every direction, and the hollow sounding bells round the necks of the cattle, disturbed the silence of the night, and broke in upon the solitude of the place in an impressive manner. These dogs, the faithful guardians of their masters and their masters' property, are of immense size, and perfectly white; the manner in which they extract the sheep from the snow is quite marvellous. The barking of the dogs soon brought out one of the shepherds, who, knowing our errand, presented us with poles with iron points, so indispensable upon these expeditions as to merit the name of a *third leg*. Having taken the bridles off our horses, and turned them loose on the plain, we collected our forces, which consisted of two guides and Madame de C— and servant, and set forth at two o'clock in the morning on our hazardous ascent. Our reasons for setting out in the middle of the night were, to avoid the heat of the day, and to see the sun rise. This, however, we soon found

impossible, as Madame de C— was obliged to stop every two or three minutes, in consequence of the steepness of the path. Seeing that our great object was likely to be defeated by the slowness of her progress, she begged us to leave her with the guides, and to go forward. I was most unwilling in the first place to leave her, and also I did not relish the idea of going without a guide. My companion, however, laughed at the idea of danger, and the guides said we could not miss the way; and so on we went. The young are apt to think the old fools, whilst the old know the young to be so. Accordingly, we had not proceeded very far before we had to choose between two paths, one along the glaciers, which we had now fairly reached, and the other between two mountains, which had evidently been torn asunder by some sudden effort of nature. The intermediate space was this dubious way, so precipitous, and difficult to ascend, that I was relieved when our guides answered our call from beneath, by saying "All right," though the alternative was a glacier. The light of the stars now yielded to that of the moon, which, though shorn of its fair proportions, rose majestically above the tops of the hills we had left. Its light was most acceptable. No sooner had we surmounted the difficulty of this glacier (and how small and insignificant does it now appear when compared with those we afterwards encountered), than a choice of roads was again offered us, and our voices could now no longer reach the guides.

We differed about these roads. I was for continuing along the glacier; my friend, with the activity of the chamois which inhabit these mountains, was disposed to climb the ravine. His reasons appeared good, and we chose the latter, which proved wrong, though the mistake did not involve us in any natural difficulty beyond unnecessary additional fatigue. We now reached a plain of three or four hundred yards square, and found the level ground a great relief to those muscles which had been kept so long on the stretch by the rapidity of the ascent. This plain was covered with snow, whereon we saw the recent foot-marks of a bear. It was here where Plantade perished, surrounded by his philosophical instruments, with which he had been making observations. At half past three we began to perceive the approach of day. The effect of the gradual increase of light was interesting; the lofty summits of the mountains first receiving its influence, threw the valleys into still deeper shade. On this plain I perceived blocks of granite and gneiss: whence they came I cannot tell, as the mountain, as far as I could judge, is entirely composed of schiste. Their angles were rounded by attrition, so that the adjoining mountains, which, from their pointed summits, seemed granitic, may have once owned them. The side of the glacier being laid bare, proved to me the immense depth of the snow over which we had been walking; it was at least thirty feet in thickness! We now began to look out with anxiety for the lake Ouchet, which is only two thousand five hundred feet below the Pic. In a few minutes we perceived it, entirely frozen over, though the snow upon it was partially melted. The basin in which it is situated is circular, its circumference about a quarter of a mile, and it has all the appearance of the crater of an extinct volcano. From hence, the mountain rises so abruptly, that our hearts almost failed us, and we now felt the difficulty of our position, and the folly we had committed in undertaking such an ascent without a guide. We were now nine thousand feet above the level of the sea, and the keen air began to penetrate through our thin clothes; but you know well the exhilarating effects of mountain air, particularly at high elevations. We now commenced the ascent of the cone, and, though we saw the summit illuminated by the rays of the sun, we were sorely embarrassed to know which direction to take. We first attempted to ascend in a straight line to the top, but were soon obliged to abandon this for a zig-zig. An opening in the valley gave us a view of the sun, which shed its purple light over the whole range of the mountains; we saluted it with all the enthusiasm of its ancient adorers. Nothing, in fact, could exceed the grandeur and sublimity of the scene. After gazing for a few minutes upon this glorious sight, we resumed our dangerous journey over the glaciers, between which and the lake there was not a projecting rock, not an obstacle in the way of the unfortunate man who should make a false step, so difficult to avoid on the frozen snow. Now, indeed, we felt the danger of our situation, when to retreat were as dangerous as to advance; in short, the very act of turning round might have proved fatal. My head began to fail me, and I no longer dared to look down to the lake beneath; it was not, however, till afterwards, that I was aware of the full extent of our danger. We had, unfortunately, no crampsons, or spiked shoes; and as we traversed the side of the glaciers, inclined like the roof of a house, we had to make a hole in the snow with our sticks before we could advance. Luckily, this side of the mountain being exposed to the south, there were considerable intervals from which the snow had disappeared; here the danger was less, but still so great, that at every step, after seeing where to put my foot, I closed my eyes, and laid hold of the rocks, for the precipice of a thousand feet was too appalling for an unaccustomed eye to look upon without emotion. My companion was considerably above me on the face of the hill, and, ignorant or regardless of danger, was singing with all the gaiety of a French heart, when his attention was attracted

by a voice (and no one who has not heard it, can tell how striking is the sound of the human voice in such solitudes): the voice was that of a guide who had nearly gained the summit, warning M. de V— of his danger, and telling him to pass below the glacier. He prudently listened to the voice of experience, and joining me, we passed the last of the glaciers in safety. We had now a most painful though not dangerous ascent to gain the summit. The path lay over a bed of schiste, which, being reduced to small fragments by the operation of those causes always in activity at such a height, gave way so under our feet as to double the fatigue, and to render the ascent as tedious as it is over the cinders of Vesuvius.

My chamois-footed companion was up before me, and had taken my Macintosh, of which I had now great need; for although in the most profuse perspiration, the piercing wind of these elevated regions appeared to go through me. I seemed as if I could now lay hold of the Pic itself; but how fallacious are distances in this rare atmosphere! I soon, however, touched the goal I had so long in sight. It was now five o'clock. I will not add to this already too long letter by giving a description of the view from the Pic du Midi: suffice it to say, that the whole chain of the Pyrenees, from east to west, was visible under the most favourable circumstances; the course of the Garonne as far as Toulouse, and the Adour as far as the sea. Such scenes fill the mind with a thousand agitating and overwhelming feelings: the omnipotence of the hand that formed, and the insignificance of the creature that contemplated, these magnificent works of the creation, were painfully brought to the mind. Placing our backs against a rock to shelter us from the wind, and with the sun full upon us, we gazed for nearly an hour upon all the wonders by which we were surrounded.

An incident happened, which proved the courage and insensibility to danger of these intrepid mountaineers. M. de V— let fall his drinking-cup, which rolled down the glacier out of sight, and as we thought into some unfathomable abyss. The guide, however, starting up, said he would soon fetch it. We did all we could to dissuade him, by pointing out the great risk, and the utter insignificance of the thing lost; but he hesitated not a moment, and was soon suspended from the rocks on the side of the glacier. I closed my eyes, not daring to look upon what I deemed inevitable destruction. He disappeared; was absent about five minutes, during which we imagined all sorts of horrors, but at length returned with the cup in his hand. Whilst seated on the summit, four vultures came close to us, continuing to fly for a while over our heads, increasing the circle at each revolution, and ascending still higher, till they were apparently the size of swallows. M. de V— discharged a pocket-pistol for the sake of the echo, but it was but very faintly answered, and that at an interval of several seconds, probably by some higher Pic. We now thought of returning, but a ceremony, deemed indispensable upon such occasions, was first to be performed, namely, that of engraving our names upon the rock. We found a considerable variety of flowers on the very top, and the blue iris amongst the number. The summit is entirely composed of talcose schiste, and bears evident marks of having been struck by lightning. Having inscribed our names (as monuments of our folly perhaps), we began to descend, preceded by the guide, who reached the bottom of the schistous path before described almost at a bound. We descended with more measured steps, but faster than was agreeable. Each person detaching fragments of rock, which, collecting others in their course, and acquiring fresh impetus as they descended, produced a singular effect, and as they tumbled into the ravine, sounded like distant thunder. We now reached the first glacier, where an accident happened to one of the party, which must have proved fatal but for the intrepidity and presence of mind of the guide, who had first descended to the foot of the glacier. I went down next, and by forcing my heels into the snow, arrived safely, though I had acquired such an impetus, that had not the guide arrested my progress, I never could have stopped myself. Next came one of the strangers, who, contrary to the advice of the guide, seated himself on the snow, and in this manner began to slide down the smooth surface of the glacier. He had not, however, proceeded far, before he had acquired such a velocity that he became terrified; his head took the place of his heels, and he came towards us with an appalling rapidity, uttering the most piercing cries of "I am lost!" "I am lost!" Nothing can ever efface from my remembrance this awful sight. At this moment, between him and the lake, two thousand feet below, there was nothing but fragments of rocks to arrest his progress. The guide, with a promptitude and courage beyond all praise, ran from the spot where he was standing, to place himself between a fellow-creature and inevitable death, and this at the imminent peril of his own life, for the impetus the man had gained in falling through a space of three or four hundred yards, was likely enough to hurry them into the abyss beneath. Regardless, however, of himself, he rushed to the spot, placed his staff firmly in the ground, held it with his left hand, and was prepared to receive the terrified man with the right. Fortunately for both, at the bottom of the glacier there was a large stone, which broke the fall against the guide, though it covered the poor fellow with wounds and blood. For a second I thought the guide had lost his balance; it was one of the most painful moments I ever remember to have passed. The poor man bled from several parts of his body; his hands were cut, his nose and eyes dreadfully swelled, but fortunately no bone was broken, and he was enabled to continue his descent. This event impressed us all with the greatest alarm, particularly M. de V— and myself, as this was the very glacier we had crossed

in our way up. The guide was in a state of great agitation, and his trembling hand as he took hold of my arm by no means gave firmness to my feet. However, we reached the lake once more. To our great surprise we found Madame de C—; but great, indeed, was our astonishment on hearing that she had gained another of the summits of the mountain. The keenness of the air, however, caused her to spit blood. After taking a hasty view of the scene, she descended to a more genial atmosphere.

After sitting some time contemplating this dreary scene, and listening to the personal adventures of the guides, in whom the *ars narrandi* had not suffered by their libations of brandy, we thought it time to continue our descent. One of the guides mentioned a singular position in which he was once placed on the summit of the mountain, with a bright sun over head, and a storm of thunder and lightning raging below. The gentle shepherd was at once transformed into a Jupiter, and the Pic du Midi into an Olympus. The effect must, however, have been singular. We here saw a chamois, which had much the appearance of a roe-buck. Nothing material occurred in our descent, excepting my falling on a glacier, and going from the top to the bottom with such a velocity that I lost my breath; I, however, preserved my presence of mind so far as to guide myself with my hands, and to keep my feet foremost. The only damage done was to my nails, which were broken by my rapid motion over the snow. We reached the peasant's hut at nine, the ascent and descent having each occupied three hours. Madame de C—, whose courage I never saw equalled in any woman, was a good deal exhausted after a walk on glaciers of seven hours. We left the kind-hearted shepherds, thirty of whom inhabit the same small hut, and, mounting our horses, reached Grippe at half past eleven, and Bagueres at one, under the most scorching sun possible.

THE RIVAL COUSINS,

A STORY.

ABOUT two miles from the large commercial town of G—, there lived, some years ago, an old couple whose family consisted of two daughters, both uncommonly pretty girls, yet very unlike each other in disposition and appearance. The dark lustrous eyes of Margaret told of feelings, tender, deep, and strong; while the bright coquettish blue eye of Jane said, as plainly as eye could say, "I like you very well, but I like myself better." Mr Langley, the father of the beauties, was in respectable circumstances; he had begun life a poor man, carrying a pack from fair to fair, until his profits enabled him to take a shop wherein to display his lawns and muslins, and a wife to adorn the back of his counter, and make his house comfortable when the toils of the day were over.

While the girls were children, they had been accustomed to play with Willie Lindsay, the son of their next-door neighbour, a baker, with a thriving business and a large family. An attachment was formed between Margaret Langley and Willie, which pleased and amused the parents of both parties for some years; but at the period when my story opens, Mr and Mrs Langley had retired from business, a very wealthy couple, and had begun to think their pretty Margaret would be quite thrown away on William Lindsay, especially as richer and grander men were anxious to wed her. They began by looking coldly on William whenever he came to the house; but it was some time before the fond lover could allow himself to believe he was less welcome to the old people than formerly. His eyes were opened to the truth, however, when he saw the marked encouragement given to a Mr Foster, a wealthy manufacturer, who was deeply smitten by Margaret's charms. Poor Willie! wretched and restless he passed a sleepless night; one moment fearing Margaret might change as well as her parents, and the next blaming himself for daring to doubt her truth and love. He arose from his sleepless couch, determined to fathom the depths of Margaret's heart, and if he found her wavering, to leave Scotland for ever, forswear the love of woman, and seek for glory or death fighting in a foreign land. The lovers met, and the lovers parted happy in the consciousness of each other's affection, and pledged to each other for weal or woe.

It boots not to tell how for two long years Mr and Mrs Langley opposed the marriage by every means in their power. Mr Foster, at length convinced that Margaret would never be persuaded to have him, transferred his affections to her sister Jane, and she, rather vain of having won Margaret's rich lover, was nothing loath. The marriage was celebrated with great splendour, and Jane was placed at the head of a handsome establishment in the town of G—. A few months after, the old people, hopeless of changing Margaret's determination, yielded a reluctant consent, and she became the wife of William Lindsay, who had now, with his father's assistance, commenced business as a corn merchant. Years elapsed, during which, old Mr Langley, tired of doing nothing, had speculated in steam-boats, and other things, and lost considerable sums of money; his wife died, and he drooped daily, till at length he sank into the grave, leaving only four or five thousand pounds, instead of twenty or thirty. Mr Foster grumbled excessively, and hinted to his wife that his marriage was a complete take in; while William Lindsay drew his weeping Margaret closer to his bosom, saying, "What care I for this world's wealth, when I have such a treasure in you!"

The communication between the sisters after they were married, had gradually become less and less frequent. The style in which they lived was very

different; and both Margaret and William felt the inferiority of the entertainments they gave in return for Foster's splendid dinners, more than they liked to allow to themselves. At first they tried to cope with them, but their rooms were small, and their servants awkward. They found it would not do; and sorry am I to say, they retired from the absurd contest with more bitterness of feeling than one would have anticipated from hearts so warm and affectionate.

The two sisters had several children, but my story chiefly concerns the eldest boy of each. Robert Foster was sent to school when six years old. Spoiled and petted by his father at home, he was an unruly cub at school, and being a bold strong-built little fellow, he lorded it over all his companions. None could match him, with the exception of Willie Lindsay, who, though not so strong, was more active and agile, and had a thorough command of temper, of which Robert Foster was altogether deficient. I fear it was in consequence of incautious language overheard at home, that these cousins from the very first seemed to regard each other as natural enemies.

No boy could be the friend of both. The fault, however, lay chiefly with Foster, who would associate with no one that was on amicable terms with Lindsay, while the latter took it as a thing of course that Foster's friends should be his enemies, but without feeling any particular ill will to them on that account. At the age of eight, the two boys went to the grammar school. Foster was accompanied by a lad of the name of Crawford, who had been sent from the West Indies to his father's care; and the elder Crawford being a man of wealth and influence, Mr Foster kept the young gentleman under his own roof, and paid him every attention. The lad was delicate and peevish; young Foster and he agreed but indifferently; but Jamie Crawford soon found he could put Robert into good humour by playing all sorts of mischievous tricks on Willie Lindsay. He scattered ink on his clothes and his books, he abstracted his marbles, and he once tripped him up when running, but only once, as he got in return such a severe thrashing that he feared to do it again.

It happened one day that Willie was about to join a party who were playing at ball, when Jamie Crawford called out, "We don't want any bakers' sons here; we are all gentlemen's sons." "Pelt him with your balls, boys," cried Robert Foster, "and take the flour out of his jacket." Willie, burning with indignation, caught the ringleader, but the other boys defended him from the summary punishment intended; and feeling he was safe, Crawford continued his abuse, spitting in his face, and saying, "There's the price of a penny roll for you." "You—you—rascal," said Willie, "you shall not escape me; I'll break every bone in your skin yet." "When you catch me, you may beat me to dough, Willie," Crawford shouted after the retreating boy.

It might be about an hour after, that one of Willie's companions came to him and said, "You've got your revenge now; Crawford has scrambled to the top of that new house that's building, and some of the scaffolding has given way, so that he cannot get down, and there he sits, perched like an owl, and howling like one too. Do come and see him!" Lindsay willingly accompanied his friend, and sure enough he saw Crawford in a very dangerous predicament. He stood on a piece of the broken scaffolding, about thirty feet from the ground; he clung to the wall, crying, "Oh, I shall be killed, I shall be killed, I am getting so giddy!" It seemed but the work of a moment, and Willie stood beside him. The boy was a first-rate climber. "Could you not manage to come down after me," he said, "and I'll show you where to place your feet?" "No, no," said Crawford, "I'm so giddy; I'm falling now," and he began to totter. About ten feet under them, part of the scaffold stood firm; and just as Jamie was falling, Willie caught him in his arms, and kept down on it. It was easy to get down from this spot, but Willie had twisted his ankle, and could not move. By this time a number of people had assembled, and amid the hurrahs of his companions the lame boy was carried home. It was some weeks before he was able to return to school; and long before that, Crawford, wretched, penitent, and overflowing with gratitude, had become his sworn friend; and his friendship was put to the proof. Robert Foster hated him for being Lindsay's friend, and hated Lindsay more than ever, for every boy spoke loudly of his noble generosity.

Foster was left in the minority. Neither of the boys had previously been very diligent scholars; but Foster, determined to get ahead in some things, studied hard, and was soon at the top of his class. Lindsay, with equal talent, had less bodily vigour; and from this moment a contest began, which sapped Lindsay's strength. The two boys soon outstripped all other competitors; the parents of both entered keenly into the competition. When Lindsay gained the prize, his father and mother felt they had gained a victory far beyond the paltry one of having given a finer dinner; but when Foster was successful, then old defeats seemed doubly disagreeable.

The classes were examined every six weeks, and parents might be present if they chose; it rarely happened, therefore, that the Lindsays or Fosters were absent. This was an additional spur to both the boys—to Foster, because his father's allowance of pocket-money was proportioned to the degree in which he was superior or inferior to his cousin; and to Wil-

liam Lindsay, because no delight was equal to the maternal love and pride which he saw beaming from the dark eyes of his mother. He was a happy boy when, on the evening of those days in which he had excelled Foster, she would, when saying "good night," press him to her bosom and whisper, "Bless you, my darling; you'll be a greater man yet than ever Bob Foster will be, though they think themselves so much grander than we are." It was thus that the purest and holiest of earthly affections, the love of a son towards his mother, was poisoned by a mixture of envy, hatred, and uncharitableness. The Greek and Latin authors which the boy studied had rather a tendency to nourish these feelings within him, by assisting him in giving them other names; envy, he fancied was but noble emulation; hatred, self-respect in repelling insult; and uncharitableness, a virtuous contempt and abhorrence for those who affected to look down upon his beloved parents. He gloried in outstripping all other boys; but to outstrip his hated cousin, conveyed to his mind an exultation almost fiendish; and they who should have watched over these baleful feelings, and crushed them in the bud, encouraged them, and nourished them in the generous soil of the noble boy's heart, where some of the fairest flowers would otherwise have flourished luxuriantly. Feelings such as these carry their punishment along with them; happiness and hatred, peace and envy, cannot exist in the same bosom, and the withering effects of over-exertion were increased by the tumultuous war of evil passion within.

For some months Lindsay had kept the superiority, and Foster's pocket-money was at a low ebb, when two prizes were to be given; one for the boy who committed the greatest number of lines from Horace to memory, and the other to him who translated the largest portion of Virgil. For some time previous to giving the prizes, the boys repeated their tasks weekly, and Foster and Lindsay redoubled their efforts, but for a time they were nearly equal.

As the period drew on, Foster began to get ahead. The pale care-worn countenance of Lindsay told of hard work by day and night. Not a moment was now devoted to play; Virgil and Horace were his constant companions, while his devoted friend Crawford sat beside him on the playground, anxiously watching his pale cheek, and wishing it were possible for him to do a share of the work. "Do come, Willie, and have one game at ball," said he to him a few days before the prizes were to be given; "you'll kill yourself, man, if you study so hard; you're getting as thin as my greyhound did, when Foster starved him when I was from home." "I must beat him," said Lindsay, "though I die for it; and yet, were it only myself, I would give in, for my head aches constantly now, and I cannot eat for thinking about it." "Do, dear Lindsay, give up the contest," said James; "why should you make yourself ill for a paltry prize, when every body knows already you are the cleverer fellow of the two, and able to beat him whenever you like." "Ay," said Willie; "but his father and mother don't know that; and if he beats me, they'll exult over poor mamma with their saucy looks, all the time pretending to condole with her on my defeat. No!" he cried, getting into a state of great agitation; "there are three days and three nights yet, and I'll work like a horse, and I'll drink green tea to keep me from being sleepy, and I'll beat him yet, cost what it may." The boy kept his unholly resolution: he gained both prizes; but the exultation of his parents failed to convey to his mind the happiness it was wont to do. Exhausted and worn out, he laid his head on his mother's bosom, and burst into a passion of tears. "Put me to bed, dearest mother," he said; "my head aches dreadfully, and I am really ill." A dangerous fever was the consequence; he recovered, however, and a few months in the country served to recruit his wasted strength, and in winter he was pursuing at college the same system.

The prizes gained at the end of the first session by William and Robert were nearly equal; the latter, however, was in full bodily vigour, while William began to complain of pain in his side, which became very troublesome after long study. A summer spent at the sea-coast again restored him to his usual health, and he returned to town, determined to get in advance of his cousin, if possible. At first he sat up one night in the week, then two, and as the session drew to a close, he never slept above four hours at a time. His fellow-students looked up to him as a prodigy; the professors held him out as an example to others; his parents gloried in their son; and his friend James Crawford was the only one who seemed to have any fear for the result.

One day, towards the end of March, he said to his friend, "I wish, Willie, you would take a walk with me in the country, now and then. You have got a nasty short cough, and I see you often put your hand to your side as if in pain." "Oh! it's nothing," said William; "I got a little cold some time since when my fire went out one frosty night, and I was so busy with a problem, I never thought of it till I had done, and then I was so stiff with cold, I could hardly undress; that is the cause of my cough, but it will soon go away." James looked his fears, but he did not give them utterance; and Willie laughed at his long face, and told him he was sure he had pounced upon him for a patient, ever since he had decided on being a doctor.

A second summer at the coast recruited him a little;

and it is possible he might have been saved, had his parents been sufficiently watchful. It was no want of love on the part of his parents, for they actually doated on him; but the desire of seeing him excel all others, especially his cousin, had blinded them to every thing else; and the certainty they felt of his yet becoming a great man, shut out from their view the possibility of his being taken from them.

During the Christmas holidays, a hard frost having come on, the river was frozen sufficiently to admit of skating. William and James were looking on, while Foster, who skated admirably, was exhibiting to a crowd of students. "Take care," cried one; "the ice is not safe in that quarter." Hardly were the words uttered, when the ice gave way, and half a dozen fell in. They were quickly extricated, however, with the exception of Foster. Lindsay and Crawford had been active in assisting; and when Foster was missed, Lindsay instantly had a rope fastened round his waist, and saying, "He shall not be lost if I can save him," dived under the ice, and shortly reappeared with his cousin, who was quite insensible. It was some little time before it was ascertained he still lived, and William stood in his wet clothes anxiously watching. As soon as he opened his eyes, however, he left him in Crawford's care, and ran home to change his freezing garments. This adventure accelerated his doom. A severe cold was the consequence, which ended in rapid consumption.

The first meeting between the cousins was deeply affecting. Robert wept like an infant; the hatred and rivalry of years had vanished for ever, to give place to unbounded gratitude and brotherly love. The tender attentions of Foster and Crawford were only exceeded by a mother's care, during the few months Lindsay lingered. They were his constant attendants day and night. They vied with each other in contriving how to interest and amuse him. A total change of feeling seemed to have taken place in both families. Mr and Mrs Foster knew they owed the life of their son to William Lindsay, and they would have given all they possessed to restore him to health. The anguish of the Lindsays at their son's danger, was mingled with a proud consciousness of his noble conduct, and their really kind and affectionate natures were soothed and gratified by the unity of feeling now subsisting between the families. A few days before Lindsay died, he thus expressed himself:—"How different are my feelings now from what they once were! I fancied I was happy when I gained victories over you, Robert; but I thought so, because I did not know what true happiness was. Oh, what a blessed thing it is to be at peace with all, to love all, and to be loved by all! Do not weep for me; I am going to that happy land, where there will be no rivalries, no emulations, for love will reign triumphant. My beloved friends, strive to meet me there!" "We will," said Robert, "we will; and by following your example, of overcoming evil with good."

THE CHESS-PLAYER.

[From "Pictures of the French, drawn by Themselves."]

LIKE an universal alphabet, the chess-board is known to all nations. The Bonze plays at chess in the pagoda of Juggernaut; the palanquin-bearing slave reflects how he may best checkmate a pebble king, on a chess-board traced on the sands of the Ganges; the Icelandic bishop wiles away the tedious gloom of a polar night, with his long-calculated moves on the chess-board, commencing with that which has become identified with the name of Captain Evans: in short, from pole to pole, the sixty-four squares of the noble game have solaced the sorrows of the lords of the creation.

In the middle ages, the chess-player travelled the world like a knight-errant, challenging emperors, kings, and mitred prelates, and acquiring wealth and honours by his victories. Boy, the Syracusan, was the most celebrated of these pacific warriors. He fought, rook in hand, with the Emperor Charles V., and conquered; *hand to hand* he fought with Don Juan of Austria; and that prince conceived so extraordinary a liking for both player and game, that he constructed in an apartment of his palace an immense chess-board with sixty-four squares of black and white marble, the men being of real flesh and blood, and moving at the command of the two chiefs. At the battle of Lepanto, Boy played a game of chess with Don Juan, and conquered the conqueror of the Ottomans.

At the present day, chess has lost none of its high merit, though he who sways the sceptre of the ivory kingdom may no longer enter the lists with sovereigns and popes. In Paris, in London, Vienna, Berlin, and St Petersburg, the most ambitious chess-players are content with the admiration of their friends, and are often unknown beyond the precincts of their clubs. Two great men alone have crossed the seas, and their names are known even to the Indian, thus conferring additional glory on the French chess-board. The clubs of England, and the circles of Germany, furnish no rival to M. Deschappelles and M. de Labourdonnais. It has been M. Deschappelles's good fortune, in his military life, to revive, in some sort, the exploits of Boy, the Syracusan. After the battle of Jena, he entered Berlin with the victorious army of France, repaired to the amateur chess-players' circle, and challenged the most skilful member, offering his opponent the advantage of the pawn and two moves. At this supplementary battle of Jena, the circle of Berlin was beaten singly and collectively, and M. Deschappelles ended by offering the rook. The reflective gravity which the Germans ascribe to their exact and

mathematical organisation, was conquered by the prompt and spontaneous calculation of the Parisian amateur.

Fifteen years have now elapsed since M. Deschappelles, the most intricate player of his day, retired from the lists. At the time we write, M. de Labourdonnais sways the sceptre, and reigns absolute monarch. He is about forty-five years of age; every thing about him indicates superiority. The development of his forehead is extraordinary; his eyes, overhung by immense protuberances, seem constantly closed to all outward things, and in incessant communion with the mind within. Grandson to the illustrious governor of India, immortalised by Bernardin de St Pierre, endowed with superior intellect and incredible application, he has never been ambitious of higher title than that of the first chess-player in the world; and this he has achieved. All Europe knows that M. de Labourdonnais resides in Paris, at No. 1, Rue de Ménars, the splendid hotel of the Chess Club, and that he there receives challenges and gives lessons. Strangers every day arrive from all parts of France and of Europe; some, fired with the noble ambition of encountering De Labourdonnais with equal arms; others, with the humility of acknowledged inferiors, submitting to receive an advantage; all happy to make the acquaintance of, and to cross pawns with, the renowned master. The monarch refuses no duel, no proposition: he is ready at all times, and for all opponents. At noon, fierce encounters begin in the vast saloon of the Hotel de Ménars, heated to a comfortable degree in the winter, and cool as a grotto in the summer. There may be seen the staff of M. de Labourdonnais, composed of the elite of amateurs, who, unassisted by their master, can beat all the players of the Westminster Club. As soon as M. de Labourdonnais sits down to play a game with an unknown visitor from London, St Petersburg, Vienna, or La Haye, every other game is suspended; all present flock to head-quarters; the monarch and his antagonist are hemmed in; and all eyes are fixed on the unerring finger and thumb that move the victorious pawn or man. The interest attached to the amusing scenes is intense and inexhaustible; and although the profane cannot well understand such emotion, it is enough, in order to justify this interest in the eyes of those who are not organised to comprehend it, to say, that the greatest of men have made it their favourite passion.

More successful than Napoleon, M. de Labourdonnais effected a descent in England, and conquered the Island. More fortunate in another respect, he had not to complain of his adversaries' harsh treatment, the English chess-board having no square of injustice. At the period of De Labourdonnais's visit, much was said in France of Mr Macdonald, whose play was, by some, supposed to surpass that of the great French master. All the nabobs from Pondicherry and Calcutta, all the envoys of Lord William Bentinck, all the explorers of the Indian peninsula, all the English from the East and West Indies, protested that Macdonald, of Edinburgh, was a more skilful player than the Brahmin Fla-hi, of Juggernaut, and that he would easily beat M. Deschappelles, or M. de Labourdonnais. One day, the latter quickly crossed the Channel, and repaired to London; and no sooner was his arrival at Jaunay's hotel known at the Westminster Club, than a courteous invitation was dispatched to his address, and it was not long ere a sharp contest commenced between the friendly adversaries. M. de Labourdonnais found, on this occasion, an antagonist worthy of him; the English had not boasted without reason of their champion's skill. The struggle that ensued was more warm and spirited than London will probably ever witness again. Victory, however, fell to the share of the Frenchman, being clearly established by a series of brilliant and decisive moves. To the honour of England, be it said that the members of the Westminster Club bore this memorable defeat with magnanimity. They gave M. de Labourdonnais a splendid dinner at Blackwall; the toasts, in compliment to the guest, being drunk exclusively in claret and champagne.

Macdonald's death, a few years since, left the British chess-board in a remarkable state of inferiority. The last national game, played by correspondence between the Clubs of London and Paris, was marked, on the English side, by deplorable errors. In 1838, an article in the *Talisman*, commented upon by Bell's Life, wounded the susceptibility of the nation that reckons a Chancellor of the Exchequer among its high dignitaries. That paper noticed M. Deschappelles's supplement to the battle of Jena. The noise of the levy of bucklers raised in Westminster, induced M. Deschappelles to emerge from his retreat, and throw down his glove in defiance of all England. Protocols were issued previously to the actual outbreak of hostilities. Deputies from the Britannic Club arrived at the Hotel de Ménars, and were received with an urbanity quite chivalrous: it was agreed that diplomatic notes should be exchanged after a grand dinner at Grignon's. All the elite of Paris chess-playing society were invited to the restaurant of the Passage Vivienne; the assemblage was composed of artists, bankers, peers, deputies, literary men, magistrates, generals, capitalists, physicians, lawyers, and the leading members of the Club Ménars. M. de Jouy taking the chair. The entertainment was a perfectly convivial one; the English drank toasts to France, and the French to England; and when the dessert made its appearance, the guests began to grow serious, and the cartel was produced as a crowning dish. The discussion that ensued to determine the principles of the war between the two nations, was prolonged till two o'clock in the morning, the fineness of the cabinet of St James's being conspicuous on the occasion. At day-break, the question was not advanced a stage; and it having been found impossible to come to an agreement, the treaty was broken off. M. Deschappelles, who was preparing to make his descent in England, returned to his tent; and the only result of the discussion was the reminiscence of an excellent dinner at Grignon's.

The evenings at the Club Ménars have latterly been very animated, and have moreover created a prodigious

sensation beyond the precincts of the club-house, on account of the marvellous games played by M. de Labourdonnais, with his back turned towards the chess-board. Philidor, the renowned musician and chess-player, was the originator of these incredible feats, and no one since his time thought of reviving them. M. de Labourdonnais had long pondered on the tradition, and this laurel of Philidor's frequently disturbed the monarch's sleep. One day, he attempted one of these intuitive combinations, and with complete success: the next day he played two more games on the same plan, playing out and winning both. The report of these games spread like lightning, and caused a great sensation in the chess-playing world. The doors of the Ménars Club were thrown open to amateurs and the curious, and M. de Labourdonnais twice again repeated his experiment in public. The two games were played in the billiard-room. M. de Labourdonnais seated himself in a corner, with his back towards the two chess-boards, his face turned to the wall, and hidden by his hands. An amateur stood by to proclaim aloud the move made by the antagonist. M. de Labourdonnais then played in his turn, naming the piece he required to be moved, as if the chess-board had been before him. As the game drew to a close, and as the board became cleared of taken pieces, the increasing intricacy of the position brought about by anterior moves, so difficult to be remembered by the blindfolded player, excited the imagination of the spectators to such a degree, that they deemed a happy termination of the game next to impossible. Let the reader, knowing the wonderful complication of the game, add to this the confused hum of voices from all parts of the saloon, the stifled murmurs of the bystanders making remarks and expressing their astonishment, the opening and shutting of doors, the dull tramp of feet, the reiterated noise of coughing (it was in the depth of winter), the loud and joyful exclamations of parties newly entering in ignorance of what was going forward—in a word, all the innumerable trifling incidents, any one of which is usually sufficient to distract attention, and imagination becomes almost inadequate to conceive an idea of the mental prodigy. Psychological analysis of such a labour is impossible: the mind turns from it bewildered. The fact can only be stated, without explanation or comment.

OCCASIONAL NOTES.

PERQUISITES OF SERVANTS.

WE congratulate ourselves in this age upon the abolition of the practice of giving vails to servants, without considering that another custom as vicious still prevails amongst us with reference to this part of the community. The necessity under which tradesmen lie, or suppose themselves to lie, of giving allowances to servants on all the monies paid by their masters or mistresses for goods purchased, is as grievous a tyranny as the custom of vails was in former days, and not less worthy a vigorous effort to get it abrogated. Many employers of servants are not perhaps aware of the mischievous effects of this custom. It is nearly universal, we believe, in all our large towns, or at least may be said to hold with regard to all servants who are entrusted with any direct transactions with tradesmen. The cook expects an allowance from the butcher, baker, and vegetable merchant; the butler looks for a douceur from the wine-merchant and goldsmith; and the housekeeper requires a per-centage on every pound spent on groceries. Perhaps five per cent. may be the average profit realised by servants on the goods purchased by their employers—a profit realised without outlay of capital, without industrious exertion, without any sort of merit on their part whatsoever, while the profits of the tradesman himself, with all his industry, outlay of capital, risk of loss, and skill in business, is not in many instances quite so much, and in few instances much more. Many masters may be under an impression that this allowance is something abstracted or deducted from the tradesman's profits, and therefore is no concern of theirs. But this is a delusion. The necessity of giving such allowances must upon the whole have the effect of raising the prices of goods, for it must take its place amongst the circumstances which determine prices. Thus the master is in the long-run the loser. He is not so, perhaps, to the full amount of the allowances given to his servants, for as some customers do not exact the servant-allowance, and yet pay the same prices as the rest, the loss will of course be apportioned over the whole; but it cannot, we should suppose, be any consolation to a set of honourable men or women, that the whole mischief resulting from an error of theirs, is not concentrated upon themselves, but shared by innocent parties. This, indeed, should only be an additional and most powerful reason for the effort which is required to put an end to the practice. It is with masters alone, we believe, that the power of extinguishing the custom resides. The tradesmen can no more do it than can a few of the subjects of an oriental despotism resist the powers placed over them. If any one on any occasion refuses to give the customary allowance, the servant is in general at no loss to take away his master's custom. Suppose the case of an oil-merchant: the servant has only to mix a little water with the oil to prevent it from burning clearly, in order to make the master give orders for trying another shop. And so on with other articles of domestic consumption. Nor is this the only means of bringing the refractory "to reason." There are many modes of annoyance which servants have it in their power to practise against tradesmen. For example,

* Exchequer (*Echiquier*) means in French a chess-board.—Ed.

in the case of plate borrowed from the goldsmith, it is easy for a butler to return it in a state so far from its original cleanness, as to make the tradesman fully worse off than he would have been by granting even a liberal allowance. In fact, this custom is simply a tyranny which one portion of the community exercises over another, and, like all tyrannies, it is as demoralising for the active as for the suffering party. It may not be easy at once to put an end to it; but all conscientious masters and mistresses are bound to use every effort in their power for that purpose. They should, in the first place, make such arrangements as to wages with servants, as to leave no pretence for the expectation of perquisites. It should be an agreed point, that no such thing is to be in any case exacted. They should see that this is understood by their tradesmen, whom, on the other hand, they should bind not to give allowances. Finally, they should be guarded against complaints brought by servants against these tradesmen, and in every case inquire for themselves into the alleged cause of dissatisfaction. By such means, under a vigorously sustained effort, the system might be brought to an end, and with no higher advantage to any, we are convinced, than to servants themselves, with whom it is at present only a source of corruption, tending to impair that respectability which, as a large and useful portion of the community, they are entitled to enjoy.

ODD LONDON CHARACTERS OF FORMER TIMES.

SAMUEL BOYSE.

FIELDING, in the introductory chapter to the seventh book of *Tom Jones*, after citing the well-known passage from Shakspeare, "Life's a poor player," &c. says, "For which hackneyed quotation I will make the reader amends by a very noble one, which few, I believe, have read. It is taken from a poem called *THE DEITY*, published about nine years ago, and long since buried in oblivion—a proof that good books, no more than good men, do always survive the bad:—

From Thee all human actions take their springs,
The rise of empire and the fall of kings!
See the vast theatre of Time displayed;
While o'er the scene succeeding heroes tread;
With pomp the shining images succeed;
What leaders triumph and what monarchs bleed;
Perform the parts thy providence designed;
Their pride, their passions to thy ends inclined!
A while they glitter in the face of day,
Then at thy nod the phantoms pass away;
No traces left of all the busy scene,
But that Remembrance says—*THE THINGS HAVE BEEN!*"

These are sounding lines, and if the whole poem were presented, the reader would probably say that it contains many other passages equally good, and is altogether a most respectable production for its time. Pope himself acknowledged that there was much of it which he would not have been ashamed of as his own; and the pious Hervey recommended it as "truly evangelical, admirably fitted to delight and comfort the heart, alarm and improve the reader." The author of this poem was Samuel Boyse, a man at the very time of its composition living something worse than even that wretched life ascribed by Johnson to Savage, and perhaps the most striking association of good intellect with low and dissipated habits which our literary history presents.

He was the son of an eminent dissenting minister in Dublin, where he seems to have been born in the year 1698. His father, probably intending him for his own profession, sent him at eighteen to prosecute his studies at the University of Glasgow, where, however, he had not been for two whole seasons, when, unsettled in life, without immediate means of his own, his professional education even unfinished, he married. With his wife, who was the daughter of a tradesman named Aitchison, he was soon obliged by want to go to Dublin, and throw himself upon his father. As if to make the burden as great as possible, he took his wife's sister along with him. The old man, who seems to have been a person of simple and amiable character, treated his three dependents with kindness, trusting that his son would soon exert his abilities to some purpose. But Samuel, instead of diligently applying himself to any course of productive industry, spent his time in trifling pursuits and in expensive frivolities, so that in a short time he exhausted the resources of his father, who, running into debt, was forced to sell a small patrimonial estate in Yorkshire to relieve himself from embarrassment, but nevertheless died in such penurious circumstances, that he was buried at the expense of his congregation.

Boyse had meanwhile become a poet. The death of his father leaving him and his wife destitute, he returned to Scotland, possibly in some hopes of assistance from her relations. How a poor Irishman of poetical tendencies should have thought of settling in Edinburgh—at that time not a literary mart—we cannot divine; but he appears to have betaken himself to the Scottish capital about the year 1730, and to have there published his first volume of poems in the ensuing year. His talents had secured some respectful attention and pecuniary encouragement from Susanna Countess of Eglintoun, noted for her beauty and her patronage of literary men; and to this lady, Boyse dedicated his volume. On the death of the Viscountess Stormont, who was also a lady of taste, Boyse wrote an elegy, entitled "The Tears of the Muses," which so pleasingly affected her surviving

husband, that he ordered his agent, an Edinburgh writer, to present the author with a certain sum of money. It has been stated that some difficulty was experienced in getting the money conveyed to the poet. He lived so obscurely, and associated with such mean people, that no respectable person was found who could tell where he lived. An advertisement in the newspapers was the means resorted to for the purpose of bringing him to receive Lord Stormont's bounty. He afterwards obtained the patronage of the Duchess of Gordon, who exerted herself to obtain for him a permanent means of subsistence. This lady had actually succeeded in getting him the promise of a place in the Custom-house; Boyse being with her, at her country house, a few miles from Edinburgh, she gave him a letter which he was to take with this view to one of the Commissioners of Customs. The day was rainy, the poet was indolent. He did not go at the proper time with his letter, and the commissioner, disappointed, gave the office to another. In time he exhausted the benevolence and patience of all these patrons, and, falling deeply in debt, found it necessary to leave Edinburgh, and try his fortune in London.

He carried with him recommendatory letters from the Duchess of Gordon to the first English poet of the age, and to the Lord Chancellor King. When he called at the house of the former at Twickenham, Mr Pope was not at home: he never called again, and thus lost all the benefit which might have been expected from the friendship of that illustrious person. He used to speak of the favourable reception he met with from the chancellor, and of once or twice dining with him; but his friends never could believe the tale, for Boyse had no power of conversing on equal terms with gentlemen, and "was of such an abject disposition, that he never could look any man in the face whose appearance was better than his own." Lord Stormont had given him a letter to his brother, the Solicitor-General (afterwards Earl of Mansfield), but of the fate of that letter no notice has been taken by his biographers. The personal aspect of Boyse was not prepossessing; no one could have guessed from his conversation that he possessed superior intellect. What was worst of all, he had no esteem for himself. He felt no right in his own nature to the least respect from his fellow-creatures, much less any title to be considered as superior to most. He was content with the meanest friendships, and was willing to send the fruits of his talents into the world through the humblest channels. This want of spirit made him submit to distresses which he easily might have avoided or remedied. It reconciled him to supply a temporary want by a mendicant letter, when a little well-regulated exertion might have made him independent of all such wretched expedients. He was also voluptuous, without the least taste for elegance. "Can it be believed that often when he had received half a guinea, in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, without having any one to participate the regale with him, and while his wife and child were starving at home! This is an instance of base selfishness for which no name is as yet invented, and except by another poet [Savage], with some variation of circumstances, was perhaps never practised by the most sensual epicure." This was the man who could occasionally write in the following strain:—

"Hence, distant far, ye sons of earth profane,
The loose, ambitious, covetous, or vain;
Ye worms of power! ye minioned slaves of state,
The wanton vulgar, and the sordid great!
But come, ye purer souls, from dross refined,
The blanchest heart and uncorrupted mind!
Let your chaste hands the holy altars raise,
Fresh incense bring, and light the glowing blaze;
Your grateful voices aid the muse to sing
The spotless justice of the Almighty king!" &c.

It appears that many eminent dissenters assisted Boyse with small sums of money, out of respect for the memory of his father; but at length he exhausted the patience of these friends, who saw that it was in vain to aid one who could not aid himself, and who never was permanently the better of their generosity. About this time (1740), according to the writer just quoted, "Boyse had not a shirt, a coat, or any kind of apparel to put on; the sheets in which he lay were carried to the pawnbroker's, and he was obliged to be confined to bed, with no other covering than a blanket. He had little support but what he got by writing letters to his friends in the most abject style. He was perhaps ashamed to let this instance of distress be known, which might be the occasion of his remaining six weeks in that situation. During this time he had some employment in writing verses for the magazines; and whoever had seen him in his study must have thought the object singular enough. He sat up in bed, with the blanket wrapt about him, through which he had cut a hole large enough to admit his arm, and, placing the paper upon his knee, scribbled in the best manner he could the verses he was obliged to make: whatever he got by these, or any of his begging letters, was but just sufficient for the preservation of life. And perhaps he would have remained much longer in that distressful state, had not a compassionate gentleman, upon hearing this circumstance related, ordered his clothes out of pawn, and enabled him to appear again abroad.

"This six weeks' penance," continues our authority,

"one would imagine sufficient to deter him for the future from suffering himself to be exposed to such distresses; but by a long habit of want it grew familiar to him, and as he had less delicacy than other men, he was perhaps less afflicted with his exterior meanness. For the future, whenever his distresses so pressed as to induce him to dispose of his shirt, he fell upon an artificial method of supplying one. He cut some white paper in slips, which he tied round his wrists, and in the same manner supplied his neck. In this plight he frequently appeared abroad.

He fell upon many strange schemes of raising trifling sums. He sometimes ordered his wife to inform people that he was just expiring, and by this artifice work upon their compassion; and many of his friends were frequently surprised to meet the man in the street to-day, to whom they had yesterday sent relief, as to a person on the verge of death. At other times he would propose subscriptions for poems, of which only the beginning and conclusion were written; and by this expedient would relieve some present necessity. But as he seldom was able to put any of his poems to the press, his veracity in this particular suffered a diminution; and, indeed, in almost every other particular he might justly be suspected, for if he could but gratify an immediate appetite, he cared not at what expense, whether of the reputation or purse of another."

Boyse was a contributor of poetry to the *Gentleman's Magazine*, and thus became acquainted with Samuel Johnson, then also a struggling man of letters, but one who never lost sight of rectitude. Johnson informed Mr Nichols that he once raised a sum of money to redeem Boyse's clothes, which had been pawned, and which, in two days after, were pawned again. Mr Nichols relates, from the same respectable authority, that Boyse translated well from the French; but if any one employed him, by the time one sheet of the work was done, for which a sum could be obtained, he pawned the original. If the employer redeemed it, a second sheet would be completed, and the book again be pawned; and this perpetually. He wrote various poems, of considerable merit, including the one which we have quoted, and which was his best; but they came before the world through the hands of booksellers from whom nothing good was expected, and thus fell unobserved from the press. In 1742, he was brought to a sponging-house in Grocer's Alley in the Poultry, from which he wrote a strange letter of entreaty to Mr Cave, the publisher of the *Gentleman's Magazine*. It began in rhymed Latin verse, describing himself as "without bread, without money, and famishing of hunger," yet in a strain of humour which makes us for the moment regret a resolution to admit as little as possible besides English into these pages. "I am every moment," he adds, in prose, "threatened to be turned out here, because I have not got money to pay for my bed two nights past, which is usually paid beforehand; and I am loath to go into the Compter, till I see if my affairs can possibly be made up. I hope, therefore, you will have the humanity to send me half a guinea for support, till I finish my papers in your hands. I humbly entreat your answer, having not tasted any thing since Tuesday evening I came here; and my coat will be taken off my back for the charge of the bed; so that I must go into prison naked, which is too shocking for me to think of." Johnson used to write to Cave for little sums, adding to the signature of his name *Impransus* [Undined]; but his distresses were nothing to those of Boyse.

About the year 1745, the wife of this wretched man died. He was then living at Reading, engaged in the compilation of a large work of modern history, for which he was paid a salary of half a guinea a week. He had an affection of appearing very fond of a little lapdog, which he always carried about with him in his arms, imagining that it gave him the air of a man of taste. Being too poor to afford black clothes for himself, he bought half a yard of black ribbon, which he tied round this little creature's neck, by way of mourning for the loss of its mistress. This apparently was not in mockery of the deceased, but from a mere spurt of that light and inconsiderate nature which was the cause of all his woes. The work upon which he was engaged at Reading included a history of the Rebellion of 1745-6, which we have read, and consider as well executed for the time.

After his return from Reading, some improvement was remarked in his conduct. Early impressions of piety returned to him, and he formed a resolution to live a better life. But this moral improvement seems to have been the mere result of a decay of the powers of life, which was now taking place, probably in consequence of literary toil and deficient aliment. He now married again, his second spouse being a decent widow, who served him as a faithful nurse during the remainder of his days. He survived the second marriage only nine months, dying in an obscure lodging near Shoe Lane, in May 1749. Mr Francis Stewart, son of a bookseller in Edinburgh, and an amanuensis of Dr Johnson, has given us the last melancholy chapter of his biography. "After his death," says this person, "I endeavoured all I could to get him decently buried, by soliciting those dissenters who were friends of him and his father, to no purpose; for only Dr Grosvenor, in Hoxton-Square, a dissenting teacher, offered to join towards it. He had quite tired out those friends in his lifetime; and the general answer that I received was, 'That such a contribution was of no service to

him, for it was a matter of no importance how or where he was buried.' As I found nothing could be done, our last resource was an application to the parish; nor was it without some difficulty, occasioned by the malice of his landlady, that we at last got him interred on the Saturday after he died. Three more of Dr Johnson's amanuenses, and myself, attended the corpse to the grave. Such was the miserable end of poor Sam, who was obliged to be buried in the same charitable manner as his first wife; a burial of which he had often mentioned his abhorrence." Another friend of Boyse says, "The remains of this son of the muses were, with very little ceremony, hurried away by the parish officers, and thrown amongst common beggars; though with this distinction, that the service of the church was performed over his corpse. Never was an exit more shocking, nor a life spent with less grace, than those of Mr Boyse, and never were such distinguished abilities given to less purpose. His genius was not confined to poetry only: he had a taste for painting and music, and was well acquainted with heraldry. His poetical pieces, if collected, would make six moderate volumes. Many of them are scattered in the Gentleman's Magazine, marked with the letter Y and Alcaeus. Two volumes were published in London; but as they never had any great sale, it would be difficult to find them." It may be added, that a selection of the writings of this miserable man is usually included in the collected editions of the English Poets.

The character of Samuel Boyse appears to us eminently illustrative of some propositions hazarded in a late article on mental ability. We clearly see in him thinking powers superior to those of most men, brilliant imagination, and elegant powers of expression. He can also simulate or affect the finest feelings on moral subjects. But he has not in himself any active moral feelings. He has no desire to provide for himself and those dependent on him; he clings first to relations, and then as readily to strangers, for the means of supporting his necessities. No humiliation shocks him so far as to make him wish to avoid such for the future. He has not the least sense of the decencies of the social world. Besides, he is selfish, and will gratify himself with luxuries while his wife and child are in want of the simplest necessities. What are we to say of such a mind? Are we to consider it as a great or high mind, with certain failings? This, in our opinion, is not the philosophical course. We rather regard it as an extremely ill constituted mind, some faculties being in large endowment, and others nearly altogether wanting. We may pity it as something monstrous, but cannot give it the least admiration.

SKETCHES OF SUPERSTITIONS.

MAGIC—AMULETS—TALISMANS.

MANY of the superstitious observances and ideas common among the Greeks and Romans, and some of which survived till later times, were, as has been mentioned in the preceding sketches, originally derived from Egypt and Persia. These countries, with Chaldea in Arabia, appear to have formed a fountain of knowledge to mankind, either truthful or consistent with nature, or altogether vain and delusive. At a period fully two thousand years before Christ, Persia and the adjacent regions of Babylonia and Chaldea were inhabited by a comparatively learned people. Persia, in particular, was distinguished for its wise men or magi, whose knowledge of geometry, astronomy, and other branches of science, became the wonder of surrounding nations, and (perhaps with their own concurrence) procured them the reputation of dealing with beings of a supernatural order. Thus, from the general appellation of *magi*, the term *magician* took its rise, and was deemed equivalent to that of conjuror, or a possessor of supernatural gifts.

The pretended art of conjuration which the magi, or their imitators, affected to cultivate, appears to have been, in its chief departments, nothing else than a species of jugglery, resembling that which is now practised in India, and also in modern Egypt. Common sense, independently of all inquiry, proves that it possessed no higher character. The belief attempted to be inculcated, was, that its professors enjoyed the mysterious power of calling up the spirits of persons deceased, and of compelling an ideal order of demons or genii to perform certain services for which human agents were not competent. But no such powers, it is clear, existed, and the apparently wonderful performances which for centuries imposed upon the vulgar, could have been easily explained by a reference to sleight of hand, collusion of confederates, secret information of facts, and ventriloquism. That the last was practised for purposes of deception, there can be no manner of doubt. The priests of the Egyptian, as well as the Grecian, oracles, were well acquainted with acoustics, or the science of sound, and how a small voice could be made to proceed, in appearance, from the mouth of one of their marble or brazen deities. It was common for them, also, to lead a multitude of

worshippers into the recesses of a grove, to hear a tree deliver an oracular response to some important inquiry which was put to it. In the present day we can account in a natural manner for these mysterious manifestations, but at the time that such sleights of skill were practised, they were invariably ascribed by the uninitiated to supernatural causes.

The cultivation of magic, as a kind of science—in reality the science of self-delusion and imposture—was in some respect dignified by its alliance with astronomy, and the other branches of learning which were known or in vogue. All pretended magicians in ancient times boasted of a kindred knowledge of the stars, by which, as they alleged, they could foretell future events in the destiny of nations and individuals. In perusing the pages of Scripture, we are struck with the repeated allusions to the abominations of idolatry, conjuration, and other vain arts, of which the Israelites were guilty, and which they learned from the Egyptians and Babylonians, both their near neighbours. If Josephus is to be credited, Solomon, who flourished a thousand years before Christ, and was one of the most enlightened men of his time, was an adept in magical arts. "He had (he observes) the skill to expel demons, which is a science useful and sensitive to men. He composed such incantations, also, by which distempers are alleviated. And he left behind him the manner of using exorcisms, by which they drive away demons, so that they never return, and this method of cure is of great force unto this day; for I have seen a certain man of my own country, whose name was Elcazar, releasing people that were demoniacal in the presence of Vespasian, and his sons, and his captains, and the whole multitude of his soldiers. The manner of the cure was this:—He put a ring that had a root of one of those sorts mentioned by Solomon to the nostrils of the demoniac, after which he drew out the demon through his nostrils; and when the man fell down immediately, he adjured him to return to him no more, making still mention of Solomon, and reciting the incantations which he composed. And when Elcazar would persuade and demonstrate to the spectators that he had such a power, he set a little way off a cup or basin full of water, and commanded the demon, as he went out of the man, to overturn it, and thereby to let the spectators know that he had left the man; and when this was done, the skill and wisdom of Solomon was shown very manifestly: for which reason it is, that all men may know the vastness of Solomon's abilities, and how he was beloved of God, and that the extraordinary virtues of every kind with which this king was endowed, may not be unknown to any people under the sun; for this reason, I say, it is that we have proceeded to speak so largely of these matters."

Josephus wrote upwards of a thousand years after Solomon, and we may be excused for believing that at that distance of time the wisdom of that great man had been so misrepresented by tradition, as to appear magical or supernatural. It will also be well to recollect, that on the return of the Israelites from their captivity in Babylon, they brought with them the arts of conjuration or jugglery, so that the Jewish magi, as they were called, at about the commencement of the Christian era, and till the final destruction of Jerusalem by Titus (A.D. 70), rivalled in their sorceries, or frauds, the early and accomplished magi of Persia. Among these Jewish professors of the neeromantic art, and of whose performances Josephus was a witness, the Cabala or legendary lore (properly, unwritten belief) of the Hebrew nation, was held in great esteem. With much that was historical and excellent, it contained a mass of artificial and mystic science, referring to the potency of certain charms, words, figures, and numbers. Among these, the name of Solomon, when pronounced in a particular manner, and accompanied with certain looks and gestures, was believed to possess extraordinary virtue. There was, in truth, no species of jugglery which was not occasionally sanctioned by the use of that wonderful name; and such was its supposed efficacy, that, until the present day, it is used by the pretended magicians of Arabia, Persia, and other oriental countries. Josephus, in the story we have quoted, alludes to the root of a magical herb concealed in a ring, which, he says, had been mentioned by Solomon; a description is elsewhere given by the historian of a wonderful vegetable production of this nature,† and we extract it as a curiosity. He is describing a place in Judea called Macherus:—

"In that valley which encompasses the city on the north side, there is a certain place called Baaras, which produces a root of the same name with itself; its colour is like to that of flame, and towards the evening

it sends out a certain ray like lightning; it is not easily taken by such as would do it, but recedes from their hands, nor will it yield itself to be taken quietly;

* * * * * may, it is certain death to those that touch it, unless any one take and hang the root itself down from his hand, and so carry it away. It may be taken another way, without danger, which is this: they dig a trench quite round about it, till the hidden part of the root be very small; they then tie a dog to it, and when the dog tries hard to follow him that tied him, this root is easily plucked up, but the dog dies immediately, as if it were instead of the man that would take the plant away; nor after this need any one be afraid of taking it into his hands. Yet, after all this pains in getting, it is only valuable on account of one virtue it hath, that if it be only brought to sick persons, it quickly drives away those called demons, which are no other than the spirits of the wicked, that enter into men that are alive, and kill them, unless they can obtain some help against them." How lamentable is it to find a respectable writer giving credit to such a silly fable!

From legends equally illusive, the practice of using magical or sacred charms in the form of talismans and amulets, as preventives of disease, specifics for the cure of maladies, or as shields for averting the malign influence of demons, was common among the ancient Babylonians, Jews, Egyptians, Greeks, and Romans. All were tainted with the same delusive superstition, though each practised it in a different way. The charms, by whatever name they were called, were usually composed of scraps of herbs, bones, stones, or metals, shaped in a particular manner, and hung round the neck, or fixed in a ring on the finger. There is reason to believe that the fashion of wearing rings had its origin in this kind of superstitious observance, or at least was greatly promoted by it. Talismans of metal, covered with astrological and literary jargon, were of great antiquity, especially among the Arabian and Persian tribes. The charms of the Egyptians were more commonly in the form of small earthenware or stone figures, symbolical of some of the gods of the country, and were worn privately about the person. Many thousands of these talismanic figures have been found in the linen swathings of the mummies, and are exposed to the inspection of the curious in every repository of antiquities; hundreds of them are to be seen in the British Museum in London.

The phylacteries of the Jews were a species of talismans or amulets, though ostensibly used for the pious purpose of reminding the wearer of his duty. They consisted of fillets, on which were inscribed passages of the divine law, and were bound on the wrist, on the forehead, or some other part of the person. The practice of using these sacred charms appears to have originated in the desire to act literally on the injunctions of Scripture, to ponder diligently on the commandments, and also the sacred offices of religion; as, for example, "And thou shalt bind them for a sign upon thine hand, and they shall be as frontlets between thine eyes."—Deut. vi. 8. "Bind them about thy neck, write them on the table of thine heart."—Proverbs, iii. 3. Phylacteries are still used by all the more scrupulous, indeed, we believe, by all real Jews, in whatever country or situation of life they may be placed.

Of the various jargon of words inscribed on the talismans of the ancient Syrians, no term was supposed to possess such mystic influence, nor was so frequently used, as the name of one of their gods or tutelary genii. This very notable and strange-sounding word was ABRACADABRA. The name of Solomon was not a greater spell among the degenerate Jews than Abracadabra among the Syriac race. To be of any value, however, as a charm, it was indispensable that it was written on a tablet in a very peculiar tapering manner, and hung by a linen thread about the neck. The word was written thus:—

ABRACADABRA
ABRACADABR
ABRACADAB
ABRACADA
ABRACAD
ABRACA
ABRAC
ABRA
ABR
AB
A

What are we to think of the intellect that could for an instant imagine there was any virtue in such a piece of nonsense?

For several centuries, the early apostles of Christianity endeavoured to abolish these superstitious, or at least formal observances, but the bulk of mankind were at the time in a state of intellectual darkness, and prepossessed in favour of the old superstitions, and were unwilling to abandon, even on becoming Christians, their ancient delusive customs. Judging from the denunciations of St Chrysostom, and other early fathers, the practice of using amulets was common among the Roman and Grecian converts to Christianity; and thus, by an easy process of transition, sundry superstitious observances of the heathen worship and belief were unfortunately attached to the pure and exalted faith which succeeded them. Whether from this or any other cause, it is certain that some of the ancient superstitions continued in popular use, notwithstanding the edicts of the later Roman emperors, and also the anathemas of the church. In the reign of Caracalla there was a law passed to inflict a severe punishment on those who should continue to

* Antiq. Book viii. Chap. II.

† Wars of the Jews, Book vii. Chap. vi.

wear amulets. As appears from the following incident, magic continued to be practised as a profession in the reign of Valens, in the fourth century. A party desiring to ascertain who should be the emperor's successor, had recourse to one Jamblicus, a professed magician, for the required information. The sorcerer adopted a mode of divination as follows. Having written the letters of the Greek alphabet in the dust, and laid a grain of wheat upon every one of them, a cock, magically prepared, was let loose amongst them, and those letters out of which he picked the corns being joined together, were to form the name of the fortunate successor to the reigning monarch. The cock, however, as bad fortune would have it, picked up only four grains, namely, those upon the letters *th e o d*,* making the half word *Theod*, and therefore left it uncertain whether Theodorus, Theodotus, Theodorus, or Theodates, was the person designed by the fates to be emperor. Worse than all, Valens heard of the magical rite, was enraged at it, and put to death several persons for no other reason than that their names began with *Theod*; he also caused a diligent search to be made for poor Jamblicus, who, to avoid a cruel death, ended his life by poison.†

We cannot conclude the present article on amulets and charms more appropriately, than by quoting the following account of a remarkable talisman of great antiquity, still preserved at Lee, a gentleman's house in Lanarkshire, and popularly known as the *Lee Penny*. We use the narrative given in the *Picture of Scotland*, by R. Chambers.

"Simon Locard of Lee accompanied the good Sir James Douglas to Palestine [in the fourteenth century], bearing the heart of King Robert Bruce enclosed in a locked case, on which account his name was changed to Lockhart, and he obtained for his armorial bearings a heart attached to a lock. Engaging in the wars of the Holy Sepulchre, this hero, who, at the death of Douglas in Spain, became the leader of the mission, had the good fortune to make a Saracen of rank his prisoner. The lady of the warrior came to pay his ransom, and was counting out the money, when she happened to drop from her purse a small jewel, which she immediately hastened to pick up with an air of careful solicitude. Lockhart eagerly inquired the nature of the jewel, and learning that it was a mediatory talisman, refused to deliver up his captive, unless it were added to the sum previously stipulated. The lady was obliged to comply, and Simon brought it home to Scotland, where it has ever since continued in the possession of his descendants, perhaps the only existing memorial of the crusades in this country. It is called *THE LEE PENNY*, on account of its being set in the centre of an old English silver coin. Triangular in shape, it measures about the third of an inch each way, and is of a dark red colour, but perfectly transparent. The nature of the stone cannot be determined by lapidaries, being apparently different in all respects from any known in this quarter of the world. To the edge of the coin a small silver chain has been attached, and the whole is deposited in a gold box which the Empress Maria Theresa presented to the father of the late Count Lockhart.

The *Lee Penny* did not lose its talismanic property on being transferred to a country of Christians. On the contrary, it has been all along, even till the present day, remarkable for medical virtue. It is especially sovereign in the diseases of horned cattle. The mode of administering it is this:—Holding it by the chain, it is three times plumped down into a quantity of water, and once drawn round—*three dips and a swirl*, as the country people express it—and, the cattle or others affected drinking this water, the cure is speedy and effectual. Even at this day, rife as the gospel is now said or supposed to be, people sometimes come from great distances with vessels, which they fill with water charmed in the manner described, and which they take home in order to administer it to their bestial. In the reign of Charles I., the people of Newcastle being afflicted with the plague, sent for and obtained a loan of the *Lee Penny*, leaving the sum of £6000 sterling in its place as a pledge. They found it so effectual, or were impressed with so high an opinion of its virtues, that they proposed to keep it, and forfeit the money; but the Laird of Lee would not consent to part with so venerable and so gifted an heirloom. The laird of that time was a high Cavalier, and one of the charges brought against him by the party whom he had to oppose, was, that he effected cures by means of necromancy. One other remarkable instance of its efficacy is recorded. About the beginning of the last century, Lady Baird of Saughtonhall having been bit by a mad dog, and exhibited all the symptoms of hydrophobia, her husband obtained a loan of the talisman; and she, having drunk and bathed in water which it had sanctified, got completely better. That this transaction really took place, seems indubitable, for an ancient female member of the Lee family, who died lately, remembered hearing the laird who lent the Penny to Lady Baird, describe how he and his dame had been invited to Saughtonhall, and splendidly entertained, in gratitude for the use of the talisman.‡

Being now visited by an incredible number of persons, whose curiosity has been excited respecting it, Sir Charles McDonald Lockhart, the present proprietor, has adopted the idea of keeping an album, in which their names are recorded. We have all seen the use made of it by the Author of *Waverley*, in his fine chivalric tale, 'the Talisman.'

THE LONDON AND BIRMINGHAM RAILWAY.

AN uninterrupted double line of railway now extends in a diagonal direction across England, from London to Liverpool, a distance of nearly two hundred miles, and is daily travelled by passengers in the space of ten hours. The line, unfortunately for the perfect comfort of the public, is not one concern throughout, but belongs to three different companies; and in making the entire journey, a change of carriages takes place at Birmingham, which is rather more than half way between the two extremities. One company owns the line from London to Birmingham, another owns the Grand Junction, as it is called, which extends from that town to a point upon the Liverpool and Manchester railway, and this last is the property of the third company. A fourth company has lately opened a line in connection with the preceding to Preston, and shortly another extension will take place to Lancaster. Any line farther north than Lancaster is, we believe, still a matter of speculation.

The London and Birmingham line, which we propose in the present paper to describe, was fully opened in September 1838: it extends 112½ miles from the entrance at Euston Square in the northern part of London, to a spot in the northern environs of Birmingham. It passes through six counties, within one mile of the city of Coventry, and of numerous towns, as Rugby, Tring, Stratford, Leighton Buzzard, Berkhamstead, Walford, and Harrow, &c. &c. Between Camden Town and Euston Square the trains are worked by a stationary engine, by means of a rope 100,000 feet in length, and eight inches in circumference.

The fine Doric portico in Euston Square reminds us of the propylee of the Greek cities, with centre and two lodges upon each side. Its proportions are elegant; the columns are eight feet and a half in diameter, forty-two feet in height, and the full height of this noble edifice, to the apex of the pediment, is seventy-two feet. The cost of the front alone, with the wings, exceeded £35,000. The entire offices are upon an admirable plan for convenience and respective communication; and we find all the arrangements simple, comprehensive, and exact. With regard to the station of the carriages, and the passing of the trains, the simple regulation of adhering to the old practice of keeping the left side, has wonderful effect in facilitating the general business, while it obviates all danger of accident, or collision by the trains. Passing through a handsome suite of offices, where tickets are given, we enter a capacious yard covered overhead, with a roof supported by iron columns. Proceeding from this great starting point, the train carries us speedily through a wide cutting twenty feet deep, with iron balustrades at the top, and which terminates at about a mile's distance at Camden Town. To this place four lines of railway may be observed, but afterwards there are only two, except at depôts and sidings. At Camden Town station the locomotive engine is attached to the train, and in an instant we are swiftly carried forward on our journey, the vehicles almost immediately passing through a tunnel of 1100 yards in length beneath Primrose Hill. On emerging into open day at the farther extremity, we have a pleasant open landscape of hill and dale before us; the hills of Hampstead, Highgate, and Kelburn, greet the eye, spotted with villas and church-spires; and not far from us the quiet secluded neighbourhood (Kingsbury), where Goldsmith withdrew from the town wits and clubs to compose his *History of Animated Nature* and his *Vicar of Wakefield*. A little farther on we pass the Kelburn tunnel, 420 yards, and the Brent valley embankment, rising in parts thirty-five feet, and affording wide and diversified views. Harrow is seen crowning the highest point of vision, and the river Brent flowing beneath through a picturesque bridge, with arches which rise nearly forty-five feet above the level of the stream.

Soon after entering the Colne valley, the line passes over the London road by a viaduct of five arches of forty-three feet span each, composed of ellipses, with vausoirs at the intrados, the centre arch being oblique, to adapt itself to the course of the road. The Walford tunnel is a singular work, formed by sinking six shafts, and then by excavating the earth horizontally in what is called by miners a drift—a small aperture, only wide enough to admit one man at a time. The use of this is to obtain greater certainty in setting out the line, a communication being formed to the several working-shafts, with a free ventilation of air to facilitate the labour of the works. A wide opening is still observed; and this, it would appear, was rendered necessary, by a serious accident; the whole of the soil surrounding one of the shafts giving way, and overwhelming ten men who were at work below. Not one had time to save himself; and a poor bricklayer was taken out three weeks afterwards, standing perfectly upright, with his trowel advanced in his hand. It took a whole month to remove the entire mass of soil, when the opening was found so extensive that it was at once decided to

turn it into a large ventilating shaft. The excavation was carried to between fifty and sixty feet in depth. We next traverse an embankment three miles long and nearly forty feet high, which contains an elegant iron bridge, passing obliquely over the Grand Junction Canal.

Passing the village of King's Langley, we enter a cutting of two miles, reached the Box-moor station on an embankment commanding a view of a cultivated and extensive valley, running parallel to and crossing the London road, by a bridge of one arch, at an angle of 32 degrees. It is a finely executed specimen of the oblique arch, especially in the spiral courses of the bricks. Next we come to the Berkhamstead station, built in the Gothic style, where the line approaches so nearly the Grand Junction Canal as to require a very extensive reclaiming wall, 650 feet in length, which has all the appearance of a long viaduct. Some excavations still mark the spot where stood the ancient castle of Berkhamstead, erected by the Saxons, and at which William the Conqueror met the English confederates, and swore to the observance of the established laws. Many traditions relative to the ancient church and its neighbourhood are found in Stowe and Hollinshed; nor is Berkhamstead less remarkable as being the birth-place of the poet Cowper. The North Church tunnel, the Tring station, the Leighton tunnel, Cheddington, where the Aylesbury branch line commences, Linslade tunnel, Denbigh Hall bridge, Wolverton station, where large works are still in progress, and Stoney Stratford, are the next portions of the line we traverse. The viaduct over the Ouse is a noble piece of architecture, in the execution of which great difficulties were encountered. At the central station of Wolverton, the extent of the works for the railway is such as to excite the admiration of every beholder. It is a little artificer's world within itself; engine-manufactories, machinery, a grand depot, dwellings for the workmen, the whole establishment laid out on an excellent plan, the sight of which, as the model of a perfect work-town, would have delighted Peter the Great. A number of converging roads and canals render it an appropriate site for communication, and small hamlets and various establishments near it upon the line are fast rising into importance. The locomotive-engine station is a noble work, erected from the designs of Mr Aitcheson, who has the appointment of architect to the stations. No trade but has here its appropriate and perfect exercise. A large wharf and store-houses render this grand establishment, with its fine architectural structures, combining elegance and beauty with utility, and every accommodation and luxury a traveller can desire, more like the fabled mansions of German gold-hunters and dwarfs, than the work of a single English company. Leaving this peaceful emporium of the useful arts, we next cross the Grand Junction Canal by a neat iron bridge, the railing over the entire length of which gives it a light and pleasing appearance; and we thence reach the great Wolverton embankment, and see the trains pass in fine style across the valley of the Ouse—the most extensive along the line. The village of Castlethorpe, Hanslope, its ancient church, and the tower of the church at Grafton—a place possessing many interesting traditions—are among the next objects we notice. Near the last spot we leave the county of Buckingham, and enter that of Northampton, pass over a lofty embankment which divides the village of Ashton, and arrive at the Roade station, where coaches meet the trains to convey passengers to and from the adjacent towns, Northampton, Leicester, Nottingham, as well as from the towns of Lincolnshire and Bedford. Thus Roade, from a petty village, has assumed the importance of a large posting town.

The Blisworth cutting is the next great work, in depth fifty-five feet, not less than one million cubic yards of earth having been removed from it. It is a curious fact also, that in the completion of the embankment at Ashton, owing to the unsound state of the valley at the base, the materials disappeared as fast as they were deposited, and the surrounding surface outside the railway actually burst in consequence of the enormous pressure, and a culvert near the spot was completely destroyed. The power of a culvert to sustain an embankment fifty feet in height, may be supposed to be great; and its construction upon a soft foundation is a task upon which no engineer, however cautious and skilful, can calculate with any certainty. Nearly £100,000 beyond the original estimate was expended on this work; a wonderful evidence of the extent of engineering science in this country.

An inclined plane succeeds this cutting, from either side of which are seen extensive prospects over the country—villages, picturesque seats, and spires, and the tower of Blisworth church in the distance. Soon we come to a lofty bridge of one arch, which spans the high-road between the towns of Twycroft and Northampton. A covered staircase leads from the railway to the Blisworth station; and near Gayton wharf, the Grand Junction Canal is crossed by a bridge running parallel with the line for several miles. We next reach the Stowe Hill tunnel, 480 yards long, pass under the Holyhead road, and from the summit of the hill above the tunnel catch extensive views of the hills round Weidon and Daventry, the pleasant village of Stowe, &c., surrounded with delightful scenery.

Again crossing the Holyhead road over an oblique iron bridge, we pass under the ancient Watling Street, and pursue our course through a wood be-

* To make but one letter in the Greek alphabet.

† Potter's *Archæologia Græca*.

‡ It is almost unnecessary to mention, that the supposed influence of the penny was an entire delusion, and that if the cures were performed, as stated, something else than the charm of the alman must have been the cause. In this, as in all similar traditions, the testimony is defective, every circumstance unfavourable to the superstition being suppressed.

longing to the Brock Hall Park estate. Thence we come to an iron suspension-bridge—a stupendous work, braced together by cast-iron frames, and forming an arch of seventy feet span, on which the platform is hung. Leaving Buckby to the right, we arrive at the Crick station, and thence to the grand tunnel through the Kelsay ridge, considered one of the most extraordinary works of the present day. It is 2428 yards in length, 18 inches thick in the brick-work, and the whole is built in either Roman or metallic cement.

After leaving the tunnel, we gain a fine open view, diversified with every variety of scenery, through which the majestic trains sweep along the fine level with tremendous velocity. At the eightieth mile from London we leave Northampton county, and enter that of Warwick; the line crosses the Oxford Canal, and to the west we see the village of Hill Morton, its church and parsonage, and are told that a bridge of communication has been formed between them and the railway. We pass another embankment, and a cutting spanned by a bridge of three arches, and reach the Rugby embankment. Clifton and Brown-sour are seen to the eastward; and farther on, a sharp turn to the west shows us the viaduct of the Midland Counties railway, which joins the line at this place, as does the Birmingham and Derby, now completed, farther on.

We are next delighted with a magnificent view over the Avon valley; the river winding along the eastern side, Newbold with its spires seen rising in the same direction. We pass the Brandon embankment, two and a half miles in length, across the Avon valley, reaching the Roman Fosseway by a bridge, and the river by a grand viaduct of nine arches. Through this the distant landscape appears to peculiar advantage. The Brandon intermediate station is situated at this point.

Approaching Coventry, we come to a bridge of one arch, built at an acute angle, and forming an angle with the railway of 28 degrees. Here, as elsewhere, we observe policemen, each having his duties well defined, some provided with signal-flags, and with revolving signal-flags during the night. When near Coventry, we obtain an indistinct view of Combe Abbey, built on the site of the first Cistercian monastery founded in Warwickshire, and belonging to the Earl of Craven. We pass through some very interesting scenery as we approach the Castle of Warwick by a handsome stone bridge, from which a view of this time-honoured and magnificent structure is obtained. At length, after traversing a succession of important and highly finished works, we reach the last grand embankment, terminating in the grand viaduct over Lawley Street and the river Rea, unrivalled, perhaps, by any to be seen.

Another embankment brings us to a massive stone bridge, sufficiently expansive to admit the passage of the Junction railway, and it was for this reason executed at the joint expense of the two companies. The Birmingham depot is just 112½ miles from London; the station is one of the finest in the world. The entrance is by a handsome portico with Ionic columns; the receptacle for the trains has six instead of four lines, as at Euston Square; it is 217 feet in length; the roof is of wrought iron, in two spans of fifty-six feet six inches each. The engine-house is capable of holding sixteen engines and tenders, and under each engine is a pit three feet deep, which enables the engine-men to get underneath to examine and repair it. In front of the engine-house are store-rooms, offices, workshops, over which is a tank holding 170 tons of water, with provision for a steam-engine to work a pump from a well below, in case the regular supply should fail. In the locomotive department, preparations are made to ensure the safe and economical working of the railway. Each engine carries a box of tools; the various out-stations are fitted up with forges, work-benches, &c., enabling the engineers to execute necessary repairs.

Wolverton, however, is the grand central station, where preparations for every thing have been made upon a vast scale, equal to any want that can possibly arise. It is a curious fact, showing the amount of the general consumption of materials required, that in an average trip to London the engine will exhaust 2000 gallons of water and twenty-four hundred-weight of coke; and the tender carries a ton of coke, and upwards of 700 gallons of water.

For the accommodation of travellers going the entire distance, the trains which arrive from London run into the Grand Junction line at Birmingham, where there are excellent refreshment-rooms. In the same way, the trains from Manchester and Liverpool run into the London and Birmingham station, whence they are forwarded after a brief interval.

This magnificent work, which has carried the previous inventions of men of genius to a degree of public usefulness never anticipated, has now, it appears from the reports before us, already begun to make returns of interest exceedingly promising for the future. The outlay being upwards of six millions, it will require, to pay 10 per cent., that the road should produce £600,000 annually, besides a large addition to defray the various expenses of maintaining so vast an establishment. It is, at the same time, far removed from all fears of its proving a mere speculation; hosts of travellers, both for business and pleasure, will render its returns certain and ample; the receipts have been steadily advancing, from the hour of its partial opening to its complete operation, and its half-yearly reports conti-

nue to be more and more satisfactory. As a proof of this gratifying fact, it will be sufficient to mention that the receipts for the first six months of 1839, namely, from the 1st of January to the 30th of June, reached as high a sum as £270,000; which sum, added to the same for the other six months, will give for a total annual receipt the handsome income of £540,000 a-year. But if we estimate the annual receipts by the returns of a single month (July last), they would realise the immense sum of £720,000 per annum. During some weeks the receipts were as high as from £15,000 to £20,000, or upwards of £60,000 per month; an immense increase upon the previous year, months, and weeks, preceding it. This increasing ratio is in part to be attributed to the immense numbers flocking out of town for the season.

The recent opening of the Derby and Birmingham railway, of the branches of the north and midland counties, the Aylesbury and Birmingham, will all, like tributary streams falling into a vast river, bring a rapid increase of business, besides adding to the prosperity of the rural districts, and forming an important epoch in the annals of civilisation and of science. Thus, in whatever point of view contemplated, whether in its magnitude, in its triumphs of skill and labour over incredible difficulties, in its national utility or social results, this head and centre of British railway lines will remain an enduring monument of the enterprising spirit, genius, wealth, industry, and indomitable perseverance of a British proprietary.

THE EVERLASTING ROSE.

[BY JOHN ANSTER, ESQ.]

Hail to thy hues! thou lovely flower:
Still shed around thy soft perfume,
Still smile amid the wintry hour,
And boast, ev'n now, a spring-tide bloom.

Thine is, methinks, a pleasing dream,
Lone ling'ring in the icy vale,
Of smiles that hail'd the morning beam,
And sighs more sweet for evening's gale!

Still are thy green leaves whispering
Low sounds to Fancy's ear, that tell
Of mornings, when the wild bee's wing
Shook dewdrops from thy sparkling cell!

In April's bowers thy sweets are breath'd,
And June beholds thy blossoms fair;
In Autumn's chapel thou art wreath'd,
And round December's forehead bare.

With thee the graceful lily vied,
As summer breezes waved her head,
And now the snowdrop at thy side
Mockly contrasts thy cheerful red.

'Tis thine to hear each varying voice,
That marks the seasons sad or gay;
The summer thrush bids thee rejoice,
And wintry robin's dearer lay.

Sweet flower! how happy dost thou seem
'Mid parching heat, 'mid nipping frost:
While gath'ring beauty from each beam,
No hue, no grace of thine is lost!

Thus Hope, 'mid life's severest days,
Still smiles, still triumphs o'er despair:
Alike she lives in Pleasure's rays,
And cold Affliction's winter air.

Charmers alike in lordly bower,
And in the hermit's cell she glows;
The Poet's and the Lover's flower,
The bosom's Everlasting Rose!

—Poetical Scrap-Book.

SCOTCH DROVERS AT BARNET FAIR.

A FAIR is held annually at Barnet, on the great north road, in the vicinity of London, for the sale of cattle and horses collected in the north of England and in Scotland in the early part of the season. The fair for 1839 was well attended by purchasers, upwards of 45,000 head of cattle and 10,000 horses having changed owners. Since the introduction of steam-vessels to the northern parts of Scotland, especially in the Moray Firth, the transit of cattle to the metropolis has become a matter of easy accomplishment, but it will be a long period before journeys by land be superseded. It is a question if the old system be ever totally done away with, as the following description of the route and method of accomplishing it will show—besides, many of the cattle are purchased at markets in the interior of the country, and the easy progress of the animals in their journey southward improves their condition previous to their being submitted at the London market. The majority of the dealers who attend Barnet Fair, the great metropolitan market, generally reside in some of the rich and fertile counties on the borders of England and Scotland, and when the opening spring and genial April showers revive nature in all its beauteous forms, supplying with ample store of provision the sweet-smelling cows and their numerous progeny, these enterprising men proceed northwards, in some instances as far as the Kyle of Sutherland, before they commence operations. In their progress southward they visit the Muir of Ord, and collect as they proceed through the eastern parts of Inverness-shire and Nairn, Moray, Banff, and Aberdeen shires, the beautiful small Highland breed of cattle that had been purchased the previous season by the ever-active agriculturists of these districts. The markets are so excellently arranged throughout Scotland, that by the period of the dealers meeting at Falkirk Tryst they have generally collected a very large stock. The cattle are then formed into lots of about 1000 each, and entrusted to a number of Scottish drovers, and the dealer sees no more of them until he meets the whole at Barnet. The commencement of the journey is usually calculated from Keith, in Banffshire, that spot

being in a manner a key to the Highlands of the north of Scotland and the fertile plains of Morayshire. The journey from Keith to Barnet occupies thirty-four days, the average number of miles travelled each day being sixteen. The pay of a drover is two shillings per day and the expense of his bed. When he crosses the Tweed, he is allowed "night wages," to the amount of one shilling extra from the owner, and one shilling from the grazier who supplies food for the cattle. The amount realised by a drover for the whole journey is about £8, and from ten to fifteen shillings for return-money. The majority of the drovers return by land, in parties of twenty, and accomplish the distance in thirteen days, at an average expense of one shilling per day, including food and lodging. And yet one of these men, whose whole wardrobe would not fetch fourpence in Rosemary-lane, is entrusted with from £700 to £800 to pay the expenses of the food required by the cattle, and the tolls to be passed during their journey. The number of Scottish drovers who visit Barnet fair annually is about 1500. Last year about 300 thimble-riggers were present, and, by sleight of hand, succeeded in winning a large sum from them. This would have been a sad tale to tell their wives and friends in the north, and but a poor excuse for the loss of their hard won earnings; they therefore watched the motions of the pea and thimble gentry, and being convinced that cheating was the order of the day, on a given signal they surrounded the thimble-riggers, and compelled them to return them all their money. A gentleman residing in the neighbourhood, who was present on the occasion, was so well pleased with the thrashing the gamblers got, that he gave the Scotsmen three sovereigns to purchase beer.—*Correspondent of the Inverness Herald.*

A "DIET."

While at Presburg, I attended two sittings of the assembled diet, and had to ask myself whether it was really a meeting of deputies entrusted with important duties, or merely a comedy. At all events, it was a chaotic scene, in which every one spoke at the top of his voice, and used his elbows lustily, but in which a very small minority knew either what they were doing or what they were about to do. It was performed in a large hall, in the middle of which was a table covered with green baize; on this were strewn the hats, sticks, and papers of the honourable members. At one end was a sort of stage as in a theatre; here sat the president and secretaries, surrounded by folios containing the laws of the country, and behind them, or by their side, sat a number of deputies, generally speaking, those who do not belong to the opposition. The others sat at long tables in the body of the room, where they are surrounded by a crowd of reporters, who assist them on occasion in shouting; these are young men who are studying the law, or preparing themselves for the service of the state; they all wear the Hungarian national dress, and each has a sabre hanging by his side. They are of noble families, and their throats when they exert them have considerable weight in discussion. At the entrance of the hall the space is occupied by as many spectators as can crowd in: there is also a gallery for the public. Sometimes there is such a mob of spectators at the entrance, that the deputies cannot get in, and have to remain standing outside the door. They can make no effectual complaint, for it is first come first served, and those who are the earliest in getting into the chamber, whether they be deputies or not, keep their places the whole day if they please. Thus it is impossible to say of a Hungarian member of parliament that he was in his place, inasmuch as place he has none, and he never sits down at all. When the hall is filled, there is a murmur like that in a bee-hive. Then the president shouts *hajuk!* (hear!), which is echoed by all present; but the noise continues equally loud until some member of the opposition commences a bitter attack on some particular law, or makes a general charge against the government; this is the signal for profound silence, which is now and then interrupted by a menacing *hajuk!* or by a thundering *eljen!* (vivat!) When an unpopular deputy rises to reply, one expects from the fierce expression with which he is universally regarded, and from the huge mustachios and altogether military appearance of the crowds opposed to him, that he will either have to make a sudden exit at one of the windows, or that, if his arguments should be particularly cutting, sabres will be drawn to meet them. But nothing of the kind occurs; the assembly separates peaceably after the necessary quantity of parliamentary demonstration has been performed by both parties; and they whose patriotic excitement has been roused to an extraordinary pitch by the discussion, adjourn to a tavern in order to vent it.—*The European, No. 11.*

A NEW LIGHT.

An interesting experiment was made at Bordeaux a short time ago, in the presence of the mayor, on the husks of grapes, when pressed, and the lees of wine, in order to show their use for the purpose of lighting. A pound of the dried husks put into a red-hot retort gave in seven minutes two hundred litres of carburetted hydrogen gas, free from smell, and which burnt with an intense light, and free from smoke. A second experiment with the dried lees was equally satisfactory.—*Newspaper paragraph.*

ARTIFICIAL IVORY.

Certain parties in Sheffield lately obtained a patent for the making of a substance so nearly resembling ivory, and so applicable to all the purposes of that valuable material, that it is almost impossible to detect the difference. In one instance, a working cutler had a quantity of scales given out to him, consisting partly of the fictitious compound and partly of ivory, and he used them in hasting his knives, and returned his work without discovering the difference. We understand, also, that an imitation of tortoise-shell is prepared and in use, which for some purposes is little inferior to some varieties of the real article.—*Newspaper paragraph.*

CONNECTION OF DISTANT AGES BY THE LIVES OF INDIVIDUALS.*

EVENTS which we are now accustomed to regard as remote, are brought strangely before us—into our very presence, as it were—when we hear of persons still living, or but just dead, who were connected with them, or whose fathers were. There is a feeling respecting time and its events which is curiously pleased when a connection is thus established between ourselves living in the present young world, and those who acted in some of the older and more romantic, or it may be ruder worlds, which seem to us to have long passed away. We behold a surviving denizen of those elder ages with a kind of awe, as considering him a being not exactly like ourselves; and we cannot even read of the death of such a person in the newspapers, without feeling that a very different kind of event is there recorded from what we find in the adjacent columns.

When M. Talleyrand came a few years ago as ambassador to England, he unavoidably became an object of curiosity on account of his connection with events long become matter of history. On his appearing on a state occasion in the House of Lords, crowds rushed to see the yet living and breathing man who sat with Mirabeau and Bailly in the States-General, in 1789. The books now appear old in which the youth of Britain read of the early career of the ex-Bishop of Autun; yet here was the man still in public life, with his eye as black and bright as ever. Even more interesting it must have been for an English or American visitor of Paris, three or four years ago, to see LAFAYETTE—not only the same Lafayette who, as commander of the National Guard, kissed the hand of Marie Antoinette on the balcony of Versailles, on the terrific 6th of October, and thereby saved her and her family from an enraged populace, but the companion in arms of Washington and Rochambeau many years before that event. The French Revolution is now a tale half a century old, and most of those who figured in it perished amidst its tremendous violences; yet a few of the main actors still survive. A visitor of the city of Brussels may yet, we believe, see BARRERE—the associate of Robespierre and St Just, in the most sanguinary transactions of the period, and author of all the reports drawn up in name of the atrocious committee of safety, and laid before the Convention. He will see this man, and be at the same time informed that he has been employing his time latterly in writing a work *against capital punishments*! The mother of Bonaparte died so lately as February 1836—a lady who had mingled in and suffered from the wars of the Corsicans with the Genoese not long after the middle of the last century, and who was then for some months a fugitive amongst the mountains of her native land, when about to bring into the world the being destined to do every thing but subdue it.

Amongst old historical people still living in our own country, the Earl of Leicester is one of the most remarkable. As Mr Coke of Holkham, he represented the county of Norfolk in parliament in the year 1776. He has since then been constantly in parliament, and, as a peer, still is so. He may therefore be said to have been a member of the legislature for sixty-three years—a space of time which constitutes the extent of many lives, without their being looked upon as very short. Mr Adam, the Lord Chief Commissioner of the Scottish Jury Court, who died in February last, had been in parliament two years before Mr Coke—namely, in 1774. He survived his first entrance

into the House of Commons sixty-five years. These two men take us back to the days of Chatham. It was two years after Mr Coke, and four after Mr Adam, had entered the House of Commons, that the illustrious rival of Walpole made his celebrated *last appearance* in the House of Peers, to speak and vote against an address for the recognition of American independence—on which occasion "he entered the house in a rich suit of black velvet, a full wig, and wrapped in flannel to the knees"—"supported by his son William Pitt and his son-in-law Lord Mahon"—"looking emaciated"—but yet able to stand, with his hands resting on his crutches, and to deliver an address marked with his usual power, and which concluded in these impressive words: "My lords, I rejoice that the grave has not closed upon me, that I am still alive to lift up my voice against the dismemberment of this ancient and most noble monarchy;" soon after which he fell back in a fit, and was carried out of the house, to die thirty-four days after. How different were the ideas and maxims which ruled state affairs when Mr Coke began his parliamentary career, from what he must now see in operation! And how completely changed must the *personnel* of the political world be! He will scarcely now see around him, in Westminster, a single person who held any office or exercised any political function on the same spot sixty-three years ago. The recently deceased Earl of Lauderdale was another of these links between remote political eras. He and the present Mr Miller of Glenlee, who is still an acting judge in the Court of Session, were both in parliament in 1780. The Earl of Lauderdale and Mr Adam were the individuals who respectively moved in the different houses a revision of the judgment pronounced on the unfortunate Muir of Huntershill. It is also to be remembered of Mr Adam that he was present at the exhibitions which Mr Clerk of Eldin made in London, in 1780, of his new system of naval tactics, at which Sir Charles Douglas was also present, through whom it seems next to proved that that system became the means of gaining Rodney's great victory of April 12, 1782. Talking thus of the parliamentary men of the early part of George III.'s reign, reminds us that a daughter of Lord North survived at the beginning of the present year, to communicate to the world, in Lord Brougham's volume of "Characters," a most interesting and affecting account of her eminent father in his domestic capacity, exhibiting him in the unambitious serenity of a private gentleman's life, full of playfulness and good nature, and apparently the last man in the world who might have been expected to plunge a nation into war, or to keep it there.

It was only on the 16th of May last, that the newspapers announced the death of the Earl of Powis. Many would suppose this to be an ordinary nobleman, and his name would with them pass unregarded. But Lord Powis was no common person. He was the son of the very Robert Clive who established the British power in India—that "heaven-born general," as he was called by Chatham, who, going out as a clerk to India, illiterate, proud, poor, and irritable, nevertheless in a very few years rose to high military command, and performed such exploits as caused civilised nations to gaze at him in wonder across intervening oceans. It was the father of this newly deceased earl, who, so far back as 1744, when ordered to ask pardon of a secretary whom he had unjustly offended, and when afterwards in a forgiving spirit invited by that person to an entertainment, said, "No, sir; the governor did not command me to dine with you." It was the father of this newly deceased earl who, in 1768, with nine hundred European soldiers, and two thousand three

hundred native troops, fought and overthrew, at Plassey, a native army of fifty thousand foot, eighteen thousand horse, and fifty pieces of cannon, thereby laying the foundation of that mighty empire which has since been the source of such enormous wealth to Britain!

In August last, died at Cheltenham, Sir James Steuart, of Coltness, Baronet. This obituary notice would also be apt to pass unnoticed. Yet to those who know a little of, and feel some interest in, the domestic history of our own northern portion of the island, Sir James Steuart was a somewhat remarkable man. He was alive in 1745, though only, it is true, as an infant. His father, in the month of October in that memorable year, proceeded from Holyroodhouse as ambassador from Prince Charles Stuart to Louis XV. of France, in order to arrange for a French invasion, which was to have overturned the Hanoverian dynasty in Britain. Such strange things may the life of a single man bring into connection with our own peaceful age! Sir James's mother was sister to the Lord Elcho who acted a conspicuous part in the insurrection, and at Culloden is said to have entreated the Prince to charge with the wreck of his army against the too victorious troops of Cumberland. Sir James himself, this very old gentleman who died a few weeks ago at Cheltenham, was a friend of Lady Mary Wortley Montagu! She speaks of him in some of her letters as a fine young officer. She, it will be recollected, was born a subject of King William and Queen Mary! He was also a pet of the Duchess of Douglas, a singular specimen of the old world, who spoke broad Scotch, uttered all sorts of broad jokes, and never went out of her way for any body: this duchess's husband was made a duke at the Union in 1707, and fought on the government side at Sheriffmuir; transactions which appear almost resolved into ancient history. The former Sir James, the Prince's ambassador, was a man of vigorous talent, and wrote the first treatise of any importance in our language on political economy. Yet he was not exempt from superstitions, such as those which shaded the majestic intellect of Johnson, and from which perhaps no man of that age was altogether free. He had agreed with a youthful friend named Trotter, that whichever of them died first, should come back, if possible, to give an account of the other world to his surviving companion. A grove near Coltness House, in Lanarkshire, where they had often studied together in summer, was the place appointed for this re-appearance; that there might be no mistake or misapprehension, the hour was to be noon, and the deceased party was to come in the form and appearance he usually bore in life. Mr Trotter died, and for many years before his expatriation in 1745, Sir James went regularly at mid-day to the appointed place, in the hope of meeting his friend. Seventeen years of exile elapsed, during which his mind was engrossed by one of the most rationalising of all studies. Yet, when permitted by the clemency of George III. to return home, and resume possession of his paternal mansion, he had still the same feeling respecting his engagement with Mr Trotter. He resumed his meridian visits to the grove, and continued them to the end of his life, even when the gout had made him scarcely able to walk. He used to say, in apology, that we do not know enough of the world beyond the grave, to entitle us to say that it is impossible for one who has entered it to return to this terrestrial sphere. We must look with additional interest on the scarcely yet dried obituary notice of the last Sir James Steuart, when we find him connecting the present age with a tale savouring so much of—we may almost say—the seventeenth century. Does the grove of Coltness still

* An article somewhat like the present in its general scope, but altogether different in detail, appeared in the 51st number of the Journal.

exist! The estate, alas! has been sold to a mining company for its iron and coal. We would fear that, under its new circumstances, romantic associations respecting its surface may be little regarded. Yet it were worth while to take some care of the mansion and its "pertinents" of the five Sir James Steuarts of Coltness—all of whom were men of some eminence in the service of their country, though in different walks—the second being perhaps the most remarkable. He was a fellow-adventurer of William of Nassau in his voyage of November 1688, wrote his manifesto for Scotland, and after the successful achievement of the Revolution, became his Lord-Advocate (first officer of the executive) for that country. "Jamie Wylie" was the popular name of this statesman, on account of his dexterous movements amidst the troubled politics of that era; and that the name was not undeserved, one anecdote will show. In 1708, when the Chevalier St George was hovering on the Scottish coast with a French fleet, some one represented to Sir James that of course the man who wrote so important a paper for William could not but be in great danger—"Hoot," replied the old politician, "I'll e'en write his manifesto too!"

Of individuals who have long held possession of titles, the Duchess of Sutherland, who died in January last, was a remarkable example. She had been Countess of Sutherland, or *Banie Morar Chat*, as the Highlanders style a female representative of that great family, for seventy-four years. The succession was opened to her in her infancy by a lamentable accident. Her father, William Earl of Sutherland, an amiable young man, married to an equally amiable young woman, had two children, of whom the lately deceased duchess-countess was the younger. Lord Sutherland, coming up to the drawing-room one evening after dinner with a few friends, after having carried conviviality, as was the custom of that age, a little into excess, sportively took up his eldest daughter, and threw her high above his head—lost his hold, and allowed the infant to fall on the floor, whereby she received a hurt of which she died. Overwhelmed with grief, the young earl and his lady went to Bath, in the hope of regaining some degree of composure. He there caught a fever; in the course of which his lady attended him constantly for twenty-one days, and thus so completely exhausted an already shaken frame, that she died: he survived little more than a fortnight, and the corpses of this lately blooming pair, respectively thirty-one and twenty-six years of age, who had left Scotland in the possession of high honours, wealth, and all that the world can give, returned to it in one hearse, to be interred in one grave! A still more remarkable instance of the long possession of a peerage was furnished by the well-known Duke of Queensberry, who, at his death in 1810, had been in enjoyment of the title of Earl of March for eighty years except a few months. Mr Robert Craig of Riccarton, in Mid-Lothian, died in 1823, at the age of ninety-three: it was then a hundred and forty-two years since his full uncle, Thomas Craig, had acceded to the same property! Sir Robert Grierson of Rockhall, who died in August of the present year, had enjoyed his paternal estate for seventy-three years, and half-pay as an officer in the British army for three years more! This gentleman was supposed to have reached the extraordinary age (for a gentleman) of a hundred years. He also connected us moderns in a curious way with a distant historical era, for he was no more than grandson to Grierson of Lag, noted as a persecutor of the presbyterians in the reigns of the two last Stuarts.

Surprising as is this last circumstance, it yields in that respect to one stated a few months ago in the newspapers, namely, that there lives in Lancashire (the name and particular place have escaped us) a man whose father was a subject of the Commonwealth. The father, born in 1659, married in 1743, when eighty-four years of age, and soon after had this son, who is now ninety-five. Even this, again, is less wonderful than the circumstances stated in the following paragraph, which appeared in the Aberdeen Journal last summer:—"There is now living, in the vicinity of Aberdeen, a gentleman who can boast personal acquaintance with an individual who had seen and conversed with another, who actually had been present at the battle of Flodden Field! Marvellous as this may appear, it is not the less true. The gentleman to whom we allude was personally acquainted with the celebrated Peter Garden of Auchterless, who died in 1775, at the reputed age of 131, although there is reason to believe that he was several years older. Peter, in his younger days, was servant to Garden of Troup, whom he accompanied on a journey through the north of England, where he saw and conversed with the famous Henry Jenkins, who died in 1670, at the age of 169. Jenkins was born in 1501, and was of course twelve years of age at the battle of Flodden Field; and on that memorable occasion he bore arrows to an English nobleman, whom he served in the capacity of page! Our reason for thinking that Peter Garden was older than he is reported to have been, is this: There are still living individuals who knew Peter, and to whom he used to boast that he had served under Montrose, and been present at the fight of Fyvie. He used to say he was then a 'gey loun,' and page to Ogilvie of Forglan. He had a vivid recollection of the encounter, and of the personal appearance of Montrose. The battle of Fyvie was fought in the year 1644; and supposing that Peter

was then between ten and twelve years of age, he must have been at least 141 years old when he died." We may remark in addition that to remember Peter Garden is no great stretch of memory. One who died in 1775 may have surviving acquaintances for five-and-twenty years to come. How strange it will seem, about the year 1864, that there should be persons living who knew a man that had been present at a battle which took place in 1644, two hundred and twenty years before, and who had seen one that had been present at another battle a hundred and thirty-one years earlier, or distant three hundred and fifty-one years in all! When we think of such things, the ordinary laws of nature seem to have undergone some partial relaxation; and the dust of ancient times almost becomes living flesh before our eyes.

Here we conclude for the present this chapter of old-world gossip, spun almost at random, and chiefly from memory, out of a mind which loves such things, not for their quaintness, but because it sees in them a sentiment of an elevated and refined nature. The past is certainly one of the materials of poetry. Its men and its modes may have had their imperfections; but time smooths all these away, and when we look back beyond our own age, we see only what is calculated to delight the imagination and engage the affections. For this reason we would be disposed to encourage a feeling for the past, and should be glad if any effort of ours, however humble, should be attended in any degree with that effect.

ANECDOTES OF FEMALES IN DEPRESSED CIRCUMSTANCES.

THE sufferings of woman in this world of ours are peculiar, and greater than the generality of people, who look only on the surface of things, seem to have any just conception of. The conventional rules which hold society in voluntary bondage, press hard on the gentler part of creation, in many respects, of which every one is cognisant; but, in other points, woman endures much in secret and silence, displaying a patient and unostentatious fortitude more truly heroic than most of the actions which receive from us that misused appellation. In the secluded walks and nooks of life, there are at all times numerous females, young and old, who bear, with virtuous resignation, such toils and privations as would in most instances drive impatient man to vice and crime, and who will thus suffer on, even to the death, without a murmur or complaint; while, at the same time, the training to which the sex is ordinarily subjected, and the strict and exclusive regulations which hem them in on all sides, neither provide nor admit of any escape from a position so depressing and unfortunate. A thousand sources of employ and subsistence are open to man. Very different is the case with woman; and the consequence is an amount of suffering and sorrow, which, being seldom obtruded on its notice, the world in general has but little idea of.

Some years ago, a well-educated individual, named Galley, went with a civil commission to the East Indies, whence, after no long residence, he returned with considerable wealth, and two very young children, a boy and a girl, the deep tint of whose skins indicated that their mother had been of a coloured race. Respecting the birth of these young persons he observed a profound silence. He placed them under the care of humble though decent people in a country village, and there he left them. The two poor little foreigners, for such they were in appearance at least, won the affections of those around them, and were happy with each other, till the father came and took away the boy. This was a great grief to the sister, and it remained so to her all her days, for she never saw her brother more, nor did she ever learn what became of him. She remained in the country till she reached the age of womanhood, scarcely ever hearing from her parent, who had taken up his residence in one of our larger towns, and had married a lady of family and wealth. Catherine Galley, for that was the name borne by the young girl, received an education of a humble kind, and was instructed, as she grew up, in dress-making, being told that her bread was to be gained by her own exertions. And, accordingly, when she reached the age of twenty-one or twenty-two, her father sent her a small sum of money, coldly advising her at the same time to remove to the metropolis, and endeavour there to establish herself in the trade she had learned. He told her also to expect no further help from him, and to "write to him no more."

Miss Galley obeyed his desire, and removed to the metropolis, where she took a respectable lodging, and commenced business as a dressmaker. The adventure was one of little promise, as the reader may readily imagine. Although, considering her opportunities, Miss Galley was an intelligent girl, she was totally ignorant of the world, unskilled in the ways of acquiring and securing a town business, and devoid of

both friends and acquaintances. Most assiduously did she apply for employment; but few gave her any occupation, and her means were insufficient for her humble maintenance. Her funds were nearly all expended at the outset on the furniture and other things necessary for her abode; and, accordingly, within a short time after her entrance into it, it became the scene of privation and suffering. To none but the unfortunate inmate herself, and partially to the old woman who brought her the necessaries required for sustaining life, were the secret hardships of that habitation known. Yet the gentle creature never murmured, though many a day passed without almost a morsel crossing her lips, and though her best fare, at any time, was such in kind and quantity as scarcely even the poorest in this country are condemned to. At last Miss Galley was reluctantly compelled to write to her father, who was living in the midst of ease and abundance, and part of whose fortune, if one may judge from the rapid way in which it was acquired, was probably derived through her mother. This ought to have given weight to the daughter's claims, even if the father, on his own part, did not hold himself bound to attend to his child's welfare. But the letter was unanswered, and such was the fate, also, of one or two other applications which Miss Galley found herself necessitated to make.

Things grew rapidly worse with the subject of our story, and the evil of declining health was added to the other misfortunes that surrounded her. This prevented her from making exertions which the extremity of her distress might have led to; though, under any circumstances, her total unacquaintance with a town life in a measure closed against her even the very few avenues by which a decent subsistence could have been gained by one like her. Can a more touching picture be imagined than that of this poor young creature, sitting alone in her noiseless home, without friends, and almost without food, in the midst of a rich and populous city, pining hourly under the pressure of want and sickness, and listening ever in vain for the step of some one to bring her temporary occupation and temporary relief! She did often hear footsteps on her stair, but they all passed to some more fortunate neighbour, some one who had friends to speak to, and to receive support from. One day, when Miss Galley was almost sinking into broken-hearted despair, being then without a penny in the world, and having not a morsel in her dwelling, a lady called upon her, and spoke about work. But this was only the ostensible cause for the visit. In a few minutes the lady disclosed herself to be the step-mother of Miss Galley, or at least the present wife of her father. She had accidentally seen one of the letters written by the unfortunate girl, and, being a woman of good dispositions, had taken advantage of a visit to some of her friends to call on Miss Galley. The wan and wasted appearance of the latter moved the visitor to tears; but unfortunately her husband was to her a master rather than a husband, and kept her so straitened in pecuniary matters, that it was out of her power to bestow much more than her pity. She gave Miss Galley the little sum which she could command, and said that while she lived she would be a friend to her. But earthly friendship was not long required. Still patient, still uncomplaining, the poor coloured girl faded away by degrees. In her latter days, her case became known to one or two people, who gave some attention to her wants. But the help came too late to do her essential good. She died, and those who saw her believed that mere want had killed her. The consolation of her last moments, as it had been of her term of trial, was religion, and the trust arising from innocence of heart and life.

This is no imaginary, and we fear, no uncommon case, for the circumstances in which Miss Galley was placed are but those of too many females. A father or a brother dies, and leaves a woman dependent on her own exertions. She has recourse to her needle, and if unsuccessful in earning a livelihood thus, she has nothing but want before her. This is at least the case as education and other matters are at present ordered, with almost all in the middle and humbler classes of society. The evil may not be susceptible of an entire cure, but, as was suggested in an article on the Employment of Females in an earlier number of this periodical, much might be done towards its diminution.

We do not wish, however, to trouble the reader with a long moral here, but in place of this, will relate to him another anecdote, suggested to us by its slight similarity in some points to the preceding case, though the issue was different, and indeed remarkably so.

Pauline de Meulan, a young lady of good family in Paris, was deprived of the friends who had brought her up, and was compelled to look out for some source of support for herself. She had received a good education, and, having a taste for literature, made an attempt to gain her bread by the use of her pen. She sent various little stories and other contributions to several of the newspapers, but all her pieces were too long or too short, too grave or too light—any thing, in short, but entitled to reception. Had Pauline not possessed uncommon energies, as well as uncommon abilities, she would have found it impossible to fight her way through the briary path that leads to literary success. Many a time and oft, in her solitary chamber, she would cast down her pen in despairing lassitude, but the difficulty of seeing any better mode of maintenance made her always lift it anew, with revived determination. Her efforts were

at length rewarded with something like success. Her essays found favour with the managers of the periodical paper called the *Publiciste*, and she became a regular contributor to its pages, being paid for her labours in such a manner as to maintain herself in comparative comfort. She became even the object of considerable notice, and was occasionally an invited member of the literary soirées so common among the Parisians. At M. Suard's, in particular, a well-known member of the world of literature, Pauline met and mingled with many of the rising people of talent, male and female, in the French metropolis.

Things continued thus until Pauline fell ill, and became unable to send her contributions as usual to the *Publiciste*. Unluckily for her, the capital supplied too many young persons of literary ability to make the cessation of her labours a matter of much consequence to the people with whom she communicated. She was sensible of this, and her sickness was harassed by fears of indigence and distress. But at this moment, a kind though unknown assistant stepped in to relieve her terrors, and save her from falling a prey to the evils in prospect. One morning, while musing sadly on her state, she received a packet, which proved, on being opened, to contain a contribution, in her own line and manner, for the *Publiciste*. It was accompanied by a note, in which the writer stated his intention to send her a similar paper at regular intervals, hoping at the same time that they might be accepted in place of her own, until she was well enough to resume her tasks. The handwriting of the note and paper were unknown to Pauline, and she could form no guess who was their author. The promise made was fulfilled, however. Articles of a fitting kind were regularly sent, and they procured for the young invalid, from the conductors of the *Publiciste*, the same remuneration which her own toils had produced. All necessary comforts were thus assured to her in her illness, and she recovered that health which distress of mind might otherwise have aided to keep back.

Pauline's correspondent dropped his labours when she was enabled to resume her own. It may be imagined that her mind dwelt much on this circumstance, and that she longed to know and thank her benefactor. She was not long left in the dark. A pale and slender young man, with a mild and expressive countenance, called upon her, and modestly revealed himself as her unknown assistant. He was immediately recognised by the young contributor of the *Publiciste* as one whom she had seen at M. Suard's, and who had won for himself the repute of being one of the most promising young men of the day. He also had seen her at M. Suard's, and it was from no common feelings that he had been induced to act as has been related. After their first interview, they saw each other again and again, and Pauline soon learned to reciprocate the affection which the other had already conceived for her. They were married. At this day they live happily with each other; and while the husband fills one of the highest places in the senate and literature of his country, the wife, while holding no ignoble station also in the world of letters, is elevated high among the matrons of France. Reader, the parties of whom we have been speaking, are Monsieur and Madame Guizot. The "Letters on Education" and other works of the latter show her to be a worthy partner of a statesman and historian so distinguished as M. Guizot.

EXCURSION ACROSS VAN DIEMAN'S LAND.

It was some time in the month of September or October, I forget which, that my official duties took me from Launceston, on the north side of Van Dieman's Land, to explore the source of a river; a journey involving the necessity of passing over a chain of rugged mountains. My equipment consisted of four prisoners as servants, with a cart and six bullocks to carry my tent and provisions. I shall never forget the delight I felt in the anticipation of this journey; the service was new to me, and I entered upon it with an enthusiasm, which would have induced me to contend with any difficulties that might have presented themselves, and I was forewarned that I should have many of no ordinary aspect to cope with. A friend had volunteered to accompany me, but an unexpected circumstance prevented my having the pleasure of his society. To prepare for the journey, I had to go to Launceston to procure the necessary supplies of provisions, &c., which occasioned a few days' delay: these, however, were spent pleasantly enough, for by the kindness of the police magistrate and a few others, I was prevented from passing the time gloomily by myself in my tent.

Having completed my arrangements the night previous to my departure, I retired to rest in my tent, intending to start early the following morning; but on being called, I discovered that my temporary abode had been entered during the night, my boxes removed and ransacked, and the case of spirits and tobacco supplied by the government for the use of the men, had been

taken away. Suspicion fell upon one of the government servants, from the circumstance of his pipe, which was easily recognised from its peculiarity, being found near the boxes. Although this was not sufficient to convict him of being concerned in the robbery, he was sentenced to receive fifty lashes, and to serve a month in the chain-gangs, for being absent without leave; and thus I got rid of a troublesome and dangerous servant before I started, but it occasioned a further delay of another day. It was a daring adventure, whoever the thieves might be, for it was well known that I had a double-barrelled gun and a sword by my bed-side, upon which I could put my hand in an instant; but the night was boisterous and windy, and the constant flapping of the drapery of the tent prevented my paying attention to any noise that might have been made in the removal of the boxes, and of that they availed themselves.

My first day's journey was about twelve miles, through an uninteresting and gloomy forest, the termination of which brought me to the banks of a rapid river, the South Esk. Here the country opened, displaying the most lovely prospects. Beautiful plains expanded along the vale through which the river flowed, cultivated here and there, and speckled over by the cottages of the enterprising colonists. These plains were terminated by a forest clothed with an ever-green foliage, stretching in all directions; whilst high ranges of mountains rose in the distance, running east and west, till they apparently faded into thin air.

A little above where I crossed the river, it was joined by another, which I had to follow into the mountains. This stream is more sluggish than the first, and continues so till it turns suddenly to the westward, where it is also joined by another river equally sluggish, or even more so. The stream then increases in rapidity as we approach the mountains, when it runs over a succession of rapids or falls, with abrupt mountains rising on both sides. To the foot of the mountains my route was through a most beautiful and naturally fertile country, the capabilities of which were gradually being developed by the industry of the settler.

I had occasion to pitch my tent for a few days at a settler's hut, which is worth describing, but it is difficult adequately to convey what I there witnessed. In the first place, there were the settler and his wife, he a well-educated man, belonging, when in England, to the higher class of farmers, and she an amiable and accomplished woman. They had nine fine healthy children, but wild as young colts. The residence of this family was, what is there called, a "wattle and dab hut." It had formerly been the domicile of a stock-keeper; the farmer, finding it on the land when he took possession of his grant, adopted it as his residence, and spent in it the remainder of his life. It was a hut of one room only, of about twelve feet by sixteen, in which the whole family ate, drank, and slept, and all the cooking and other domestic operations were performed. The floor was of clay, worn into holes by the daily treading and occasional sweeping it received. The chimney was spacious, and constructed of rough stones about three feet up, and finished by sods. The door was a few split palings nailed together, and the spaces for the two windows were stopped with sheep-skins. The roof was covered with the bark of trees, whilst the "dab" had more or less disappeared from all parts of the building. Take it for all in all, I witnessed in this abode of wretchedness more of discomfort than I hope I shall ever meet with again. It is quite impossible to convey what there presented itself, and it has made such an indelible impression on my mind, that nothing but death can ever efface it.

Determined to avoid the error into which many of the settlers had fallen in the commencement of their colonial career, by launching into expenses beyond their means, this individual had adopted the opposite extreme, and the consequences were likewise fatal, for the wife became disgusted and indifferent to the fate of herself and family; the children were almost of necessity the companions of the prisoner servants, and, as a matter of course, became familiar with and participators of their vicious practices; and I have but little doubt that, had not the establishment been broken up by the death of the father about four years afterwards, which determined the mother to return to England with her children, some of the sons would have been the inmates of the penal settlement, whilst the daughters would probably have been degraded to a worse fate.

A journey of a few miles from this spot brought

me to the foot of a range of mountains, the very aspect of which seemed to bid defiance to any attempt to cross them with a bullock-cart laden as mine was, for hill above hill rose in succession, all of them apparently with sides nearly vertical. It being desirable, however, that I should proceed by this route, we prepared to make the ascent. The first and second rises were surmounted with difficulty, but without any occurrence worthy of note, the distance being probably about a mile and a half. To the inexperienced, the passage over these two hills would have appeared insurmountable; they were indeed formidable, strewn as they were with dead timber of various dimensions.

Our first day's success filled us with confidence as to the future, whilst the various good qualities of the bullocks were the theme of the bullock-drivers and the men, each of them being particularised in some way or other according to the character and success of the animal. Duke and his mate were excellent for a steady pull at a pinch, whilst there were none like Major and Blackbird in the pole. "Up or down hill, it was all the same to them; they were the bullocks that would draw."

It ought to be borne in mind, that bullock-drivers, on all ordinary occasions, are in the habit of making a more liberal use of the whip than is necessary—for the purpose, I imagine, of showing their skill and dexterity in cracking it, as well as to enforce the respect of the unfortunate animals. But on occasions in which difficulties are encountered, the noise that they make by the cracking of the whip, the calling and hallooing to the bullocks, is augmented to a degree that can scarcely be credited.

On the following morning we were again on the move early, but we soon discovered that my horse had wandered from us during the night, and some of the men were dispatched to look for him, with instructions to go as far back as the hut which I have described; when, should they not be successful, they were to return to me, which they did without either hearing or seeing anything of him. The bullocks were now yoked, and again the labours of the day commenced. Passing over three or four short and steep rises, about eleven o'clock we came to a high rocky hill, studded over with the huge trees that every where abound in these mountains, many of which had fallen, either from the effects of age or the ravages of fire, which occasionally spreads through the whole extent of these heights. The side of the hill was covered with them, which, with the underwood growing amongst them, together with the steep acclivity, made us contemplate the chance of success with feelings almost amounting to despair. We halted, and took the bullocks out to rest them for a couple of hours, for they were somewhat jaded by the exertions they had already made. In the mean time, I sent the men to the right and left to examine and ascertain whether a more practicable route could not be discovered, but without success.

Our next task was to reconnoitre and determine the line of ascent, and to remove from it as much of the fallen timber as we could; this being done, we again advanced, creeping up the hill by slow degrees, taking first the right hand and then the left, to save the ascent as much as possible. Every exertion was necessary on the part of myself and the men to prevent the cart rolling over, and in spite of all our endeavours it upset twice before we got to the top of the hill, and when we stopped to let the bullocks take a little breath, there was a difficulty in preventing the cart running back again, although one of the men was in readiness to block the wheel with a large stone.

About two-thirds of the way up, the hill was so steep that the bullocks refused for a length of time to face it, and we deemed it expedient to take them out to afford them a little rest. It had the desired effect. We then unloaded the cart, and carried the luggage up the rise on our backs. The distance might be about eighty or a hundred yards, but, short as it was, it took an hour and a half to get the bullocks and the empty cart up. It was after sunset before we got to the top of the hill, when we were too much tired and exhausted to take the trouble of pitching the tents; we therefore satisfied our appetites with bread and tea, wrapped ourselves in our blankets, and lay down in front of a good fire, where we slept soundly through the night, till we were aroused at daybreak by the notes of the black magpie and crow.

We were not long at our toilet or our breakfast when we were again on our march, invigorated by the hope that the labours of this day would terminate our difficulties, which we imagined would be the case from the general appearances around us.

We had not travelled more than an hour, when the steepness of the ascent again compelled us to unload the cart, and to toil up the hill with the packages on our backs; after which, with one upset, we conquered the difficulty of getting the cart up also.

This delay over, we found our track more level, but we met with disagreeables of another kind; for we had to pass over occasional steep rises, between which rills of water had worn channels, varying in width from one to two yards, which occasioned us the labour of filling them with dead timber, and making a secure footing for the bullocks with boughs, well filled in with earth.

Between two of these rises, however, the land was flatter, which occasioned the water to spread over a wider surface, rendering it soft and swampy. Although we took every precaution to prevent the bullocks and the wheels of the cart from sinking in, by placing a coat of green boughs and long grass, they sank at almost every

step, and we had not gone many yards, when one of the wheels stuck so suddenly, that the cart was upset, nearly killing one of the men, whose life was only preserved by a bunch of swamp grass and sedge, which prevented the load from crushing him to death.

Our first object naturally was to extricate the man, and then to unload the cart; when thus lightened, the bullocks were again yoked, but the ground was so poached by the treading of the bullocks, that we had proceeded but a few yards when the pole-bullocks sank to their bellies, and in plunging to extricate themselves, the pole snapped in two.

This was a perplexing disaster; it was impossible to replace the pole, and the only alternative was to send one of the bullock-drivers back to Launceston for another cart, a distance of five and thirty miles, ourselves meantime to remain in anxious inactivity. The remainder of the day was employed in getting the cart out of the swamp, lashing the pole with splinters above and below the fracture, after the fashion of setting a man's arm, carrying our luggage to a dry situation, and pitching our tents. On no one day did we retire to rest more fatigued and disheartened than on this, which had dawned upon us so full of hope. The next morning I sent two of the men with a bullock-driver back to Launceston, and during their absence we employed ourselves in forming a causeway, and going ahead to determine the best track to follow when we should resume our journey.

It was a little past noon on the fourth day from their departure, that our ears were gladdened by the well-known cracking of the whip, which re-echoed in the mountains, and came to us more welcome than the sweetest music. Not long after the driver made his appearance with a fresh cart and two additional bullocks. We now set out afresh; we encountered one more steep hill, which we surmounted with difficulty, but without any accident, and in the afternoon of the second day descended into the "Regent's Plains."

These plains are not very extensive, but diversified as they are by clumps of trees, and the river meandering through them, they have a park-like and particularly cheerful aspect, especially to one who has been buried for days in the gloom of vast forests. They are surrounded on all sides by mountains, covered to their very summits with varieties of the eucalyptus, and other evergreens, presenting to the eye a mass of the most magnificent foliage.

There is but one *practical* entrance into this beautiful and secluded valley, for that by which I came could not be termed such, and the direction in which I had to proceed could not be by this route; I at length ventured on taking the opening at the foot of the mountains, as it appeared to offer the best chance of an easy passage through them. After a couple of days' fatigue, our whole party fortunately reached the flat country beyond these mountain passes. My journey was now through extensive undulating plains bounded by forests. By an intricate and rather circuitous route, I came, at the end of two days, to the shores of Lake Arthur, the scenery about which is picturesque and beautiful. Valleys branch off from it in various directions, intercepted by hills covered with timber jutting down to the water's edge, with lofty and rugged mountains in the distance. The lake itself is extensive, about 5000 acres; the water clear as crystal, and free from weeds. Black swans are seen floating in flocks on its surface, wild ducks abound, whilst the solitary crane is seen here and there patiently waiting for its prey.

It was on the evening of the third or fourth day after I had encamped in this beautiful and romantic situation, that I was returning a little before sunset after a hard day's work, with two of my men, one of whom had loitered behind a considerable distance. The day had been and still continued very windy, and I observed from a distance that the sides of the tent fluttered in the breeze, which I supposed originated in the neglect of the men left in charge. But I was soon made aware of the real cause. Two strangers advanced to me; they were armed, but that did not excite my suspicion or distrust, for it is customary for travellers in the bush to carry their guns. I thought it therefore probable that they were colonists, in search of a tract of land on which to locate themselves, or constables in search of the bush-rangers Brady and McCabe, two desperate characters, who were then at large.

The strangers approached me till within about fifteen yards, or less, when they presented their guns, and ordered me to stand. They then told me who they were; uttering the names of the two dreaded bush-rangers, but at the same time assuring me that no personal violence would be offered, unless I resisted them. Unarmed as I was, it would have been folly to have thought of such a thing; I therefore yielded to circumstances, and became their prisoner.

They then tied the hands of the men who were with me, and of the other also, who came up a few minutes afterwards, searched me, took from me my watch, and marched us up to the tent, where I found the bullock-driver and tent-keeper bound and made fast. They had plundered my tent of every thing—clothes, provisions, and fire-arms. They were then dressed in my apparel, but, with the exception to this aggression, they were civil, and communicative with respect to the circumstances in which they were placed. They said they were very miserable—that their life was one of constant anxiety—that every man's hand was against them—that a twig in the forest could not fall, nor a kangaroo move, but they were filled with the dread of coming in collision with the parties of soldiers and constables who were dispersed in all parts of the colony in search of them. At my earnest solicitation they returned my watch to me, and after some little time longer, Brady remarked, that as I had had a long day's work, I must be both tired and hungry, and that therefore I had better partake of that which he had made my tent-keeper cook for me, to which I gladly assented, and made as hearty and comfortable a dinner as might be expected under such circumstances.

They remained about two hours after my return, when they departed, taking with them one of my men to assist in carrying their spoils. They left me sufficient provisions to take me to the nearest stock-keeper's hut, where I procured a supply of flour and sugar for the remainder of my journey. And thus terminated this expedition, for I reached Hobart Town without meeting with any other occurrence of interest.

THE SICK-CHAMBER.

IN passing along, when we see the street at a particular place carefully covered over with bark or straw, to deaden the jarring sound of passing carts and carriages, and observe the close blinds and muffled door, we cannot help thinking of the still and comfortable, though it may be sad and sorrowful, sick-room, and contrasting it with the many poorer and less comfortable abodes of sickness and poverty, too often to be found near. Yet, a little art, and attention, and method, may make even the most humble sick-room comfortable; and without these, the most splendid apartment will be but a place of restlessness and loathing. In the first place, then, if possible, a well-aired apartment, of moderate dimensions, should be chosen, containing no more pieces of furniture than what are absolutely necessary for use. All lumber and loose articles should be carefully removed. A medium temperature is the first requisite to be attended to. Accordingly, in hot summer weather a proper ventilation should be made, by opening a window from above, if possible, and occasionally the door partly so as to produce a temporary current; avoiding, however, this current immediately where the patient is lying. In extremely hot and dry weather, the wood-work of the window may be sponged frequently with water, or a wet cloth may be hung up at the opening where the air enters. In cases of fever, where the utmost coolness is of importance, such expedients will be found of the utmost consequence; and ice, or iced water, when it can be procured, may be freely used in the sick apartment for sponging the hands, face, and head. In winter, on the other hand, the chief object must be to keep the sick-room of a grateful temperature. It should seldom be below 50 degrees of the thermometer, and for this purpose either a stove or open fire should be used. There is something exceedingly heart-cheering in a clear-burning fire in a sick-chamber; besides the heat it imparts, its lively effect upon the senses, and its ventilating power in constantly renewing the air in the sick-chamber, render it preferable to almost any other mode of procuring warmth. A clear-burning fire of coke or charcoal is the best, increased or diminished according to the temperature required. In large apartments, however, and under certain circumstances, a stove may be advisable. The Arnot stove, or any other of similar construction, may be used, taking care that a proper ventilation is at the same time employed, and that the air of the apartment is not rendered too dry; for an over-dry air is by no means wholesome. To obviate this, a shallow basin containing some water may be placed on the top of the stove, so that a gradual evaporation shall take place. In all affections of the chest, the regulation of the temperature of the sleeping and sitting apartments is of the greatest consequence; for this purpose, rooms with double window sashes, or storm-window blinds and sides, are admirable. By storm-windows are meant window-shutters made like Venetian blinds, to open or shut as the state of the weather requires. Temporary ones may readily be made of deals; and as wood is a bad conductor of heat, the thicker the deal the better. The bed-curtains of the sick-bed should be of the simplest and lightest construction; indeed, where the windows of the room can be darkened by curtains, the less of them on the bed the better. In all cases attended with fever, and increased heat of the system, a mattress is preferable to down or feather beds, and neither in health nor sickness should such beds be used of a too soft or yielding nature; a bed moderately elastic, but which does not yield to the body so as to become hollow and depressed, is the best. Smooth cotton sheets are at all times preferable to linen, and they should be frequently changed. In febrile diseases, and in hot weather especially, two beds are highly grateful to the patient, one being cooled and aired, while the other is occupied, according to the suggestions of Dr Franklin. These beds may be either in the same or adjoining rooms; a sofa may suit very well for one of the temporary changes. Where the patient is confined to one bed, an agreeable way of airing it is occasionally to lift up the bed-clothes, by grasping them in the middle, raising them gently so as that the air may enter at the sides without uncovering the patient, and then letting them down, and forcing out all the heated air. This process may be once or twice repeated. The utmost cleanliness is also essential in a sick-room. Water should always be at hand, and the sponge freely and frequently used. Every thing offensive should be instantly removed.

A little aromatic vinegar, or lavender water, or other perfume, may be employed, according as they are grateful to the sick person, but these should never be employed to disguise odours that would otherwise be offensive. To neutralise all unpleasant odours, the following wash should be employed in every department of the sick-room:—Take an ounce of chlorate of lime, and dissolve it in a gallon of water, or about one drachm to a pint, and keep it closely corked. The floor, wood-work, and all parts of the sick-room, may be sponged with this, with the exception of metals and coloured cottons or cotton clothes. Although the smell of this solution may at first be offensive, it will soon pass off, and leave the air of the apartment perfectly sweet and purified, it being at the same time perfectly harmless to the invalid. In cases of contagion, it is of the utmost consequence frequently to use this lotion. The sick-nurse should be one of gentle, patient, and assiduous habits—sober, watchful, and methodical; in short, one out of a thousand—a being formed by nature with accomplishments for the office, and which station even the anxiety and love and solicitude of the tenderest relations will not always fit them for. One person should have the sole direction in the sick-room, and it should on no occasion be crowded by strangers, whose conversations and unsuitable remarks and vitiating breathings are all circumstances of much annoyance. The room should at all times be kept still, moderately lighted, or darkened altogether, as occasion may require. A vessel with hot water, and a glass of toast and water, and other cooling drinks, should always be at hand. A common beer bottle filled with hot water, well corked, and a piece of stout linen or leather tied over the cork, will be a convenient application when warmth for the feet or any part of the body is required; or a bag of hot sand, or a heated brick rolled in flannel, may be substituted. In applying hot fomentations, a piece of stout coarse flannel is to be dipped in the fluid, and wrung hard out, and immediately applied to the part. The necessary medicines should be laid aside, so as that they may be readily found, and not confusedly mixed with each other, so as to cause serious mistakes in administering medicine, as well as food and drink. Particular care should be taken to have every article employed in a state of perfect cleanness; nothing is so disgusting to a sick person as any violations of this sort. Some of the various simple contrivances for obtaining a light during the night should always be at hand, and a rush candle so placed that it may be readily found.

These directions may seem minute and trifling to some, but without their observance the bed of sickness becomes under all circumstances a bed of solitary privation; while, if strictly followed out, even the greatest afflictions may be soothed and alleviated. We have somewhere read of the pleasures of sickness; and no doubt, under judicious management, even disease may be productive of enjoyments. It is seldom, indeed, that man suffers unmitigated afflictions. Even a "fever's burning rage" may have its intervals of intense pleasurable sensations. After a restless and perturbed night, when a thousand frightful fancies have continually broken in upon the hours of accustomed sleep, how grateful to doze away the noon in a cool and secluded and perfectly peaceful apartment, where scarce an irritating ray of light or heat is permitted to enter—where there is no sound but the occasional buzz of a wandering house-fly, or the cautious tip-toe step of the angel nurse! The icy water has cooled the throbbing head and the burning palms, the fresh-changed sheets smell of wild thyme, and carry the fancy to the daisied knoll beside the purring country brook where they were washed and bleached in the sun—the sounds of the busy world without only come so faintly to the ear, as to remind you of the bustle and turmoil of ordinary life, from which you seem isolated and sublimed; the body is weak and reduced, and almost incapable of motion, but the mind is active with a thousand fancies; many past scenes of life now come up vividly before you—long walks with dear friends amid beautiful scenes—snatches of poetry and simple tales of the affections buried and lost amid the cares of the world—all now throng the busy sensorium. Then a state of gradual convalescence brings new varieties every day—the first getting out of bed—the first sight of green fields and waving trees—the congratulations of kind friends—the keen appetite, and the gradual progress from slops to solid food, joined to the overflows of gratitude and thankfulness, and ease of a restored nature—all serve to encircle as with a halo the past pangs of sickness, and make the entrance at last to the every day bustle of the world be looked upon with something approaching to regret.

Before concluding, however, we must offer a few remarks and cautions to the convalescent. After recovering from sickness, especially if this has been severe and protracted, be cautious in again resuming your ordinary habits. You are enfeebled and emaciated, and the powers of life have suffered great depression; be cautious, therefore, in keeping up a due warmth, both by clothing and the keeping your apartment till the animal vigour is so far restored. When you do go out, let it be at first for a short time, and in the warmest part of the finest day. Keep moving while out, and on the first indications of lassitude, return to the house; avoid sitting long motionless in the open air, and, above all things, avoid the damp and chills of evening. We have frequently seen

the pale emaciated convalescent shivering even in the noonday breeze, and frequently returning, after a too long and incautious exposure, to experience a relapse of his malady, more serious than the first. It is, no doubt, an exquisite enjoyment to drink in the pure air, and enjoy the glories of earth and sky, after having inhabited a gloomy room for weeks together, and fed on drugs, under a fever's burning agony; but beware of indulging too much of even this simple enjoyment, until you gain strength to do so with impunity. In the next place, although your appetite may be keen, and though you think and dream of beefsteaks and roasted chicken as of enjoyments more than kingly, recollect that your stomach and digestion are yet weak and impaired, and that your system must be renovated by gradual and moderate means. Eat little at a time, then, and let your food be of that nature suited to your particular condition. If you eat little at a meal, you may be allowed to repeat this gratification oftener in the course of the day than health is accustomed to. It will be advisable, also, to strengthen your system with food a little while before you take your exercise. When you find your shrivelled flesh again swelling out to its usual dimensions, your nails becoming red, instead of the pale blue or yellow colour of sickness, and your skin of a shining rosy hue of health, you may then, and then only, with impunity resume your ordinary habits, and bid adieu, with a grateful heart for your recovery, to the sick-chamber.

SMOKE.

SMOKE! the very word is enough: it is always associated with recollections of nature in a state of pollution, and of feelings oppressed, tortured, and stupefied, by all that is odious and unsightly. We see, in idea, the dingy clouds issuing in substantial volumes from the summits of tall brick chimnies, first shooting in perpendicular columns, as if spouted from the craters of volcanoes, and then lazily—quite at their ease—wending away in mid-air, and dissolving in showers of culm over the streets, the house tops, the gardens, the clothes, nay, into the very mouths of the people. All this is seen and felt in what are called manufacturing towns. We have never envied the inhabitants of these places, although assured that they all make great lots of money. We should much rather prefer a crust with a clear bracing atmosphere—

“Health in the breeze and shelter in the storm”—

on one of the picturesque eminences of our own ancient town, than a fortune with smoke—smoke to look upon, smoke to breathe, smoke to eat, drink, and sleep amongst, all day and all night; smoke never ending—bating a clear moment on Sunday—and so at last be choked, die outright, and sink into a grave over which clouds of smoke are to roll and blacken till the final day of doom. The idea is horrid. No! Our mind is made up. We could not live in a manufacturing town.

So much for the mere burlesque of the thing. The subject, fortunately, is open to treatment in a different manner. Essential as fuel is to the arrangements of manufacturing towns, there is no reason why the inhabitants should not endeavour to get rid of smoke. It is not the smoke that makes the money. The smoke is rather so much money flying away and vanishing into air. In the case of smoke from steam-boats, the money is literally thrown in the sea—just so much valuable material sunk in the ocean. How, it may be asked, can these things be? That is easily explained. Smoke consists of infinitely small unburnt particles of coal, which are carried upward along with the ascending heated air from the fire; as long as the united mass retains its heat, the smoke is seen to rise in a compact body; but when the heat is withdrawn by coming in contact with the cool external atmosphere, the particles of coal, no longer supported, fall by their natural gravity to the earth. In this manner a certain quantity of every portion of coal put into a fire or furnace, is blown away in an unburnt condition; and thus we have two great evils—a loss of fuel, alias money, and our atmosphere polluted to a most unwholesome degree. If all the coal were collected which falls daily in the form of culm in the streets of Glasgow, Manchester, Liverpool, Birmingham, London, and other manufacturing cities, and re-cemented into solid heaps, a saving of many thousands of cart-loads would be effected. In an economical point of view, this is a subject deserving serious consideration.

Various plans have been proposed and tried for consuming the smoke of furnaces, and so saving the portion of fuel now blown into the atmosphere, but few have been of practical utility, in consequence either of their complex arrangement, or of the loss incurred—the cost of working the process being more than all the saving which could be effected. This latter substantial reason, whether well or ill founded, has generally disinclined proprietors of steam-engines from attempting any plan by which their smoke might be consumed. Thus the inhabitants of manufacturing towns continue to be smoked and discomforted. At length a plan has been devised which we seriously think likely to prove effectual in consuming the smoke of steam-engine fires, and saving fuel at the same time. The plan, which is that of Mr Ivison, usually called “Ivison's Smoke-Consuming Apparatus,” has already been some time before the public, and was described in the 349th number of the Journal, but without that confidence in its efficiency which we are now inclined

to entertain. It has lately been tried in connection with a steam-boiler on the premises from which this work proceeds, and we have thus had an opportunity of satisfying ourselves, from personal observation, of the utility of the plan. The furnace usually employed for steam-boilers consists, as is generally known, of a long narrow fire between brick sides, the whole length of the boiler, with an iron door in front to open occasionally for throwing in coal; the air to the fire is admitted partly by this door, but chiefly from the ash-pit beneath. In order to create a sufficient draught, as well as to carry off the smoke, a tall chimney is erected near the farther end of the furnace. Such, in most instances, is the strength of this draught—a strength requisite in order to keep the fire clear—that the smoke is hurried quickly along the surface of the fire, and gets into the chimney in a dense unconsumed volume. But it is not the draught alone that causes this: if the smoke were to lag over the fire, it would not burn, because there is a deficiency of oxygen (or the ingredient in the atmosphere that supports combustion); the whole that is admitted going to the fire, and the smoke thus wanting the necessary supply of this material, the flame of the furnace cannot possibly operate upon it. An artificial means of admitting oxygen, so as to enable the flame of the furnace to attack and destroy the smoke, is, we believe, the basis of all smoke-consuming apparatuses.

The principle of Ivison's patent is the discharge, above the fuel, of steam, either of high or low pressure, and the quantity of which does not appear to exceed the proportion of one per cent. of that generated and used for the purposes of an engine. The steam is discharged in the following manner:—A small iron pipe is brought from the top of the boiler down in front to the top of the door of the furnace, and then is projected forward close to the roof of the furnace below the boiler, and terminates, at a certain distance, in the form of a fan. This fan-shaped extremity is perforated with small holes, from which the steam is discharged in a rushing invisible shower upon the smoke as it rises from the coal. By a steam cock upon the pipe at the furnace door, the discharge can be regulated, or altogether stopped. The pipe, where exposed to the open air, is covered with a coating of some kind, to prevent the loss of heat. By the manner in which the apparatus is regulated, the discharge does not act as a blast to the fire, for that would cause an increased consumption of fuel; it acts, as we have said, on the smoke or products of the furnace; and thus, without increasing the combustion of coal, adds flame to the surface of the existing fire; in other words, consumes the smoke, and gives an additional heat to the boiler.

The due working of the apparatus depends on admitting into the furnace, above the fuel, a certain quantity of air, either hot or cold, along with the steam; hot air being best for the purpose, it is employed in preference. A sheet-iron pipe of about two inches diameter is fixed in the building of the furnace, at each side of the door. These two pipes proceed from the outer air for six or eight feet along the upper sides of the flue, and returning backwards, terminate in the inside of the furnace behind the distributor. By this arrangement the air is heated, but not destroyed, before entering the fire, and so does not diminish the intensity of the combustion. What with the discharge of steam and hot air together in this manner, the draught is greatly increased, exclusive of all other results, and means must therefore be adopted for lessening it. This is done by keeping the door of the furnace and also the ash-pit shut; but if this does not answer the desired end, a small opening is made near the root of the chimney. On account of the increase of draught by the application of the patent, it is alleged that more beneficial results in the saving of fuel are obtained from chimnies of small than of large dimensions.

Such is Ivison's smoke-consuming apparatus, as it has been applied to the furnace of the steam-engine which moves our printing machinery. The cost of applying it was a mere trifle, and so likewise was the licence given by the patentee. We have now had it in use for about two months. It effectually consumes the smoke. The only times that smoke is visible are when the fire is lighted, and when the door is opened to shovel in the fuel; in the one case the steam is not raised, and in the other the draught becomes so great as to prevent the due working of the apparatus. At all other times, if proper care be taken, the smoke is consumed, and it is seldom that there is any visible fume at the top of the chimney.

The great question remains as to the saving of fuel. We reckon in our own case that we can make the coal formerly required for twenty-four hours' work, serve for twenty-six (or perhaps a little more), which gives a saving of fully eight per cent. This, of course, is the estimate after allowing for the waste of steam by the discharge. We do not think it of importance to calculate what is the proportion of steam consumed by the apparatus; it is quite enough for us to know how much we save on the whole, and that, as we say, is at least eight per cent. Our boiler is calculated for a six horse high-pressure engine, but works one of four horse, and at the same time gives steam sufficient to heat a suite of capacious premises five stories in height. As no great quantity of coal is required for such a small apparatus, and as we work only during the day, the actual saving in money is only a few shillings per week; this, however,

is a point of inferior importance, as the main object in view was to remove any ground of complaint by the Commissioners of Police on the subject of the smoke, and we are quite satisfied to find, so far as we are enabled to speak from experience on a matter so important both to the comfort of the public and to economy, that that end at least has been accomplished.

Various experiments, as we perceive from the public prints, have been performed on Ivison's apparatus by scientific and other gentlemen, and with a success more determinate than that which we are able to narrate. The following table, copied from an Edinburgh newspaper, shows the result of a number of experiments detailed below, and certified respectively by Professors Forbes and Trail, Dr Fyfe, Messrs Slight, Hamilton, and Dougall, engineers, and others.* The experiments were performed with common Scotch coal. In the table, the results are also stated in reference to English caking coal.

EXPERIMENTS.	lbs. water to 1 lb. of Scotch coal.	lbs. water to 1 lb. of English coal.	lbs. English coal to cubic foot water, or horse power per hour.
FORMER METHODS—			
Watt's average	5.55	7.4	8.4
United Mines' Loam. (Ed. Phil. Jour. July 1839),	6.9	9.58	6.23
Parke of Warwick's method, Huel Towan (Ed. Phil. Jour. July 1839),	7.72	10.32	6.03
M. Henwood's former experiment,	7.91	10.55	5.9
Ivison's—	8.9	11.87	5.32
Average of eight experiments, certified April 13, 1839,	11.41	15.21	4.00
Average of two experiments, certified May 10, 1839,	13.94	18.58	3.35
Average of twelve workings, certified July 1839,	13.25	17.66	3.52
Maximum result of ditto,	14.72	19.62	3.12
Average of the four preceding lines,	13.13	17.96	3.46

Unless some very extraordinary fallacy shall be found to lurk under these experimental results, as well as in the manifestations of our apparatus, the world may be congratulated on having at length discovered a simple and profitable plan of relieving itself from the nuisance of smoke from engine chimnies. The inhabitants of manufacturing towns may now expect ere long to breathe the fresh air of heaven, instead of the murky fluid which they have hitherto been inhaling; while processes of manufacture may be introduced, without any anticipatory horrors, into those seats of population from which, till the present time, they have been excluded.

SPECIMENS OF THE ENGLISH SONNET WRITERS.

SECOND ARTICLE.

SPECIMENS of the sonnet, from the works of those of our older writers who most successfully cultivated this variety of poetical composition, were presented to the reader in a recent number. The view was carried down to the age of Drummond, whose principal successor in this department of verse was one deserving of most especial notice. Milton, indeed, in whose hands, as Wordsworth grandly says, “the thing became a trumpet,” has strong claims to be pronounced the best sonnet-writer in the English language. The severe correctness and majestic melody of his style, and the elevated character of his thoughts, obviously fitted him for success in this species of poetical composition, and accordingly we have a few specimens from his pen, which leave it a subject of lasting regret that he did not extend their numbers—“soul-animating strains—alas, too few!” That which we quote, besides its other merits, is interesting as exhibiting the noble consolations wherewith the heavy dispensation that fell on Milton in his latter years was softened and soothed. It is addressed to Cyriac Skinner, the poet's friend:—

Cyriac, this three years' day these eyes, though clear,
To outward view, of blemish or of spot,
Bereft of light, their seeing have forgot;
Nor to their idle orbs doth sight appear
Of sun, or moon, or star, throughout the year,
Or man, or woman. Yet I argue not
Against heav'n's hand or will, nor bate a jot
Of heart or hope; but still bear up, and steer
Right onward. What supports me? dost thou ask;
The conscience, friend, to 've lost them overpy'd
In liberty's defence, my noble task,
Of which all Europe talks from side to side.
This thought might lead me through the world's vain mask,
Content though blind, had I no better guide.

Milton had no immediate followers of much note in sonnet-writing. After a considerable interval, Gray produced a few pieces of this order, but was not so successful as might have been anticipated from the polished precision of his ordinary style. We cannot

* There are various other certified reports of experiments, but or these we cannot afford room. Individuals interested in the question can have no difficulty in procuring every kind of information from W. Bell, Esq. W. R. 8, Queen Street, Edinburgh, who grants licence for working the patent.

give a more favourable sample of his powers in this department than the one annexed.

In vain to me the smiling mornings shine,
And reddening Phœbus lifts his golden fire:
The birds in vain their amorous descant join,
Or cheerful fields resume their green attire:
These ears, alas! for other notes repine,
A different object do these eyes require:
My lonely anguish melts no heart but mine;
And in my breast the imperfect joys expire.
Yet morning smiles the busy race to cheer,
And new-born pleasure brings to happier men:
The fields, too, all their wonted tribute bear:
To warn their youthful loves the birds complain.
I fruitless mourn to him who cannot hear,
And weep the more, because I weep in vain.

Thomas Warton, a writer of very similar taste to that of Gray, produced a number of sonnets which Hazlitt preferred to any in the language. The sonnet to the river Lodon will afford a fair specimen of his powers and style:—

Ah! what a weary race my feet have run,
Since first I trod thy banks with alders crown'd,
And thought my way was all through fairy ground,
Beneath thy azure sky and golden sun:
Where first my muse to lip her notes began!
While pensive memory traces back the round,
Which fills the varied interval between:
Much pleasure, more of sorrow, marks the scene.
Sweet native stream! those skies and suns so pure
No more return, to cheer my evening road!
Yet still one joy remains, that not obscure,
Nor useless, all my vacant days have flow'd,
From youth's gay dawn to manhood's prime mature;
Nor with the muse's laurel unbestow'd.

This, like all Warton's pieces, is sweet and pleasing poetry, but since his days our literature has been enriched with so many fine specimens of the sonnet, that justice, and a wish for variety, require us to pass on to others. Mrs Charlotte Smith, a lady of great talents and many misfortunes, was in her day a popular sonnet-writer, and not undeserving to be so, as the following two pieces, the one on "Spring," and the other on the "Glow-worm," will satisfactorily show:—

The garlands fade that Spring so lately wove,
Each simple flower which she had nursed in dew,
Anemones that spangled every grove,
The primrose wan, and harebell milidly blue.
No more shall violets linger in the dell,
Or purple orchis variegates the plain,
Till Spring again shall call forth every bell,
And dress with humid hands her wreaths again.
Ah, poor humanity! so frail, so fair,
Are the fond visions of thy early day,
Till tyrant passion, and corrosive care,
Bid all thy fairy colours fade away!
Another May now buds and flowers shall bring:
Ah! why has Happiness no second Spring!

When, on some balmy-breathing night of Spring,
The happy child, to whom the world is new,
Pursues the evening moth of mealy wing,
Or from the heath-bell beats the sparkling dew;
He sees, before his inexperienced eyes,
The brilliant Glow-worm, like a meteor, shine
On the turf-bank; amazed and pleased, he cries,
"Star of the dewy grass, I make thee mine!"
Then, ere he sleep, collects the moistened flower,
And bids soft leaves his glittering prize enfold,
And dreams that fairy lamps illumine his bower;
But with the morning shudders to behold
His lucid treasure rayless as the dust;
So turn the World's bright joys to cold and blank disgust!

The Rev. W. Lisle Bowles has been a voluminous writer in the department of verse now under consideration, and his pieces have been deservedly admired. There is such an equality of merit about them, however, that, from one example, a pretty complete idea may be formed of the general merits of his style. The River Itchin has been honoured by the address subjoined:—

Itchin, when I behold thy banks again,
Thy crumbling margin, and thy silver breast,
On which the self-same tints yet seem to rest,
Why feels my heart the shivering sense of pain?
Is it, that many a summer's day has past
Since, in life's morn, I carolled on thy side?
Is it, that oft since then my heart has sighed
As youth and hope's delusive gleams flew fast?
Is it, that those who circled on thy shore,
Companions of my youth, now meet no more?
Whate'er the cause, upon thy banks I bend
Sorrowing, yet feel such solace at my heart,
As at the meeting of some long lost friend,
From whom, in happier hours, we wept to part.

Coleridge assigned to the sonnets of Bowles, who is one of the oldest poets now living, the high honour of having attracted him to poetry, and soothed his hours of care, in his early years. This is no mean eulogy.

John Keats composed a few, a very few sonnets, of a most powerful and original cast—as, indeed, all his productions were. One, written on the occasion of the author's first perusal of old Chapman's masterly translation of Homer, we commend to the best attention of the reader, and would have him to look at it more than once, as the perfectness of its beauties only dawns on one's mind by slow degrees.

Much have I travelled in the realms of old,
And many goodly states and kingdoms seen;
Round many western islands have I been,
Which bards in fealty to Apollo hold.
Oft of one wide expanse had I been told,
That deep-browed Homer ruled as his demesne;
Yet did I never breathe its pure serene,
Till I heard Chapman speak out loud and bold:
Then felt I like some watcher of the skies,
When a new planet swims into his ken;
Or like stout Cortez, when with eagle eyes
He stared at the Pacific—and all his men
Looked at each other with a wild surmise—
Silent, upon a peak in Darien.

Nothing could be more perfect than the two closing similes, or than the last line, which to us has an effect

at once fine and indescribable. Keats has been usually called a pupil of Leigh Hunt, but in the two or three sonnets which the latter has written, he seems rather to have been the imitator of his younger brother in the muse. The beauty of the following very finished sonnet is of the same order as that which distinguishes most of those of Keats. It is on a "Lock of Milton's Hair":—

It lies before me there, and my own breath
Stirs its thin outer threads, as though beside
The living head I stood in honoured pride,
Talking of lovely things which conquer death,
Perhaps he pressed it once, or underneath
Ran his fine fingers, when he leant, blank-eyed,
And saw in fancy Adam and his bride
With their heaped locks, or his own Delphic wreath.
There seems a love in hair, though it be dead.
It is the gentlest yet the strongest thread
Of our frail plant—a blossom from the tree
Surviving the proud trunk; as though it said
"Patience and Gentleness is Power. In me
Behold affectionate eternity."

Many other bards have written good sonnets in our day, and we have purposely left to the last, one great sonnet-writer—the greatest, indeed, in many respects, who ever attempted this variety of verse. Others have given us beautiful poetry in this shape, but their pieces might often pass merely for so many lines extracted from some larger poem. They have formed no specific conception of the sonnet, as a thing requiring a peculiar style of thought and language. Wordsworth has adopted clearer views on this point, and carried them admirably into practice. Every one of his three hundred and odd sonnets is a unity, a thing complete in itself; so much so as to have, like Milton's, somewhat of a logical character—a proposition being first stated, then illustrated or established, and afterwards closed inductively. The variety of purposes, too, to which he has applied it, as we shall show by the arrangement of our examples, is wonderfully great. Even with the effusions of Milton, Shakspeare, and others before it, the world was still apt to regard the sonnet as a fit vehicle only for the disburdenment of any light casual thought, but it has been conclusively shown by Wordsworth to possess far higher capabilities, and has become "in his hands a trumpet" to awake the fervour of patriotism, an organ to arouse the spirit of devotion, and a rural pipe to excite our sympathies with the beauties of external nature. The subjoined specimens, taken from among many of equal excellence, will give an idea of what the poet of Rydal has made of the sonnet:—

The world is too much with us; late and soon,
Getting and spending, we lay waste our powers;
Little we see in nature that is ours;
We have given our hearts away, a sordid boon!
This sea that bares her bosom to the moon;
The winds that will be howling at all hours,
And are upgathered now like sleeping flowers;
For this, for every thing, we are out of tune;
It moves us not.—Great God, I'd rather be
A Pagan, suckled in a creed outworn;
So might I, standing on this pleasant lea,
Have glimpses that would make me less forlorn;
Have sight of Proteus coming from the sea;
Or hear old Triton blow his wreath'd horn.

SUBSTITUTES FOR PERSONAL TALK.

Wings have we—and as far as we can go
We may find pleasure: wilderness and wood,
Blank ocean and mere sky, support that mood
Which with the lofty sanctifies the low.
Dreams, books, are each a world; and books, we know,
Are a substantial world, both pure and good:
Round these, with tendrils strong as flesh and blood,
Our pastime and our happiness will grow.
There find I personal themes, a plenteous store,
Matter wherein right voluble I am,
To which I listen with a ready ear;
Two shall be named, pre-eminently dear—
The gentle lady married to the Moor:
And heavenly Una with her milk-white lamb.

These are examples of the simply moral and didactic powers of the sonnet in the hands of Wordsworth. As a vehicle for the portrayal of natural objects, the reader will admit it to be equally suitable, when he peeps in upon the charming picture of the Wild Duck's Nest:—

The imperial consort of the fairy-king
Owns not a sylvan bower, or gorgeous cell
With emerald floored, and with purpureal shell
Ceilinged and roofed, that is so fair a thing
As this low structure, for the tasks of Spring
Prepared by one who loves the buoyant swell
Of the brisk waves, yet here consents to dwell;
And spreads in steadfast peace her brooding wing.
Words cannot paint the o'ershadowing yew-tree bough.
And dimly-gleaming nest—a hollow crown
Of golden leaves inlaid with silver down,
Fine as the mother's softest plumes allow:
I gazed—and, self-accused while gazing, sighed
For human-kind, weak slaves of cumbrous pride.

Of the sonnets upon liberty, many of the best have been frequently quoted, but there is yet no difficulty in selection from the store. How much true wisdom there is in the following, and how amply was this proved by Napoleon's later history and end! It was composed in 1801:—

I grieved for Bonaparte, with a vain
And an unthinking grief! The tenderest mood
Of that man's mind—what can it be? what food
Fed his first hopes? what knowledge could he gain?
'Tis not in battles that from youth we train
The governor who must be wise and good,
And temper with the sternness of the brain
Thoughts motherly, and meek as womanhood.
Wisdom doth live with children round her knees:
Books, leisure, perfect freedom, and the talk
Man holds with week-day man in the hourly walk
Of the mind's business: these are the degrees
By which true way doth mount; this is the stalk
True power doth grow on; and her rights are these.

While giving pleasure, we hope, by these poetical quotations to general readers, to whom the works of such a poet as Wordsworth are yet too little known, we have not been without an eye to the benefit of those numerous young folks—and there are many of them, we trust, among our readers—who innocently devote a leisure hour now and then to verse, and who are apt to fly to the sonnet as the easiest form of all. The path to success, as well as the difficulties (not light ones) that lie therein, have been alike shown to them here, by precept, and by example far better than precept; and we confidently anticipate that the poets' corners of the provincial papers will be none the worse in future for our humble endeavours to elucidate the true nature of sonnet-writing.

SKETCHES OF SUPERSTITIONS.

FETISHES—OBEEAH.

THE ancient superstitious belief in the power of talismans, amulets, phylacteries, and charms of all kinds, finds a parallel in modern times in the wide-spread reverence for fetishes. Over nearly the whole of Africa, part of Asia, and a number of the Polynesian and American islands—wherever mankind are most deeply sunk in ignorance—fetichism prevails, to the exclusion in a greater or less degree of right ideas on the subjects concerned.

The word *fetish* or *fetich*, which is believed to be from the Portuguese language, signifies any object in nature or art to which, by a process of consecration, a supernatural or divine power is supposed to have been communicated, and which is therefore deemed worthy of religious veneration and worship. A *fetish* is thus a kind of idol, or visible representation of deity, and may be ranked with the household gods and presiding genii of the Egyptians, Greeks, and other nations of antiquity. Amongst no people of the old or new world do we find fetichism brought to such perfection as amongst the negroes of Africa and the West Indies. These rude tribes have no rule to determine the kind or number of their fetishes; it is a matter of free choice, so that whim and accident, much more than any definite feeling, settle which shall be the revered objects of their hopes and fears. There are national, local, and private fetishes; and besides one which is the tutelary genius of every single individual, the negroes provide themselves with many others for particular purposes. Like the ancient inhabitants of Ethiopia, Nigritia, and Egypt, they often take along with them upon their journeys a living animal as a fetish, which is preserved with extraordinary care. Inasmuch, also, as the ancient Egyptians and their neighbours went to war on account of injury or insult to their gods—on one occasion there was a furious religious war between the cat and rat worshippers—so vindictive wars and dissensions spring up between negro tribes, if either maliciously or accidentally kill or injure a fetish of the other.

The Moors of Northern Africa, who, as Mahomedans, are opposed to the worship of idols, are attached to fetichism. They honour the fetishes as divine beings of an inferior rank, and carry them about their persons as amulets or charms. In Whiddah, and other parts of Africa, towards the south, a small insect, called the creeping leaf, is highly honoured; he who gets a sight of one considers it a happy omen, and he who kills one despairs of success; the serpent, also, is worshipped as a fetish in temples by priests set apart for the purpose. In Benin, fetishes are more numerous, and, in part, of an entirely different description. The whole material universe is believed to be animated and furnished with spiritual powers: water, land, animals, stones, trees, and vegetables of every description, are all full of divine spirits and secret influences. He who makes any eatable article his fetish, touches nothing of that sort whatever, whilst he consumes, without the slightest hesitation, what others consider holy. There is a depth and mystery in this superstition which cannot be very clearly understood. As far as can be reasonably conjectured, this species of fetichism implies a connection between the visible and invisible, and that every thing may by certain means be made to have a relation to man and his destiny. The quality of the thing arbitrarily set apart and invested with an attribute of divinity, is of no consequence; it may be a piece of bone, rag, egg shell, or clay, indeed no matter what; there must merely be a belief of a relation subsisting between it and man, which relation often commences only for the first time when the thing is consecrated; in a word, every thing properly consecrated and revered as the residence or tangible investiture of deity, is supposed to have a divine power, which, when evoked, is able to incline the Deity to comply with the wishes of men. Under different names, this superstitious reverence for visible objects has prevailed in all ages and countries. At Cape Coast there is a rock projecting into the sea, invested with the character of a fetish, and worshipped by the priests, who annually offer sacrifices to it, with ridiculous gestures and strange invocations. In the great temple of Mahomedanism at Mecca, there is a stone which is the object of unbounded respect and adoration. The Lacedaemonians had a sacred stone, which, at the sound of a trumpet, is said to have raised itself to the surface of the water from the bottom of the Eurotas. The ancient Germans and Gauls had also their holy rocks, caves, seas, springs, and trees, which afforded miraculous aid, and delivered oracles. In Iceland there was a stone in

which a divine spirit was supposed to reside, and was therefore an object of religious worship. The Laplanders had a sacred mountain and a consulting drum. All these superstitions are not a whit more respectable than the belief of the negroes in fetishism; they are, indeed, almost the same thing.

According to the visionary ideas of some ancient sages, a divinity was supposed to reside in matter, and to be liable to be roused from its latent state into activity, by means of consecration and the performance of solemn mysteries. The frequent consecrations, especially among the Roman emperors, are well known. Any place or frontier line which was menaced by an enemy, was carefully guarded by sacrifices on the spot, and the erection of statues as protecting deities. These arrangements had the effect of preventing the enemy from venturing too near the place which had been fetiched in this manner, and frequently deterred them from making any inroad across the frontier. There is little substantial difference between these superstitions and the delusions of modern fetishists. In some of the islands of the Pacific, if any person wishes to protect his property, such as a house, field, or place of sepulture, from robbery or intrusion, he declares that it is tabooed, or placed under the guardianship of his gods; and the belief that such is the case being universal, the property is safe from aggression. Mr Ellis, in his "Missionary Tour through Hawaii," mentions some interesting particulars regarding the superstitious delusions of the natives, which incline us to think that these remotely situated people must have had some early connection with the ancient natives of Asia and Africa, from whom the Greeks and Romans imported their learning and mythological observances. These Hawaiians, as we are told, previous to their embracing Christianity, believed in a number of ideal gods, who were ministered to by priests, and were propitiated by sacrifices of animals; in making these sacrifices, the diviners observed "the manner in which the victims expired, the appearance of the entrails, and other signs. Sometimes, when the animal was slain, they embowelled it, took out the spleen, and, holding it in their hands, offered their prayers. If they did not receive any answer, war was deferred. They also slept in the temple where the gods were kept, and after the war-god had revealed his will by a vision or dream, or some other supernatural means, they communicated it to the king and warriors, and war was either determined or relinquished accordingly." The images of the gods who constituted the guardians of the tabooed places of sepulture, are described as figures oddly carved in pieces of wood; these were stuck on the fences and trees of the enclosure, and with their horrid aspect and ragged garments, seemed no improper emblems of the system they were designed to support. Adjoining the sacred enclosure, the author was shown a *Pahu Tubu*, or city of refuge, which was open for the reception and security of all classes of delinquents, and resembling in its regulations the sanctuaries of antiquity. These, and some other circumstances, mentioned by Mr Ellis, open an interesting field for speculation on the probable connection of ancient and modern superstitions, or, at least, on the similarity of the delusions by which the untutored human being has in all ages been affected.

Fetichism has long been practised among the negroes of the West Indies, under the name of *Obeah* or *Obi*—a term most likely originating in Egypt and the adjacent parts of Africa, where anciently there was a deity of a demoniacal character with the name *Ob*, or *Oub*, and from which Moses commanded the Israelites to abstain from making inquiries. *Obi* is therefore one of the exploded oracles of the ancient world, which has been carried by captured negroes to the West Indies, and there set up as an oracle and the patron of incantations, charms, and all other superstitious delusions. The adepts who practise this kind of fetishism are called *Obeah-men*, or *Obeah-women*, for both sexes engage in the mysteries of the science, and the most noted for their skill and power are generally old negroes, living in a solitary manner in huts.

Mr Bryan Edwards, in his History of the West Indies, presents the following accounts of *Obeahism* and its professors, from authorities which he quotes:—

"As far as we are able to decide from our own experience and information when we lived in the island, and from the current testimony of all the negroes we have ever conversed with on the subject, the professors of *Obi* are, and always were, natives of Africa, and none other; and they have brought the science with them from thence to Jamaica, where it is so universally practised, that we believe there are few of the large estates possessing native Africans, which have not one or more of them. The oldest and most crafty are those who usually attract the greatest devotion and confidence; those whose hoary heads, and a somewhat peculiarly harsh and forbidding in their aspect, together with some skill in plants of the medical and poisonous species, have qualified them for successful imposition upon the weak and credulous. The negroes in general, whether Africans or Creoles, revere, consult, and fear them; to these oracles they resort, and with the most implicit faith, upon all occasions, whether for the cure of disorders, the obtaining revenge for injuries or insults, the conciliating of favour, the discovery and punishment of the thief or the adulterer, and the prediction of future events. The trade which these impostors carry on is extremely lucrative; they manufacture and sell their *Obeis*

adapted to the different cases and at different prices. A veil of mystery is studiously thrown over their incantations, to which the midnight hours are allotted, and every precaution is taken to conceal them from the knowledge and discovery of the white people. The deluded negroes, who thoroughly believe in their supernatural power, become the willing accomplices in this concealment, and the stoutest among them tremble at the very sight of the ragged bundle, the bottle, or the egg shells, which are stuck in the thatch or hung over the door of a hut, or upon the branch of a plantain tree, to deter marauders. In cases of poison, the natural effects of it are by the ignorant negroes ascribed entirely to the potent workings of *Obi*. The wiser negroes hesitate to reveal their suspicions, through a dread of incurring the terrible vengeance which is fulminated by the *Obeah-men* against any who should betray them; it is very difficult, therefore, for the white proprietor to distinguish the *Obeah professor* from any other negro upon his plantation; and so infatuated are the blacks in general, that but few instances occur of their having assumed courage enough to impeach these miscreants. With minds so firmly prepossessed, they no sooner find *Obi set for them* near the door of their houses, or in the path which leads to it, than they give themselves up for lost. When a negro is robbed of a fowl or a hog, he applies directly to the *Obeah man* or woman; it is then made known among his fellow blacks, that *Obi is set for the thief*; and as soon as the latter hears the dreadful news, his terrified imagination begins to work; no resource is left but in the superior skill of some more eminent *Obeah-man* of the neighbourhood, who may counteract the magical operations of the other; but if no one can be found of higher rank and ability, or if, after gaining such an ally, he should still fancy himself affected, he presently falls into a decline, under the incessant horror of impending calamities. The slightest painful sensation in the head, the bowels, or any other part, any casual loss or hurt, confirms his apprehensions, and he believes himself the devoted victim of an invisible and irresistible agency. Sleep, appetite, and cheerfulness, forsake him; his strength decays; his disturbed imagination is haunted without respite; his features wear the settled gloom of despondency: dirt, or any other unwholesome substance, becomes his only food; he contracts a morbid habit of body, and gradually sinks into the grave. The *Obi* is usually composed of a farrago of materials, most of which are enumerated in the Jamaica law, namely, 'Blood, feathers, parrots' beaks, dogs' teeth, alligators' teeth, broken bottles, grave dirt, rum, and egg shells.'

It may seem extraordinary, that a practice alleged to be so frequent in Jamaica should not have received an earlier check from the legislature. The truth is, that the skill of some negroes in the art of poisoning has been noticed ever since the colonists became much acquainted with them. Sloane and Barham, who practised physic in Jamaica in the last century, have mentioned particular instances of it. The secret and insidious manner in which this crime is generally perpetrated, makes the legal proof of it extremely difficult. Suspicions therefore have been frequent, but detections rare: these murderers have sometimes been brought to justice, but it is reasonable to believe that a far greater number have escaped with impunity. In regard to the other and more common tricks of *Obi*, such as hanging up feathers, bottles, egg shells, &c. in order to intimidate negroes of a thievish disposition from plundering huts, hog-sties, or provision grounds, these were laughed at by the white inhabitants as harmless stratagems, contrived by the more sagacious, for deterring the more simple and superstitious blacks, and serving for much the same purpose as the scarecrows which are in general used among our English farmers and gardeners. But in the year 1760, when a very formidable insurrection of the Koromantyn or Gold Coast negroes broke out in the parish of St Mary, and spread through almost every other district of the island, an old Koromantyn negro, the chief instigator and oracle of the insurgents in that parish, who had administered the fetish or solemn oath to the conspirators, and furnished them with a magical preparation which was to render them invulnerable, was fortunately apprehended, convicted, and hung up with all his feathers and trumperies about him; and his execution struck the insurgents with a general panic, from which they never afterwards recovered. The examinations which were taken at that period first opened the eyes of the public to the very dangerous tendency of the *Obeah* practices, and gave birth to the law which was then enacted for their suppression and punishment. But neither the terror of this law, the strict investigation which has ever since been made after the professors of *Obi*, nor the many examples of those who from time to time have been hanged or transported, have hitherto produced the desired effect. We conclude, therefore, that either this sect, like others in the world, has flourished under persecution, or that fresh supplies are annually introduced from the African seminaries.

The following (continues Mr Edwards) is a narrative respecting *Obi* from a planter in Jamaica, a gentleman of the strictest veracity, who is now in London [this was twenty years ago], and ready to attest the truth of it.

Upon returning to Jamaica in the year 1775, he found that a great many of his negroes had died during his absence, and that of such as remained alive,

at least one half were debilitated, bloated, and in a very deplorable condition. The mortality continued after his arrival, and frequently two or three were buried in one day; others were taken ill, and began to decline under the same symptoms. All was done, by means of medicines, and the most careful nursing, to preserve the lives of the feeblest; but in spite of all his endeavours, this depopulation went on for above a twelvemonth longer, with more or less intermission, and without his being able to ascertain the real cause, though the *Obeah* practice was strongly suspected, as well by himself as by the doctor and other white persons upon the plantation, as it was known to have been very common in that part of the island, and particularly among the negroes of the Papaw or Popo country. Still he was unable to verify his suspicions, because the patients constantly denied their having any thing to do with persons of that order, or any knowledge of them. At length a negress, who had been ill for some time, came one day and informed him, that feeling it was impossible for her to live much longer, she thought herself bound in duty, before she died, to impart a very great secret, and acquaint him with the true cause of her disorder, in hopes that the disclosure might prove the means of stopping that mischief which had already swept away such a number of her fellow slaves. She proceeded to say, that her stepmother (a woman of the Popo country, above eighty years old, but still hale and active) had put *Obi upon her*, as she had also done upon those who had lately died, and that the old woman had practised *Obi* for as many years past as she could remember.

The other negroes of the plantation no sooner heard of this impeachment, than they ran in a body to their master, and confirmed the truth of it, adding, that she had carried on this business ever since her arrival from Africa, and was the terror of the whole neighbourhood. Upon this he repaired directly, with six white servants, to the old woman's house, and forcing the door open, observed the whole inside of the roof (which was of thatch), and every crevice of the walls, stuck with the implements of her trade, consisting of rags, feathers, bones of cats, and a thousand other articles. Examining further, a large earthen pot or jar, close covered, was found concealed under her bed. It contained a prodigious quantity of round balls of earth or clay of various dimensions, large and small, whitened on the outside, and variously compounded, some with hair and rags, or feathers of all sorts, and strongly bound with twine; others blended with the upper section of the skulls of cats, or stuck round with cats' teeth and claws, or with human or dogs' teeth, and some glass beads of different colours; there were also a great many egg shells filled with a viscous or gummy substance, the qualities of which he neglected to examine; and many little bags stuffed with a variety of articles, the particulars of which cannot at this distance of time be recollected. The house was instantly pulled down, and with the whole of its contents committed to the flames, amidst the general acclamations of all his other negroes. In regard to the old woman, he declined bringing her to trial under the law of the island, which would have punished her with death, but, from a principle of humanity, delivered her into the hands of a party of Spaniards, who (as she was thought capable of doing some trifling kind of work) were very glad to accept and carry her with them to Cuba. From the moment of her departure his negroes seemed all to be animated with new spirits, and the malady spread no further among them. The total of his losses in the course of about fifteen years preceding the discovery, and imputable solely to the *Obeah* practice, he estimates at least at one hundred negroes."

ANECDOTES OF THE APE AND ORANG.

THE great physiologist Blumenbach had one of the monkey tribe, whose movements and conduct he carefully watched for more than a year together. It came to manage the wood for the stove with great dexterity, and would put it in with as much judgment and economy as a cook-maid or a parsimonious spinster. This animal was very partial to the fire, like all other apes, and would occasionally singe himself, when he would sally forth and roll round about in the snow with all the ecstasy of a Russian after taking a warm vapour-bath at 180 degrees of heat. After enjoying this luxury for a time, he would return to his old quarters by the fire. He was often at the college, where he used to turn over and examine the specimens with a gravity and grimace which was quite irresistible. He once swallowed a lump of arsenic, large enough to have done the business of ten Kalmucks; but in him it produced only a trifling indisposition, and in a short while he was quite well again. A work on insects happened to lie for some time upon the table, and which our philosopher contemplated with solemn studiousness for about an hour. The illustrations particularly rivetted his attention: whether they awakened reminiscences of his former haunts, is unknown; but when the book came to be examined, it was discovered that with consummate address he had pinched out all the beetles of the large plates, and actually eaten them—it is supposed, mistaking them for real insects in some unknown state of preservation.

Some curious details are given in the Magazine of Natural History, of the habits of the Orang Outangs exhibited in the Egyptian Hall, London, in 1831. They were male and female, the former the Chimpanzee, and the latter the Borneo. In some respects they presented a marked contrast, and did not show the least tenderness of attachment to each other. The social habits of the Chimpanzee far exceeded those of the female. On first

approaching in a morning, or after being absent from him for a short time, he would utter a loud cry of recognition to the person whom he knew, and running towards him, would stand perfectly erect, spreading his arms like a child to be taken up, when he would wind them round the neck of the individual in the manner of the fondest embrace; nor was it an easy task for those to whom he was attached, to leave the room except by stealth. The instinct of providing and placing warm materials for her bed was most marked in the female, who would be for two hours dragging blankets from various parts of the room, smoothing and changing their position, and beating any raised part down with her knuckles, assuming at the same time a look of gravity and an appearance of wisdom. The hearing of both animals was remarkably acute, and the knowledge of sounds was accurately shown. They were in the daily habit of riding in a coach; and on being seated, before the vehicle moved, they would secure themselves by getting a firm grasp of the hold-ropes attached to the side of the coach. They also seemed to have a pretty good idea of time, for as the hour approached at which they were removed to their nightly residence, they would of their own accord get the blankets, and enfold themselves in readiness to depart; and if their removal was protracted beyond the usual time, it required force to prevent them from going to the door. The Chimpanzee having caught a cold, which ultimately caused his death, he had a violent cough that in sound was remarkably human; and as when a fit of coughing came on he was usually given some sweetmeat or cordial to stop it, he soon adopted the cough as a means of obtaining these luxuries. Really, those creatures who "ape humanity so," create in us strange, and by no means agreeable sensations about ourselves.

A STORY OF LYNCH LAW.

DETERMINING to try my fortune farther south, and seeing one day in the Richmond Inquirer an advertisement offering one hundred dollars reward for a runaway slave, I resolved to go in search of the individual described. With this view I rambled through the country, keeping a watch in out-of-the-way places, and looking very hard at all the negroes who passed. On the second day of my search, I reached a little village, which I will call Featherville. I had given up all hopes of attaining my object, and was sitting on a rock, with my chin resting on both hands, and my elbows on my knees, hungry and disconsolate, when a rough gripe was laid on each of my shoulders; and on attempting to rise, I was roughly prevented. On looking round, I saw that Judge Lynch, with his whole posse comitatus, had pounced upon me. With a skillful celerity they tied my hands behind me, and then, amid shouts and execrations, drove me towards the village square.

"My good friends," exclaimed I, "you are mistaken in the person—whom do you take me for? Let me ent-tr-tr"

My expostulations were abruptly broken off, by one of the foremost of my captors, whom I took to be his honour, gagging me with a handful of shavings. Finding it quite difficult to talk, after being supplied with this mouthful, I submissively held my peace. My amiable conductors dragged me towards an old poplar tree, and tied me to the trunk.

"Now, my lads," exclaimed his honour, with a horrid grin, rubbing his hands; "now, my lads, we'll show you a bipped with feathers. It can't be said now that the devil's to pay, and no pitch hot. Hand along the tar kettle, Mike, my lad; and, Jemmy Dicken, toss along that bag of feathers."

With a horrible alacrity these orders were obeyed. I tried to speak—to move—oh, the dastards! I was bound fast. I could not. I looked unutterable things. Dust was flung in my eyes. What could I do? I ground my teeth in agony, in wrath and in scorn. There is but one step from the farical to the tragical. Like imps of pandemonium, the good people of Featherville flocked round me, and beheld unmoved such tortures inflicted as an uncivilised Arab would weep to witness. The tar and the feathers were bestowed with a liberal hand. There was no lack of generosity in these articles. I believe they are both the natural productions of the state.

As soon as there was a cessation in the tender mercies of *Messieurs* the mob, I unlogged my right eye from the tar that surrounded it, and looked forth. On the slope of the opposite hill I noticed a horseman riding at full speed, and making vehement gestures towards the crowd. They were arrested in their valiant doings by these pantomimical appeals. In a few moments the rider arrived on the spot, and, dismounting, drew the judge aside, and communicated to him the intelligence with which he was charged. The result was, that his honour approached me, relieved my mouth of the shavings which he had thrust into it, and, untying my arms, told me "that I might go; that he believed there was some mistake, but that it was better that fifty innocent ones should suffer than that one guilty should escape; and that he took me for an abolitionist." The jury shouted acquiescence in the decision of the judge.

I attempted to speak, but could not—not that my heart was too full of gratitude for utterance, but because my lips were glued with the tar.

At the tavern at which I had casually stopped that morning, I had given my name as Andrew Jackson Smith. It seems that a trunk, with that name upon it, was received after my departure, and as it was tied with red tape, sealed with wax, the landlord remarked that "it was very mysterious."

"Very, indeed," echoed the editor of the Featherville Banner of Liberty, as he threw his tobacco quid away, and swallowed a mint julep.

"Upon my word, it's very odd," said the postmaster, trying the lock. "Landlord," continued he, "bring me a hammer and a chisel, and I'll take the responsibility, as the old gin'ral says. Amos will bear me out in it."

The hammer and chisel were brought, the trunk was forcibly opened, and in the dressing-case, carefully concealed under some soap and razors, was found a torn

page of a murderous print, published in New York, called the Emancipator.

"Treason!" shouted the postmaster, holding the scrap up to view.

"Bloody treason!" echoed the landlord. "What is it?"

"Lynch him," said the editor, lighting a cigar.

"Call the judge—call the judge," said the postmaster.

"Ay, ay," rejoined the editor, who, by the way, was a pig-eyed gentleman, rather slim and snugly dressed, with light eyebrows and hair—a blackguard in print, and a vulgarian out of print.

"Where is he?" "Who is he?"

"Is he here?" "Is he gone?"

"Where the deuce is he?"

These questions were poured in upon my host in rapid succession. He finally recollected that a wo-begone looking gentleman, in a suit of rusty black, had bought a loaf of bread of him that morning, and that his name corresponded with that on the trunk. You know the rest of my story. The whole village was soon at my heels, and I was regularly Lynched. It was afterwards ascertained that the trunk containing the incendiary article belonged to the son of an eminent slaveholder, whose name I had unwittingly borrowed.

The morning after this unpleasant affair, on taking up the Banner of Liberty, I read the following flattering version of the transaction:—

"A white man, of the name of Andrew Jackson Smith, was yesterday arrested on a writ issued by Judge Lynch. It seems that the suspicions of our vigilant postmaster were aroused by the singular appearance of Smith's trunk, and on breaking it open his worst conjectures were more than realised. It was found full of inflammable papers, Emancipators and Liberators, evidently intended for distribution among the slaves. On this being known, the people of the town, headed by his honour Judge Lynch, turned out in pursuit of the monster Smith. He was soon caught, and being brought into the village, was furnished gratis with a new coat—of tar and feathers—black turned up with white. The craven roared lustily during the operation, and manifested the most cowardly impatience. He has had a lesson which he will not soon forget.

P. S. We learn that it has been satisfactorily ascertained that Smith is innocent of the charges against him. We are glad of it. The man who would come here at this time to raise a rebellion, is unworthy the name and the respect of a man. He is, indeed, 'fit for murder, stratagem, and spoils.' We congratulate Mr Smith that the suspicions against him have proved to be unjust."

And this was all the satisfaction that I could obtain!—*New York Mirror.*

FOR EMIGRANTS.

For intending emigrants, the following is a good hint, well expressed:—"Before concluding this volume, the writer earnestly entreats that no one will be induced by it to leave his native land, unless, after a fearless examination of himself, he believes that he is in mind, body, habits, feelings, and estate, a fit person to persevere in so great a change. The country is beautiful, and the future prospects cheering; but he must remember, that it is a difficult, hard-working, matter-of-fact life, until he has established himself, built his house, and put land under proper cultivation, and his flocks and herds under the care of faithful and experienced men. Let him remember that it is a step, when once taken, not easily recalled, and that by steadiness, prudence, perseverance, and right application of his means, he must stand or fall."—*Ogle's Western Australia*, 1839.

REMARKABLE PETRIFYING SPRING.

There is probably no one unacquainted with the nature of what are called petrifying springs, fountains of water where plants, animals, &c. are changed into stone, the peculiar organic structure of the object being still distinctly marked in its strong similitude, "another, and the same," as the poet hath it. At Clermont, in the south of France, a place where mineral waters abound, there is a spring which possesses the power of petrification in a very extraordinary degree. Some years ago, when a learned professor of the name of Blanqui visited that quarter, there was an ox undergoing the process of transformation; and although the animal had begun to sit, or rather stand, for his statue only twelve months before, one half of him was already done into a stone monument! Several horses are said to be seen turned into monuments to themselves, and ornamenting in the capacity of statues the fields where they once pastured; whilst a collection of other quadrupeds, and of birds, fruits, and flowers, bear ample testimony to the formidable powers of this truly magic spring. There are many petrifying fountains in this country, but none whose powers at all approach that of Clermont. Even the renowned hot springs of Fumas must yield to it, although there also the process is carried on to a great extent. It may be mentioned, that the district around Clermont is mountainous and volcanic, and that the tuffa and ashes thrown out by eruptions which occurred antecedent to the historical era, contain an immense variety of the bones of animals of the quadruped class, as well as birds. Cuvier has described many of those remains as belonging to new or extinct species of the mastodon, elephant, hippopotamus, and so on.

PALM WINE.

This beverage, which is often mentioned by the ancients, is obtained by making an incision in the bark of the palm-tree, and inserting a quill or reed, through which the juice exudes. It is very pleasant to the taste, but powerfully intoxicating; and people in the East are frequently much amused by observing its effects on lizards, which, as soon as the tree is left by those who have been extracting the liquor, run up and suck it with eager delight. They soon become intoxicated, and in that state lie listless, looking up in the face of the spectator with a stupid stare. Parrots and other birds also sip the palm wine, but they seem to be proof against its effects, or else they are seasoned toppers, for none have ever been observed to be the worse for it.

ANCIENT INKS.

According to the Roman naturalist Pliny, and other authors, the basis of the ink used by ancient writers was formed of lamp-black, of the black taken from burnt ivory, and soot from furnaces and baths. Some have also supposed that the black liquor which the cuttle-fish yields was frequently employed. One thing is certain, that whatever were the component ingredients, from the blackness and solidity in the most ancient manuscripts, from an ink-stand found at Herculaneum, in which the ink appears as a thick oil, and from chemical analysis, the ink of antiquity was much more opaque, as well as encaustic, than that which is used in modern times. Inks of different colours were much in vogue; red, purple, blue, and gold and silver inks, were the principal varieties. The red was made from vermilion, cinnabar, and carmine; the purple from the murex; one kind of which, called the purple encaustic, was appropriated to the exclusive use of the emperors. Golden ink was much more popular amongst the Greeks than amongst the Romans. During the middle or dark ages, the manufacture both of it and of silver ink was an extensive and lucrative branch of trade, and the illuminated manuscripts which remain are a striking proof of the high degree of perfection to which the art was carried. The making of the inks themselves was a distinct business; another connected with it, and to which it owed its origin, was that of inscribing the titles, capitals, as well as emphatic words, in coloured and gold and silver inks.

VERSES ON THOMAS CLARKSON, BY L. E. L.

[These verses are from *Fisher's Drawing-room Scrap-Book for 1840*; a most superb volume of engravings, including portraits, views of Spanish and Asiatic scenery, and fancy subjects, with letter-press accompaniments chiefly poetical, the composition of the lamented L. E. L. and of our excellent friend Mary Howitt, into whose hands the task of editing this elegant work has very fitly fallen.]

Not to the many doth the earth
Owe what she hath of good;
The many would not stir life's depths,
And could not if they would.
It is some individual mind
That moves the common cause:
To single efforts England owes
Her knowledge, faith, and laws.

Too much by small low interests bound,
We track our selfish way,
Careless if hope to-day still takes
Its tone from yesterday.
We look upon our daily path,
We do not look beyond,
Forgetful of the brotherhood
In nature's mighty bond.

England, how glorious thine estate!
How lovely thine array!
Thou art the throned Island Queen,
Whom land and sea obey.
Responsible is power, and owns
The holiest debt on earth—
A strict account it owes that Heaven
From whence it had its birth.

Can such be rendered up by thee?
Does neither guilt nor shame—
Guilt to redress—shame to efface—
Shade thy imperial name?
Thou who dost ask for wealth and rule
Wherever rolls the sea,
Oh, Island Queen! how rests the claim
That millions have on thee?

And yet what grievous wrong is wrought,
Unnoticed and unknown,
Until some noble one stands forth,
And makes that wrong his own!
So stood he forth, who first denounced
The slave-trade's cursed gain;
Such call upon the human heart
Was never made in vain.

For generous impulses and strong
Within our nature lie:
Pity, and love, and sympathy
May sleep, but never die.
Thousands, awakened to the sense,
Have never since that time
Ceased to appeal to God and man
Against the work of crime.

The meanest hut that ever stood
Is yet a human home;
Why to a low and humble roof
Should the despoiler come?
Grant they are ignorant and weak,
We were ourselves the same:
If they are children, let them have
A child's imploring claim.

The husband parted from the wife,
The mother from the child—
Thousands within a single year,
From land and home exiled.
For what?—to labour without hope,
Beneath a foreign sky;
To gather up unrighteous wealth—
To droop—decline—and die.

Such wrong is darkly visited;
The masters have their part—
For theirs had been the blinded eye,
And theirs the hardened heart.
Evil may never spring unchecked
Within the mortal soul;
If such plague-spot be not removed,
It must corrupt the whole.

The future doth avenge the past—
Now for thy future's sake,
Oh, England! for the guilty past
A deep atonement make.
The slave is given to thy charge,
He hopes from thee alone;
And thou for every soul so given,
Must answer with thine own.

STORIES OF THE IRISH PEASANTRY.

BY MRS S. C. HALL.

"Mind not high things: but condescend to men of low estate."
ST PAUL.

THE WRECKER,

A SEA-SIDE STORY.

"HANNAH, I have told you three times to go to bed," said Pierce Murphy to a slight delicate-looking young woman, who, notwithstanding his injunction, continued to knit the stocking she had nearly finished, while bending over the embers of a turf fire.

"Well, father, I'm going;" but still she remained.

Pierce Murphy was a tall muscular man, with rugged yet keen features, and a shaggy head of hair, that fell in great profusion over a high determined looking forehead: after having spoken, he walked backward and forward under the rafters of his kitchen, but occasionally pausing to look out through a window upon the night. It is worthy of observation that this window was singularly constructed; Pierce, tall as he was, could not reach it without standing on a stool for the purpose, and then his eyes were only on a level with the lower pane.

"Holy saints!" he muttered to himself, "there's a flash! Well, that is something like."

The girl who had been knitting started to her feet, terrified at the loud thunder-peal that shook their long narrow cottage, and frightened the poultry that were roosting at the far end of the kitchen on the high rafter, so completely, that two of them tumbled down, and ran towards her as if for protection, while the old cock shook his feathers, and chuck-chuck'd something by way of caution to his more assured companions.

"What a night, father!" she exclaimed; "I should think there could be no chance of their running in such a night as this."

"Stuff!" answered the man; "women always talk like fools. What are they to do?—if they have come as far down as where we think, they must put in, or tack about for sea-room, which they can't do, because the wind is right in their teeth, or be seized in the morning by the revenue cutter! There's another blast. Go to bed, go to bed—that's a good girl—go to bed."

And he pressed his forehead close to the glass, which, contrary to the practice in Irish cabins, was perfectly whole and free from dust.

"I'll be as quiet as a lamb, father, but do let me stop up with ye; if I went to bed, sorra a wink would come on my eye. Sure, what's in the differ, if I wake here or in the crib within?"

Her father's thoughts seemed to have taken another direction, for he made no reply to her request; but after gazing intently through the glass for some minutes, he turned abruptly to the door, which opened on the same side as the window, directly towards the sea, and attempted to look forth. It was, however, but an attempt: the wind rushed in with such terrific violence, that the turf ashes were blown about in every direction, and it required all his strength, assisted by his daughter's exertions, to force back and bar the entrance. It will seem strange to those who know what Irish cabins by the sea-side generally are, to talk of "a bar" to the door. A latch, above which a hole is sometimes bored to permit the twine to pass through, so that the latch may be lifted by the stranger or the friend, both alike sure of a welcome; or a rusty lock, where want of use has engendered rust—these are common enough; but, nevertheless, Pierce Murphy's cabin-door was not only furnished with two bolts, but was as sound and substantial a door as any one need desire to have, even in the

neighbourhood of London, where, if you do not lock your doors, and bar your doors, and bolt your doors, you cannot rest secure from danger. Both the door and the long, low, narrow cottage of Pierce Murphy, were substantial, and certainly the recurrence of such storms would seem to render it necessary that they should be so. Pierce, however, had more than one reason for having a strong door and a strong bolt to his dwelling, which stood boldly forward on a toppling cliff, near Point Forlorn; the foundation had been formed of the blue slaty stones, large enough to be called rocks, so general along the coast: these were cemented with stiff yellow clay, and the remainder of the walls was composed of smaller fragments of the same kind of stone; the rafters were, despite all superstitions, of drift-wood; the ribs of many a noble ship having been destined to support the thatch of Pierce Murphy's cabin. Murphy's professed occupation was fishing; indeed, I may say it was his *real* employment when he had no other: he was one whom danger never daunted; in his little smack he braved all weathers; and when he *did* send fish to Wexford market, it was always the finest there: the kitchen of his dwelling was hung with the implements of his ostensible calling, though many did not fail to remark that Pierce's nets were generally dry, except when the coast-guard was on the alert; and coast-guards twenty years ago, the period to which my tale refers, were not as active as they are now; they also wondered at the stability of his door and his high up window; but Pierce said the place was lonely; that he was often out at nights fishing; and that his old woman was "timid of being alone" during the long winter's evening.

This "old woman" was comparatively an old woman when he married her, and had been bedridden many years. The fruit of the marriage was one boy: the young woman whom he called daughter, and who evinced towards him all the duty and affection of a child, was the wife—it might be widow—of Luke Murphy, his only and beloved son.

"Now," exclaimed Hannah, glancing at him from beneath her dark eyelashes, when they had really succeeded in fastening the door, "what would you have done if I had been in bed? Bedad, father, the wind would have had the better of ye!"

Pierce Murphy looked down upon the gentle, earnest face of the pale girl, who had spoken in the half jesting half serious tone of one who does not exactly know how the words will be received, and there was both ire and pride in the expression of his countenance.

"The wind have the better of me—of ME! The wind never crossed the Atlantic, let alone St George's Channel, that would have the better of me," he answered proudly.

"Oh, father dear, take care. God be betwixt us and harm! But sure my poor Luke used to call the breezes and winds the Almighty's breath."

"And why should you mention him to me now?" exclaimed the impetuous man; "what put him in yer head? I say," he repeated, in a voice loud as the tempest, as the trembling creature shrank away without replying, "what put Luke in yer head now?"

A shrill unearthly sort of laugh rang from one of the two small bedrooms that were partitioned at the farthest end off the kitchen, and a voice feeble and sharp replied, "And that shows that Pierce Murphy is the same fool as ever, to ask a young wife what puts her husband in her head—to ask fond Hannah Gowry what puts her lawful husband (may the Lord's care be about him day and night!)—to ask her what puts her husband, Luke Murphy, in her head! Oh,

Pierce, agra! is it now ye have to *larn* that the head and the heart of a young Irishwoman are one! What put Luke in her head! bedad, that's quare! ah, ah!—" and the old bedridden woman went on laughing and muttering to herself in a way that showed her intellects were not clear. Pierce swore at her while commanding her silence, but she did not heed him; accustomed to his rough words and rough usage, perhaps she did not understand his meaning.

"Bedad, ye're a nice lad, Pierce Murphy," she continued half distinctly, and, fortunately for herself and Hannah, the smuggler did not hear above half she said. "Ye turn the Almighty's blessing, yer own flesh and blood, until ye make it into a curse; the *gra* boy! just married too; and in for it, so deep, that if he didn't make a *tartue* of necessity, the law would have sent him abroad free of expence. My beautiful boy! but never heed that, he'll soon be back now—his pardon's granted; my blessing be about Hannah for that same; didn't she work it out for him, with her perseverance and her sweet ways—and he'll soon be back, he'll soon be back—and thin, Pierce, my boy, Pierce, slashing Pierce Murphy, ye're book sworn, so ye are, to turn out all rats—all rats; hush—hush—every rat—before my boy comes home."

"I tell ye what," said Pierce, swearing a dreadful oath, "I tell ye what it is, Hannah: if you don't find some way of stopping that ould woman's tongue, I will—not even her being the mother of my son, your husband, will save her—do ye understand me! The ould hag gets worse and worse;" and the smuggler spoke these words in the stern under-tone of a resolved and desperate man, hissing them through his teeth, while his fingers grappled convulsively, as if he did, in imagination, what he threatened.

Hannah had glanced at him before; now she looked fixedly, if not firmly, in his face; and ere she had spoken a sentence, the crimson that had mounted to her cheek, faded into a death-like paleness.

"You have a right to remember, Pierce Murphy, that if the poor ould senseless creature is what she is, it is *your doing*. Whin she took you first, she had full and plinty. She trusted it all to you; and where is it?"

"Hannah!" exclaimed Pierce, astonished at her boldness.

"Let me alone, then, with your hints, father; I don't think ye mane half what ye say—I know ye don't. Ye could not be Luke's father if ye did. But while I've a heart to feel, I'll feel for her; while I've a hand to work, I'll work for ye both, as I have done. Oh, father! let me love ye both, for the sake of HIM, my own heart's core! Oh! how could ye be so cruel as to ax what put him in my head! My thought by day and drame by night!" and she burst into tears.

Pierce did not repeat his brutal language, reckless as he had grown from long habit and bad associates; he was touched by the truth and faithfulness of the young creature who gazed on him so mournfully. He muttered a few words; and then dashing his elbow against a half door in the wall, which the nicest eye could not have discerned, he disappeared down a narrow subterraneous passage, which led through the cliff to the strand below his dwelling. The memory of the oldest dwellers on that sea-coast could not carry them back as to when the cave was formed that extended upwards, and which Pierce and his associates had continued. Some said, "It was always so!" others said, it was the work of men even more daring than its present possessors. The cave appeared to all but those initiated into its mysteries, precisely as it had always been; but Pierce Murphy more than fifteen

years before the occurrence of the incident I am about to relate, had, with the assistance of two or three companions, hollowed a passage as far as the roof of the cavern, which might be about ten or twelve feet above the rugged stones that formed its flooring. It was wonderful how well the opening was concealed; and the rocky roofing was of itself so uneven and commonplace, that, though the revenue officers, as I have said, not by any means as active then as they are now, though perfectly well aware that smuggling if not more fearful crimes were carried on in that immediate neighbourhood, could not form an idea how the business was managed. Indeed, they were sometimes found to be too well satisfied with the proscribed article, to care much for its distribution, though it is a well-known fact that a revenue officer was never yet really trusted by a smuggler.

When Pierce descended, the young woman sat down by the fire, which she had replenished with fresh turf, and wept long and bitterly; it was sad to hear the voice of one so young and fair, and with an expression of so much innocence in her countenance, harmonising with the moaning into which the madness of the storm had for a time subsided.

"Hannah, *arourneen*!" inquired the half-demented woman, from the little room. "Hannah, *arourneen*! is there any fresh trouble on ye, my comfort?"

"No, mother; go to sleep."

"There's no use, darlint. Is there any noise about the hearthstone, my jewel?"

"No, mother."

"I thought I heard the ticking of the death-watch; the only clock that ever strikes here."

"I didn't hear it, mother."

"Hannah, how long is it since there was a winding-sheet on the candle?"

"I don't know, mother; but sure the last time Father Gandy was in it, he tould ye not to be minding such foolishness; that the Almighty would be above giving a hint about such a thing as death out of a bit of candle-grease; and that a poor little insect—which he says the watch is—could have no knowledge of life and death, only keeps minding its own business in the warm places."

"Ah, ah!" laughed the crone, "and sure he's a fine man, and said more than that whin he was about it."

"Ay, mother, both priest and minister say good enough if we'd only heed it. God help us, he did say a dale of what was true, and so did Mither Burrows, heaven bless them both! about the sin of breaking the law, which was both bad and dangerous; and what was worse, about the curse of sinful people, which sich doings bring about a poor man's house; and the evil courses such lead to, the swearing and the drinking; and the fear o' God, put all on one side for the lucre of gain; and the end that comes of it all, transportation and shame, or may be death. Oh, it's a cruel wicked way; and how poor Luke, though brought up in it, ever turned to it, so fine and honourable as he was, I do not know. I little thought how it was when I married him!"

"And would that have hindered ye, if ye had known it?" inquired the old woman.

"I don't know, I'm not thinking it would; for all the trouble I've had on his account seems to draw my heart closer to him; he is more to me now than ever he was; and when he's with me again, we'll go to some furrin part, and work in the honesty that will bring peace."

"Ah, ah, ah!" laughed the old woman, "I shall be dead before that; but the worms will have no feast, for I'm only skin an' bone, skin an' bone;" and she laughed again the laugh that made poor Hannah's flesh creep, and then continued—"Luke, *a-lanna*, never took to it, though you don't know, for reason ye didn't come to us for good and all, till he was on the point of going; but he never took to it. Sure if a man's in a whirlpool, he doesn't take to it, though he is drowned in it. And Mither Burrows said all that agin the smuggling. Ah! he said all that agin the smuggling, did he! and yet I'll go bail he took the hot drop of the hot stuff afore he left; that's no way to instruct the poor whin they're in the sin, and have the temptation to go on in it; the example must go with the lesson to do good; the poor have the comfort, and not the stroung principle, and yet they'd take away the one, and not give them the other!—that's quare—that has no *sinn* in it—no more than ould Margate Murphy."

"Go to sleep, mother dear," said Hannah.

"Will you pray for me the while?" inquired the old woman, earnestly, and there was sorrow in the tone of her voice. "I can sleep if you pray for me, *arourneen*."

Hannah replied she would, and knelt down for the purpose; but nothing could keep Margaret Murphy quiet.

"Lave off, Hannah, and come sit by me," she said; and accordingly the gentle girl, who was so unsuited for such scenes, and who had quitted "her own people," in a more inland part of the country, simply that she might take care of her husband's mother, to prove her love for him, left off in the middle of an "ave," and seated herself by the bedside of the strange woman, whose former mode of life, before she became Pierce Murphy's wife, was unknown to her neighbours, though various had been the rumours in circulation on the subject.

Margaret Murphy seemed worn more by the perpetual restless anxiety she could not quell, than by age; her bright, wild, blue eye was never calm, and her lean, colourless lips were in perpetual motion. She was subject to occasional fits of insanity, but her memory was at all times distinct, and her reason frequently clear; her observations were keen and sarcastic; and whatever of affection lingered round her woman's heart, was for her son. Hannah she regarded as a part of him, and the tenderness evinced towards her by the kind young woman, was the only balm her heart tasted. Margaret was in reality the daughter of a gentleman in a distant neighbourhood, the natural daughter, and consequently treated in an unnatural manner. She had a better sort of education until she was thirteen or fourteen; her father then married, and she was put forth with her degraded mother to endure as best she might the contempt which follows the parent's sin. Of all the crimes which man in a civilised state of society is guilty of—and there are many of which the law can take no hold—there is none equal to this; none so black in its depravity; none so injurious in its consequences to the moral dignity of society. What her after career was, for many years, remains a mystery. She fell, it was believed, into sin herself; for the dwellers in the neighbourhood never spoke of her without saying, "God break hard fortune before every one's child;" a Christian and beautiful prayer, to which each kindly heart must say Amen! "Hard fortune," however, seemed the poor woman's "rock a-head" all her life. When she did marry, there was little doubt that she wedded Pierce for the sake of being made "an honest woman," and he took her because of the possession of a scanty store of that ill-gotten gold, which melts away, and leaves nothing behind but its poisoned memory.

Still, when Hannah, seated by her bed-side, looked into her worn and wrinkled features, she felt how lonely would be her own fate, if that poor half-wild woman were to die. She was the mother of her beloved husband, and that formed a strong link in her affections.

Again the storm whirled on without; the winds did not howl more furiously than the waters; both raged together; and the din of elements became more fearful than ever. So loud, indeed, was the tumult, that the thunder over the cliffs, which at any other time would have seemed to shake them to their foundations, formed now only a part of the troubled whole. The only distinctive feature during this storm was the lightning, which flashed and forked throughout the dwelling, like a thing instinct with life.

"It's dancing, jewel," said Margaret; "dancing mad it is with joy, because of the mischief that will come upon those that walk the wathers before morning. There's another blast of the ould one's bellows! Hannah, pray, in the core of your own heart pray, *arourneen*, for the walkers of the wathers. God bless you, girl!" she added, suddenly, while darting her quick glittering eye over the calm clear face of her daughter-in-law; "God bless you! sure it's a mercy to have any thing near such a wretch as me that puts one in mind there is a heaven upon earth, where there's innocence. But pray, Hannah jewel; pray—only don't lave me."

If Hannah had been even more inclined than she was to pray, she could not have done so, for her mother-in-law continued to mutter and give voice to various exclamations and broken ideas that were in ill keeping with prayer. Suddenly the secret door through which Pierce Murphy had descended to the beach, opened, and a tall active-looking smuggler, by name Andrew Furlong, proceeded to a cupboard; and, taking out a quantity of tow and other combustibles, asked Hannah why she was not gone to bed, and commenced forming something which appeared like a very long and massive torch.

"Any sign of the boat, Andy?" inquired Hannah.

"None; and there's some of the *lobsters* we hear beyond the Point, so we can't make the right signal, and the waves are dashing like mad in there. It's as dark as pitch, and even if she had a light (which, of course, she wouldn't), we could not get a glimpse o' her, good or bad, bedad! The weather is as contrary as yerself," he added, in a low voice; "there's hardly

half o' ye left, fretting yer heart and soul after one ye'll never see again."

"A blither on yer heart for that speech," exclaimed the old woman, who, despite his effort to lower his voice, had heard the whisper; "a blither on yer heart for that same, Andrew Furlong. Hav'n't ye wickedness enough on hand by sea and land, but ye must thry to take from my lone boy the only thing he has left in the wide world—his young wife's love? Ah! yer reign'll not be long when he's in it! ye must harry the salt sea then on another tack."

The young smuggler muttered a curse, and after finishing one torch commenced another.

"Ah, thün," inquired Hannah, "what do ye want of another; sure the lantern from the window is as good as any, and they"—Andrew Furlong interrupted her.

"Hav'n't I tould ye that the *lobsters* are at the other side the Point; and would it be sense, do you think, to have light *here*, to bring them to our own hiding-place? Sure we must strike a light lower down; it's to warn them off we want, not to get them in."

"But one red flare is the warning light," persisted Hannah; "and what do you want of two?"

"Suppose one goes out! there's hardly a glimmer will stand such a wind."

"One will stand it as well as another; besides, I know ye shelter yer lights."

"If ye're so knowledgeable, may be ye'll lend me a hand at melting a drop of pitch to make them burn stronger; we'll be ruined entirely if the boat comes in—better it should go to the bottom."

"Oh, my God!" she exclaimed, "how can you say so? and the poor craythurs on board o' her! But, Andy, is it going to make another ye are?"

"Three torches!" said the old woman, who had risen from her bed without Hannah having given her any assistance, or even perceived her intention, and stood now by their side with no other covering than her cloak, which she grappled rather than folded round her. "Three! is it three ye're about? Them it's well ye know that the boat is far enough away; three had never any thing to do with a smuggler's sign; it isn't the boat ye're thinking of. Hannah, are ye a fool to suppose it's a boat they're minding! No, no; it's a false light they're after, to 'tice some unfortunate ship into the very jaws of death, that's it," and having so said, she seized the small vessel in which Hannah, unconscious of the real design, had melted the pitch, and before Andrew had time to prevent it, she had flung the contents upon the embers of the fire. In an instant there was a blaze that illumined the cottage, and glared fiercely on the old woman's spectral figure, the pallid and anxious features of her daughter-in-law, and the excited and strongly marked countenance of the reever.

"Answer for it to yer masther," he said, sneeringly. "If ye must know the truth, and I don't see the use o' screening it, there is a ship close in shore; and what's more, no earthly power could get her out. What does it matter to the craythurs aboard, whether they're dashed to pieces here, or lower down? though it'll matter to us. Sorra take the woman, just look at her! Sure I didn't make the storm? Ye might just as well say it's a sin to burn the branch the wind tears from the tree."

"Pierce Murphy swore me an oath, that never, never, while grass grew or wather ran; never, while the sea was salt and the moon bright; never would he resort to that, after—after what *we both know*. Ough my grief! the smuggling's had enough, brought sorrow enough on us; but the curse of drowning men, the laugh, and the jibe, and the jeer, of the walking spirits who rise up from the rocks and sands, and cold sea beds, all green and slimy, their shrouds of sea-weed—there—I see them now—and now!"

So terrific were her gestures, in a great degree the workings of insanity, so bright her eyes, so haggard her features, while she stood like a resurrection before Hannah and Andrew, that even Andrew, bold villain though he was, forgot his task in the momentary terror she inspired. Visions of the past crowded to her heated brain; she had depended on her husband's promise, adhered to, as she believed, for some years, that he never again would link himself with wreckers. She did not know, poor miserable woman, how hard it is to overcome a tendency to great crime, while smaller ones are continually practised without reproof or remorse; but the agonising memories that rushed upon her, when she saw the well-known preparation for decoy-lights, were too much for her shattered senses, and she conjured up the most horrid visions from the depths of the ocean, the roarings of which mingled with the wind that beat around the cabin.

After an instant's pause, Andrew seized his "corpse candles," and had nearly gained the secret passage, when Hannah sprang after him—"Ye would not go heavy with my curse!" she exclaimed. "Andy, Andy, think first on what ye're after!—drawing them to their doom, whin they think they are gaining a harbour from the raging seas; think, if ye had a brother, a father, on board that ship; think, what that would be. Oh, can ye have the heart to see the vessel beat to pieces on these rocks—the poor, poor mangled bodies! Oh, blessed Virgin!" she added, falling on her knees, "look down and save the helpless crew—save us all from this great sin!"

"Let me go, Hannah; yer keeping me here is no good. Pierce Murphy, yer own father-in-law, has decoyed them already—only you could not hear, wid the

wind; her guns have fired, and"—Before his sentence was finished, the boom of a gun, sudden and abrupt, shot as it were through the storm; it was echoed by a frightful scream from the old woman, who stood beating the air with her hands, and uttering imprecations too horrid to repeat. Hannah ran to her side, not, however, before she had heard the voice of her father-in-law shouting up the cavity to Andrew Furlong to hasten down.

The poor young woman at any other time would have sunk under the conflicting feelings, tortures I should rather say, of that desperate hour, had it not been that the deplorable state of Margaret obliged her to act rather than think or feel.

Smuggling is, unhappily, considered, even by some of the best of the Irish peasantry, as a venial offence, and they catch at every excuse for a crime which furnishes them at a cheap rate with the liquid fire that distils poison through their veins; they totally overlook the demoralising effect of what is contrary to law, inasmuch as it immediately forces even a man with comparatively good intentions into the most depraved society. But though my poor countryfolk find a too ready excuse for smuggling, I never knew them make excuse for "wrecking;" their national hospitality rises against it, and the crime is always referred to with a shudder, even by those who would make no scruple of committing other equally lawless crimes. Bad as Pierce Murphy had been, bad as he still was, he never systematically practised this base sin, but his associates and his depraved habits in other respects led to it; and the conviction that the doomed ship was too far in shore to escape on that fearful night, that she must go to pieces somewhere, led to the argument, "she may as well come in here as go elsewhere;" and instead of devising means to save his fellow-creatures from so wretched an end, he plotted with the elements to destroy, by imitating in a particular way the light of the nearest light-house; thus luring the ship to the very rocks which groaned for her destruction, when, having lost their bearings, they believed they were avoiding danger.

"Did I not tell you of the winding-sheet and the death-watch?" screamed the old woman; "but my curse will be on him for this, and the curse of a broken oath; think of that, Hannah. And there's another gun, nearer the shore," she added, "much nearer the shore, on the rocks." She paused a moment, and then added, with a calmness of manner that astonished Hannah, accustomed though she was to her fitful changes, "And now the Lord have mercy on their souls! for nothing can save 'em. Help me to bed, girl, *asthore*, for the strength has left me intirely." It would then have been a mercy to poor Hannah if the wind had continued to battle with the waves; but after the discharge of the last gun, the wind lulled, and the sea rolled and roared in proud mastery, save when the thunder gave token that the lightning had glared over land and sea. Hannah, after a pause, finding that her mother-in-law continued quiet, placed a chair beneath the window I have before mentioned, opened the casement, and looked out over the troubled waters. It was more like the mad riot of a fearful dream, than reality; and accustomed as she had been to sea storms, this seemed the most terrible she had ever witnessed. To say that the waves were mountains high, gives no idea of their awful appearance. Far out from land, the huge black billows, frowning and dark, heaved themselves to the heavens, as if the mysterious world beneath, disturbed by some mighty earthquake, flung up the heavy waters, rebelling against their pressure. Exactly opposite to where she stood, the moon (then at its full) shone palely out from between the parted clouds, that rolled back from its path. Pale, stern, and supernatural, it gleamed, like the unclosed eye of the dead (deriving its light from *without* instead of *within*), over the mighty tumult; while the forked lightning glared upon and amid its fierce playfellows, showing their darkness the more terrible by its surpassing brightness. As the waves neared the rocks, they reared themselves high, and more high, until their inky crests, maddened by opposition, broke into snowy and sparkling masses of glittering drift-like foam, and upon those the lightning showed like living fire—now tossing its brilliancy aloft, now beautiful in its destruction, tipping the foam with magic light, and then twisting like a fiery serpent in the very jaws of death! A little to the right of the cabin, where Hannah well knew the rocks were most fearful, a dark mass seemed fixed amid the spray. As if the very lightning of heaven determined to show the worst, a broad mass of light fell upon the devoted ship; short as was its duration, Hannah screamed with agony at its revealments. The shrouds were thickened by despairing wretches, who clung to them as their last frail hope; the stern of the vessel, high in air, was covered with human beings; nay, more, she saw them struggling in the water, dashed into crimsoned atoms against the murderous rocks. Although all was again darkness, she covered her eyes with her hands, and so suddenly still did the tumult become, that she distinctly heard Pierce Murphy's voice calling to his comrades. With the quick and sudden impulse of her countrywomen, she could have fallen on her knees, and cursed—WHOM? Her husband's father! There was no touch of humanity in the tone of his cruel voice; it arose on the night-wind like the fierce growl of a tiger over his prey.

She looked again. Now God have mercy on their souls! The ship had split asunder; one half was

hurled with a mighty crash higher on the rocks, the other dispersed amid the boiling bubble of the stormy deep. Bright masses of lightning continued to illumine the frightful scene; horrible as it was, poor Hannah continued to look down upon it, though her face and hair were drenched with the salt spray; and the voice of the old woman was heard (though not by her) imploring that the window might be shut, it was so cold. At length the idea occurred to her that she would brave the storm below, and perhaps she might save some sailor from the jaws of death; and then the memory of her own beloved one rushed with its full tide of tenderness into her woman's heart; her eye rested for a moment (as, dashing the water from her face with the tresses of her long hair, which the wind had flung over her shoulders) on the sea, and, strongly illumined by a flash of lightning, she saw, or fancied she saw, for it is difficult to believe that a mortal eye could have distinguished an object so distinctly at that distance—still Hannah thought she saw upturned towards her, amid the foam, the face of her young husband, Luke Murphy!

She sprang, rather than ran, down the secret passage, and along the shore. Pierce Murphy (for the morning was breaking), seeing her flying like a seamew through the haze and mist of the sea spray, seized her by the arm, and roughly demanded what she wanted; her words were few, but they were enough to paralyse the avowed smuggler—the secret wrecker. She called him *his son's murderer*. She declared she had seen that dear, that well-remembered face, rise upon the surface of the water. Her father-in-law, as I have said, was paralysed at her words, but he believed them to be the dream of a distempered brain; he called to one of his companions to bear her up the cliff, for the scene was awful. The mangled remains of more than one body, still quivering with life, had been washed in, mutilated by the rocks, or crushed by the cargo that the wreckers were dragging on shore, heedless of the cries and supplications for help of the drowning crew. Her screams rose above the echoes and the sound of the watery tumult. She would not leave the beach; and the wicked, always superstitious, trembled at her incoherent words—at her wild shrieks; trembled even amid their thirst for such unlawful, such unholy plunder. Through the mist, amid the dawning light, and down the steep but beaten path leading from the cliffs to the shore, several of the coast-guard were seen descending, and this rendered Pierce more furious, as his prospect of booty decreased.

"Away, mad fool!" he exclaimed, as, with eyes straining from their sockets, Hannah opened her arms to every advancing wave, as if she expected it to yield her husband to her embrace.

"Take her away, will ye!"—she lies," said Pierce. "No, no; I do not—I do not," she exclaimed wildly. "See—see—see—he comes—he!"—and with the effort of a despairing woman, she threw herself farther into the white surf, which had run up on the sands, bearing another victim to the land.

The story is well remembered to this day—it is this:—That Hannah clasped her husband's body, and was dragged back to the shore along with it. Pierce Murphy, fully awake to the fact that he had been the means of the destruction of his own son, who, full of hope and joy, was on his return to his young wife and his native land, could only gaze on the fruits of his wickedness—no one can tell with what feelings, for he imparted them to none. His companions in sin quickly recognised the once gay, light-hearted youth; but Hannah would suffer none to approach her. She dragged the body under shelter of a rock, and, sitting down with frightful calmness, drew it across her knees, resting the mangled head upon her bosom, and enfolding all that she loved on earth, as a mother enfolds her child. She did not heed the oozing blood, the broken bones, nor the cold chill of the dead, but parted the streaming hair from the brow, and kissed and murmured over it words of such tenderness, that the wreckers, and the coast-guard, the one forgetful of their plunder or personal safety, if their share in the destruction should be discovered, the other neglectful of their duty, but all strong fearless men, accustomed to death and terror, looked on with tears at that sad picture of mute and maniac agony. Gentle as she was with the poor senseless clay, she would not, even when the sun was high in the heavens, and the receding tide showed how fearful the destruction had been, suffer any one to approach her. Several of the crew were saved, and their testimony was of such a nature, that Pierce (who made no attempt to escape) was seized, and conveyed to Wexford jail. As the evening drew on, it was determined to remove Hannah from the body by force. To shield her from the sun's heat, which burst forth as if to contrast the power of light with the power of darkness, one of her neighbours had thrown her cloak over the broken-hearted woman and her burden: the same kind hand removed it when the parish priest declared she must not be longer left with the corpse. Alas! there was nothing living to separate—to put apart from the dead. The heart which had beat so warmly within that gentle bosom was broken!

To the great horror of the country, Pierce Murphy destroyed himself in prison—a crime never anticipated in Ireland, because of such rare occurrence.

Margaret, the old woman, wandered for many a day—months, years—throughout the neighbourhood, a

confirmed maniac; her bodily strength seemed to return when her faculties were totally destroyed; but she has now long been dead.

"To see how the innocent suffer for the guilty, and how one crime leads to another," observed a country girl to her companion, after hearing this sad tale.

"True for ye, *aileen*; and sure it's a great pity people don't think of that in time."

SKETCHES OF SUPERSTITIONS.

ASTROLOGY.

THE study of the stars, with a view to foretelling the destiny of nations and individuals, or of unravelling other mysteries hidden to ordinary investigation, and which received the name of JUDICIAL ASTROLOGY, was, as already mentioned, of very ancient origin, having been first practised by the Babylonians and Chaldeans from two thousand to a thousand years before Christ. The avowed reason for assigning such properties to the planetary bodies, was, that the heavens are one great book, in which God has written the history of the world, and in which every man may read his own fortune and the transactions of his time.

Proceeding on this very explicit doctrine, the study of the planets, and their various movements in reference to each other, became in time one of the most imposing superstitions of the east, and extended its delusive influence even down to a comparatively late period of history. It is almost needless to state that no shadow of a reason exists for believing that either stars or planets possess the smallest power over the affairs of mortals; and it is doubtful if they have any effect upon the common atmospheric phenomena, such as clouds, winds, thunder, rain, &c. The moon, which was long supposed to exercise some peculiar influence over the seasons and certain mental affections, is now understood by scientific men to have no such effect. One thing is very certain, that the destiny of human beings is in no respect governed by sun, moon, or stars; for all these luminaries, great and small, are either so many globes resembling that which we inhabit, or suns, giving light in their respective spheres. The idea, therefore, of these inert masses of matter, removed to the distance of millions and thousands of millions of miles from us, and each with solemn placidity whirling in its appointed path, having any influence over human affairs, is among the most wild or visionary conceptions which ever entered into the mind of man.

In an age when the external manifestations of nature were attributed to supernatural causes, the practice of astrology received its share of encouragement both from the learned and ignorant, each class being alike superstitious and open to the frauds of pretenders. The two branches into which the science was divided, judicial and natural, were distinguished in the following way. Natural astrology comprehended the study and prediction of meteorological phenomena—of winds, storms, hurricanes, thunder, earthquakes, and the like; and, excepting always in so far as its professors assumed to derive their knowledge from the stars, this department of the art had its foundation in the rational principles of natural philosophy. Judicial astrology, again, which is the matter to be considered at present, was simply the art of fortune-telling by the stars. The east has been mentioned as the scene of its origin. Amongst the Chaldeans, the Egyptians, the Chinese, and the Hindoos, it was for ages in universal practice, and in Persia at this day the sovereign will not cross the threshold of his palace, or perform the most ordinary act, without receiving assurance that the hour is declared by the stars to be favourable. The predestinarian character of the Mahometan system was favourable to the maintenance of the astrological fooleries, and among the prophet's immediate followers, the Arabs, the practice of these flourished greatly. It was through that people that the art was introduced into Spain, whence it first spread over Europe; for the previous records of the northern nations do not present any distinct traces of such a belief. It is true that the Romans had brought the art from Egypt, and had cultivated it with avidity, but the incursions of the barbarian Goths and Huns had again removed almost every vestige of it from Europe.

We first receive, accordingly, something like a systematic view of astrological science from the Arabic and Jewish writers of Spain, of whom the professors in England, France, and Germany, were merely the followers. They divided the whole heavens, visible and invisible, into twelve imaginary and equal parts, formed by drawing lines from north to south, in the same way as the lines of longitude are marked on a map or globe of the earth. These circles were supposed to remain motionless, while the daily revolutions of the globe took place under them, and every heavenly body passed through each of the circles in twenty-four hours. They were called the twelve houses of heaven, and had different powers assigned to them; one being the house of life; a second, of riches; a third, of death; a fourth, of marriage; a fifth, of health; and so on. All the planets and stars had specific powers assigned to them, and their position with respect to these houses, and to one another, at the hour of an individual's birth, or at any special epoch, formed the basis for determining the fate of persons or the issue of events.

It would be treating the matter with unnecessary

seriousness to attempt to educe any thing more precise out of the mass of absurd and contradictory rules which constituted, according to its professors, the imaginary science of astrology. What will strike every one as peculiarly ridiculous, Jews, Mahometans, and Christians, while viewing with contempt the whole religious system of the Greeks and Romans, were content to hold the characters of the planets as identical with those of the old heathen divinities, simply because the names of these personages had been assigned to them, from mere caprice, in very early times. Think of the inconsistency of a Christian father allowing Mars to possess fiery and warlike powers and tendencies; while at the same time he scouted the notion that such a being as Mars ever existed, though that notion formed the sole pretence for transferring such an attribute to the celestial bodies in question! With Jewish rabbi, and Mahometan mufti, the inconsistency was equally glaring. Because the heathens gave the name of Saturn, whom they painted as a gruff old man with a scythe, to one planet, and the name of Jupiter, who was their god of gods, to another, while to a third they assigned the name of their commercial god Mercury, this was held as a sufficient reason by all parties in later times for believing that the first of these luminaries shed a black and baneful influence on mankind, that the second had the power of bestowing crowns and greatness, and that the third overruled all matters of property and merchandise among mortal men!

It was said that "the Ram (Aries) had a strong influence over the young of the flocks and herds, the Balance (Libra) could inspire nothing but inclinations to good order and justice, and the Scorpion (Scorpio) could excite only evil dispositions." In short, every sign produced the good or evil intimated by the name originally bestowed on it, in consequence of some resemblance of the slightest and most fantastic kind, and which, even if real, had no more to do with moral qualities and influences than if it had not existed at all. "If a child," says the author of Thaumaturgia, already quoted, "happened to be born at the instant when the first star of the Ram rose above the horizon—when, in order to give this nonsense the air of a science, the star was supposed to have its greatest influence—he would be rich in cattle; and he who should enter the world under the Crab, would meet with nothing but disappointments, and all his affairs go backwards and downwards. The people were to be happy whose king entered the world under the sign Libra, but completely wretched if he should light under the horrid sign Scorpion. Persons born under Capricorn, especially if the sun at the same time ascended the horizon, were sure to meet with success, and rise upwards like the wild Goat and the sun, which then ascends for six months together. The Lion (Leo) was to produce heroes, and the Virgin (Virgo), with her ear of corn, to inspire chastity, and to unite virtue with abundance. Could any thing be more extravagant and ridiculous?"

All this is but a mere inkling of the powers ascribed to the heavenly bodies in connection with human affairs. Every hour of the day had its presiding star. Every part of the body was under the domination of a sign. The Ram presided over the head, the Bull over the gullet, the Twins over the breast, the Scorpion over the intestines, and the Fishes over the feet. A true devotee of the art took great care at what hours and seasons he swallowed a dose of physic. If he swallowed it under the Bull, for example, he would never be able to keep it on his stomach, as the food of that animal regurgitates, it being a ruminant, and therefore his medicine would inevitably do the same.

An immense degree of good and evil influence was ascribed to the number seven, that being the number of the days of the week, and of the planets, including the sun and moon. Seven times seven was the climacterical number, critical to private individuals, princes, and principalities; and marvellous, indeed, were its supposed effects. All the metal, too, in the bowels of the earth, was produced by, and under the rule of, certain planets; and if any one could make his search at the lucky moment, he was sure to get as much metal as he desired. The sun being yellow, and gold being yellow, of course, according to the profound system of reasoning on which this science was based, the sun was the luminary for gold. Saturn being a heavy, dull, grey-headed old gentleman, nothing could be fitter than that he should be superintendent of all lead-mines. Iron being the metal for weapons of war, Mars very properly got charge of it; and on the same enlightened principles, Mercury, who was famous for activity, was the dominator over quicksilver. "It was the province of Jupiter (says the author formerly cited) to preside over tin, and as this was the only metal left to him, it would appear to have been a kind of Hobson's choice," that is, based upon indispensable necessity.

The reigns of the Stuarts in the seventeenth century formed the era during which judicial astrology chiefly flourished in our island, and indeed over all Europe. Previously to this age, Alfonso, king of Castile, surnamed the Astrologer, had assembled the Arabic and Jewish sages of his empire, and had sat in consultation with them five years, drawing up the Alfonsine Tables, which gave to Europe all the mysteries of the Arabic and Hebrew astrology. Nostradamus and others had gained note by their predictions in France and Germany. In the time of James I., however, England outstripped all its neighbours in devotion to the science. William Lilly, who fortunately

left a personal memoir behind him, Doctor Simon Forman, Alexander Hart, "the Philomath," and many others of note, cheated the people with pretences to a power of prediction that had no limits. They professed to foretell every thing and any thing, and the whole being an imposture, one thing, no doubt, was just as easy to them as another. They affected, indeed, to go by rule in their operations, and kept up a kind of common jargon among themselves, but this was merely to give colour to their assumptions. When some poor dupe wished his fortune told, they pretended to draw up an elaborate scheme of his nativity. They inquired the day and hour of his birth, and the point of the ecliptic which had then risen above the horizon gave his horoscope, while the stars then in the ascendant, or in the house of life, as well as in the other houses, gave the secret of his whole fate. The issue was, that they told the fool—just what he wished to be told. Lilly's Memoirs show us the almost unlimited length to which all ranks of his countrymen carried their credulity in those days. His supposed powers made him a most important actor in the civil wars, and in the politics, generally, of his time. The pieces of mystic folly which he issued under the title of prophetic almanacks, were spelled over in the tavern, and again and again quoted in the senate, though some of its members were among the clearest-headed men England has ever produced. No plot of any consequence, in those plotting times, was entered upon by any party, without previous consultation with the wizard. All classes of persons in succession glided into the study of the wise man, and poured into his ear strange tales of love or war, trade or treason. From the finding of a stray thimble to the restoration of the royal authority, nothing was considered too mean or too difficult for him who held dominion over the stars, with all their signs and houses, advents and portents.

If any thing were required to expose the contemptible trickery of astrology, the confessions of William Lilly afford ample materials for the purpose. It is humbling to human nature to think what persons, and what numbers of persons, such a creature, and such pretensions, could deceive. "We know not," says an able writer, "whether it should more move our anger or our mirth, to see an assemblage of British senators—the contemporaries of Milton and Clarendon, of Hampden and Falkland—in an age which roused into action so many and such mighty energies, gravely engaged in ascertaining the causes of a great national calamity, from the prescience of a knavish fortune-teller, and puzzling their wisdoms to interpret the symbolical flames which blazed in the misshapen woodcuts of his oracular publications." From the disgrace attendant on such credulity, however some memorable exceptions ought to be made. Samuel Butler, in the seventeenth century, thoroughly exposed the astrological fooleries in his Hudibras, and at a still earlier era, the intellect of Shakespeare soared high above the common degradation. "This is the excellent foppery of the world!" he says in Lear; "that we make guilty of our disasters the sun, the moon, and the stars; as if we were villains by necessity; fools, by heavenly compulsion; knaves and thieves, by spherical predominance. An admirable evasion of man, to lay his evil disposition to the charge of a star!" Again, when Owen Glendower boasts that at his nativity "the front of heaven was full of fiery shapes," and the "frame and huge foundation of the earth shook like a coward," Hotspur is made to reply, "Why, so it would have done, at the same season, if your mother's cat had but kitted." We see by the first of these passages that the great poet not only laughed at this imaginary art, but at once traced to its main source the tendency evinced by mankind to put faith in it. A belief in the irresistibility of the starry influences could not but tend wonderfully to quiet the conscience of any knave who had done an act which he found it difficult to excuse to himself. Fatalism is certainly the most dangerous doctrine that can be entertained by erring man.

The discoveries of Copernicus are usually held to have given the death-blow to astrology. When people found that the earth was only one among other planets, and neither the largest nor most important, the notion that these luminaries existed for the purpose of telling the fortunes of the inhabitants of our earth, could not long keep its ground. The discovery of the probable nature and true bulk of the stars threw still more light on the vanity of the astrological doctrines. Besides, the introduction of the inductive system of reasoning was in itself sufficient to degrade from the rank of the sciences an art which had not one fact to rest upon. Astrology can scarcely be said to have survived the seventeenth century, during which the system of Copernicus, who flourished about 1520, spread gradually over the civilised world. Morin, who may be termed the last of the real astrologers, and who was a man of great learning, died in 1656. From this period, those who pursued the art were an inferior order of impostors, who gained a living by telling fortunes, vending nostrums for the prevention and cure of diseases, and giving information on the important subject of lucky and unlucky days. One of the most noted of these pretenders was a person named Partridge, who flourished in London about eighty years since, and issued an annual publication, entitled "Poor Robin's Almanack." In this work, for 1773, the following advertisement occurs, and no doubt had great effect in its day:—

"The best time to cut hair. How moles and dreams

are to be interpreted. When most proper season to bleed. Under what aspect of the moon best to draw teeth, and cut corns. Paring of nails, on what day unlucky. What the kindest sign to graft or inoculate in; to open bee-hives, and kill swine. How many hours' boiling my Lady Kent's pudding requires. With other notable questions, fully and faithfully resolved, by me Sylvester Partridge, student in physic and astrology, near the Gun in Moorfields. Of whom likewise may be had, at reasonable rates, trusses, antidotes, elixirs. Washes for freckles, plumpers, glass-eyes, false calves and noses, ivory-jaws, and a new receipt to turn red hair into black."

With this amusing piece of quackery we conclude the present sketch, and only require to add, that as from evil good often comes, so in the case of astrology mankind were to a certain extent benefited. The cultivation of the delusion led to the discovery of many new facts in astronomy, the true science of the stars; indeed, many of the greatest astronomers were first led to their peculiar studies by vain hopes of reading the fates of men in the heavens, and were tinged to their dying day with some remains of this delusive belief.

SONGS OF THE NORTHERN COAL-MINERS.

THE miners or pitmen employed in the extensive collieries of Northumberland and Durham, are an exceedingly numerous class of men, differing essentially from the other portions of the population of those counties, in their general characteristics. This difference can only be accounted for from the fact of their being accustomed to live constantly in their own exclusive society, and to intermarry only, or for the most part, with the women of their own class. The miners reside, in great numbers, in cottages immediately surrounding the various coal-mines; and their houses are remarkable for internal cleanliness, and for the substantial furniture which they contain. They earn good wages, but, generally, their habits are rather of an improvident kind; being greatly addicted to extravagant living and dress, to intemperance, and to amusements of a demoralising tendency; such, for example, as quoit-playing, cock-fighting, and bowling matches, for ruinous sums of money, and attending *hoppings* and horse-races. It is, however, but due to them to state, that for some years past these vicious pastimes have visibly declined among the miners, and that they are substituting others of a more rational and innocent kind in their stead.

There are several collections of songs, mostly of a humorous and satirical kind, extant in Northumberland and Durham, written in the peculiar dialect of the miners, and illustrative of the traits of their character and manners, from which it is now our purpose to make a few extracts, accompanying them with such explanatory notes as seem necessary to render them generally intelligible. The miners are universally and ardently attached to Newcastle-upon-Tyne, or, as they endearingly term it, "Canny Newcastle;" and this characteristic is humorously illustrated in the following extract from the song entitled

CANNY NEWCASTLE.

'Bout Lunnun aw'd' heard aye sic' wonderful spokes,
That the streets were a' covered w' guineas:
The houses aye fine, an' sic' grandes the folks,
To them huz i' th' north were but ninnies.¹
But aw' fand maw-sel' blonk'd' d' when to Lunnun aw' gat,
The folks there a' luidk'd' wishy-washy;²
For gowld' ye may haw'k' till ye're blind as a bat,
For their streets are like wor'—beas and blashy!
'Bout Lunnun, then, direct ye myek sic' a rout,
There's nowae³ there na winkers⁴ to dazzle;
For a' the fine things ye are robbin'⁵ about
We can marris⁶ i' y⁷ canny Newcastle.

A cockney chep show'd me the Thames' drury⁸ fyace,
Whilk he said was the pride o' the nation;
And thout at their shippin' aw'd myek a haze-gaze;⁹
But aw' whopt naw foot on his noration.
Wi' huz, mun, three hundred ships sail iv a tide;
We think nowae on't, aw'l myek accoyday;¹⁰
Ye're a gowk¹¹ if ye din't know that the lads o' Tyne-side
Are the Jacks that myek faimish¹² wor navy.

'Bout Lunnun, &c.

We went big Saint Paul's and Westminster to see,
And aw' warm't ye aw' thout they luidk'd' pritty;
And then we'd a keek¹³ at the Monument te,¹⁴
Whilk ma friend ca'd¹⁵ the Pearl o' the City.
Vey hinny, says aw, we've a Shot Tower see hee¹⁶
That biv¹⁷ it ye might scraffie¹⁸ to heaven;
And if on Saint Nicholas¹⁹ ye once cus²⁰ an e'e,
Ye'd crack²¹ on't as lang as ye're livin'.
'Bout Lunnun, &c.

The miners from all the collieries in the neighbourhood used habitually to flock in considerable numbers to Newcastle races, which are held in June, and usually continue for about a week. They do so still, but not to so great an extent. In the following humorous song, it is meant to illustrate this trait in their character, and to narrate the impressions which a visit made by a party of the colliers to these races left upon the mind of one of them. The reader must suppose it to be spoken by a collier himself on his return. It is, of course, a fiction, but, upon the whole, at the time it was written it would be true to life, and in nowise exaggerated. It is called "X Y Z at Newcastle races." We ought to observe, in explanation, that

1 I had. 2 Such. 3 Simpletons. 4 Disappointed.
5 Pale. 6 Gold. 7 Dig. 8 Ours. 9 Nothing.
10 Eyes. 11 Talking. 12 Match. 13 In. 14 Muddy.
15 Much ado. 16 Affidavit. 17 Simpleton. 18 Famous. 19 I.
20 Look. 21 Too. 22 Called. 23 High. 24 By. 25 Climb.
26 This is an allusion to the beautiful steeple of St Nicholas's Church in Newcastle, of which the miners, and indeed all the inhabitants of Newcastle, are justly proud. 27 Cast. 28 Talk.

X Y Z was the name of a celebrated race-horse belonging to the late Mr Riddell of Felton Park, Northumberland, and in his day was deservedly a favourite with the Northumbrians, but especially so with the miners, who were exceedingly enthusiastic in their praises of him.

Smash! Jemmy, let us buss,²⁹ we'll off
And see Newcastle races;
Set Dick the Trapper for some syp,³⁰
We'll suin wesh a' wor³¹ faces.
There's ne'er a lad iv Percy Main
Be bet this day for five or ten;
Wor pockets lin'd wi' notes an' cash,
Among the cheps we'll cut a dash;
For X Y Z, that bonny steed,
He bangs them a' for pith an' speed,
He's sure to win the cup, man.
We reach'd the Moor, wi' snairish tews,³²
When they were gawn to start, man;
We rav' a fellow tuppence³³ each,
To stand upon a cart, man;
The bets flow round frae side to side;
"The field agyen X Y," they cried;
We'd hardly time to lay³⁴ them a'!
When in he cam—Hurraw! hurraw!
"Od smash!" says aw, "X Y's the steed,
He bangs them a' for pith an' speed,"
We never see'd the like, man.

The song goes on to say, but in language unintelligible to any but a local reader, that, after the races were over, the party entered a tent upon the race ground, where, among other luxuries of which they partook, the narrator says they

"Smok'd nowse but patten shag, man."

After various whimsical mishaps and adventures we find them, on their way homeward, on board one of the small steamers which carry passengers up and down the river Tyne:—

Next board a steamer boat we gnt,
A laddie rang a bell, man;
We haddent sitten vary lang,
Till byeth asleep we fell, man.
But the noise suin myed poor Jemmy start—
He thowt 'twas time to gan to wark;
For pick and hoggers³⁵ roard' out he,
And myed sic noise it waken'd me.
"Od smash!" says aw, "X Y's the steed,
He bangs them a' for pith an' speed,
Aw never see'd the like, man."

The next song we select is locally known by the name of "Billy Oliver's Ramble between Benwell and Newcastle," and though, like those we have already quoted, it is a caricature, it has nevertheless some resemblance to those of a former one, its fidelity will be acknowledged by every one acquainted with them:—

Ma nyem is Billy Oliver,
Iv Benwell toon aw dwell;
An' aw's a clever chep, aw's sure,
Tho' aw de say'd mosel.
Sic an a clever chep am aw, am aw, am aw,
Sic an a clever chep am aw.
There's not a lad iv a' wor wark,
Can put or hew w' me;
Nor not a lad iv Benwell toon,
Can coax the lassies sae.
Sic an a clever chep am aw.
When aw gans tiv Newcastle toon,
Aw myeks mysel' see fine;
Wor neybors stand and stare at me,
An' say, "Eh! what a shine!"
Sic an a clever chep am aw.
An' then aw walks w' sic an air,
That, if the folks hev eyes,
They a' wis³⁶ think it's sum greet man
That's cum in i' disguise.
Sic an a clever chep am aw.
An' when aw gans down Westgate Street,
An' along bie Denton Chare,
Aw whussels a' the way aw gans,
To myek the people stare.
Sic an a clever chep am aw.
An' then aw gans intv the Cook,³⁷
Ca's for a pint o' beer;
An' when the lassie cums in w'd,
Aw a' wis says, "Ma dear!"
Sic an a clever chep am aw.
An' when aw gets a pint o' beer,
Aw a' wis sings a sang;
For aw've a nice yew aw can sing,
Six-an-thirty vairses lung.
Sic an a clever chep am aw.
An' if the folks that's i' the hose
Cry, "Hand your tongue, you cull,"
Aw's sure to hev a fight w' them,
For aw's as strang as ony bull.
Sic an a clever chep am aw.
An' when aw've had a fight or twee,<
An' fairly useless gawn,
Aw back, as soon as aw can be,
To canny Benwell toon.
Sic an a clever chep am aw.

There is another song, called the "Keel Row," set to exceedingly sweet and simple music, familiar to the miners, and, indeed, to all classes, rich and poor, of the Northumbrians, and sung by them with as much patriotic feeling as the Swiss chaunt the "Ranz des Vaches," or the Dutch their song of "Faderland and King," of which the following is the chorus:—

Weel may the keel row,
The keel row, the keel row,
Weel may the keel row,
That maw laddie's in;
He wears a blue bonnet,
A bonnet, a bonnet,
He wears a blue bonnet,
A duple in his chin.

In conclusion, we wish to observe, that these songs are given here, less on account of containing anything very deserving of perusal, or worthy of being circulated beyond the locality to which they relate, than for the purpose of giving the general reader an idea of the peculiar manners, dialect, and habits of the colliers of Northumberland and Durham of a former and not very remote period, which these songs convey with more truth and fidelity than we could hope to do by any attempt at description. The specimens given, possess, unquestionably, some degree of humour, but it must be confessed that it is rather of a coarse kind; and we doubt that any but a local reader will be able to discover it. We disclaim all participation in the spirit in which these songs appear to have been conceived and written; their intention obviously being to caricature the harmless foibles and characteristics of the miners. It is but justice to the present generation of colliers to say, that those songs were written, for the most part, a great number of years ago; and however universally true they may have been in their application to the miners of those days, it is only fair to presume that they are not so generally applicable to those of the present day, who may reasonably be supposed to live within the reach and influence of the exertions now made on all hands to ameliorate the moral and intellectual character of the lower classes, and to be advancing in civilisation.

Of the state of local manners of a bygone day, however, those songs remain as faithful memorials, and on that account, perhaps, are worthy of preservation, and of a fame more extensive than that which they at present enjoy, namely, a mere

"Local habitation and a name."

WATERFORDISING.

THE pranks of a merry young Irish marquis, as recorded with much pains and zeal in the newspapers, have had the same effect in raising imitators, which the notoriety of a Monument suicide had a few days ago in causing a baker's boy to drown himself in the New River. Waterfordising has accordingly become a great thing, taking its place beside National Education, Chartism, Socialism, Prison Discipline, and other important subjects now occupying public attention. And is it not a cheering consideration that, while a multitude of pale thinking men are wasting themselves in anxious considerations as to declining manufactures, high prices, monetary distresses, and social perplexities of all kinds, a few choice spirits are still to be found, who, despising all such stuff, devote themselves to the worship of the Goddess Fun, and do their best to break the imposthume of the public melancholy by raising a good laugh? The philosophy of these joyous youths is not understood. It lies far beneath the surface, and there is perhaps but one public writer in the empire who could give a full exposition of it. For our part, we have some sort of understanding of it, without that discrimination of metaphysical niceties which would be required to explain it. We look upon the Marquis, however, as the founder of a great new sect, whose object, generally speaking, is to break the spell of morose gloom and discontent in which the world is at present plunged. This sect and its leader perceive that every thing is now carried on in the spirit of Extremes—that even so small a matter as a cup of ale is made a point of conscience. As the puritanism of the Roundheads two hundred years ago led to the opposite philosophy of the roaring, swearing Cavaliers, so has the enthusiasm with which every good moral and social aim is now prosecuted, led to the mighty efforts of the illustrious Waterford sect to keep up something like merriment in the land. It is a great demonstration in favour of nonsense. The men are apostles of good humour, bent on making head against stern utilities and dismal forebodings and complaints. A few weeks ago, a party of two or three, on a mission through our northern land, where good humour is at present particularly needed, came to Perth, with a view to put the "Fair City" in a trim worthy of the name. One of them acted as post-boy to the rest—a most original idea, worthy of consideration amongst the emissaries of other enthusiasms, especially those who wish to make a good appearance on narrow funds. Soon after arriving at a hotel, they sallied out on their work, and having bought some baskets of apples, began to employ those convenient missiles in pelting all whom they met on the street. The individuals pelted put up with the infliction in the spirit of Galatea's lover, and pocketed what they got. The missionaries of fun then attacked a beer-cart, upsetting barrels and bottles in a sublime wreck, typical of the end of all such things now approaching. Having no enmity, however, to the drayman or his master, they paid for the damage. "Scene third," pursues their newspaper historian, "opened with the party seated in an inn, the whole establishment supplying them with porter. A tub

was ordered to be brought to them, when they amused themselves emptying the porter into it; but as drawing corks was a plebeian way of emptying bottles, they adopted the more noble way of decapitating the bottles as they were brought in. When the tub was full, two of them carried it out to the street, where biped and quadruped were invited to drink; the quadruped, however, being a tee-totaller, declined the invitation. Scene fourth was an attempt, about midnight, to serenade the inhabitants of the Fair City with the dulcet notes of a hunting-horn; but the guardians of the night interfered, and the horn-blower was kindly escorted to the Police-Office. [Here was an example of that persecution which all apostles of new ideas have to lay their account with.] On the return of the party, after leaving their pledge, the bugleman addressed his escort, before entering the inn, in a most eloquent speech, thanking them for their kindness, expressing a desire to gratify their curiosity by exhibiting himself to them, politely taking off his hunting cap, and concluding his address by intimating that he entertained the most sovereign contempt for every policeman in Perth, and in every other place; and courageously vowing that, unless it had been to gratify the good people, not one nor all of the police in the city would have been able to take him! when, bowing again, he declared that he was their most obedient humble servant. (Erit.) The serenade was several times attempted, but it would not do, till they accomplished it with the help of their carriage, in defiance of the police. Scene fifth was a march through the town with hats with paper covers, to the great amusement of the juvenile population. This scene concluded with a ride in a wheelbarrow. The last appearance was their attendance at our Police Court, to answer for various parts of their performance, where their knowledge of Blackstone had nearly confounded our provincial judges."

So concludes this somewhat prejudiced account of the great Perth mission. In time, of course, the sect will have their own historians, who will not fail to do them justice. Not long after the Fair City had thus been startled from the grave tenor of its ordinary thoughts, another fellow of the Waterford college made his appearance on a much wider and worthier field—namely, the city of Glasgow—where, however, there is need for scores of similar labourers. This gentleman was evidently very rich; a circumstance reflecting great credit upon him, when we consider how few rich men are ever found to devote themselves in any way to the public good. There was also a rich originality of genius about him, marking him out as no ordinary member of the body. "On several occasions, accompanied by one or two friends," thus proceeds the local chronicler, "he crammed a carriage with street musicians of every kind—from the blower of the bagpipe to the organ-grinder—and drove them over the city, at the same time supplying them with liquor literally from buckets. He was seen posting over the town in a carriage and four, with his head surmounted by * [we really cannot reprint the thing his head was surmounted by] *; the equipage stopped at a house in Stirling Street, and a large crowd collecting, the surveillance of the police was found necessary. Frequently this nondescript has been observed amusing himself remunerating porters and boys with handfuls of silver for their dexterity in ground and lofty tumbling on the street; and a porter was well paid on one of these occasions for drawing the worthy in his hurly several times across a back court in Trongate. A favourite amusement is tearing women's caps, and then paying treble their value; and if report speaks true, the servants of the hotel at which he resides have made a capital spec. by throwing their head-gear in the way of the youth. It is said, too, that several shopkeepers have been astonished to see such expensive articles as the finest hats purchased, and then kicked recklessly into the street. But the next to insane demeanour [what intolerance!] of this stranger presents so many varieties, that it is altogether impossible for us to follow them out, nor have we any inclination further to do so." You have done it far enough, in all conscience, we would say, if you are to do it in this short-sighted and unsympathising way. But it is indeed very remarkable with what an absence of all profound and penetrating views the Waterford enthusiasm has been treated by the public press. None of the public journalists have yet seen the idea. It might have been expected, that, when gentlemen began to twist off knockers and knock down policemen, it would have been suspected that there was something under it. It might surely have been supposed that it was not for nothing that a troop of the first youth of the realm began mysteriously to employ themselves at night in such pranks as shifting the signs of undertakers to the fronts of the houses of physicians. That strange novelty, too, the boldness with which these youth spoke up to the old and crazed authorities before whose benches they were called, might have been expected to awaken some notion in the brains of even the muddiest of provincial writers, of the occult phi-

²⁹ Dress (verb). ³⁰ Soap. ³¹ Our. ³² Fatigue.
³³ Tuppence. ³⁴ To bet or wager. ³⁵ Upper stockings without feet, used as gaiters. ³⁶ Always. ³⁷ A public-house.

losophy which animates the Waterfordian sect. But no. All has appeared to them as mere folly. We look forward to the time when the thing will be generally seen in the light in which it has appeared to ourselves, and when the name of Waterford will be ranked with those of the Owens, the St Simons, and the Pestalozzis of the age; and it will be accounted amongst the most enviable of distinctions to have been instrumental in any degree in carrying out views so profound, so philanthropic, and which shall then have proved of such incalculable service to mankind.

TEA OF PARAGUAY.

It is well known that, from various causes which do not require to be explained in this place, our commercial relations with China are sometimes placed on a precarious footing. Such is the case at the present moment, and some have begun to entertain disagreeable apprehensions relative to their favourite beverage; though we believe there is no serious ground for dreading that our supplies of tea will be immediately cut off or even curtailed. These squabbles, nevertheless, have had the effect of calling the attention of our Indian authorities to the cultivation of the tea-plant in some of those eastern territories over which we hold a superiority. It appears that the undertaking is likely to prove successful, for flattering accounts of the flourishing state of the plantations have lately reached this country. Whether Hindostan will ultimately produce an article which shall supersede what is raised in the celestial empire, is doubtful, for the latter possesses great advantages over all the neighbouring countries in the peculiar adaptation of the soil and climate for the production of the plant; in the superabundance of the population, which renders labour cheap, and consequently the article cheap; and in the agricultural and manufacturing skill and industry of the Chinese. But still, as the Dutch have been pretty successful in Java, there is no reason why equal success should not crown the efforts of the speculators in Hindostan. To render ourselves even to a limited extent independent of the Chinese, who are at once proud and capricious, would be a great point gained. One strong reason why we ought to multiply our resources of that kind is, that, from the rapid growth of the population in North America, Europe, and other parts of the world, the consumption of Chinese tea will become so great, that the price of the article will be much raised, if China continues to be the only source of supply as at present.

There is another way, besides that alluded to, of rendering ourselves so far independent of China, and that is, by importing the famous tea of Paraguay, a country which lies much nearer our own than the celestial empire. For nearly a century the question has been asked, why has this valuable article never been brought to Europe? Why, when all the inhabitants of South America, and every traveller who visits the country, extol its merits, why are we at home allowed to remain in ignorance of them? The simple answer to the question is, that South America was under the worst management when the Spaniards held the superiority over it, the precious metals attracting the chief attention, whilst agriculture, the true wealth of the country, was neglected. Since the provinces declared their independence, broils and squabbles of one sort and another have greatly retarded the advancement which they might otherwise have made, and thus their resources have been allowed to remain in a state of dormancy. Paraguay in particular, the very paradise of the *Yerba maté*, or tea-plant, has been governed by a person in whom we know not whether the madman or the monster predominates, and who has done all in his power to isolate the country from the rest of the world. We are quite convinced that the absurd restrictions laid on commerce by this intellectual savage, Dr Francia, are the real cause why the tea of Paraguay has not found its way into Britain within the last twenty years. An article which the country produces in almost boundless profusion, and which is so highly valuable in itself, ought long ere this to have enriched Paraguay with the manufactures of Europe, whilst the population of this and other countries would, in return, have been in the enjoyment of a delightful beverage, equal to the finest bohea of China. We hope ere long to see this accomplished; but public attention ought in the meantime to be drawn to the subject, and this is our object at present. The first point of which it is necessary to convince every one, is the sterling virtues of the article in question; and that can only be effected by producing the testimony of those who have used it.

Sir Woodbine Parish, a recent and high authority, imparts some valuable information regarding the article, and with reference to its qualities, says, "From the practice of reducing the plant nearly to dust, probably originated the general custom in South America of sucking the infusion when made through a tube; at one end of which is a strainer, which prevents the small particles of the tea-leaves from getting into the mouth. It is usually made very strong, very hot, and very sweet with sugar; its properties seem to be much the same as those of the China tea. The Spaniards learned to use it from the Guarani Indians."

Mr Luccock, in his "Notes on Rio de Janeiro and

Southern Brazil," describes it in much the same terms, and mentions its general use and the high estimation in which it is held by the South Americans. He also states that it is cultivated over a wide extent of country besides Paraguay, which is an important fact.

The Messrs Robertson, who resided some time in the country, and have lately published a work on it, visited the yerbaes, or woods of the Paraguay tea, and describe the mode of gathering, preparing, and packing it up, but these we pass over. Speaking of the tea, one of the brothers observes:—"This formed so extensive a branch of the commerce of the country, that, like a little China, Paraguay may be said to have supplied the whole southern part of the new world with the refreshing beverage."¹ Messrs Rengger and Longchamps, for some time detained as prisoners by Dr Francia, mention that the immense forests of Paraguay "yield spontaneously two very valuable objects of exportation, the *herb* of Paraguay, and timber for ship-building."²

Martin Dobrizhoffer, for eighteen years a Jesuit missionary in Paraguay, paid much attention to the tea-plant; he has described it at considerable length, and expressed his surprise that it is not made the object of regular export traffic.³

Mr Bonnycastle, in noticing the yerba, says, "So useful is this western tea, that the mines would stand still, if the owners were to neglect to supply the workmen with it; and all persons in Peru, Chili, and Buenos Ayres, consider themselves wretched, if not able to procure it; two millions of piastres worth of this herb being sold from the province of Paraguay every year. The smell and colour of this drink is nearly as fine as that of the best Indian teas."⁴ Equally favourable are the accounts of it presented by Major Gillespie,⁵ Dr Southey,⁶ Mr Miers,⁷ and Captain Basil Hall.⁸ Mr Webster's evidence is to a certain extent equivocal. He says, speaking of the Monte Videans, "As in other parts of South America, they also use the *maté*, which is nothing more than the leaves of the Paraguay holly, but it is not so pleasant to the palate of an Englishman as his favourite China tea."⁹ With regard to the taste, it may be remarked that China tea is by no means pleasant at first, but becomes so by frequent use. An article, therefore, similar to it in its general nature, but differing in peculiarity of flavour, could scarcely be expected to be "so pleasant to the palate" when tasted for the first time. There is abundant evidence to prove that those habituated to its use prefer its flavour to that of the tea of China.

The statement of Mr Campbell Scarlett is very much in favour of the Paraguay tea, and proves what we have stated as likely to happen, that it will become perfectly agreeable to the palate by a little use, just like Chinese tea, or like coffee. "We have brought a good deal of the famous *yerba* or *maté* with us, and I begin almost to prefer it to tea, when made by the natives, who seem alone perfectly to understand the mode of mixing this beverage."¹⁰ The housewives of Britain would not be long in discovering the best mode of preparing the beverage: that would form no obstacle to its success.

Mrs Graham thinks that it "is harsher than tea, but still very pleasant."¹¹ Mr Beaumont does not express his opinion directly, which is the case with many other travellers, whose approbation of the beverage seems implied in their notices of its universal use, and of the partiality of the inhabitants to it, preferring it to either coffee or China tea. Mr Beaumont says, that "the far-famed *maté* is produced in great abundance,"¹² which is essential to the object we have in view. Mr Caldecleugh, in describing its scarcity during the period of which he writes (arising entirely from the jealous policy of Dr Francia, the Dictator of Paraguay), says, "But such is the predilection for it, that it must be procured at any price. Foreigners, as well as the natives, get accustomed to the flavour, and as readily subscribe to its good qualities."¹³ This is distinct and much to the purpose. It is also of great weight, coming from so highly intelligent a traveller.

Senor Nunez describes the extraordinary productiveness of the country in yerba *maté*, and says that "it is greatly superior to that of Brazil, and of which, in that part of America, there is a greater consumption, than of tea from China, in the United States."¹⁴ Mr Proctor says "it has a bitter but not a disagreeable flavour."¹⁵ These words might stand for a description of China tea. It would, however, carry us much beyond our limits to quote what is said of this

plant in encyclopedias and systematic works on geography.

We think we have made out a sufficiently strong case as to the excellence of the tea of Paraguay, by the abundance of testimony which has been brought forward. We have not met with a writer who speaks of it in disparaging terms, whilst we could easily augment the evidence in its favour. It seems to us to be clearly proved that *maté* bears a considerable resemblance to China tea, in those peculiar qualities which render that plant so great a favourite in this and other countries; that it is a soothing, refreshing, and slightly exhilarating beverage; that it "cheers but not inebriates," which is an essential point. Were it possessed of any of those baneful properties which belong to coca, the scourge of Peru, we should be the last to recommend the introduction into this country of any such pernicious drug. But no evils are attendant upon its use; only when abused by being taken over strong, and to excess, is it found to derange the system; and all the world knows that the same is the case with Chinese tea.

The next point to be determined is, can the article be obtained in sufficient quantity so as to become a remunerating speculation to those who undertake its importation. That the country where it grows is capable of supplying all Europe with the commodity, provided proper attention be paid to its cultivation, is abundantly proved, both by the extracts which we have given, and by the statements of many other writers. There are large forests of it growing spontaneously, but allowed to remain untouched, because it is the narrow and jealous policy of the present ruler of Paraguay, Dr Francia, not to cultivate an intercourse with other countries, lest his subjects, or slaves rather, become too enlightened and knowing for him. Knowledge is inimical to the purposes of the tyrant, just as light is fatal to the designs of the robber. But Francia cannot much longer inflict his dictatorship on the country, for he is above eighty years of age. Besides, the plant is raised in large quantities in many other parts of the country, over which he exercises no control. In 1819, the celebrated naturalist M. Bonpland, the companion of Humboldt, settled in Corrientes, which lies below Paraguay, and there proposed to rear extensive plantations of the yerba tree. Had he been allowed to go on peaceably in his laudable undertaking, there would have been plenty of the article for exportation long before this time. But the barbarian of Paraguay sent an armed force against his settlement, which was completely ruined, and its owner dragged into slavery. He was only released in 1831, and, we are glad to learn from a highly respectable source, "is now in Corrientes, actively engaged once more in agricultural plans."^{*} Of course, the tea will form the chief object of his attention, and some enterprising English merchants might encourage him by ordering a supply. The consequences of the wretched policy of Dr Francia are thus alluded to by Sir Woodbine Parish:—"Even the yerba *maté*, or Paraguay tea, once so fruitful a source of profit to the viceroyalty of Buenos Ayres, is now introduced from the southern provinces of Brazil. It is true that Paraguay Proper, where the greater part of it was grown, has been closed for some years, but there is no reason why it should not have been cultivated in Corrientes or the Misiones (a large territory adjoining it), with just as much success as in the Brazilian province of Rio Grande."[†] We are convinced that all that is wanted for making the tea of Paraguay a profitable object of speculation to the British merchant, is the presence of some enterprising individuals on the spot, with capital enough to set the business a-going. The failure of the mining schemes in which so many embarked, has given a bad notoriety to this part of South America, but the prejudice against it is most unfounded. Any enterprise will fail if it be badly managed, and this was the case with the mines. An agricultural speculation, like the raising and exporting of an article of such unquestionable value as the Paraguay tea, is very likely to be successful. It is surprising why the thing has not been thought of before, and measures taken to bring the plant into the British market. It were quite preposterous to suppose that prejudice in favour of bohea would for any length of time operate unfavourably to its popularity. When a thing is really valuable, it soon finds its way into general use, provided the price be reasonable. Notwithstanding that labour is dear in South America, the soil is so prolific in yerba *maté*, that it might be procured very cheaply. In his statement of the exports of the republic, Mr J. P. Robertson mentions, that of the yerba "there were annually shipped 40,000 bales, containing nine arrobes (of twenty-five pounds each arrobe), or 360,000 arrobes, which, valued with duties and charges, at two dollars the arrobe, make 720,000 dollars." Reckoning four shillings in the dollar, this is rather less than fourpence per pound. Whatever profits might be expected from the article, they would never raise its price so high as that of China tea or even coffee; that is, if the business be properly conducted. In conclusion, we strongly recommend this speculation to the attention of those enterprising bodies of men, the London and Liverpool merchants. There are no obstacles to our obtaining considerable supplies of the article, but such as capital, skill, and enterprise, may readily overcome. The principal one is

likely soon to be removed, as the following extract from Sir Woodbine Parish will show: he is speaking of the miserable state of slavery in which Paraguay has for thirty years been kept by Francia. "That so extraordinary a state of things should so long have existed, is, I believe, entirely to be ascribed to the miserable weakness of the adjoining provinces, which, had they been able to make the slightest combined effort, might long ago have put an end to the tyrannical rule of this crazy old despot. Nature will probably do this ere long, when it may be expected that Paraguay will once more join the confederation of her sister provinces." It is immaterial whether she joins the Union of the Argentine republic, or remains an independent state as at present: we would prefer seeing her in the latter position. But at all events it is to be hoped that the resources of a country, about the fairest on the map of the world, will be fully developed when the opportunity so devoutly to be wished arrives—and let some of our enterprising countrymen be upon the spot, ready to catch the tide which undoubtedly leads on to fortune. Little time is to be lost. The expectations which were blasted by the failure of the mining speculations will be amply realised by undertakings which shall supply this country with the tea of Paraguay. At all events, let us have a few packages brought home on trial.

THE ANNUALS.

THE following historical sketch of this ephemeral class of publications appears in a late number of the "Art-Union, or Monthly Journal of the Arts":—

"The most high and palmy state" of the *Annals* belongs to history. They are now, like the few flowers that still linger in our gardens, dwindled in character, and remind us, with far more of pain than pleasure, of the beautiful things they have been. They have had their day; and if the age has grown too fastidious to enjoy them, we can, at present, perceive no signs that they will be succeeded in public favour by objects more worthy of it. A short history of their rise and progress may, we think, be agreeable to our readers. In 1822, Mr Ackermann introduced the exotic from Germany into England; but 'The Forget Me Not,' a title borrowed also from the same source, was merely a slight improvement on the pocket-books which for centuries had been the customary gift-books of a season, when to present tokens of friendship or affection is considered a sort of duty. The next year the 'Friendship's Offering' made its appearance, and the same year 'The Graces,' containing a series of elegant poems on the months, from the pen of Dr Croly. But with the three were combined blank paper for memoranda, cash accounts, &c.; and they were, as we have said, little more than a degree removed from the time-honoured trash that had contented our forefathers. Yet the project was found to answer, and the natural results followed. Exertions were made, and successfully, to render them valuable as literary volumes, and excellent as works of art. 'The Literary Souvenir,' edited by Mr Alaric Watts, was a huge step in advance; to this gentleman, indeed, was mainly owing the vast improvement they subsequently underwent. 'The Amulet,' edited by Mr S. C. Hall, was another; 'The Winter's Wreath,' a provincial volume, was a third; 'The Keepsake' was a fourth; and in the year 1829, so popular had this class of works become, that no fewer than seventeen were published.

Competition necessarily gave rise to prodigious efforts to obtain pre-eminence. In their earlier years they were all bound up in tinted paper, and enclosed in a case. Paper yielded to silk, in which the majority of them soon made their appearance; then followed morocco leather, and, much more recently, velvet. The public was startled at finding elegant books, full bound in morocco, for the binding of which they had been accustomed to pay nearly as much as the cost of the whole work, illustrated by exquisitely engraved prints from paintings by artists of the highest celebrity, any one of which formerly would have been valued at the charge demanded for the series, and containing prose and poetry, written for the several publications by all the leading and most popular writers of the age. These improvements had indeed been gradual, and had grown out of the large circulation to which some of the *Annals* had attained, and, in especial, to the spirit of energy and enterprise which a laudable rivalry had called into existence. Sums of money that sound preposterous were lavished upon the several departments; five hundred pounds were given to Sir Walter Scott, and proportionate remuneration to other authors, for articles contributed to a single volume of 'The Keepsake'; amounts varying from twenty to one hundred and fifty guineas were paid to artists for the loan of pictures to be engraved; and it was by no means uncommon for the engraver to receive one hundred and fifty guineas for the production of a single plate. For one, indeed, 'the Crucifixion,' after Martin, engraved by Le Keux, that gentleman received one hundred and eighty guineas, making the cost of the print, including the sum paid for the drawing, two hundred and ten guineas. The volume of 'The Amulet' which contained this costly work had also two other engravings, which together cost two hundred and sixty guineas; the other nine prints amounted, perhaps, to seven hundred guineas; so that for the embellishments alone the publishers had to pay nearly twelve hundred guineas; and yet, strange to say this was the only volume of the whole series of

'The Amulet' that yielded a profitable return upon the capital expended and the labour bestowed. Until 'The Keepsake' entered the field, all the *Annals* were published at twelve shillings; 'The Keepsake' was an experiment at a guinea, and it was generally thought would be a failure; the beauty of the embellishments, however, was very great; the letter-press was wretched in proportion, yet the trial was a successful one; and the next year, Mr Heath, the proprietor, amended the mistake into which he had fallen, and obtained the co-operation of nearly all the great authors of the age and country. His expenses for the literary portion of his second volume amounted to no less than £1,600. The existing *Annals* having been made nearly as perfect as they could be, novelties were projected, as the next step to obtain profit. A volume of engravings from the old masters, consisting exclusively of religious writings, entitled 'The Iris,' had existence for two or three years, and was abandoned; a Landscape *Annual* was conceived by Mr Charles Heath; *Annals* for Children were devised; 'The Book of Beauty' was a new and happy idea; Scientific *Annals* made their appearance, and Mr Hood entered the field with his *Comic Annual*. They all had their day, and vanished by degrees. Of the earlier works, the oldest, 'The Forget Me Not,' the second in age, 'The Friendship's Offering,' and the sixth in years, 'The Keepsake,' are the only ones that now exist; the three are unquestionably vastly inferior to what they were a few years ago. But, lately, a new class has sprung up. Messrs Ackermann, some three or four years ago, produced a quarto volume, 'The Flowers of Loveliness,' at the price of a guinea and a half; it was a novelty, and it succeeded, although its merit was any thing but great. Rivals of course followed [including 'The Book of Beauty,' and 'Drawing-Room Scrap Book, both quarto size], and not long ago one was issued at the price, to the public, of two guineas and a half.

Beyond question, the character of the *Annals* has deteriorated; the fashion, we might almost say the passion for them, gradually declined. In proportion as they became unprofitable, exertions were relaxed; and if we look through any of the volumes published within the last five or six years, we shall perceive only mediocre engravings from mediocre paintings, while among the contributors to their literary contents we shall now find scarcely a single name of eminence. Publishers who used to pay largely for the assistance of both authors and artists, have been compelled either to abandon their speculations, or dole out recompense very sparingly; and their value as literary works, or as works of art, has nearly, if it have not altogether, vanished.

Yet they have undoubtedly been useful as well as agreeable—profitable as well as pleasant—both to literature and to art; and the sneers directed against them, just at the commencement of their decline, were as unmerited as they were unwise. Before their introduction into England, the Christmas gift-books were, as we have stated, and our readers know, paltry pocket-books; their successors contained much to interest, and somewhat to instruct; the prints which used to ornament the chimney-pieces of houses of the middle class, were tawdry-coloured daubs, prejudicial to taste, and very often injurious to morality; they were displaced by engravings after the choicest works of our great British painters, executed in such a manner as to cultivate the eye, and give employment to the mind; and we are by no means to put out of sight the fact that the popularity of the *Annals* spread through various channels a very large sum of money every year—such sum being divided among persons whose occupations were beneficial to the country. For some years, indeed, nearly £100,000 per annum were thus expended. We shall not be wide of the mark if we assert that for several years 150,000 volumes were circulated. We made in the year 1829 a calculation of the expenses incurred, and on now referring to it, we have no reason to change our opinion of its accuracy; it may interest, or at least amuse, the curious in such matters, at the same time that it will sustain our argument as to the benefit conferred by this class of works. For 150,000 volumes (including the 'guinea' books, of which there were always two or three), the public paid about £90,000. The sum was thus distributed:—

Authors and editors	£6,000
Painters	3,000
Engravers	12,000
Copper-plate printers	4,000
Printers	3,500
Paper-makers	5,500
Binders	9,000
Silk-manufacturers and leather-sellers	4,000
For advertising, &c.	2,000
Incidental matters	1,000
	£50,000
Publishers' profits	10,000
Retail booksellers' profits	30,000
	£90,000

Thus—and it will no doubt startle many of our readers—during the seventeen years that the *Annals* have flourished in England, a million and a half of money has been expended upon them by the public. There is another consideration that should have some weight; they are issued at a period of the year when trade is proverbially 'dull,' and when book-selling is

especially so. They create business when, according to the Irishman, there is 'nothing stirring but stagnation.' We contend, then, that there are few luxuries in the purchase of which the public money could have been better expended; and we repeat, that in rejecting them, or at least in so far neglecting them as to cause their obvious deterioration, the public has been a loser and not a gainer. We have as yet had their places supplied by nothing more useful, or more agreeable."

We beg to add a single word of observation to this somewhat interesting account of the rise, progress, decline, and fall of the *Annals*. It has always appeared to us that, with a few exceptions, the literature of these publications was excessively puerile, and could not reasonably be expected to command an enduring reputation or patronage. The works, in fact, were never any thing but beautiful picture-books, and therefore liable to be deprived of public favour when an improved taste or new means of satisfying it became predominant. The drawing-rooms of the wealthy being furnished with a sufficient number of red, blue, and green morocco-covered picture-books, the sale of these works naturally diminishes, and objects of greater novelty—perhaps original paintings in frames—take their place. Such seems to be the true cause of the decline and fall of the *Annals*.

FAMILIAR OBSCURITIES.

THERE are certain words and phrases which, though in familiar use, are never made the subject of regular explanation, simply because every body is supposed already to know their meaning; and as these words and phrases seldom appear in dictionaries, it follows, as a natural consequence, that many persons remain in ignorance of them during the whole or a greater part of their lives. We propose to throw a little light on a few of these familiar obscurities. The first that comes to our recollection is the term

ALLGEMEINE ZEITUNG.

Allgemeine Zeitung is common in newspaper intelligence. "We learn from the *Allgemeine Zeitung*," says a daily paper, "that Prince Metternich is at present in a declining state of health, and intends visiting," &c.; or, "It is confidently reported by the *Allgemeine Zeitung*, that an important meeting is shortly expected to take place between the ambassadors of the leading European powers at Toplitz," &c. &c. The term *Allgemeine Zeitung* is, in short, constantly before the public; every body has seen it hundreds of times; there is no end to it. But who knows exactly what it means? Is it the name of a newspaper, a magazine, or a human being—what is it? We shall explain. The *Allgemeine Zeitung* is a newspaper published daily in the German language at Augsburg in Bavaria. The name signifies Universal Gazette or Intelligencer, the word *Zeitung* being from the same root as our English word *Tidings*. The *Allgemeine Zeitung* is to Prussia, Austria, and various other continental powers, what the *Times* or *Morning Chronicle* is to England, with the superior attraction of being written upon a plan of more general interest. It is, we believe, the best newspaper in Germany, and is particularly celebrated for the correctness of its intelligence from Turkey and the adjacent countries. The *Allgemeine Zeitung* has existed for upwards of forty years, and is now, or was lately, the property of Baron Cotta, who employs regular correspondents in Constantinople, Athens, Cairo, Smyrna, and all the chief capitals in Europe; also in America. It is occasionally made use of by Austria and other states as a kind of demi-official organ, and therefore exerts an influence to a certain extent in continental politics. It is small in size, cheap in price; and its circulation, as is believed, is not above five thousand copies. People in Germany care little for newspapers, and grudge spending money upon them.

SILHOUETTE.

The word *Silhouette* is another of these obscurities. "He has had his likeness taken in silhouette," "Silhouette likenesses executed here, at one shilling each, by Mr —," and so on with many other observations and announcements, in which the word *silhouette* occurs. It is generally known that a *silhouette* is a small profile likeness in black, or black slightly streaked with white or coloured lines. But the origin of the word is to most persons a mystery, and is rather curious. The term took its rise in France eighty years ago, and was occasioned by the nation being at that time in a state of financial distress, under the administration of M. de Silhouette. That gentleman endeavoured by severe economy to remedy the evils of a war which had just terminated, leaving the country in great exhaustion. During the period of M. de Silhouette's government, all the fashions in Paris took the character of parsimony. Coats without folds were worn; snuff-boxes were made of plain wood; and, instead of painted portraits, outlines only were drawn in profile, and filled with Indian ink, &c. All these fashions were called *à la Silhouette*; but the name was retained only in the case of the profiles, which, from their simplicity, and the cheap manner in which they could be executed, survived the period of their compulsory origin. Thus, the name of a French Chan-

cellor of the Exchequer has been attached to the most common of our miniature profiles.

BENEFIT OF CLERGY.

This was a privilege formerly possessed in England by all clergymen, and consisted in their exemption from trial for felony before the civil tribunals: when they were charged with a felonious crime, they were handed over to their own ecclesiastical courts. The privilege was afterwards modified in various ways, and was extended to all persons who could read, and also to women; and, practically, those who were entitled to the benefit of clergy were not punished for any crime, further than suffering a short imprisonment, and, at the discretion of the judge, being branded on the thumb; in other words, none were hanged but unlettered persons. The privilege was, however, frequently broken through, and was reduced to little else than a mere name, by a statute of Queen Anne; it was formally abolished in the reign of George IV., since which event all persons are equal in the eye of the law. The term "benefit of clergy" is now used only in a jocular sense.

A few more explanations by and bye.

ANNOYANCES OF OFFICIAL PERSONS IN AMERICA.

To the people of this country, who are accustomed to regard high official men with a sort of distant awe, the familiarity with which the same class of men are treated in America must appear extremely strange. We have been assured by an American gentleman of the highest intelligence and respectability, that there is not a state official of popular appointment in "the States," who is not under the necessity of holding himself ready to receive familiar calls at every hour from persons who in this country would not be allowed entrance even into the lobby of a respectable house. And the privilege is taken advantage of in no sparing manner. In a late clever work entitled "Aristocracy in America," a curious account is given of the shoals of people who come to Washington to bore the President and other officers for posts. We extract the passage:—

"And then what a continual influx of paupers! interrupted the bar-keeper; 'all coming here to seek office, to see the President, and to avail themselves of their acquaintance with one or the other member, to obtain a place for themselves or one of their relations. Would you believe that people come here from a distance of from six hundred to a thousand miles, to hunt an appointment of six hundred dollars a-year; and that, in order to enable them to get home again, after they have spent their last farthing, the President is often obliged to pay their passage out of his own pocket?'"

"I can testify to that," said one of the gentlemen; "General Jackson has done so more than once. When they first come here, they expect nothing less than an appointment of two thousand dollars a-year, but by degrees their expectations become more moderate: they would then be satisfied with a clerkship; by and bye with a still more subordinate station; and at last they would be glad if any one would pay their bill, and enable them to get home again. I remember a most remarkable story, which was current here shortly after the election of General Jackson, and which is singularly characteristic of the notions of our people as respects the power of the executive.

One morning, scarcely a fortnight after the general's arrival at the White-house, a shabby-genteel looking man presented himself at his parlour, and, after the usual salutation and shaking of hands, expressed his joy at seeing the venerable old gentleman at last hold the situation of chief magistrate of the country, to which his bravery, his talents, and his unimpeachable rectitude, fully entitled him. "We have had a hard time of it," said he, "in our little place; but our exertions were unremitting; I myself went round to stimulate my neighbours, and at last the victory was ours. We beat them by a majority of ten votes, and I now behold the result of that glorious triumph!" The general thanked him in terms of studied politeness, assuring him that he would resign his office in an instant, if he did not think his election gave satisfaction to a vast majority of the people; and at last regretted his admirer's zeal for the public weal should have been so severely taxed on his account. "Oh, no matter for that, sir!" said he; "I did it with pleasure—I did it for myself and for my country" (the general bowed); "and I now come to congratulate you on your success" (the general bowed again). "I thought, sir," continued he, "that as you are now President of the United States, I might perhaps be useful to you in some official capacity." (The general looked somewhat embarrassed.) "Pray, sir, have you already made a choice of your cabinet ministers?" "I have," was the reply of the general. "Well, no matter for that; I shall be satisfied with an embassy to Europe." "I am sorry to say there is no vacancy." "Then you will perhaps require a head-clerk in the department of state?" "These are generally appointed by the respective secretaries." "I am very sorry for that: then I must be satisfied with some inferior appointment." "I never interfere with these: you must address yourself to the heads of departments." "But could I not be postmaster in Washington? Only think, general, how I worked for you!" "I am much obliged to you for the good opinion you entertain of me, and for your kind offices at the last election; but the postmaster for the city of Washington is already appointed." "Well, I don't particularly care for that; I should be satisfied with being his clerk." "This is a subject you must mention to the postmaster." "Why, then, general," exclaimed the disappointed candidate for office, "haven't you got an old black coat?" You may well imagine that the general gave him one.

Extravagant as this story appears, I can assure you that there are at any time in Washington hundreds of persons seeking employment of some sort or other, nine-tenths of whom return home disappointed, cursing the ingratitude of those whom they have elevated by their suffrages, and who are now so monstrously ungrateful as to suffer them to gain a livelihood by common labour. All these men finish by joining the opposition, expecting to be treated with more consideration by the next administration."

ANOTHER AND ANOTHER.

"Among the many foreigners with whom Mr Mathews was intimate, was a M. P.—lle, who frequently visited us after our marriage. M. P.—lle and his wife, a pretty Englishwoman, had been married several years, but no child had blessed the otherwise happy couple. At the time we became acquainted with them, in York, the lady had given promise, and in due time the critical period arrived which was to complete their happiness, as they believed, by a more powerful bond of union. On the evening when this event was expected, and M. P.—lle hoped to become a father, he invited himself to dinner with us, desiring to divert, if possible, the intensity of his feelings from the little less than agony of suspense which he experienced lest his dearly beloved wife should fall a sacrifice to her situation. It was almost impossible, even while witnessing the husband's suffering, not to smile at the ludicrous expression he gave to it. Mr Mathews urged him to take more wine than the habit of the abstemious Frenchman would have allowed him to drink at any other time; but now he seemed glad to use any artificial means to sustain himself. A second bottle of port had been produced after dinner, before any intelligence from home reached the anxious husband, when, lo! as he was sipping a second glass of the newly-opened wine, a servant from home was admitted, almost breathless with haste, and announced that his mistress was 'put to bed' with a fine boy! The rapture of the father was as whimsical as had been his dread. He was flying off to see his first-born; but a prudent message from the doctor was added, recommending M. P.—lle not to return immediately, but to wait, satisfied with present intelligence, until summoned. To this he reluctantly submitted; and re-entring himself, indulged in his future prospect of added bliss. Nothing had been wanting but a son to perfect the interest of his life; one child was sufficient for their mutual wishes; indeed, as he observed, a large family would not be desirable, or consistent with his means; and as he and his wife were no longer youthful, it was not probable that any very serious increase to his family circle could be expected—he was in fact the happiest of men. After a short interval, the servant appeared once more, to acquaint Monsieur his master that, since his first message, 'Mistress had got another bairn!' Surprising was this news, and somewhat *damping*, we thought, to the happiness and satisfaction which the first intelligence so indisputably occasioned. However, after the first ejaculation of surprise, M. P.—lle inquired how his wife was, and on being again assured that there was nothing to fear, and that he would soon be allowed to see her, he appeared to resign himself to his twofold blessing, observing, 'Well, well! it cannot be prevented—it is one more *den* I expect—*mais* I not repine—two children at one time is rather inconvenient & very expensive!—*mais* n'importe! I cannot help him—I must be resign to it.' In this manner he philosophised while he sipped his wine, looking into the fire, at the same time, in a musing attitude; now and then, however, taking out his watch, and again expressing his anxiety lest his 'dear wife' should be in danger. We had some difficulty in preventing him from appearing at his house before the ruling powers there thought proper. A third time his messenger rushed in, more agitated and pale than at first. He appeared to bring fatal news, for his eyes seemed almost bursting from their sockets, and his whole appearance was truly alarming to us all. 'Well?' we simultaneously exclaimed, 'how is Madame?' 'She's as well as can be expected, doctor says; but —' 'But what?' asked the agitated husband. 'But she's gotten another bairn!' replied the messenger. 'Another child!!' cried the astonished Frenchman, starting from his chair, and pushing his hair back from his forehead, with a 'Wheugh!' as if sudden heat had distressed him. In truth he looked less in sorrow than in anger at this unseasonable augmentation; and after a second's pause in seeming reflection, he suddenly assumed a resolute manner, as if from a strong effort of mental decision; buttoned up his coat rapidly; called for his hat, forced it with a blow down upon his forehead; drew in his breath; and, in a calm yet determined voice, as he hastened out of the room, exclaimed, as if in soliloquy, 'I must put a stop to *dis* business!'—*Mathews's Memoirs*.

THE SABBATH.

Blessings, and ten thousand blessings, be upon that day! and let myriads of thanks stream up to the throne of God, for this divine and regenerating gift to man. As I have sat in some flowery dale, with the sweetness of May around me, on a week day, I have thought of the millions of immortal creatures, toiling for their daily life in factories and shops, amid the whirl of machinery, and the greedy craving of mercantile gain; and, suddenly, that golden interval of time has lain before me in all its brightness—a time, and a perpetually recurring time, in which the iron grasp of earthly tyranny is loosed, and Peace, Faith, and Freedom, the Angels of God, come down and walk once more among men! Ten thousand blessings on this day—the friend of man and beast. The bigot would rob it of its healthful freedom on the one hand, and coop man up in his workday dungeons, and cause him to walk with downcast eyes and demure steps; and the libertine would desecrate all its sober decorum on the other. God, and the sound heart and sterling sense of Englishmen, preserve it from both these evils! Let us still avoid Puritan rigidity and French dissipation. Let our children and our servants, and those who toil for us in vaults, and shops, and factories, between the inter-

vals of solemn worship, have freedom to walk in the face of heaven and the beauty of earth; for in the great Temple of Nature stand together Health and Piety. For myself I speak from experience; it has always been my delight to go out on a Sunday, and, like Isaac, meditate in the fields; and especially in the sweet tranquillity and amid the gathering shadows of evening; and never, in temple or in closet, did more hallowed influence fall upon my heart. With the twilight and the hush of earth, a tenderness has stolen upon me—a desire for every thing pure and holy—a love for every creature on which God has stamped the wonder of his handiwork, but, especially, for every child of humanity; and then I have been made to feel, that there is no oratory like that which has heaven itself for its root, and no teaching like the teaching of the Spirit which created, and still overshadows, the world with its infinite wing.—*William Howitt*.

MULTITUDE OF RETAILERS OF ARDENT SPIRITS.

In the year 1838, the number of persons who obtained certificates to sell ale and spirits, in the county and city of Edinburgh, was 2195. The number of families in the city and county is 47,415. There is therefore a dealer in ale and spirits for every 21½ families in the city and county of Edinburgh.

THE BROTHERS CHEERYBLE.

It may be right to say, that there are two characters in this book which are drawn from life. It is remarkable, that what we call the world, which is so very credulous in what professes to be true, is most incredulous in what professes to be imaginary; and that while every day in real life it will allow in one man no blemishes, and in another no virtues, it will seldom admit a very strongly marked character, either good or bad, in a fictitious narrative, to be within the limits of probability. For this reason they have been very slightly and imperfectly sketched. Those who take an interest in this tale will be glad to learn that the Brothers Cheeryble live; that their liberal charity, their singleness of heart, their noble nature, and their unbounded benevolence, are no creations of the author's brain, but are promoting every day (and oftentimes by stealth) some munificent and generous deed in that town of which they are the pride and honour. —*Preface to Nicholas Nickleby*. The Messrs Grant of Manchester are understood to be the gentlemen meant. —*Newspaper*. The individuals here alluded to are natives of Scotland. They left Strathpey in their boyhood, without any advantages from fortune, and are now amongst the most affluent and respectable merchants in Manchester. As a trait of their character, justifying the view taken of it by Mr Dickens, it may be mentioned that a few years ago, observing one of their clerks to be in declining health, they sent him out to Madeira to recover it, after having first stuffed some hundred and fifty pounds into his pocket. The object was not accomplished, for the young man died; but the brothers are not the less to be praised for their good intention. It is not, perhaps, quite right in us to publish this anecdote; but somehow we never can hear of a generous human being without feeling an uncontrollable desire to make his merits known.

HELPS IN MICHIGAN.

Some of my dear theorising friends in the civilised world had dissuaded me most earnestly from bringing a maid with me.

"She would always be discontented and anxious to return; and you'll find plenty of good farmers' daughters ready to live with you for the sake of earning a little money."

Good souls! how little did they know of Michigan! I have since that day seen the interior of many a wretched dwelling, with almost literally nothing in it but a bed, a chest, and a table; children ragged to the last degree, and potatoes the only fare; but never yet saw I one where the daughter was willing to own herself obliged to live out at service. She would "hire out" long enough to buy some article of dress perhaps, or "because our folks have been sick, and want a little money to pay the doctor," or for some such special reason; but never as a regular calling, or with an acknowledgment of inferior station.

This state of things appalled me at first, but I have learned a better philosophy since. I find no difficulty now in getting such aid as I require, and but little in retaining it as long as I wish, though there is always a desire of making an occasional display of independence. Since living with one for wages is considered by common consent a favour, I take it as a favour; and this point once conceded, all goes well. Perhaps I have been peculiarly fortunate; but certainly, with one or two exceptions, I had little or nothing to complain of on this essential point of domestic comfort.

To be sure, I had one damsel who crammed herself almost to suffocation with sweetmeats and other things which she esteemed very nice, and ate up her own pica and cake, to the exclusion of those for whom they were intended; who would put her head in at a door, with—"Miss [the Michigan word for Mrs] Clavers, did you holler?" I thought I heered a yell."

And another, who was highly offended because room was not made for her at table with guests from the city, and that her company was not requested for tea visits. And this latter high-born damsel sent in from the kitchen a circumstantial account, in writing, of the instances wherein she considered herself aggrieved; well written it was too, and expressed with much *naïveté*, and abundant respect. I answered it in the way which "turneth away wrath." Yet it was not long before this fiery spirit was aroused again, and I was forced to part with my country belle.—*Mrs Clavers's Glimpses of Western Life, newly published*.

It is respectfully intimated that no communications in verse or prose are wanted.

THINGS WISHED TO BE TRUE.

IN the mental progress both of individuals and of nations, the feelings are in activity before the reasoning powers. This is one of the great causes of superstition, prejudice, and fallacy of every kind. Even in a comparatively mature state of individual or national intellect, reason has a sore battle to fight with the dictates of the feelings, and for one thing ascertained to be true, we probably sanction a score which we only wish to be so. In cases where the assumption rests upon a feeling in itself good and beautiful, the error is sure to be the more inveterate; for as we advance, we cherish such feelings the more warmly, and are thus apt to cling the more eagerly to every thing which they dictate to us.

The system of trial by ordeal, by combat, and by touching the body of the murdered, which prevailed in the middle ages, is a lively example of an error arising from good feelings, and which was on that account the more difficult to be got quit of. The Deity was expected to guide the steps of the innocent among the burning ploughshares, and to buoy him up when thrown bound into the flood. He was expected to give the victory to the protector of innocence and the pursuer of guilt. It was supposed that he would interfere to cause the corpse to bleed at the moment when the guilty hand was placed upon it. In these convictions we see a strong trust in Providence—a beautiful and laudable feeling, but here in a false and mistaken form. The touching of the sick was a similar error, with the addition of a second and scarcely subordinate faith in the king as an immediate deputy of God. We cannot but admire these devout and amiable feelings; but it is nevertheless unquestionable that they led to bad results. Many an innocent man must have perished through the accident of touching the ploughshares, or of not being able to sustain himself in the water, or because his adversary was of more powerful make, or through the chance of his touching the corpse at the moment when the tumid vessels happened, under the influence of natural causes, to burst in the stomach. By trusting, moreover, in the efficacy of the royal hand, many must have been prevented from taking the right natural means for restoring their afflicted relatives. By the methods now pursued in the respective cases, innocence is evidently safer, and scrofula runs a better chance of being cured. It may be said, "Well, an advantage is thus gained; but still is it not a pity that feelings so laudable should be suppressed or left unemployed?" They are not, however, necessarily suppressed in consequence of their ceasing to dictate trial by ordeal or touching for the king's evil. The faculties which produced those feelings are still in the human mind, ready to be employed on any objects which may be presented to them. Only let them be exercised on right objects and to right ends, under the direction of reason; and we shall then have good instead of evil results. It is a fallacy to suppose, that, when some dictate of our feelings is confuted, the feeling, with any merit there may be in it, is lost. We might as well say that discommending a diet of pastry was suppressing agriculture, when it is obvious that the wheat may be employed in a salutary instead of an injurious way.

Society still gives currency and partial sanction to many notions which certainly take their rise in good feelings, but nevertheless are clearly wrong in fact and in reason, and must therefore, by a principle inseparable from every kind of error, be upon the whole, though perhaps not very immediately, injurious. We shall first adduce an example of a comparatively innocuous nature. Cruelty is generally detested, and

bravery is as universally admired. Admiring the brave, we do not wish that they should be cruel. Then, remembering that, under alarm or terror, there is a tendency to do cruel things, which a brave man, from his calmness, might avoid, we rush to the agreeable conclusion that the brave are *never* cruel. Yet it is an unquestionable fact, that many brave men have been extremely cruel. William Duke of Cumberland was, like all his family, almost insensible to fear; yet the cruelties with which he visited the Highlanders in 1746, were such as most deservedly to obtain for him the ignominious name of "the Butcher." Nelson's bravery will not, we think, be questioned; yet he exercised the most atrocious cruelties upon the Neapolitan patriots, not to speak of the infamous breach of faith by which these cruelties were preceded. The Duke of Alva, who shed the blood of the Netherlanders like water, was never called a timid man. Graham of Claverhouse, who shot simple and innocent peasants without compunction, was a hero on the battle-field. Marius and Sylla, Richard III. and Wallenstein, were all of them brave men. But, in fact, it is absurd to reckon up instances of brave men who have been cruel: the question would be more easily exhausted by pointing to those who have not been so. History is full of bold fellows who have been quite unscrupulous about human suffering. The brave who have also been habitually merciful are but a few. This, at the same time, is not because there is any necessary connection between bravery and cruelty. There may quite well be the one quality where the other is wanting. But as bravery is independent of cruelty, so is it independent of clemency. We may admit that, in many cases, a brave man, not fearing an enemy, may be merciful to him, where a coward, from very fear, would be unrelenting. But, on the other hand, the brave are apt to be led by their courage into the rougher scenes of life, where human life and suffering are little regarded; and thus more cruel acts are likely to fall in their hands than in those of timid men, who generally seek the gentler and more peaceful scenes, where the quality, if they have it, is less liable to be called into action. Upon the whole, then, though bravery and cruelty are not necessarily connected in human character, there is little reason to believe that they are never, or rarely, found together.

There is a set of maxims, which men of liberal and philanthropic views are likely to entertain, as encouraging to their hopes and wishes, but which a little cool reflection shows to be greatly open to challenge. One of these is expressed in Byron's verses—

Freedom's battle, once begun,
Bequeathed from bleeding sire to son,
Though baffled oft, is ever won.

It certainly is in many cases won, after a long series of reverses and difficulties. But is it not also often permanently lost? Has not the nascent spark of freedom, after a little fitful flickering, been extinguished in many countries, where, after the lapse of centuries, we have not seen it re-illuminated? As the proposition is one which only can be proved by the invariableness of the assumed fact, we must hold it as only an agreeable fancy, which is occasionally realised. It may be very encouraging under certain circumstances, but, as not being strictly true, it may also mislead. Better, then, that mankind should be at once made sensible of how the case really stands. Another maxim, nearly related to the above, is, that it is impossible to keep down the expression of public opinion. Mr D'Israeli has treated this subject at some length in his *Curiosities of Literature*, and shown many curious clandestine expedients that have been

adopted for diffusing and communicating thought, when open methods were impossible. But, while we do not deny that the ingenuity of a depressed party is capable of defeating severely repressive measures in many surprising ways, we cannot be insensible to a fact which so broadly appears on the face of history, as well as on the surface of continental society at the present moment, as that the measures taken by government for repressing opinion, and preventing its communication, are in many instances sufficiently successful to secure the desired end. It would be pleasant to think that tyranny must ever be baffled in such attempts; but it may be still more advantageous to acknowledge the truth of the case, for then men may make more strenuous exertions to resist the first encroachments of a power which is sure to be irresistible, if allowed to grow to full strength. A third maxim of the same nature is, that persecution never succeeds, but only has the effect of adding strength and force to the thing persecuted. This is a notion very likely to obtain currency at a time when persecution is rarely exemplified except in a very mild form. It would not have been so apt to gain credence a few centuries ago. Then persecution often was successful. And this simply because it was then carried out with the required degree of vigour. When it could condemn to the flames, or deprive of land and goods, or imprison and banish, it always succeeded in pretty well extinguishing the obnoxious doctrines. It is only at a time when it appears willing to wound, and yet afraid to strike, when it only frets and irritates, without destroying, that it seems to be attended with an effect the contrary of that contemplated. Such is the fact with regard to the grosser and better defined modes of persecution. There are more refined methods, appropriate to the refined character of the age, which are yet in full play, and attended with the most complete success. Persecution not effectual! it might be as proper to say that steel and poison do not kill. The real truth is, that there is a tendency in things under a certain amount of persecution to rise up into greater vigour, as fire burns brighter under a slight sprinkling of water; but, under a sufficient amount of persecution, their repression is as unavoidable as the extinction of the same fire by a sufficient quantity of water. To look this fact broadly in the face may also have better effects than to remain under the delusion. An inclination to adopt severe measures with dissentients may be checked, when it is considered that such measures will only be successful if carried to a pitch which humanity will not sanction. On the other hand, dissentients, if convinced that a certain amount of persecution is sure to be effectual, may be prompted by that conviction to guard the more anxiously against the first efforts of a power seeking to keep them down. It is also something to show, where opinions or systems really have been repressed, that it may have been from the severity of the measures taken with them, and not from want of good foundation on their part, which might otherwise be presumed—for, clearly, if any one denies the power of persecution to extinguish a speculative system supported by him, and if that system, being persecuted, languishes and decays, he must be liable to hear its decay attributed to its own demerit.

To turn to more vulgar maxims. That "murder will out," is a general conviction among the common people; and at first sight it seems a very respectable kind of conviction. It certainly is not true, for many murders have remained concealed. It seems to be only a hasty inference from a number of surprising cases in which that crime, long concealed, had been unexpectedly discovered. It may be said that the

conviction, though erroneous, is likely to be useful, and it is therefore a pity to undeceive the multitude on the point. We would answer, there is no certain dependence to be placed on what is not true. Let us rather promulgate the fact, as it stands, that, from natural circumstances, there is a very great likelihood that murder, when it takes place, will be discovered. In this alone, there is much to deter men even in their present state from the act. But the true way to prevent men from committing this act is to improve their moral natures, so that they shall become incapable of it. That "ill-gotten wealth never thrives," is another of the prepossessions of the multitude. Apparently, such a conviction ought to serve as a check to all erroneous modes of acquiring wealth. Perhaps it does so to a small extent; but the good end would be infinitely better served, if men were enlightened so as to see not only the falsity of this maxim, but that moral means of acquiring wealth were, generally speaking, the surest, and also those which would afford most satisfaction in the long-run. Besides, supposing that a man has no other idea of the arrangements of the Deity on this point, but that he will not allow a cheat to thrive, what is he to think when he observes the not infrequent phenomenon of successful rapine? His ideas of providence must be completely confounded, and his mind left to wander into every sort of error. If, on the contrary, he knows that the Deity governs by general laws, and that these laws have each its independent sphere of action, he will rest content on seeing the occasional prosperity of the wicked, being certain that, upon the whole, the result of wickedness will probably, from the operation of the same laws, be otherwise, and that still, as a general truth, honesty is the best policy.

Many other examples of false convictions from our best feelings might be adduced, but the above will perhaps be sufficient with most readers to suggest the rest. We have been anxious to show the advantage of confessing error and seeing the truth in these cases, though perhaps with less success than might be desirable. If, however, there be any deficiency on this point, we would have the reader to call into exercise his general faith in truth. If he believes that there is such a thing in nature, and that it generally tends to better results than error, he may well be assured that no false maxim, however it may harmonise with the first impulses of good feelings, can ever be so conducive to human happiness as the opposite truth.

BYRON'S NARRATIVE.

On the 18th of September 1740, the *Wager*, one of five ships of war under the command of Commodore Anson, sailed with its consorts from St Helen's, being intended for service against the Spaniards in the Southern Pacific Ocean. The *Wager* was the least effective of all the vessels of the squadron, being an old Indianman, recently fitted out as a man-of-war, and the crew being formed of men pressed from other services; while all the land force on board consisted of a detachment of invalids, or men but partially convalescent, from Chelsea Hospital. Besides, being intended to act as a store-ship, the *Wager* was heavily laden with military and other stores for the use of the squadron. All these circumstances conspired to render the vessel more than usually hazardous, from the very commencement of its long voyage.

The *Wager* rounded Cape Horn, with the other ships in company, about the beginning of April 1741, and soon after, the distresses of the ship began. The weather became tempestuous, and the mizen-mast was carried away by a heavy sea, all the chain-plates to windward being also broken. The best bower-anchor had next to be cut away, and the ship lost sight of its companions. The men were seized with sickness and scurvy, and one evil followed another, till, on the 14th of May, about four in the morning, the ship struck on a sunken rock, and was laid on her beam-ends, with the sea breaking dreadfully over her. All who could stir flew to the deck, but some poor creatures who could not leave their hammocks were immediately drowned. For some time, until day broke, the crew of the *Wager* saw nothing before or around them but breakers, and imagined that every moment would be their last. "In this terrifying and critical juncture (says the Hon. Mr Byron), to have observed all the modes of horror operating according to the several characters and complexions amongst us, it was necessary that the observer himself should have been free from all impressions of danger." But still his attention was arrested by one, who "in the ravings of despair was seen stalking about the deck flourishing a cutlass over his head, and calling himself king of the country, and striking every body he came near, till his companions, seeing no other security against his tyranny, knocked him down." Others "grew very riotous, broke open

every chest and box that was at hand, stove in the heads of casks of brandy and wine as they were borne up the hatchway, and got so drunk, that some of them were drowned on board, and lay floating about the decks for some days after." A few sustained their courage at this fearful moment. Captain Cheap and his officers were unable, however, to maintain order, or even to attempt it.

When daylight came, land was seen not far off, and the thoughts of all were turned to the immediate leaving of the ship, and saving of their lives. With the help of the boats, the crew, with the exception of a few who were either drunk or thought the ship safe for a time, got on shore, but the prospect before them was still a dreadful one. "Whichever way we looked, a scene of horror presented itself; on one side the wreck (in which was all that we had in the world to support and subsist us), together with a boisterous sea; on the other, the land did not wear a much more favourable appearance; desolate and barren, without sign of culture, we could hope to receive little other benefit from it than the preservation it afforded us from the sea. We had wet, cold, and hunger to struggle with, and no visible remedy against any of those evils." The land on which the crew had been cast was unknown to them, excepting in so far as they were aware of its being an island near, or a part of, the western coast of South America, about a hundred leagues north of the Straits of Magellan. In all, the shipwrecked party amounted to about one hundred and forty, exclusive of the few on board. The first night was passed in an old Indian hut, and the discovery of some lances in a corner of it bred a new source of alarm—namely, from the natives. For some days afterwards, the men were busied in the attempt to get beef casks and other things from the wreck, which did not go entirely to pieces for a considerable time, although all the articles on deck were washed ashore one by one. After great difficulty, the men who remained on board, and who indulged there in great disorder, were persuaded to come on shore. With materials got from the wreck, or cast ashore, tents were got up, and a common store-tent erected for all the food or casks of liquor got from the ship in the same way. This place was watched incessantly, for the allowance was of course a very short or small one, and the men could scarcely pick up a morsel of fish, flesh, or fowl, on the coast for themselves. The weather, also, continued wet and cold.

"All humour and discontent, from the difficulties we laboured under in procuring sustenance, and the little prospect there was of any amendment in our condition, were now breaking out apace." Some men separated themselves from the others, and ten of the hardest of these seceders resolved to desert altogether. They got a canoe made, "went away up one of the lagoons, and were never heard of more!" The spirit of discord was much aggravated by an accident that occurred on the 10th of May. A midshipman named Cozens, who had roused the anger of Captain Cheap by various acts and words, was finally shot by his superior's hand. The act was a rash one, but the captain had cause to imagine at the moment that Cozens had openly mutinied, or was about to mutiny. This act made an unfortunate impression on the minds of the men, who found food every day growing more scarce. A few Indians, men and women, of small stature, and very swarthy, visited the party, and were of service in procuring food; but the seamen affronted their wives, and they all went away. "The Indians having left us, and the weather continuing tempestuous and rainy, the distresses of the people for want of food became insupportable. Our number, which was at first one hundred and forty-five, was now reduced to one hundred, and chiefly by famine. The pressing calls of hunger drove our men to their wits' end, and put them on a variety of devices to satisfy it. Among the ingenious this way, one Phipps, a boatswain's mate, having got a water punchon, scuttled it; then lashing two logs, one on each side, set out in quest of adventures in this extraordinary and original piece of embarkation." He often got shell-fish and wild-fowl, but had to venture out far from land, and on one occasion was cast upon a rock, and remained there two days. A poor Indian dog belonging to Mr Byron, and which had become much attached to him, was taken by the men and devoured; and three weeks after, its owner was glad to search for the paws, which had been thrown aside, and of which, though rotten, he made a hearty meal.

Till the 24th of September, the party continued in this condition of continually augmenting wretchedness, with only one hope of relief before them, and this resting on the *long-boat*, which the carpenter was incessantly working at, to bring it into a strong and safe condition. On the day mentioned, the *long-boat* being nearly finished, Mr Byron and a small party were sent to explore the coast to the southward, almost the whole crew being resolute to make for Magellan's Straits, although the captain wished to go along the coast to the northward. In a day or two, the party returned to the island (for such was the land on which the wreck had taken place), and the *long-boat* was immediately afterwards launched, with the cutter and barge, all of which boats had been saved at first. Eighty-one men entered these boats, being the whole survivors of the party, with the exception of Captain Cheap and two companions, who remained voluntarily, and for whose use another boat, the *yawl*, was left. The leaving of the captain was a thing unexpected by

Byron and some others, and when a necessity occurred for sending back the barge to the island for some left canvass, these parties seized the chance of going in the boat to rejoin the captain and share his fate. On the 21st of October, the final separation took place between the shore party and those in the *long-boat*, who sailed for the south. Captain Cheap and those who came to him were joined by a small party who had originally seceded from the main body; and the whole of this united band, amounting to twenty men, set sail in the barge and the *yawl*, towards the north, on the 15th of December. Up to that time they contrived, with almost unheard-of difficulty, to subsist on what they could pick up. "A weed called slaugh, fried in the tallow of some candles we had saved, and wild colery, were our only fare, by which our strength was so much impaired that we could scarcely crawl." One fine day, the hull of the *Wager*, still sticking together, was exposed, and by visiting her the party got three small casks of beef hooked up. This soon restored to them sufficient strength for their enterprise, which they undertook on the day mentioned, in the barge and *yawl*. Unhappily, the sea grew very tempestuous, and "the men in the boats were obliged to sit as close as possible, to receive the seas on their backs, and prevent their filling us. We were obliged to throw every thing overboard to lighten the boats, all our beef, and even the grapnel, to prevent sinking. Night was coming on, and we were fast running on a lee shore, where the sea broke in a frightful manner." Just as every man thought certain death approaching, an opening was seen in the rocks, the boats ran into it, and found a haven as "smooth as a mill-pond!"

The party remained here four days, suffering much from their old enemy, hunger. In passing farther along the coast, which they did at continual risk, they were reduced to such distress as to "eat the shoes off" their feet, these shoes being of raw seal-skin. They never knew what it was to have a dry thread about them, and the climate was very cold. During the first few weeks of their course, the *yawl* was lost, and one man drowned; but what was a more distressing consequence, they were obliged to leave four men on shore, as the barge could not carry all. The men did not object to being left; they were wearied of their lives. When the poor fellows were left, "they stood upon the beach, giving us three cheers, and called out God bless the king!" They were never heard of more; and it is but too probable, as Byron says, that they met "a miserable end." But, indeed, every one had now given up hope of ultimate escape, and this was shown by the resolution taken almost immediately afterwards, to "go back to Wager's Island (the place of shipwreck), there to linger out a miserable life." Eating nothing but sea-weed and tangle by the way, the poor mariners again reached the island. They were here no better off. The weather was wretchedly wet, and "wild colery was all we could procure, which raked our stomachs instead of assuaging our hunger. That dreadful and last resource of men in not much worse circumstances than ours, of consigning one man to death for the support of the rest, began to be mentioned in whispers." Fortunately one man found some rotten pieces of beef on the sea-shore, and with a degree of generosity only to be appreciated by persons so placed, he shared it fairly with the rest.

This supply sustained the whole till the arrival of some Indians, accompanied by a chief or Cacique from the island of Chiloe, which lies in 40 degrees 42 minutes of south latitude. This Cacique could speak a little Spanish; and he agreed to conduct the party in the barge to the nearest Spanish settlement, being to receive the barge and all its contents for his trouble. Fourteen in number, the wrecked sailors again put to sea, and were conducted by their guide to the mouth of a river, which he proposed to ascend. But after toiling one whole day, the attempt to go up against the current was given over, and they were forced to try the coast again. The severe day's work, conjoined with hunger, caused the death of one of the strongest men of the party, although it was thought that he might have been preserved but for the inhumanity of Captain Cheap, who alone had food at the moment (got from the Indian), but would not give a morsel to the dying man. This roused the indignation of the others, and the consequence was, that, while others sought food on shore, "six of the men seized the boat, put off, and left us, to return no more. And now all the difficulties we had hitherto encountered seemed light in comparison of what we expected to suffer from the treachery of our men, who, with the boat, had taken away every thing that might be the means of preserving our lives. Yet under these dismal and forlorn appearances was our delivery now preparing.

Mr Byron was now taken, with Captain Cheap, by the Indian guide to a native village, whence he expected to get more assistance in conducting the party, who, if they could not recover the barge for him, were to give a musket and some other articles as a reward. On coming in the evening to the Indian wigwams, after two days' travel, Mr Byron was neglected, and left alone. Urged by want and cold, he crept into a wigwam upon chance, and found there two women, one young and the other old, whose conduct amply corroborates the well-known and beautiful eulogium passed by Ledyard upon the kindness of that sex every where to poor travellers. They saw the young seaman wet and shivering, and made him a fire. They brought out their only food, a large fish,

and broiled it for him. When he lay down upon some dry boughs, he found, on awaking a few hours after, that the women had gently covered him with warm clothes, at the expense of enduring the cold themselves. When he made signs that his appetite was not appeased, "they both went out, taking with them a couple of dogs, which they train to assist them in fishing. After an hour's absence, they came in trembling with cold, and their hair streaming with water, and brought two fish, which, having broiled, they gave me the largest share." For a poor stranger they had thus gone out in the middle of the night, plunged into the cold sea, and, with the aid of their nets or other apparatus, had got him food. These kind creatures were the wives of an old Indian, who was then absent, but who, on his return, struck them with brutal violence for their hospitality, Mr Byron looking on with impotent rage and indignation. The return of this Indian and his companions enabled the native guide of Captain Cheap and Byron to make an arrangement for conducting the shipwrecked party northward as they wished. The captain and Byron then left the wigwams to go back to their companions, being joined soon after by a body of Indian guides.

It was the middle of March ere this final journey to the northward was begun. Various Indian canoes conveyed the whole party day after day along the sea-coast; shell-fish, eggs from the rocks, and sea-weed, being the food of the band, and even this being procurable in such miserable quantities as barely to sustain life. The condition of the captain in this respect was better than the others, for the Indians thought their reward safe if they attended to the chief of the whites alone, and he cruelly encouraged the notion. But what but selfishness could be expected from one in the following state:—"I could compare Captain Cheap's body to nothing but an ant-hill, with thousands of vermin crawling over about it; for he was now past attempting to rid himself in the least from this torment, as he had quite lost himself, not recollecting our names that were about him, or even his own. His beard was as long as a hermit's, and his face being covered with train oil and dirt, from his sleeping, to secure them, upon pieces of stinking seal. His legs were as big as mill-posts, though his body appeared to be nothing but skin and bone." The rest were little better, and Mr Byron had often to strip himself in the midst of hail and snow, and beat his clothes with stones, to kill the insects that swarmed about him. At length, however, after one of them had sunk under his sufferings, the party got to the island of Chiloe, a place at the north extremity of the province of Chili, and under the rule of the Spaniards. Being a remote corner, Chiloe had only a few Spaniards in it, and these chiefly Jesuit priests, but the Indian inhabitants were comparatively civilised. The troubles of the party may be said to have ended here, for the natives pitied them much, and supplied them with abundance of food. "It is amazing, that our eating to that excess we did, did not kill us; we were never satisfied, and used to take all opportunities, for months after, of filling our pockets when we were not seen, that we might get up two or three times in the night to cram ourselves."

Even after staying on the island for a considerable time, and being conveyed to the mainland to the town of Chaco, where a Spanish governor resided, the eating of the famished mariners continued to be enormous. "Every house was open to us; and though it was but an hour after we had dined, they always spread a table, thinking we could never eat enough after what we had suffered, and we were much of the same opinion." Mr Byron made friends with the governor's cook, and so carried his pockets always full to his apartment, there to feed at leisure. They were in all four in number now, namely, Captain Cheap, Messrs Byron, Hamilton, and Campbell. From Chaco they were taken to the larger town of Castro, and remained there for some months in the condition of prisoners at large, poorly clad, but decently lodged and well fed. On the 2d of January, their case having become known to the higher authorities of Chili, they were put on board a ship to be conveyed to the city of St Jago. Here they remained two years, as prisoners, but not in confinement. Fortunately for them, a Scotch physician, who bore the name of Don Patricio Gedd, entreated the governor to allow the captives to stay with him, and for two years this generous man maintained them like brothers, nearly at his own sole expense. On the 20th of December, Captain Cheap and Messrs Byron and Hamilton were put on board a French vessel to be conveyed to Europe: Mr Campbell, having become a Catholic, remained in Chili. They reached France safely, and after some detention there, were permitted to go to Britain by an order from Spain. Their friends were much surprised to see them, having given them long up for lost. Their term of absence exceeded five years.

The six men who cruelly made off with the barge appear never to have been heard of again, and perished, doubtless, on the coast. The fate of the more numerous body who went off to the south in the long-boat, is known from the narrative of John Bulkeley, gunner, one of the survivors. This band actually succeeded in rounding South America through the Straits of Magellan, and reached the Portuguese territory of Rio Janeiro, after hardships equal to those of the other party, and which reduced their numbers from nearly eighty to thirty. They reached the Rio Grande in January 1742. All of the thirty, however, probably did

not see Britain. On coming to the Portuguese colony they found food, friends, and countrymen, and separated from one another. Bulkeley and two others reached England on the 1st of January 1743.

The members of this expedition went out with the hope of gathering gold at will among the Spanish colonies. What a different fate befell the unhappy crew of the Wager!

TALE OF REAL LIFE.

A LITTLE more than twenty years ago, at the time when Britain and the United States of North America had engaged in war, a respectable merchant in Glasgow sustained such pecuniary inconvenience from that event, that he was under the necessity of calling a meeting of his creditors, and declaring his incapacity to meet his engagements. Having always borne a fair character, he met with very lenient treatment from those to whom he stood indebted; and the more so, as the cause of his commercial embarrassments was well known to be one over which he had no control. Besides, there was some hope or chance of ultimate indemnification to all parties. In the mean time, however, Mr Hamilton was subjected to all the ordinary consequences of insolvency. He gave up all he possessed to his creditors, reduced his domestic establishment, and attempted to recommence business on a small scale, with a sum which his creditors were liberal enough to allow him to retain. But being far advanced in years, the evil was in a great measure an irretrievable one to the poor merchant.

Happily, the family dependent on Mr Hamilton was a small one. He had been twice married, and his second partner was still living; but she had brought him no children, and his only offspring was a girl whom his first wife had presented him with. Elizabeth Hamilton, or Betsy, as she was almost uniformly called, was about sixteen years of age when her father's misfortunes occurred. An eye, uncommonly clear, and of the deepest blue, hair almost of the "lint-white" of the poet, and curling naturally round her well-shaped and finely set head, and a figure light and graceful, made her an object of general admiration. Betsy Hamilton, as has been said, had lost her mother, but she had found a recompense for the loss in the individual who had become her mother's successor. Mrs Hamilton was a prudent sensible woman, and set the common bye-word at nought, by loving her step-daughter dearly, and watching over her happiness unceasingly.

Mrs Hamilton did her best to comfort her husband under his distresses. She submitted cheerfully to the dismissal of her servants, and to all the other retrenchments which his altered circumstances demanded. She was even the first to suggest many alterations of this nature in their household economy; and among other plans, she suggested that they should endeavour to eke out their income by letting their best room to a lodger. In execution of this proposal, a ticket was hung out at the window, and it had not been there long until it produced the desired effect. A gentleman called, attended by a servant boy, and inquired the price of the lodgings. Mrs Hamilton thought the lodger not precisely of the proper description: she would have preferred a quiet elderly gentleman, likely to keep no company, or give much trouble, whereas her present visitor was young, not more, to appearance, than twenty-seven or twenty-eight. She therefore asked a high price, thinking the inquirer might thus be deterred from taking the lodgings. But although he remarked that the price was high, the gentleman said, "As the room is neat, and the situation suits me, we sha'n't part about the money. To-morrow at ten I will be here. My servant will be about me during the day, but he sleeps elsewhere." Mrs Hamilton could now make no further objections, and accordingly the gentleman came at the appointed time, and was duly installed in his new apartments.

Mr Salkeld, for so was the lodger named, proved to be a person of uncommonly quiet habits, and of frank open manners and disposition. He was only a visitor to Glasgow, or at least but a temporary resident in it. This much the Hamiltons soon learnt, but their lodger did not communicate any further particulars about himself, although he nightly spent an hour or two in chatting with Mr Hamilton, and in listening patiently to the honest man's irrepressible grumbings at the Americans, whose hot-headed obstinacy he arraigned as the cause of all his personal troubles. By and bye, seeing the inconvenience to which Mrs Hamilton was often put, in consequence of her having no other assistance in the house than that of an old woman who came now and then, Mr Salkeld proposed to take his meals along with the family, and this was agreed to. The lodger thus became in a measure one of the family; and his manly open bearing, and prepossessing appearance, soon led Mrs Hamilton to forget that he was not the elderly gentleman whom she had desired as an inmate of her house. Mr Salkeld's boy was also of great use to her, though he was sometimes sent away by his master, and remained absent for a day or two. At these times, Betsy, who assisted her stepmother in the house as much as the latter

would permit, had frequently to attend to Mr Salkeld's wants and requests. But then he was so plain and unassuming, that it was "more like waiting on a brother than on a stranger," as Mrs Hamilton used to remark.

After Mr Salkeld had passed between two and three months in Mrs Hamilton's lodgings, it chanced that Betsy's grandmother, by the mother's side, paid the debt of nature. She had resided at a place in the country, about five miles from the city, and at her death a considerable legacy fell to Betsy Hamilton, consisting partly of personal property or moveables of various kinds, which it was necessary for her to look after in person. It was arranged that she should do this some days after the funeral. When the morning for the visit came, she dressed herself, intending, as the distance was short, to proceed on foot to her late grandmother's residence. "Betsy, my dear," said her stepmother, when the young girl came down from her room, "Betsy, surely you are not going *thus* to your grandmother's relations? Where is your black gown? Why have you not put it on?" "You know, mother, it is not really necessary that I should put on mourning," said Betsy; "a white dress, arranged as mine is, is more used now; and I know you think white always becomes me best. Besides, my black gown does not fit me, mother, you know; and so I"—"Yes, Betsy, my dear, I know all this; but I really wonder to hear you attending to such things on such an occasion. You cannot feel much for the loss of a relative of whom you have seen so little, but I would have expected you to think less about how your gown looks when going where you are." Betsy coloured at the reproof, and hung down her head. "Well, my love," continued Mrs Hamilton kindly, "I believe it is no great matter after all, and you have not time to change your dress again. It is now full twelve; you must away to be home in good time."

At the close of the same day, when night had begun to set in, Mrs Hamilton sat in her little parlour wondering what could be detaining Betsy so long. Time ran on; eight, nine, ten o'clock came, and she made not her appearance. Mrs Hamilton fretted much about the circumstance, although her husband, whose temper was more phlegmatic, assured her again and again that Betsy would be staying all night at her aunt's house, and that nothing could be wrong. Mr Salkeld, too, when he came home for the night, endeavoured to back Mr Hamilton's assurances; but the good lady spent on the whole a very miserable evening, followed by an almost sleepless night. She had a presentiment of evil upon her mind, and, as is very common in such cases, could not tell what it was that alarmed her, or from what quarter she feared evil. Unfortunately, her forebodings proved correct. Betsy Hamilton did not return in the morning, and her father immediately walked off to inquire for her. In about three hours he returned, pale and anxious, and sank into a chair before his wife. "Mr Hamilton," said she, "for God's sake tell me where is Betsy? Is she ill—is she dead?" The poor woman had to repeat her questions before her husband spoke. "No, my dear," said he, "no, I hope she is not dead; but where she is, God knows. She has not been seen at her aunt's."

Mrs Hamilton was in greater distress than ever at this information. But she had more activity of mind than her husband, and she soon roused herself to a sense of the propriety and necessity of taking steps for discovering whether any accident had happened to Betsy on her walk to the country, or if she had stopped at the house of any friend. All this was done. Inquiries were made along the whole road, but nobody had seen or heard of such a person as Betsy Hamilton. Mrs Hamilton herself called at the houses of all the acquaintances of the family, but learnt nothing from any but one party, who had seen Betsy on the day of her disappearance. Strange to say, she had then been going in a direction quite opposite to that of her aunt's residence. The person who told this could not be in a mistake, as Betsy had spoken a few words to her in passing. Mrs Hamilton was astonished and alarmed more and more by this communication. On getting home, she urged her husband to insert an advertisement in the newspapers, entreating any person who had seen a young girl of Betsy's appearance within the time in question, to communicate what they knew. Mr Hamilton did as his wife advised, only omitting the name of the parties concerned. This appeared in the newspapers on the second morning after the poor girl's disappearance, but no information resulted from the step.

Mr Salkeld participated strongly in the distress of Mr and Mrs Hamilton, and often endeavoured to speak words of consolation to them, though it was difficult to find any reasonable grounds whereon to build hope. He offered to do any thing that Mrs Hamilton could think likely to be of use. But after two days passed away, the stepmother, remembering the circumstance of the white dress, became convinced that Betsy had gone away of her own free will, and that whenever they heard of her again, it must be through herself. So she merely thanked Mr Salkeld, but did not put his offered services in requisition. Besides, he was called away from home, and was absent for two days. It was on the fourth day of Betsy's absence that he again returned to his lodgings, and still nothing had been heard of her. Mrs Hamilton was found by him in a state bordering on distraction. She could do nothing but move restlessly about the house, wringing her

hands, and exclaiming, "My poor Betsy! my poor motherless bairn! Villanous hands must they be that can keep you away from your home. My poor misguided lassie!" These and such-like exclamations showed that a suspicion had sprung up in her mind, of Betsy having been induced to leave home by some one, who, notwithstanding her quiet, and indeed remarkably secluded life, had found means to address her, and gain her affections—whether for foul or fair purposes, none could say.

A simple accident gave a totally new turn to Mrs Hamilton's thoughts on this affair. Passing by the door of Mr Salkeld's room, about two hours after that gentleman's return home, Mrs Hamilton heard her lodger speaking in a low voice to his servant lad. But three or four words of the conversation reached her ear. These words were, "Say to her I will be with her in two hours—pointedly." At first Mrs Hamilton took little notice of what she had thus heard. It was only when, in spite of her distress, a natural feeling of womanly curiosity led her to reflect on the words, and to conjecture who the *her* could refer to, that a suspicion for the first time flashed across her mind that Mr Salkeld might be the actor in Betsy's abduction. "Oh, no," thought she again, "he is so good, so sedate, so honourable; and there never seemed any thing between him and Betsy—never." They took little notice of each other, and were never for any length of time together, except in going to church. No, no, he cannot, he would not harm her." But again, the fact of his two days' absence came forcibly on the mind of Mrs Hamilton, and she remembered his having frequently said that he knew no one in the city, not a single family but their own. Reflections of this order gained the sway finally, and the stepmother of the lost girl resolved, at least, to set a close watch on Mr Salkeld's motions. But the poor lady's impatience to be at the truth overpowered her more temperate resolve, and before her lodger left his room, after she had heard the words just mentioned, Mrs Hamilton stood in his presence. As soon as she came into the apartment, he exclaimed, "Oh, Mrs Hamilton, I am glad I have seen you just now. I will be obliged to leave home again for a short time—indeed only till some time to-morrow." These words determined the wavering mind of the lady. "Never!" she answered, turning at the same time, and locking the door behind her; "never, Mr Salkeld, shall you quit this house—this room—till you have satisfied me where you have taken Betsy Hamilton! I am convinced you know where she is; I am convinced it is you who have taken her away! Your looks admit it; you cannot—you dare not deny it!" Mr Salkeld did indeed evince confusion and discomposure, but he said, "You wrong me, Mrs Hamilton; you do indeed—and must not think to stop me on such a charge as this!" "Stop you!" cried Mrs Hamilton, whose feelings were strongly roused, "stop you! If I had my poor deluded motherless child again, whatever you may have *now* made her, I would drive you from my doors! But till I know what has become of her, you shall not go, or, if you go by force, I will follow you—every where—to the world's end, but I will have her from you!" "My dear Mrs Hamilton, for the love of goodness be quiet," said the gentleman; but his hearer was not in a mood to be thus checked. "Quiet!" she reiterated; "you will tell me to be quiet, and almost confess to what you have done! Oh, man, man! can you hope for mercy at the last day with such a sin upon your head as that of destroying a creature so young and so innocent?"

An overpowering flood of tears here came to the relief of the poor woman, and she sank into a chair, and gave way to her grief. Mr Salkeld thus got an opportunity to speak. He said, "You wrong me, Mrs Hamilton, cruelly wrong me! I am not the man to do what you accuse me of, and least of all to one whom I would give up my own life to save from harm. Yes, I confess that Betsy has gone with me; that it is I who have induced her to go from home; but it was to become *my wife*." These words aroused Mrs Hamilton, but her suspicions were not allayed. "And why has she not become your wife, if this be true?" said she. "Unforeseen difficulties came in the way, but she *is* my wife now," said Mr Salkeld, "and in a few hours she may be here herself to prove it." "Where is she?" returned Mrs Hamilton, whom the frank and truthful tone of her lodger began to inspire with a joyful hope, "where is she? Oh, if this be true, why such mystery, Mr Salkeld? You see the misery it has caused." "I have seen it with the utmost distress," was the reply, "but you will find that it was not intended. All will be explained, and Mr Hamilton, I hope, will forgive all. Shall I go for Betsy now?" "Yes, but I must go with you," said the lady hurriedly. "Well, I will get a carriage, and you too shall go if you will," replied Mr Salkeld, with a smile. Mrs Hamilton felt ashamed of her lingering suspicion, and said, "No, I am wronging you. I will stay, and prepare Mr Hamilton for again seeing his daughter."

Within two hours afterwards, a carriage drove up to the door, and Betsy Hamilton was handed out of it, handsomely or rather richly dressed, and as became a bride. She had another lady with her, a person with whose daughter she had been formerly at a boarding-school. When Betsy came into the house of her father again, she besought his pardon on her knees. "I am too happy to see you to be angry, Betsy," said he; "I am more pleased than if I had

my fortune again from these Americans." These words made Betsy look a little blank, and she exchanged a glance with her husband. Mr Salkeld knelt beside his young wife, and said, "You will forgive me too, sir—even if I should be an American myself?" "An American!" said Mr Hamilton. "Yes, my dear father," said Betsy, "that has been the cause of all our distress. Mr Salkeld was afraid you would not consent on that account." "Yes, sir," said Mr Salkeld, "I am captain and owner of a merchantman now detained in the Clyde. I saw your strong prejudices against us, and persuaded your daughter to become my wife in private. But when told that I was an American, no clergyman here would marry us, and we were ultimately obliged to go to Gretna-Green, and so were absent four days instead of one. Betsy was much fatigued with the journey, besides being so much harassed, during the days of her absence, on your account, that she was unable to come directly back to you along with me, and remained with this lady, who was kind enough to give her a refuge during all our unexpected delays."

The lady alluded to corroborated Mr Salkeld's words, and described so forcibly the sufferings experienced by Betsy on account of her parents, that the latter were more willing to pardon her, as her imprudence had already cost her much. As for the marriage, it was a happy one for all parties. Mr Hamilton ultimately recovered all his property through his son-in-law's influence. Betsy is now one of the most respected matrons of the Union. Such is a story of real life, told as it occurred. By telling it, we do not record any approval of some features in it, particularly the conduct of the heroine, which was not only indecorous, but might have had the most fatal consequences to those interested in her welfare: with this remark, we leave the tale in other respects to the judgment of the reader.

DIRECTIONS FOR EFFECTING LIFE ASSURANCE AND PURCHASE OF ANNUITIES.

In addition to a general article on Life-Assurance, which appeared in the 373d number of the Journal, we lately gave a few remarks, designed to warn the public against offices for life-assurance and for annuities, in which, whether from mistake or a design to deceive, too low rates were assumed. We have since then received a letter from a working man, who informs us that, before he saw the latter article, he had assured a sum upon his life in an English office, which he selected on account of the comparative lowness of the premiums, and that he is now alarmed for the safety of the step he has taken, and yet, for want of specific knowledge on the subject, cannot be sure that the particular office he has gone to is one unfit to be trusted. The case of this person may be that of thousands, and it is worthy of some attention. It seems desirable that, in a work which falls into so many hands as this, something should be done in the way of giving definite directions to the public for their guidance in assuring money upon their lives and purchasing annuities. We would hope that we have established with most readers a sufficient character for honesty of purpose, to assure them that, in taking such a task upon ourselves, we are animated by philanthropic motives only, and that we will execute it, to the best of our ability, with fairness to all concerned.

First—with regard to simple life-assurance. The circumstances calculated to give confidence in life-assurance offices are, we think, the following: their age, the respectability of their officers and directors, and the appearances of *bona-fide* and safe business which their rates and reports hold forth. To the first quality, few existing offices can lay claim. We know of only nine which are older than the present century—namely, the Amicable, established in 1706, mutual; the Sun, 1710, proprietary; the Union, 1714, mixed proprietary; the London, 1721, proprietary; the Royal Exchange, 1722, proprietary; the Equitable, 1762, mutual; the Westminster, 1792, proprietary; the Pelican, 1797, proprietary; and the Palladium, 1797, mixed proprietary. We know of twelve established during the first ten years of the present century: the Globe, 1803, proprietary; the Albion, 1805, proprietary; the Caledonian, 1805, proprietary; the London Life-Association, 1806, mutual; the Provident, 1806, mixed proprietary; the Rock, 1806, mixed proprietary; the West of England, 1807, proprietary; the Hope, 1807, mixed proprietary; the Eagle, 1807, proprietary; the Atlas, 1808, mixed proprietary; the Norwich Union, 1808, mutual; and the North British, 1809, proprietary. An assurance office which has lasted thirty years, as the youngest of these has done, may be considered as entitled to some confidence on that account, and such confidence it ought to have, if other circumstances be not unfavourable.

At the same time, there are many offices of later date, equally sound, and in which equal or superior advantages may be gained.

With regard to the respectability of the names which appear on the advertisements, great caution ought to be exercised. Names are often placed in the honorary situations, which "have no business there." Lists of directors are sometimes made up of men of straw, bearing or affecting to bear the names of persons of noted respectability. There is actually at this moment in London, a bustling office, with agencies in Edinburgh and other places, with the porter's name for one director, and that of a footman for another—names, however, which sound remarkably well, with Esq. attached to them. On this point, however, we need not dilate, for in such cases it is usually possible to detect imposture by the rates announced for business, to which we are now to advert.

The rates afford the most definite means of detecting fraud. Where these are not below what are ascertained to be necessary, there may be honest dealing; but where they are below, the object can scarcely be otherwise than *fraudulent*—that is to say, a set of persons must be disposed to live as officials on the funds in the mean time, content that in the long-run the heirs of those who have paid in shall get nothing. The question, then, is, what is the lowest rate ascertained to be consistent with security?

Mutual assurance societies usually proceed on a scale of rates in which lowness is not so much an object as to make assurance doubly sure that the funds will be sufficient for all contingencies. As they have originally no capital, they generally are anxious to take rather more than is expressly necessary for covering the individual risks, in order that a fund may be accumulated to come and go upon, of which fund all that can be considered as arising from superfluous payment can easily be repaid in the form of additions to policies. The rates of such of these societies as are really respectable do not differ much from each other. The following are those of five Mutual Assurance offices of undoubted respectability:—

Annual premiums to assure £100 at death.

	London Equitable and London Association.	London Amicable.	Scottish Widows' and Scottish Equitable.
Age 30	L.2 13 5	L.2 10 6	L.2 11 1
35	2 19 10	2 17 0	2 17 6
40	3 7 11	3 5 0	3 5 6
45	3 17 11	3 18 6	3 15 6
50	4 10 8	4 16 6	4 8 3

These and other institutions charging similar rates make considerable additions to policies. We do not find the rates of respectable societies in general to differ greatly from these; there is, however, one which was established a few years ago, to the best of our belief in good faith with the public, which assumes the principle of making the charges more nearly square with the actual risks, so that the assurance of a certain definite sum may be effected on the easiest terms consistent with security, and with little prospect of additions to policies, which in this case are reserved for those who have been members for such a length of time as to have paid in more than the sum for which they are assured. This is the Scottish Provident Institution. The calculations were made by the late Mr James Cleghorn, author of the article "Agriculture" in the Encyclopedia Britannica, and a most respectable accountant by profession. We have no doubt that the scale is made up with a rigid regard to the actual chances of mortality in this country, and is perfectly safe, if the number of members be sufficiently large. It is the following:—

Annual premium to assure £100 at death.

Age 25	30	35	40	45	50
L.1 18 0	L.2 1 6	L.2 6 10	L.2 14 9	L.3 5 9	L.4 1 7

We are the more disposed to trust to this as a safe scale, from finding that respectable companies in general charge only as much more as may afford a fair profit—for example, the Pelican of London and the Standard of Scotland charge as follows:—

Age 25	30	35	40	45	50
£ s d	£ s d	£ s d	£ s d	£ s d	£ s d
Pelican, 2 0 1	2 6 4	2 13 5	3 2 8	3 16 1	4 12 2
Standard, 1 19 6	1 2 4	1 11 9	3 0 4	3 10 9	4 4 2

The rates of the Scottish Provident Institution are probably, however, the *very lowest* at which business can be effected with any reasonable degree of safety in any office. We are inclined to take it as a standard on this point, and accordingly we would recommend all who are disposed to rely upon our advice, to trust to no office which offers terms considerably lower, of which there are several of the proprietary kind. The one above alluded to as having a porter and a footman for two of its directors, charges for thirty years of age only L.1, 15s., and for fifty L.3, 5s., although, as a company, it is to be understood as looking for profit on each transaction!

We now come to Annuities. Here the company last alluded to even exceeds itself. It offers, for every £100 deposited with it, by a person from 30 to 40, an annuity of L.8; from 40 to 45, L.8, 10s.; from 45 to 50, L.9; and so on. To show the unsoundness of the affair, let us suppose that a person of fifty years of age wishes to ensure £1000 upon his life. He is charged for this an annual premium of L.32, 10s.,

being at the rate of L.3, 5s. for every L.100. Suppose he also deposits L.1000, in order to have an annuity : he gets, for this, an annuity of L.90. At his death, we shall suppose 20 years after, the L.1000 which he deposited for his annuity is repaid by the company to his heirs, as payment of his policy of life-assurance ; so the account stands thus :—He has for twenty years been paying L.32, 10s., and receiving L.90, which has left him every year L.57, 10s. the richer. He has had his L.1000 lying out, to be sure ; but then what an interest he has received for it—no less than L.57, 10s., or about twenty-two pounds a-year more than he could have obtained for it in the funds ! It thus becomes clear that the above scale of annuities is unsound, and that, unless a company of real capital were concerned, which is not likely, the depositors must soon find their money lost to them. Here we cannot do better than quote the scale of annuities offered by government at the present price of stocks, which are nearly as high as can be given in this country, and much beyond which none but mistaken men will go, each case being alike fraught with danger to the depositor :—

Annuity for L.100 deposited with government.

Ages next birth day.	To a Male.	To a Female.
25 -	L.5 4 7	L.4 17 0
30 -	5 8 0	5 0 7
35 -	5 13 0	5 5 0
40 -	6 0 1	5 10 1
45 -	6 9 7	5 16 10
50 -	7 3 10	6 6 4
55 -	8 1 8	7 0 0
60 -	9 4 11	7 19 1

It is within the last few years that the societies have sprung up, to which we lately directed attention as, from mistake and with philanthropic intentions, offering sums on the principle of survivorship, far above what, it appears to us, the premiums exacted will bear. Several of these societies are established in Ireland, and we observe that one, recently set on foot in the south of England, extends its operations even into this northern region. Others, we believe, are rising on the same principles ; and it is certainly desirable that their unsoundness should be generally made plain, both that there may be a speedy remedy to past mischief, and that future mischief may be prevented. An example from one established in the south of Ireland, will give an idea of the whole. This society proposes, for instance, that a male member of forty, wishing to secure an annuity payable after his death to his wife of the same age, has only to pay L.2 of entrance-money, and L.3, 10s. as long as he lives, and the society will, for these considerations, pay to his widow an annuity which may probably be L.50, but certainly will not be less than L.25. Now, let us inquire into the adequacy of the payment to secure the annuity even of L.25. We have first L.2 of entrance-money, and then L.3, 10s. of annual payment. The value of the latter, during the joint lives of two persons aged 40, including the first payment to be made immediately, we have ascertained by the Carlisle tables of mortality to be L.45, 18s. 9d. : in all, the payment, therefore, is L.47, 18s. 9d. Now, Mr Finlaison, the eminent Actuary of the National Debt, in evidence given by him before a Select Committee of the House of Commons, in the year 1825, stated as the result of his extensive observations on human life, that, reckoning interest at four per cent., the value of an annuity to a female of 40, after the decease of a male of 40, is in the ratio of L.357, 13s. 7d. for every L.100—that is, L.89, 8s. 5d. for L.25. In point of fact, no responsible office will give an annuity of L.25 on such contingencies at L.89, 8s. 5d. ; but even assuming that they would, the association to which we allude charges less by L.41, 9s. 8d., being little more than a half of what ought to be charged ! It is true, some little contingencies are reserved in favour of the society ; as, that the lady's annuity is discontinued during any subsequent marriage ; that, in some cases, the annuity is not to commence till five years after the annuitant's nomination ; and that, if a member die before having paid five years' contributions, these must be made good by his representatives. These advantages, however, are trifling, and evidently far from adequate to make up so great a deficiency. When the person nominated for the annuity is younger than the other, a charge, under the name of disparity rate, is made ; but here also we look in vain for a sufficiency to make good the promises held out by the society. Upon the whole, including all these contingent advantages, we have to pronounce upon the whole of the societies in question, that their charges are in hardly any case two-thirds, and in many not one-half, of what they ought to be, to ensure the benefits held out ! The affair is therefore fraught with disappointment and misery to the nominees. The earlier incumbents upon the funds will for a time get more than they were entitled to, and in the long-run those who have paid largely will find an empty treasury staring them in the face. In fact, we cannot well imagine a more distressing state of things than that to which all the annuity societies above enumerated are, from the inherent vices of their constitution, unavoidably tending. We hold it to be a high duty incumbent on the noble and dignified persons who allow their names to appear at the head of them, instantly to inquire into the principles on which they are founded, and to insist on immediate means being taken for undoing the evil which has been already done.

As we, for our part, only contemplate the good of

the public, including that of the parties forming these societies, and as we take up the matter merely as one of opinion, and consequently open to free discussion, we trust that no one connected with the societies will for a moment feel offended by our remarks. We are convinced that we are right, and in this opinion are supported by an experienced accountant of our own city, who has obligingly read the present paper in *proof*, and given it his entire sanction. We have also been informed that the actuaries of various life-assurance societies in Edinburgh have lately been directing their attention to the annuity societies in question, and have been astonished at the incorrectness of the principles on which they have been founded.

One remark in conclusion. The warnings in this paper are only directed against errors in life-assurance and annuity endowment. For the things themselves we entertain the highest respect, as amongst the most notable means of lessening evil and suffering. To all we would say, Lay out your money as liberally as you choose in life-assurance and in annuity endowment, but use such precautions as are here presented to you, to ensure yourselves against deception and the consequences of mistaken calculation.

THE OX'S MINUET,

AN INCIDENT IN THE LIFE OF HAYDN.

IN 1770, the reputation of the German composer, Joseph Haydn, had spread over all Europe. He had visited Paris and London, and in both cities had been greatly cherished and admired. But he was glad to return again to Vienna, on leaving which he had wept like a child. The house which he occupied in the Austrian capital was a modest one, and was situated in the suburbs ; but it was a house honoured and resorted to by all the great lords of the court, who would fain have possessed the character at least of being connoisseurs in music, and patrons of its professors. There, too, did poor artists often find counsel and aid in their distresses. Born of humble parents himself, Haydn was ever mindful of the wants of the obscure and humble followers of his art. Generous, virtuous, sensitive, and simple as a child, Joseph Haydn ought to have been perfectly happy in his course through the world ; but this was not exactly the case. When very young, he had wedded one whose personal attractions made a strong impression on him. Unfortunately, her spirit and temperament proved to be of a very inferior order, and for thirty years the great musician underwent much domestic discomfort in consequence. Yet he was a faithful husband, and even loved his wife to the last with all the strength of his first and boyish affection.

On his return from London to Vienna, Haydn found his wife the same being that he had left her, morose, obstinate, imperious, and quarrelsome. All that the poor composer could do was to fly to his little study, and in that retreat seek consolation in the pursuit of his beloved art. One afternoon, after a storm of the ordinary kind had passed over his domestic horizon, Haydn fled to his sanctum, and had forgotten his troubles awhile over his harpsichord, when his domestic brought him information that a man wished to speak with him on an affair of pressing moment. "Let him enter," said Haydn.

"Pray, pardon—excuse me," said a stout jolly-looking personage as he entered the room, holding a heavy purse of florins in his hand, and attired in the habit of a cattle-dealer or butcher. "You are famous, sir," continued this individual, "for being the grandest composer of minuets in all Austria, or any where else in truth ; and as I am going to have my daughter married to-morrow, I come to ask you to oblige me by making one on purpose for the nuptials."

"My good friend," said the musician, "you embarrass me by this request. I have made few or no minuets, as you seem to have been told ; the few trifles of that nature which have been composed by me would not do for dancing to. They are things rather written for artists, and are more learned than lively."

"So much the better," replied the stout cattle merchant ; "that is the very thing I want. My son-in-law, that is to be, is famous upon the clarinet, and my little girl is clever at the harpsichord ; so you see, Master Haydn, that your grand music would go like pearls to swine. And then, to own the truth to you, I am as proud as an emperor, though I be no more than a butcher to my trade. I heard your beautiful mass on the birth-day of our gracious sovereign, Joseph II., and I said to myself, 'This composer is the man who shall make a minuet for the wedding of my little girl, or my name is not Hermann of Rorhau !'"

* When the minuet was a favourite dance, a piece of new music, suitable for it, was a thing in as high esteem and request as a fine waltz is at present in the world of fashion.

"Of Rorhau !" cried Haydn ; "what ! are you from that little village of Hungary ?"

"Not a doubt of it," returned the visitor ; "and what then ?"

"I was born there," exclaimed the simple and warm-hearted composer ; "I was born at Rorhau, and for forty years I have not seen it ! Embrace me, my friend, my dear fellow-countryman !" The tears ran down the composer's cheeks. In embracing Hermann, he felt as if he clasped in his arms all whom he had loved in boyhood, when, poor and needy, he had sung in the village choir, to gain a morsel of food for his widowed mother.

"And you are from Rorhau !" repeated Haydn, dwelling affectionately upon the recollections called up ; "come, sit down, I beg of you, and let us chat of our native place—that place which one loves for ever, whatever may have been the toils there endured !" Hermann's heart was as much touched as that of his celebrated compatriot. He sat down, though only after some pressing, and talked of Rorhau with the musician. Finally, they came back to the minuet, and Hermann departed, happy in the promise given to him that he should have the desired music sent to him as soon as possible.

Sensitive as a child, Haydn yet felt a glow of pleasure from the recent recognition, and disposed himself with a cheerful heart to commence the epithalamial minuet. But great was his surprise, on turning to his harpsichord, the confidant of all his cares and joys, to find lying upon it the purse which Hermann had held in his hand on entering the room. The purse had these words attached to it on a piece of paper : "Hermann, butcher, Street of St Etienne, to the greatest composer of Germany." Haydn was equally surprised and delighted at the delicacy which had prompted the manner of bestowing this gift. But calling his domestic, the composer ordered him to be ready in an hour to take back the purse, with the desired music, to the house of the butcher. Being then left alone, he proceeded to the composition of the minuet.

Often had Haydn written at the command of kings, but he had seldom felt himself so inspired as when throwing on paper the musical ideas destined to grace the nuptials of the butcher's daughter. The air which he produced was fresh and lively, and smacked of the rural simplicity of the composer's native scenes. But ere the piece was quite finished, the soothing ecstacy of spirit, under the influence of which the musician laboured, was dispelled by the entrance of his wife. Her presence put to flight the familiar genius of his art, and discord took place of the harmony that had floated for a time around him.

"What is this that your servant Franz tells me ?" said Madame Haydn, with an accent indicative of a latent storm ; "you are about to send away a sum which you have justly acquired, being given to you for work to be done."

"My dear," said Haydn gently, "do not fret at this. Be more just. Is a miserable little minuet worth a heavy purse of florins ! It would be robbery, almost, to take it."

"Always the same !" cried Madame Haydn ; "you will never be worth a copper coin, and your fine generosity will bring you to"—

"The Temple of Fame !" interposed Haydn, with a smile.

"The hospital, rather—you weak, simple creature !"

"Come now, my dear," said Haydn, "speak no more on this trifling matter, but leave me to finish the piece. I have promised, and you know I never break my word. There I am religiously faithful ; and to you, my dear Elizabeth !"

Madame Haydn, ill tempered as she was, sometimes could not resist the tender pleading of her husband, whose ill health made him often an object of pity, and who had preserved for her, as has been said, all the affection of a lover, in spite of her usage of him. But on this occasion she was determined to stick to her point ; and, accordingly, she coldly repulsed his conciliatory advances, and reiterated her demand that he should keep the purse of Hermann. The composer would not yield to this, and reading his determination in his usually gentle features, Madame Haydn became but the more enraged, and proceeded to measures by which she might at least punish her husband's contumacy, if she could not gain her point about the purse.

The cabinet of Haydn, like those of many other great men, was a place not distinguished for order. The composer, indeed, loved to have his scraps all lying loosely about him, blotted with the magic symbols which were to afford a fund of melody to posterity for ever and ever. His cabinet was, in fact, a scene of great confusion, and Madame Haydn knew well that one sure way to put her husband almost beside himself, was to attempt to put things into a different condition. In this tender point she now attacked him. Seizing a broom, the sceptre with which she governed her household, she began to sweep the room into order. The first consequence of this step was, that a cloud of dust was raised, which brought on her poor husband a severe cough, and compelled him momentarily to fly the apartment. Profiting by his absence, she swept together the manuscripts which lay on the table and on the floor—in short, here and there and every where ; and one little scrap, reckless of what it might contain, she tossed into the fire. Alas, it was the new minuet for the wedding of Hermann's little girl !

Haydn entered the room immediately afterwards,

and, attracted by the blaze, looked at the fire, where he on the instant recognised his yet unfinished minuet, just expiring in the flames. A giddiness seized him; he uttered a cry of anguish, and fell upon the sofa. His wife waited only till she saw him recover, and then, conscious that she had inflicted sufficient punishment, fled to her own region of the household.

Haydn was in great distress about the lost minuet. He could not re-write it from memory, and the hour was advancing at which he had promised to send it. The scene just related had made him ill, and had incapacitated him for a new effort, even had there been time for it. Under these circumstances, he bethought him of some minuets which he had sent to his publisher shortly before, and dispatched his servant to bring these back to him. Luckily they had not yet been published, and the manuscripts were got. Haydn then selected the best, and partly remembering the late piece, gave this one some new and perfecting touches, and then sent off the remodelled minuet to Hermann, along with the purse of florins. After this, Haydn was a little more at ease.

The minuet sent to the butcher, though perhaps not quite equal to the burnt one, was yet a charming composition, being at once lively, elegant, and original. Hermann, on receiving the precious manuscript, embraced it with delight, and immediately gave it to a copyist to have the parts separately set down. The butcher's intended son-in-law, who was really a musical amateur of no mean skill, had got some performers of ability engaged for the wedding, and these he assembled on the evening that the minuet was brought home, and had it played most delightfully. But it was at the wedding assemblage that Hermann's triumph reached its height. There the minuet excited the most rapturous applause.

"It is Haydn's!" cried the jolly butcher in a perfect transport; "it was for me—for me, his countryman—that he composed this wonderful minuet!"

"Haydn for ever!" cried the guests.

"Let us go on the instant and thank him for the honour he has done us," said the son-in-law.

"I have thought of this already, my son," replied Hermann, "and, what is more, have prepared a surprise for my countryman. I left him a purse before, but he has sent it back. Since he won't take my money, I will be quits with him in another way. I will pay him in my coin."

"That will be bringing back the golden age, when all was done by exchanges," said one of the guests; "M. Haydn has given you a minuet, and you are going to give him"—

"An ox!" cried the stout old butcher, "and a living one, too! And what a size he is! The show ox in the market the other day was a calf to him. He is here, in my stable, all ready to be presented!"

"To the stable!—to the stable!" exclaimed all the guests simultaneously, seizing their hats, from which floated favours of all hues. They proceeded to the stable, and there beheld a most magnificent ox, with his long curling horns adorned with parti-coloured ribbons, and with his white skin as clean as if he had been cut out of Parian marble. The whole wedding party, men and women, were now assembled by Hermann, and arranged by him in procession order, with the ox at the head. They marched thus towards the house of Haydn, the musicians all the while performing the minuet of the great composer. The hour was not a very late one, but Haydn had gone to bed. The noise of the music and the party entering his court awoke him. He was at first annoyed somewhat at having his rest disturbed, but when he recognised his own minuet, his surprise was extreme. He was sure it was his minuet, but there was an additional bass accompaniment that astonished him, falling as it did on his ear at irregular intervals. This was, in fact, the ox, which took upon itself to help out the music by an occasional low, like the grumbling of a tempestuous ocean.

Having thrown on him his dressing-gown, and taken a lamp in his hand, Haydn appeared at one of the windows, and was received with shouts by the marriage assemblage below. The composer thanked Hermann warmly for his attention in paying this visit; but when the jolly butcher pointed to the superb ox, and begged his acceptance of it as a token of gratitude and esteem, the musician was at first so tickled with the idea of the thing, that he burst into a hearty laugh, in which he was instantly joined by the merry crowd beneath. Fearing to offend Hermann, however, Haydn checked himself, and accepted the present with many thanks. He then descended into the court, found a stall for the animal, kissed the bride, and retired again, loaded with bouquets in showers from the wedding guests.

All the while the serenade was going on, and the people of the neighbourhood were so charmed with the minuet, that every window had half-a-dozen night-caps projected from it, at the risk of death to the owners from the night air.

But the fame of the minuet did not rest here. The story soon spread over all Vienna, and every one wished to have the piece; so that, in reality, this trifle produced an accession of fortune and fame to the great composer. The minuet received and still retains the name of the "Ox's Minuet." Under that title it will be found in every catalogue of Haydn's works. As to the animal itself, the living proof of Hermann's gratitude, the composer, after keeping it for a time to enjoy the pleasing thoughts called up by the sight of

it, gave it to the hospital, that it might have a worthy end in doing good to the poor. This was a thought worthy of the generous and single-hearted composer, but it was one, it is said, very displeasing to Madame Haydn. She did not long survive this event. Her good husband lamented her, but there can be no doubt that her departure left his latter days in peace.

SPECULATIONS ON WORDS.

FIRST ARTICLE.

Deer, Harness, Wife, Life, Housewife, Hussy.—The transitions of words from a general to a particular meaning, and from a particular to a general, are exceedingly curious. The German *thier* is any wild animal, but the corresponding English *deer* is a particular kind of wild animal. *Harnisch*, in German, is *armour*; but *harness*, in English, is *armour* for horses only. "Put on the whole *armour* of God," is in Luther's version, "Put on the *harness* of God," *zichet un der harnisch Gottes*. *Harness* was formerly used in the same way. The word *wife* in old English meant only *woman*: it retains the generic sense in the compound *housewife*, and in the phrase "old *wives'* fables," that is, "old *women's* fables," as well as in the riddle of the man who met another with seven wives as he was going to St Ives, that is, with seven women; *weib* in German retains the same meaning. So *life* meant nothing but *body* originally; and retains the primary sense in the compound *life-guard*, which is perfectly synonymous with *body-guard*. It has here nothing to do with life in the sense of vitality. The corresponding German *kib* still means nothing but *body*. But speaking of *housewife*, we may remark the curious manner in which that word has degenerated from a term of respectability, and even of compliment, into a term of abuse, under the corrupted form of *hussy*. With the goodly practices of housewifery, has gone out the good sense of the term.

Manufacturer, Upholsterer.—Whole nations, like individuals, sometimes make mistakes in the formation of words, and follow a false analogy. *Manufacture* is a Latin word, and the agent substantive should have been *manufactor*, like *corn-factor*, &c. As we have *sculptor*, *sculpture*, so we should have *manufactor*, *manufactory*. But we have treated it like a genuine English word, and given it the English ending, like *bind-er*.

An *upholsterer* was originally a bearer or upholder at funerals; hence a man who *provided* furniture for funerals; and hence it means now a man who provides *any* furniture. *Upholder* was the original term, and is still a little used. Another term was employed (corresponding in formation to *spin-ster*, *pun-ster*, *mult-ster*), which was *upholdster*, or *upholster*. But there are not many compound words, like *uphold*, which have substantives formed for them in *ster*, and it seems to have been forgotten that *ster* had the necessary meaning, and therefore *er* was added; hence *upholsterer*. Nay, we have seen on a board over a door in London *upholstererer*, which is as if we were to say *bakererer*, or *gardenererer*. The infection spread to *upholder*, and we even have *upholderer* used; with which we may compare a word that is common, but wrongly formed, *fruiterer*; wrongly formed, unless the first *er* is merely euphonic, which we rather believe. The French is *fruitier*; we might have *fruiter*. We cannot help such cases creeping into a language. Every language has some instances of the same thing. This phenomenon of doubling and trebling the terminative may be partly accounted for from the slippery nature of the letter *r*, and the tendency to repeat it, and insert it, where strict analogy would not justify it. A large number of the anomalies of language, and of the mistakes of half-educated people in pronunciation, arise from the peculiarity of the letter *r*. In the word *ludicrous*, people hardly seem to know where the *r* comes, and often say *ludricuous*. The repetition of the *t* in the vulgar form of *preventive*, *preentative*, may afford another illustration. On the sea-coast, *preventative* is the common word at the preventive stations.

Swine, Swineherd.—There are two words in English spelt *swine*, the plural of *sow*, and another word which we see in *swineherd*. Now, formed like *ox*, *oxen*, the plural of *sow* would be *sowen*, but it is contracted very naturally to *swine*, just as *cowen* from *cow* is to *kine*. But *swine* in *swineherd* is not the plural, as one might conclude from the analogous words *cothard* and *shepherd* (that is, *sheep-herd*). The generic term *swine* is employed; and *swine* is often used by old writers as a singular. Thus, Holland in his "Plinie," b. viii. c. 51., says, "Will ye know that *swine* is sick or unsound, pluck a bristle from the back, and it will be bloodie at the root: also he will carrie his neck at one side as he goeth." And the sacred proverb, "As a jewel in a *swine's* snout, so is a fair woman who is without discretion," is a familiar instance of the use of *swine* as a singular.

Maidstone, Arundel.—People are so fond of assigning causes for things, that when they really do not know the cause, they will invent one. For example, the descendants of an old family wish to ascertain the origin of the family name, but have not the requisite knowledge; they forthwith invent a story which tallies

with the name, and assign that as its origin. It may happen that something may come out after, which will lead to the discovery of the real origin of the name; then of course the story, which was only invented to explain an existing difficulty, is brought as an argument against the true explanation. But to take a modern illustration. The good folks of Maidstone, in analysing the name of their town, decided at once on Maid and Stone as the two component parts; and without examining the history of the name, forthwith made up some story about a maid and a stone, and the arms of the corporation display the maid and the stone at this day. The truth is this: the town is on the Medway; and what more obvious name for it than Medwayston, which has been corrupted to Maidstone? The word means nothing more than a town on the Medway.

The town of Arundel is said to be derived from the French *hirondelle*, "a swallow;" and the arms of the Norfolk family, to whom so much of Arundel belongs, have the *swallow*; a decisive proof, it is considered, that the town was called from the *bird*; and a story is invented to account for and reconcile the whole. Of course nothing can be more absurd than this in point of fact. The town is built in the valley or *dale* through which the river *Arun* flows, and is hence called Arundale, corrupted to Arundel.

It, Her, Hen, Ship, Moon, Sun.—The subject of gender in language is a very curious one. Some languages, as the French, make every noun one of the two genders. In English, on the contrary, as in Latin, we have neutrals, and we speak of them singly by the word *it*. The word *it* was much less used formerly than it is now. For example, in the phrase *they are they which testify of me*, we should say, as Whately has observed, *it is they*, which probably would then not have been considered correct. *Its* is a comparatively modern word. Ben Jonson would not admit it into his grammar. Even in Milton we see traces of its being a rather recent innovation; he says, for example,

"his form had not yet lost
All her original brightness,"

where he would, if he had written in the nineteenth century, undoubtedly have said *its*. In the authorised version of the Bible, the word does not occur once. A curious use of the word *her* occurs in Thirlwell's Greece. Speaking of genders, we may observe that many of the words which in English denote the female of animals, in other languages denote the male. *Hen* in German means a cock (*hahn*). A *ship* is feminine in English, and miners always speak of a mine as *she* and *her*—"She is very productive." In German, the moon is masculine, and the sun feminine; the poets frequently represent the sun as a goddess.

BURIAL-GROUNDS IN LONDON.

A CURIOUS work has just been published by a medical gentleman named Walker, the purpose of which is to draw attention to the unsalutary extent to which inhumation is practised within the bounds, and more particularly in the denser parts, of London. If there be no exaggeration in Mr Walker's statements, they are certainly of a somewhat alarming nature, for they tend to make it appear that the confined little parish churchyards of the metropolis receive so many more bodies than they ought to do, that they must needs become sources of deadly effluvia to the living. The death of a grave-digger, about a twelvemonth ago, at the bottom of a grave, from noxious gas which he there inhaled, gave some reason for apprehending that the space appointed for sepulture in London was too limited; but we were not prepared to learn that the case is so bad as it now appears to be. Mr Walker informs us, in the first place, that in the year 1833 the burials which took place in the yards and vaults connected with the churches within the bills of mortality, and in a few adjacent parishes, were in number 32,412: the number from 1814 to 1837 (inclusive), was upwards of half a million. When we see these statistics, and recollect the little confined unpaved courts which form the churchyards of London, we can readily conceive that such receptacles must be, generally, as Mr Walker describes them, saturated with the decaying matter which once formed human beings. These receptacles are, in almost every instance, closely surrounded with houses, many of which are lofty and crowded with population. Such houses must unavoidably be exposed to the effluvia or gases which arise from the heaps festering below. The unavoidable consequence is a great diminution of the public health.

There is one particular part of the city, which Mr Walker describes as strangely beset with burial-grounds. It is a narrow alley called St Clement's Lane, leading from the Strand to Clare Market. "It is surrounded," says he, "by places, from which are continually given off emanations from decaying animal matter. The back windows of the houses on the east side of the lane look into a burying-ground called the

'Green-ground,' in Portugal Street, presently to be described: on the west side, the windows (if open) permit the odour of another burying-place—a private one, called Enon Chapel—to perflate the houses; at the bottom—the south end—of this lane is another burying-place, belonging to the Alms Houses, within a few feet of the Strand, and in the centre of the Strand are the burying-ground and vaults of St Clement Danes; in addition to which there are several slaughter-houses in the immediate neighbourhood; so that in a distance of about two hundred yards, in a direct line there are four burying-grounds, and the living here breathe on all sides an atmosphere impregnated with the odour of the dead." He specially describes some of the burial-grounds in question. Of that in Portugal Street, he says: "The soil is saturated, absolutely saturated, with putrescent matter. The effluvia are at certain periods so offensive, that persons living at the back of St Clement's Lane are compelled to keep their windows closed; the walls even of the ground which adjoins the yards of these houses are frequently seen reeking with fluid, which diffuses a most offensive smell." Of Enon Chapel, he says: "This building is situated about midway on the western side of Clement's Lane; it is surrounded on all sides by houses, crowded by inhabitants, principally of the poorer class. The upper part of this building was opened for the purposes of public worship about 1823; it is separated from the lower part by a boarded floor: this is used as a burying-place, and is crowded at one end, even to the top of the ceiling, with dead. It is entered from the inside of the chapel by a trap-door; the rafters supporting the floor are not even covered with the usual defence, lath and plaster. Vast numbers of bodies have been placed here in pits dug for the purpose, the uppermost of which were covered only by a few inches of earth; a sewer runs angularly across this 'burying-place.'" The space "measures in length 59 feet 3 inches, or thereabouts, and in width about 28 feet 8 inches, so that its superficial contents do not exceed 1700 square feet. Now, allowing for an adult body only twelve feet, and for the young, upon an average, six feet, and supposing an equal number of each to be there deposited, the medium space occupied by each would be nine feet; if, then, every inch of ground were occupied, not more than 189 (say 200 in round numbers) would be placed upon the surface; and admitting (an extravagant admission most certainly) that it were possible to place six tiers of coffins upon each other, the whole space could not contain more than 1200; and yet it is stated with confidence, and by credible authority, that from 10,000 to 12,000 bodies have been deposited in this very space within the last sixteen years!" Then, as to St Clement's Church, Strand, "There is a vault under this church called the 'rector's vault,' the descent into which is in the aisle of the church near the communion table; and when opened, the products of the decomposition of animal matter are so powerful, that lighted candles, passed through the opening into the vault, are instantly extinguished; the men at different times employed have not dared to descend into the vault until two or three days had elapsed after it had been opened, during which period the windows of the church also were opened to admit the perflation of air from the street to occupy the place of the gas emitted; thus a diluted poison is given in exchange from the dead to the living in one of the most frequented thoroughfares of the metropolis."

Even in the more elegant parts of London, very great evils of this nature are allowed to exist. Hear Mr Walker:—"Buckingham Chapel is situated in Palace Street, about three minutes' walk from Buckingham Palace. There are two vaults and a burying-ground belonging to this chapel; one of the vaults is underneath very large school-rooms for boys and girls, and the other is underneath the chapel; the entrance to these vaults is through a trap-door in the passage, dividing the school-rooms from the chapel; steps lead to the bottom of the building; on the right is the vault underneath the schools. The vault is supported on wooden pillars, and there is only one grating, which fronts the street, to admit light and air; the floors of the school-rooms, whitewashed on the under surface, form the roof of the ceiling of the vault—it is no difficult matter to see the children in the lower school-room from this vault, as there are apertures in the boards sufficiently large to admit the light from above. This place is spacious, but very low; the vault on the left, under the chapel, is about the same size as that under the schools, though much lower. I was assured that the ground was so full of bodies, that there was difficulty in allotting a grave; the roof of this vault is formed by the under surface of the floor of the chapel; it is whitewashed; the light passes through it; the smell emitted from this place is very offensive. In the vault underneath the chapel there are piles of bodies placed in lead; the upper ones are within a few inches of the wooden floor. On a level with the chapel, and behind it and the school-rooms, is the burial-ground, which is much crowded, most of the graves being full seven feet deep, and nearly filled to the surface with the dead; the ground is raised more than six feet from the original level, formed only by the debris of mortality."

Some details in Mr Walker's book give a startling notion of the mercantile part of the question. There are great vested interests in the London churchyards, from the proprietors, who thrive by "quick returns," to the sextons, who retrieve the good timber, the

plates, and the nails expended on the dead, to serve again for the benefit of the living. The subject is well worth being looked into; but it will not be the publication of a book which will force to it the necessary attention. The citizens of London must be disturbed by several more accounts of men killed in the bottoms of graves by noxious effluvia; or some decided pestilence must arise in direct consequence of those effluvia; and then, possibly, some attention will be paid to the matter, and some reform instituted.

BELGIAN ANTI-DUELLING ASSOCIATION.

BELGIUM, so forward at the present day in all works of general utility, has lifted up its voice, also, against the barbarous custom of duelling. The following paper is an abridgement of one which we find in the pages of a recent Brussels Almanack, and which appears to have been elicited by the circumstance of an association being formed at Liege for the extinction of the duel.

The institution of this society (says the Belgian writer) ought to be universally known, and an appeal made to all friends of humanity, and men of sense, to aid in the accomplishment of the objects it has in view.

The immediate origin of the duel may be traced back to the times when knights and warriors, in the absence of all laws, constituted themselves the redressers of wrongs, and combated hand to hand with the oppressor in defence of the oppressed. Subsequently to the establishment of laws, single combats were formally authorised between plaintiffs and defendants, chiefly in consequence of the imperfection of the proper legal means of proving guilt or innocence. Doubtless, the superstitious hope of an immediate providential interposition in favour of the right, was another principal cause for the custom of single combats, as well as of the other ordeals, by fire, water, and touch.

Prohibited in the intervening ages by the laws, duelling has now found a refuge in the customs of society, and by them is supported against the laws. Thus backed and sustained, duelling is one of the greatest calamities of our epoch. Every day it finds new victims. No man can escape from the dominion of this barbarous idol of custom; the old and the young, the wise and the ignorant—all, in short, within the most respectable and enlightened classes of society—are sucked, willingly or unwillingly, into its vortex. A species of assassination is committed daily under the eyes of the tribunals, without their having the power of punishing the guilty; and society is at a loss whether to pity or blame. The pity, when it is given to any one, falls as often to the share of the survivor as to that of the victim of the duel.

Practices which have their origin in the customs of a people, can only be affected or altered by public opinion. It is public opinion which has long sustained the duel; the same cause alone can overturn it. In Louis XIV.'s time, the practice became so dreadfully common in France, that a law was passed, making it punishable by death. This statute produced no effect; duelling continued as frequent as ever, and the act had to be revoked, as a thing totally unseizable.

When laws were very imperfect, and when society was organised in such a manner that the strong had the weak at their mercy, without the latter having any proper help or refuge at command, the duel might have been considered as a sort of necessary practice, and public opinion might not unreasonably have branded with the name of coward the man who strove to exempt himself from the custom, or even him who did not, in pressing circumstances, become the challenger. At this day the case is totally altered. The laws are perfected, and manners as well as morals improved. Conscious of the changed state of matters, public opinion is turning against the duel; yet it is so firmly fixed among our customs, that it will require a combined and powerful exertion of the general mind to abolish it for ever. This issue, which legislative enactments cannot bring about, may be accelerated by full and free discussion of the subject; for the more closely the nature of the practice is inquired into, the more glaring will the folly of it appear.

There are two ways of considering the duel. If you look at it singly, and apart from its relation to causes or other circumstances, the practice appears nothing else than a monstrous absurdity. What justice can there be in a trial or combat which levels innocence to the same footing as guilt—equalises virtue and vice, ignorance and genius—giving them the same chances of success, or rather giving decidedly the better chance to the habitual quarreller, blusterer, and bully? What sort of a custom is this, that in a measure puts the life of every peaceable man in the power of the first bravo who may hustle, strike, or injure him? What kind of practice is it that compels a man to go out and fight in cold blood, in order to avenge some petty injury, on account of which he really feels no anger? Is it not deplorable to behold young men, indeed boys, placing themselves, in accordance with this terrible mania, in the position of assassins, and running the risk either of falling victims personally, or of destroying others, and thus loading their minds with feelings of imperishable regret, while at the same time they incur the chance of plunging one or two families into the most profound sorrow! And all this for some piece of boyish nonsense and foolery! Not less lamentable is it to see the fathers of families endangering,

for the sake of the same fatal prejudice, the peace of those dependent on them in a still deeper degree; or to see men of the highest talents and virtues risking all that hangs upon their lives, whether of a public or a private nature, to gratify this evil custom.

But, on the other hand, in all those cases where the law is inefficient, and where public opinion is incompetent of itself or unwilling to inflict punishment, what is to be done, it may be said, to offenders who do not merely touch you on some vain point of honour, but who inflict a heavy and serious injury? Are husbands or fathers to allow the libertine to go off in triumph, because they may not wish to parade their family shame, or may not have legal evidence against him, although sure that he has irretrievably injured them? Can one permit himself to be insulted, spit upon, or injured in a similar way, without endeavouring to punish the act by the only means admitted by modern usages in such cases? "There are many varieties of offence of this order for which the law, it is argued, provides no satisfactory amends."

In ancient communities there was a special tribunal for taking cognisance of social evils and errors, such as might deeply affect society and its morals, without falling under the scope or notice of the laws. At Sparta there were the Ephors, at Athens the Areopagites, and at Rome the Censors, whose principal duties consisted in preventing the demoralisation of the people, and in giving redress to the citizen wounded in his honour.

In modern times, the substitutes for these bodies, or the powers analogous to them, are partly public opinion, and partly private war or duelling.

To extend the influence of public opinion, therefore, and to make its censorship so general as to include all those offences against honour which lead to duelling, is one obvious way, and indeed the main way, to overturn the duel. In vain will you endeavour to discourage that practice, unless you make society discountenance, and punish by its moral influence, all those abuses and injuries which cause it. You will associate in vain against duellists, if you do not associate, at the same time, against dishonourable people of every stamp. You would fall into the danger of opening your ranks to persons, who, in gratifying their evil natures by harassing and trampling upon the honourable and peaceable, would find it very convenient to cover themselves with the agis of an association formed for very different purposes.

Associate yourselves, for association is the source of all power for well-doing; but if you wish to abolish the duel, support and strengthen public opinion, that by its extended influence it may reform the social evils that lead to duels. If a husband has had his happiness destroyed, let society take the task of vengeance to itself, and expel from its ranks the wretch who has been guilty of so flagrant a breach of social virtue. In the same way, let the anger of the community at large fall on other offenders, and duels would speedily be less frequent, not only because the offences inducing them would become more rare, but also because, when they did occur, the injured parties would feel satisfied with the infliction of justice by public opinion, and would leave the task entirely to it. On the other hand, if offenders are not punished by the general voice and arm, the injured will for ever pursue the practice of endeavouring to avenge themselves. Half the disorders and immoralities of society are, if not engendered, at least encouraged and maintained, by that loose tolerance for brilliant vice, which exists to such an unfortunate extent. It would often seem as if the victims of dishonourable licence were the parties who deserved the world's scorn and reprobation. The dupe is mocked and ridiculed, while the address of the scoundrel is admired, and perhaps even applauded. Whilst things remain thus, the duel will be in some sort a moral necessity—an appeal made to the justice of the Deity, when that of man fails to give redress.

If, then, you associate against duelling, associate yourselves, also, I repeat, against those social offenders whom the ordinary laws do not touch; clear up the general mind on the point, and cause society to cast from it with aversion such as have disgraced it by their crimes; in short, establish a proper censorship of public opinion; and with the evils which caused it, the duel will disappear.

WHEAT STRAW FOR HORSES.

Had any one said to me only ten years back, "What do you think of wheat straw as an article of food for horses? do you think you could bring a race-horse to the post in fit condition to run, on wheat straw and corn?" I should only have returned a smile. Well, see what a change has eight years' residence in France wrought upon my opinions and experience on this subject; I am now not only convinced that, to the fact of horses in France eating as much wheat straw as they do hay, is to be attributed their general healthy condition, and also the non-necessity for physic, even to those that work hard and eat much corn (post and diligence horses, for example); but I was informed by Lord Henry Seymour, at Paris, last March twelvemonth, that his race-horses, then of course doing good work, were eating nothing but wheat straw and corn. It is my sincere conviction that, putting what we consider a high state of condition out of the question, the comparatively more healthy state of French horses over our own, is to be attributed to the alternative properties of good wheat straw, together with the occasional use of bran, either mixed with their food or water.—*Nimrod*.

THE LOCUST OF ESTREMADURA.

From time immemorial the locust has been the scourge of the central provinces of Spain. In an old Spanish document there is the following question:—"Which is the animal that most resembles all other animals?" The answer is: "The locust; because he has the horns of a stag; the eyes of a cow; the forehead of a horse; the leg of a crane; the neck of a snake; and the wings of a dove." By the wise arrangements of nature the propagation of this destructive animal is so restrained, that its ravages are rendered local, and comparatively trifling to what they would be were an equal proportion of males and females produced. By the absence alone of such an equality, their extraordinary fecundity is kept in check. There seems to be no regularity whatever in the time of appearance of these destructive insects. In the southern parts of the United States, in Egypt, and the eastern parts of Turkey, they sometimes make their appearance in countless myriads, committing the most terrible devastation on the vegetable kingdom; and, again disappearing in a few weeks, do not repeat their visits for several years.

The natural history of these insects is highly interesting; there are a great many kinds of them; that of *Estremadura* may be taken as an example of the habits of the whole. Solitary places, such as the crevices of uncultivated soil, are always chosen by the females for their retreat; for although millions alighted upon a cultivated field, not one would make it a place of permanent residence where it might deposit its eggs. The female is invariably the architect of the cells, which she builds with the aid of a round smooth instrument attached to her body. It is four-fifths of an inch in length; at the head it is as big as a writing quill, but diminishes to a hard sharp point; it is a hollow tube; and at the root there is a cavity containing a glutinous matter, which, by a peculiar construction of the parts, can be forced through the tube at the pleasure of the insect. Having cleared a hollow space, principally by means of this hard but moveable proboscis, she emits the glutinous substance, and, mixing it with earth, kneads it into a paste, with which she plasters the walls of her habitation, smoothing all nicely and neatly with her trunk. After the completion of this operation, she commences the laying of her eggs, of which about forty are deposited in a few hours. This labour over, she covers the opening with the fore-mentioned glutinous composition, which perfects the structure, affording it complete protection against the inclemency of the weather and the hostile invasion of other insects. But the laborious undertaking proves fatal to the artificer. Exhausted with fatigue, she is unable to go in search of refreshing waters, and so perishes close beside the objects of her solicitude. When the locusts emerge from the eggs, they are of a black colour, about the size of a gnat, and collect in vast numbers at the foot of shrubs. They display great liveliness and activity, continually leaping upon each other, and occupying a space sometimes of three or four feet in circumference, and two inches in height. During this period they are supposed to live entirely on dew, their limbs being as yet weak, their wings small, and their teeth not sufficiently strong to bite the grass. In about twenty days they commence their attack on the vegetable kingdom, beginning with the youngest and tenderest shoots of plants. By degrees they get stronger, and, leaving the society of each other, extend their ravages over a wide space. Nothing that springs from the soil escapes their voracity; not even mustard seed, onions and garlic, hemlock, and the most rank and poisonous plants, such as the thorn-apple and deadly nightshade. They even prey upon crowfoot, a vegetable whose causticity burns the very hides of animals, and upon cloths of various kinds where they find them exposed on the ground.

The locust of *Estremadura* spends the months of April, May, and June, in the place of its birth. At the end of this period, the females ascend into the atmosphere five hundred feet high, forming a living cloud which darkens the sun. They make a rustling noise as they wing the air, somewhat like that of the wind blowing through the leaves of the forest. The first direction of this formidable host is against the wind, and when not too strong, it extends to a couple of leagues. The column then halts, generally over a corn-field or garden, the smell of which attracts them, for their olfactory organs are peculiarly sensitive. The whole descend in a body, and in a short while completely eat up every green thing. This formidable animal is described as having a head about the size of a pea, but longer, the forehead pointing downwards like that of a handsome Andalusian horse, with a mouth large and open, eyes black and rolling, and a timid aspect, not unlike that of a hare. In its two jaws it has four incisor teeth, whose sharp points traverse each other like scissors, their mechanism being such as to gripe or shut. When full grown the body is of great strength; and thus armed, it is not at all surprising that the devastations of the locust should be so destructive and extensive, and that the husbandman should look upon a visitation as a total death-blow to his hopes of a harvest for that year. Let the British agriculturist reflect on this whilst complaining of backward weather, and the sudden swellings of rivers, by which partial damage is done. He has never to complain of the wholesale desolation to which very many countries of the globe are not unfrequently subjected.

RAILWAY COMPENSATIONS.

The great difference between the sums claimed by proprietors, and the sums offered by railway companies, for occupation of land and damages, has frequently excited remark and surprise. The difference in the case of the Edinburgh and Glasgow Railway, and the directors of the Glasgow Lunatic Asylum, presents, perhaps, a greater difference than was ever before witnessed in the kingdom, and would almost lead to the supposition that the claim had been made by the inmates rather than by the directors. The first claim made was £44,000, but, before trial, this was reduced to something a little above £10,000. The sum awarded by the jury was £873.—*Paisley Advertiser*.

TO THE MOON.

All pale and lovely Wanderer!
Thy story who shall tell?
What pencil paint the lovely land
Where thou wert wont to dwell,
Ere yet, through boundless space afar,
Thy pilgrimage began,
Or thine eye of love was kindly set
Upon the home of man?
Fair Spirit! if to mortal muse
The privilege be given
The deeper mysteries to scan
Of thy far native heaven,
Methinks before my tranced eye
The happy hosts appear,
Whose harp-strings wak'd to love and joy
Alone when thou wert near.
Methinks I see the clouded brows
That ne'er were dimm'd before—
The desolation dire that told
Thy smile for them no more—
The sigh that rose in concert full
Still murmurs on the gale,
And memory still is brooding o'er
Thy tender, parting tale.
But seemlier far, fair Moon! may I
Essay to sing the night,
When infant nature wanted first
In thine unwonted light,
And myriad dewy drops were fain
To drink thy balmy ray,
And happy birds awoke to hail
The softer, sweeter day.
Soon as thy kindly smile outbeamed
From yon unclouded blue,
Earth's startled slumberers turned to gaze,
And deemed they dream'd anew;
Steadfast each eye upon thee set,
Fondly besought thy stay,
Fearful that loveliness like thine
Too soon would pass away.
Joyous as when the light of truth,
Long sought and long concealed,
Bursts on the mind, the sage beheld
Thy wondrous charms revealed—
The sickly lamp, the musty page,
Incontinent forsook,
And lit by thee went forth to gaze
On nature's glorious book.
Then, too, the quickening bosom
With more wondrous tumult heaved,
And answering eyes to eyes confessed
The tale that ne'er deceived;
Then young affection revelled in
A joy before unknown,
And the lover, lovely queen of heaven,
Thy radiance claimed his own.
And bless thee, "bonnie Lady Moon!"
To me thou still hast been
A beam of joy—a beacon light
Mid life's beclouded scene:
Oh! ever smile as thou wert wont
In boyhood's happy day,
For wisdom, love, and friendship, all
Are ripened by thy ray.

[The above is from the "Poetical Remains of the late Robert Fraser, editor of the *Fife Herald*," just published. From a memoir connected with this modest volume, we learn that the author was for the most part of his life a tradesman, but one who, while discharging every ordinary duty, was indefatigable in improving his mind and cultivating its powers, which seem to have been of a singular kind. Misfortune and early death nevertheless overtook him, and the volume is published for the benefit of his surviving family.]

TRUTH.

Adhere always rigidly and undeviatingly to truth; but while you express what is true, express it in a pleasing manner. Truth is the picture, the manner is the frame that displays it to advantage. If a man blends his angry passions with his search after truth, become his superior by suppressing yours, and attend only to the justice and force of his reasoning. Truth, conveyed in austere and acrimonious language, seldom has a salutary effect, since we reject the truth, because we are prejudiced against the mode of communication. The heart must be won before the intellect can be informed. A man may betray the cause of truth by his unreasonable zeal, as he destroys its salutary effects by the acrimony of his manner. Whoever would be a successful instructor must first become a mild and affectionate friend.—*Newspaper paragraph*.

BONE DUST FOR THE CULTIVATION OF GRAIN.

The exportation of bones from Germany to England constitutes a singular epoch in the annals of commerce. Myriads of tons have been already exported without glutting the market, or causing a cessation of the demand. In the North Sea, mills have been erected to pulverise them. This bone powder, or dust, was long ago exclusively applied to the purposes of hot-houses by German horticulturists; but the English, emboldened by their riches, have extended its use to general objects of agriculture, and fertilise, by these expensive means, their cold, humid, and poorest land; and have thus brought the uplands of Nottinghamshire, the western parts of Holderness, &c., into the highest state of cultivation, both in point of extent and intenseness of fertility. There is, consequently, a proverb, "that one ton of German bone dust saves the importation of ten tons of German corn." As Malta formerly covered her naked rocks with foreign soil, so does England now fertilise her clay and sandy heaths with German bones. Near the sea-coast, even the churchyards are robbed of their venerable relics, which is only ironically excused by rendering the German bone trade popular. An agriculturist, being rendered attentive by this vast exportation, instituted privately some comparative experiments, the results of which prove that bone dust acts in the cultivation of ground, as compared with the best stable manure—1. In respect to the quality of corn as seven to five. 2. In respect to the quantity as five to four. 3. In respect to the durability of the energy of the soils as three to two. It produces several collateral advantages. 1. It destroys weeds.

2. It diminishes the necessity of suffering the land to lie fallow. 3. This concentrated manure, or substitute for manure, is more easy of conveyance, less laborious to spread, and can with facility be applied to the steepest vineyards or other inaccessible lands, either in mountainous countries or in wet meadow land. 4. It renders agriculture practicable without cattle breeding, grazing, &c.—*Repertory of Inventions*.

MEWS.

The name of a collection of coach-houses and stables, now universally adopted, is the word *mews*—a word which has no connection whatever with such buildings. The application of the term originated from this circumstance: The royal stables at Lomesbury, now called Bloomsbury, having been burnt in 1537, Henry VIII. removed the hawks from the *mews*, and had them fitted up as stables, which continued to be called the King's *Mews*, although occupied by his horses.—*Newspaper paragraph*.

VITRULIUS RIVER.

Although sulphur is found to exist more or less in the vicinity of every volcano, the only instance with which we are acquainted of sulphuric acid being found in a state of nature, is in the island of Java, near Batavia, the capital. A lake of sulphuric acid occupies the crater of an extinct volcano, from which reservoir it flows in a rivulet down the sides of the mountain to a considerable distance. During the dry season of the year, this remarkable stream becomes absorbed by the thirsty arenaceous soil through which it runs; but in the rainy period it forms a confluence with another stream called the White River. The water of the latter, although saturated with a whitish clay, is not pernicious, far less fatal, either to fish or other animals. But the moment it is joined by the acid rivulet, the stream becomes transparent from the acid precipitating the earthy matter which it holds in solution; and it not only destroys the fish, but also the whole of the vegetation over which it passes.

GETTING UP A NEWSPAPER.

So many articles have been written upon the particular woes and troubles, cares and anxieties, of newspaper editors, that the subject has become somewhat stale. For that reason we have always, as much as possible, avoided any allusion to the topics upon which so many *Jeremiads* have been written. This week we are tempted to administer a little reproof to some people, who expect that every article, in every paper, should suit every body. What would a shoemaker, for instance, say to a customer, who should find fault because every pair of boots in the store would not fit his foot, and thereupon undertake to tell him that he was no workman, but a botch? Or, even if he were more reasonable than this, and merely denounced all boots that did not fit him as good for nothing and useless to every body, would he not write him down an ass? Yet such is precisely the conduct of those who measure a newspaper by their own standard of taste, and expect it uniformly to conform to that. Now, be it known to such sapient judges, that the endeavour of an experienced caterer for a newspaper is to avoid pleasing them every week. If a shoemaker turned out all his work upon one last, he would find his patrons in a minority of the boot-wearing public. The best evidence of editorial skill is to present such a varied *mélange*, from week to week, as shall offer to all tastes, not too hypercritical, a chance to find something for their peculiar gratification. Other critics expect uniform correctness and infallibility in a newspaper. They would have it, that editors should be perfect in knowledge upon all subjects, incapable of error, and above the failings to which poor human nature is liable. They expect comments upon all that is passing in the world, and that rumours be published while they are new; and there must, notwithstanding, be no mistake in any statement. There must be no omission of any circumstance; no delay to procure attested accounts—and yet the story must be such as to leave no errors to be corrected. A very little reflection would show such critics that they are expecting a little more than they would like to be compelled themselves to have to accomplish.—*Waterford Chronicle*.

TEMPERANCE IN IRELAND.

Several of the Irish papers speak in the highest terms of the indefatigable labours of a Catholic clergyman of the name of Mathew, in the cause of temperance. "Sixty thousand persons," says the *Dublin Evening Post*, "he has already blessed—sixty thousand drunkards has he already redeemed from degradation and from sin, and there is not a single instance of a relapse. In Cork, from small beginnings, temperance has at length spread through the lanes and alleys of the city, and to such a surprising extent, that hundreds of the low whisky shops have been shut up. In the town of Killybeg—certainly a jovial place—a similar change has been wrought. In Tralee great progress has been made. But the city of Limerick is said to exhibit the most extraordinary change. Some of the shebeen shopkeepers have given up business altogether, others of the better class are converting their tenements into coffee-houses, and we have the authority of the mayor—himself a teetotaler and good Protestant—for the fact, that the change in the habits of the people is perfectly marvellous. In Clonmel, a great and salutary change is also apparent; and we know, from the statement of the secretary of the Mining Company of Ireland, that in the wildest part of Tipperary, at the mines of the company in the barony of Slieveadagh, many miles from any town, most of the persons employed in the works, from being drunken and disorderly, have become quite reformed. The most drunken hole in the county of Waterford was Dungarvan. Within a few months it has declared in favour of temperance, and great progress is made in the same blessed cause in the city of Waterford. The happy contagion has not yet crossed the Shannon, nor has it been felt generally, we believe, in the north. It is progressing, however, towards Dublin. There is, for example, a flourishing temperance society in Leixlip.—*Recent newspaper intelligence*.

PRICE THREE HALFPENCE.

LIVING IN PARIS.

BY GIBBONS MERLE.

My observations on this subject are intended to be comparative; but a long absence from England may have exposed me to some errors, which the reader will excuse. I treat of three bodies; those who are independent by fortune, persons in trade, and the productive classes; and begin, as is usual, with the rich.

Paris is not essentially so *quartieré* [a term which the reader will presently find explained] as London, and therefore the rent of private houses does not vary to an equal extent according to the spot at which the residence is fixed. In London, the distance of a street, and sometimes of a few doors, may make a difference of 15 to 20 per cent. in house rent; and a professional man, who does not reside on the Regent Street side of Oxford Street, must not expect, whatever may be his skill, to count guineas with his colleague of the "far west." But Paris has also its fashionable districts. In the Rue de Rivoli, or the Rue de la Paix, and also in the streets immediately adjoining the Boulevard des Italiens, on the side of the Eglise de la Madeleine, the rent of a house, of thirty to fifty rooms, unfurnished, varies from 12,000 to 25,000 francs a-year [a thousand francs being about forty pounds sterling.] Few persons take an entire house. The lower part is generally let out as shops, and the remainder in floors. In the Rue Tronchet, which is behind the Madeleine, the *entresol** of a first-rate house, and which consists of about eight rooms and a kitchen, with two or three servants' rooms at the top of the house, lets for 4000 francs a-year; the first floor, with servants' rooms and coach-house and stable, for 7000 to 8000 francs; the second floor, with stable, coach-house, and servants' rooms, 5000 to 6000 francs; the third floor, with servants' rooms, for 3000 to 4000 francs; and the fourth from 2000 to 2500 francs, with one or two servants' rooms. A house of similar size, and similarly situated as to the quarter, would not let in London for more than L.600, or, at the utmost, L.700 a-year. The amount of taxes paid by the tenant in Paris, is certainly less than in London. It never exceeds 10 per cent. upon the amount of rent, and frequently is not so much.† The rent of shops in good situations is very heavy. In the Palais Royal, the smallest shop, with one or two dwelling-rooms, cannot be had for less than 3000 francs a-year, and in the streets of trade, the prices are little lower than in the Palais Royal.

The lowest-rented houses in Paris, with the exception of the outskirts, are in the faubourg St Germain. By merely crossing the river, and at ten minutes' walk

from the Tuileries, good houses and apartments may be had at little more than half the prices above mentioned. This quarter is unfashionable, but the houses are fully equal to the best houses of the opposite side of the river. Why there should be a difference of 50 per cent. between the faubourg St Germain and the quarter of the Chaussée d'Antin, whilst in the quarters near the latter there is not a greater difference than of from 10 to 20 per cent., is not to be explained. The faubourg St Germain is more aristocratic than any other part of Paris, for here the old nobility reside. In Paris the aristocracy of wealth vie with each other in display, and wish to be fashionable. This may be one reason for the great difference in question, but it is not by itself a satisfactory explanation. House rent in Paris absorbs a much larger portion of the income of the rich than it does in London, but the difference in the style of living is such, that whilst of an income of two thousand pounds a-year in Paris three or four hundred pounds may be thus employed, being probably 25 per cent. more than in London, when the most fashionable quarter of the town is not fixed upon for a residence, the remainder gives at least 33 per cent. in favour of the Paris resident. As many servants may be kept, but their wages are lower, and they are kept at less expense. No tax is paid upon them as in England, nor is there any tax upon horses and carriages. In England these taxes are of considerable amount, and increase in proportion with the number of servants, horses, and carriages. The style of living is different. Dinner parties are comparatively of rare occurrence; only a small quantity of the more expensive wines is used, and these are on an average 15 per cent. cheaper than the same qualities in England. Evening parties not being followed by suppers, are much less expensive than in England. In every thing, generally speaking, even to the liveries of servants, what would be thought shabby in London is stylish in Paris, and it is only amongst what the French call the *parvenus* that competition in expenditure is considered necessary. Where there are children, education, which among the higher classes is very expensive in London, is cheap in Paris: very good masters are to be had for three francs per lesson, and many of the most wealthy families do not even pay so much. With the rich, therefore, Paris is a desirable place of residence, and it is not so much so because things are cheaper than in London, but because in Paris the habits of the rich are not in themselves so expensive as in the English metropolis. There are in Paris many English families, who, with an income of about two thousand pounds sterling each, live in very good style, and lay by a fourth of their income, whereas in London the force of example would drive them beyond their means.

The *bourgeoisie* of Paris are less favoured than persons of large and fixed incomes. They earn less than English tradesmen, and the necessities of life are on an average as expensive as in London. Compared with the returns of their business, rents with them are double what they are to London tradesmen, and fuel is more than double, even if they burn coals, which are now much used, and would become general if the bad construction of the chimnies of French houses did not prevent their use. When coals are burnt, the apartment is filled with smoke, which indeed is also the case with wood: but the French are accustomed to the latter, whilst they bear the smoke of coals in horror. The following prices of some of the necessities of life in Paris will enable the reader to judge of the truth of the above observations.

Bread is on an average 4 sous (2d.) per pound, whilst

the fancy bread, called *pain de gruau*, which is generally used for breakfast when the means of the consumer permit, and which is not subject to tariff, costs at the rate of from 8 to 13 sous per pound;* according to the conscience of the baker. Butcher meat costs on an average 15 sous per pound, good loaf sugar, 18 sous; very inferior tallow candles, 15 sous; butter, of the best quality, from 24 to 42 sous, according to the season; milk, about 8 sous per quart; black tea, 6 francs per pound [a franc being tenpence of our money], and green, from 7 to 10 francs; fish, on an average, double the London price; coals, 65 to 75 francs per ton; ordinary wine, which is certainly not equal as the usual beverage at meals to good English beer, 60 to 70 francs, which, added to the *octroi*, or town duty, which it pays on entering Paris, makes it from 110 to 120 francs per cask of about 280 bottles, or about 12 sous per English quart. Poultry is on an average quite as dear if not dearer than in London; a good sized fowl never costs less than 3 francs, and frequently 6 francs; game varies much, but on the average is nearly that of the London market; vegetables are much cheaper in Paris than in London, and as they form a considerable part of the food of the middle classes, enable the tradesman to economise in the support of his family. Many of the most respectable tradesmen who on the Sunday treat their wives and children with a jaunt into the country, or a dinner at a restaurant in Paris, have nothing for dinner during the week but the *pot au feu*, which is beef boiled gently into soup, with abundance of vegetables, and a dish of the white beans called *haricots*, boiled and mixed with butter, a very cheap and nutritious diet. This, with bread and a salad, and for beverage ordinary wine weakened with twice or thrice its bulk of water, and hence called *eau rouge*, is the usual dinner of half the leading shopkeepers of Paris. Were it not for such economy, they could not pay their rent and *patente*, whereas they continue not only to exist, and to be always well dressed, but to lay by annually a small sum, with which, in time, they retire to the country, and on an independence of three or four thousand francs a-year, become *rentiers*, and aspirants to the municipal offices of their communes. The breakfast with this class is a very simple affair. It is a little *café au lait*, with dry bread, or a basin of soup, with a slice of cold meat from the *pot au feu*, or a dish of vegetables. Clothing is a very expensive article in Paris. Linen, of good quality, is a fourth dearer than in London; articles of woollen or cotton at least a third dearer. Shoes are a little cheaper, but hats are dearer, and the charges of tailors are about the same. The greatest advantage the Paris tradesman has over persons of the same class in London, is in the cheapness and the excellence of the education for his sons. There are several colleges, in which, for L.4 to L.8 English per annum, a boy may receive the most finished education, without board; consequently there are few respectable tradesmen's sons in Paris who have not to a certain extent a classical education. Here, however, the advantage stops; when the youth enters into active life either as a master or as an assistant, he has none of those opportunities of improving his mind which are so numerous in London. There are no scientific institutions of which he can become a member, like the London Institution, the Marylebone Institution, and fifty others, which form the pride and honour of the British metropolis. He may, indeed, attend the lectures of various professors without cost, but the spirit of association which makes learning attractive, and the *esprit de corps* by which young men

* The *entresol* is little known in London; it is a set of rooms of low ceilings, between the shops and the first floor. Where there are shops—and very few houses in public situations are without them—they are either let out to the occupants of the shops, or are taken by merchants for counting-houses, or by professional men as offices. This part of the house is but rarely occupied by persons out of trade, except by the proprietors of the houses themselves.

† Although the taxes on houses which are paid by the tenant are not so high as in England, the taxation in large towns is generally high, for every person in business pays for a licence or *patente*, which varies, according to the occupation of the person, from 5 to 500 francs per annum. All public establishments, such as hotels and coffee-houses, have to pay according to their rent. The *patente* alone, in some cases, costs from 2000 to 3000 francs a-year. The owners of property, also, have to pay the tax *foncière*. There is another tax in France which is very productive to the state. Every lease or other agreement, every contract or sale, is liable to the *droit d'enregistrement*, which varies from two per cent. upwards. The average amount of taxation per head in France is indeed little more than 10 francs, which is much less than in England, but in some towns this tax amounts to a much greater sum. The principle of taxation in France is to make the rich pay for the poor, and the trading towns for those in which little business is done.

* The French pound is equal to about seventeen and a half English pence.

are bound together in London by their institutions, is wanting.

On the whole, if the Paris tradesman is better off than the London tradesman, it is not because rents and the necessities of life are lower in one capital than the other: it is because he regulates his habits by his circumstances, and his expenditure is governed by his means of obtaining the comforts of life, without expecting that those comforts should assume the character of luxuries, and the cost of obtaining them be brought down to the level of created inclinations. He gives fewer dinner parties than the London tradesman; and when he does give them, he does not feel that it is necessary to show his hospitality, or the superiority of his purse, by forcing his guests to get drunk with expensive wines; and when he follows the English fashion of grog-drinking, he does not devour large tumblerfuls of rum and water because rum is dearer than brandy in France, as some English tradesmen drink brandy in England because it is dearer than gin. His greatest indulgence (I am speaking of the class, of course, and not of individual exceptions) is a cup of coffee or a bottle of beer at the coffee-house in the evening, where he plays a game of billiards or dominos. If his wife has her evening party, a little tea and some cakes, with *eau sucrée*, and perhaps a glass of sweet wine, are all that her guests expect; and this, it will be allowed, is not seeing company at a very dear rate. But the great happiness, the great superiority of the French tradesman, consists in the equality, which is all perhaps that has resisted the encroachments of successive governments upon the spirit of the great revolution. The tradesman has no notion for aping what is called quality, for he is as independent of the idle rich as they are beyond him in the means of display; and no title commands homage in France merely because it is a title. The tradesman does not disgrace himself in the morning by going bareheaded to the carriage which stops at his door, and indemnify himself in the afternoon by driving his cabriolet through the public promenades with a splendidly dressed groom at his side, or behind the carriage. The ambition of the French tradesman is to be independent in circumstances; he feels that he is already so by position. The comparatively economical habits of the French tradesman do not depend entirely on his natural temperament, the force of example, or the way in which he has been trained to commercial pursuits. The law relative to bankruptcies contributes much towards his dread of speculation, and the control of his expenditure. In England, where there is no penalty attached to over-trading beyond that which a man inflicts upon himself, the evil of such conduct is twofold. The tradesman not only gets involved frequently deeper and deeper, by launching out, when he is in a small difficulty, in the hope that a bold effort may bring back all his losses, and with the conviction that if he should fail, a bankruptcy for a large amount is considered by the world to be more "respectable" than for a small one, but as his speculations are upon a large scale, he is accustomed to take less heed of his expenditure, which is apportioned to the extent of his dealings rather than the profits which they produce. He does not always reflect that the one is fictitious, and the other is real. In France the law requires that the tradesman shall keep an account of all his domestic expenditure, even to the milk that he uses for his breakfast, and the money that he expends in what the English call pocket-money, but which comes under the head of *menus plaisirs* in France. It regards almost as fraudulent any speculation with the money of his creditors, and compels him to declare himself a bankrupt when he owes twice as much as he has the means of paying, either in money, or in stock and good debts. It is indeed true that where the expenditure for himself has not been profligate, the law, which subjects him, if enforced, to imprisonment for simple bankruptcy, is rarely exercised, and even in the case of over-trading without means, great leniency is generally shown; but the possibility of being made to suffer by some hostile creditor, operates as a check both upon wanton expenditure and over-trading. The application of the criminal law to his case, however, is not all that he has to fear. A bankruptcy in France deprives the bankrupt of many of his civil rights, and he can only recover them by paying in full all his debts, when, by a special and solemn process, he is restored to the position which he previously held, or, as the French say, *réhabilité*. The statement of this important fact will account for the prudence, I might say timidity, of the tradesman as to his operations, and also for his economy.

The condition of the labouring classes in Paris affords a vast field for inquiry and information. If Paris be a desirable place of residence for the rich, as respects the mode and expense of living; if it offers resources to the trading classes equal to the desires which they feel, it is still more favourable to the

industrious poor; for although provisions are enormously dear, as compared with many other parts of France, the wages of workmen are more than proportionably high. But it is only to the industrious and honest workman that Paris offers peculiar advantages. He who would save money from what he earns, must be uncorrupted when he arrives in the capital, and have a mind strong enough to prevent his being led astray. There is no capital in Europe, not even London, where there are so many temptations to idleness and profligacy, and none in which the upper and middle classes have done so little for the instruction and comfort of the various grades of labouring men. London has her Mechanics' Institutions. Paris has none, or rather it has none worthy of the name. London abounds with coffee-shops, many of which are highly respectable, and afford opportunities to the workman to obtain refreshment at a cheap rate, and to peruse amusing, but at the same time instructive, works. London, with all its vice, is at least free from the presence of returned *forçats* (galley-slaves), who infest Paris, and who are not satisfied with not working themselves, and with deriving a subsistence from theft, but endeavour also to deter others from industrious pursuits, and to seduce them to their own course. If London has gin-shops and public-houses, Paris has its wine-shops and cabarets, and the amusements outside the barriers on the Sunday, and on the Saint Monday, which is regularly observed every week by immense numbers of French workmen, are not always of that innocent nature which many tourists have been pleased to describe. The Parisian workman is very far from the *beau idéal* of the labouring classes in France. He earns more and works less. He discusses politics when he should be at his loom or his lathe, and becomes affiliated with secret societies for the improvement of the state, before he has done any thing to cultivate his own mind. If drunkenness be not so apparent to the Englishman who visits Paris as it is in London, it is because he does not frequent the places in which it is carried on. Let him go on Sunday or Monday to the *quinquettes* on the outer side of the barriers, and his belief that the French lower orders are sober, will rapidly cease. But to the sober, honest, and industrious workman, Paris is full of advantages. He knows that by patience and perseverance he may realise a small fund, with which he can commence business on his own account, and that all the persons with whom his master deals, will give him credit as readily as if he were already rich. His mind is not weighed down by any conviction that he is regarded as an inferior. There is no aristocratical feeling in society to prevent his rise. When he can pay the tax of a *patente*, he becomes a *bourgeois* like his former master, and his respectability is not appreciated, as in England, by the extent of his gains. When he sees the nobility taking pride in the titles to esteem which are conferred by trade, and feels that he, although in a more limited sphere, may obtain equal esteem, he has a stimulus before him which nothing can destroy. No one says of a tradesman, by way of sneer, "that man rose from nothing;" and if it be said at all, it is in the way of honour. He is a member of the National Guard, and by the side of him, also in the uniform of a private, is a wealthy banker or merchant. He goes on carefully and quietly, until, by the esteem of his fellow-comrades, he carries his election as an officer, and knows that he is then eligible to be appointed a commandant, which gives him the right, when on guard at the palace, of dining with the king. Even the bench of justice is open to him, for by election he may become a member of the Tribunal of Commerce, and sit in judicial robes, as if he had been bred to the bar. In a country where trade is honoured by all who engage in it, and where the laws and usages require that it be respected by all classes, he has every inducement to the exercise of his industry, and the attainment of a position which gives him importance in his own estimation and in that of the world. And when he considers that this is attainable by the means which industry creates, and by the economy which his ambition commands, he feels that the position at which he aims is within his grasp.

The wages in Paris of the ordinary workmen in handicraft vary from two francs and a half to six francs per day, for about fourteen hours' labour. Those of labourers, who are called *hommes de peine*, vary from one franc and a half to two francs and a half. In many of the provinces they do not exceed half this amount. Now, allowing that lodgings and provisions are twenty-five per cent. dearer than in some parts of the country, there is still an advantage of twenty-five per cent. in favour of Paris. A good and prudent workman may, in five or six years, realise sufficient to begin business in a small way on his own account; for in Paris, a small capital in trade, with good management and good credit, goes a great way. The expenditure of a French workman on mere articles of food is very small. Many of them live on fifteen or sixteen sous per day when they are without families, and the surplus of their wages is either laid by or expended in carousing at the barriers. It is not a hardship to the dissolute workman to live on bread and vegetables, with now and then a little wine and meat, so that he may have two or three francs or more to spend at the *quinquette*; and the prudent workman eats his crust with an apple or an onion with relish, knowing that he is daily adding to his reserved fund. A *pot au feu*, with half a pound of meat, and a good quantity of vegetables will serve him for two days. If he be a mar-

ried man, this is prepared by his wife, who does not, as in England, send four or five pounds of meat to a baker's, to be dried up into the volume of two or three. A dish of *haricots*, which, with a little butter, costs five or six sous, serves for the dinner of his wife, a child, and himself. Bread and vegetables complete the feast. When bread, indeed, is dear, he suffers, because this is the staple food of his family as regards their breakfast and dinner, but the average price is quite within his means. The surplus of his earnings is carried to a Savings' Bank, and it is only in seasons when work is not to be had, which are not of very frequent occurrence, that he touches this reserve.

HYBERNATION OR WINTER SLEEP OF ANIMALS.

MANY animals are so constituted, that during the winter season the activity of their functions is greatly impaired by the reduction of temperature, and they pass into a peculiar condition called hybernation,* which bears a strong resemblance to ordinary sleep. Naturalists and physiologists have sought in vain for either external or internal characters of general application, by which they might distinguish the species likely to be subjected to this singular but wisely appointed lethargy. It is a provisional faculty, dependent on external circumstances, and may be interrupted, postponed, or altogether prevented, by regulating the conditions under which the animal is placed. Hybernation is induced by a moderately low temperature, but extreme cold destroys it, so that it differs essentially from that state of torpor which cold produces in any animal by benumbing the sentient nerves, and stiffening the muscles. Many physiologists have mistaken this state of animals for that of true hybernation, but the two conditions are quite different. In the latter, the mobility of the muscles remains unimpaired, not the slightest stiffness being observable, and the sensibility of the nerves is as perfect as it is in ordinary sleep. The lethargy, indeed, is sleep, not torpidity. It is a property peculiar to a few species, which, however, differ very materially in other respects, as will be perceived when we name as familiar instances the dormouse, the hedgehog, and the bat. When the decreasing temperature of autumn reminds them that they, like a campaigning army, must look about them for cantonments into which they may retire for the winter (for all hybernating animals avoid exposure to extreme cold), each according to its species seeks out its place of repose. This is either in the earth, among old walls, in caverns, trunks of trees, or bushes, which retreats are usually lined with dried herbs, grasses, leaves, or moss. The bat chooses caverns, churches, barns, and other situations where the temperature is milder than that of the open air; and, contrary to the usual practice, it suspends itself by the hooked claws of its hinder extremities. Other hybernating animals contract themselves into balls, so as to expose the smallest possible surface to the air.

The phenomena of hybernation have been very carefully observed by Dr Marshall Hall, and an able paper of his in the Philosophical Transactions, enables us to present some interesting particulars regarding this singular "second course" of nature. It appears that respiration is almost wholly suspended during hybernation—a fact so remarkable, that it would require strong proof to convince us of its truth, and this we fortunately have. Amongst other experiments to which Dr Hall had recourse, was one in which a bat was placed in a vessel so contrived that any absorption of air which might take place could be readily ascertained. The animal was allowed to remain a whole night in the vessel, and when the contained air was examined, no alteration could be perceived in it. On other occasions, however, when the bat was aroused for a little from its lethargy, air was consumed, and its amount was always in exact proportion to the length of time in which the animal was kept in a state of activity. Additional evidence is afforded by the fact, that the temperature of animals in this state accurately follows that of the atmosphere around them. When the temperature fell in the air, it was found to fall in the animal also, and vice versa. It is well known that in the act of respiration the air absorbed by the lungs gives out a quantity of heat to the system, and thus raises its temperature above that of the atmosphere in all ordinary circumstances. This is an invariable consequence of respiration; and when, therefore, a living body is found to have no higher temperature than the air which surrounds it, it may

* Hybernation is from the Latin *hibernare*, to go into winter quarters.

oe fairly inferred that in that body respiration is very nearly suspended. The last proof of this fact which we shall notice is, that the lethargic animal is capable of bearing the total abstraction of atmospheric air or oxygen gas for a considerable time, and can live for several hours in carbonic acid, a gas of so deadly a nature that it instantaneously destroys the life of any animal when in its active natural state. The celebrated Spallanzani kept a marmot four hours immersed in this gas, and it remained unaffected by it. A rat and a bird put in along with it perished in an instant. Bats and hedgehogs were found by Dr Hall to sustain submergence in water, the first for sixteen minutes, the second for twenty-two minutes, and appeared to be quite uninjured by the experiment. The possibility of bats enduring submergence in water was curiously proved on one occasion, by their being found to live under the arch of a very low bridge, which the water filled completely on the occasion of every little flood. The floods often lasted a whole day, and yet the bats passed every winter there in perfect security. In their active state these animals "bear no charmed life," but down as fast as any others.

Some striking facts connected with surgery and medicine were illustrated by Dr Hall's experiments. It was proved that the irritability* of the heart is augmented during continued lethargy in an extraordinary degree; that the irritability of the left side of the heart is then nearly as great as that of the right, this not being the case in ordinary circumstances; and that in this condition of the animal system, the action of the heart continues for a considerable period independently of the brain and spinal marrow. These facts will be more interesting to the medical man than to the general reader, but they are sufficiently remarkable to be mentioned here. They constitute one of the numberless proofs of wisdom and design to be found in the works of creation, by which provision has been made for the well-being of every living thing. As respiration is nearly suspended in the hibernating animal, had not irritability become proportionately augmented, the actions of life must have ceased!

It is very generally stated that in animals in this state of lethargy, sensibility is greatly impaired; but Dr Hall asserts that this is a great mistake. In those animals upon which he experimented, he found the reverse to be the case, and that in hibernation the sensibility is nearly the same as in ordinary sleep. The slightest touch applied to one of the spines of the hedgehog immediately roused it to draw a deep and sonorous inspiration. The gentlest shake induces inspirations in the bat. In fact, it appears that the least disturbance given to the animal is immediately felt by it, for it begins to move. On the other hand, the sensorial functions are nearly suspended. This is proved by the suspension of respiration, which is immediately renewed for a time on exciting the animal. It is further proved by the fact, that although the animal coils itself up when touched, it immediately relaxes into the former position, whereas when it is awake such contraction and immobility are continued for some time. When the hedgehog coiled up in its state of activity is thrown into water, it immediately relaxes itself from fear, and takes to swimming. In the state of lethargy on the other hand, no fear appears to be excited under such circumstances, and the animal would probably remain still and quiet for a considerable period, if its sensibility were not acted upon by the contact of water. As has already been observed, neither stiffness nor lameness is induced by hibernation, the mobility or power of moving the muscles, like the sensibility, remaining unimpaired. The hedgehog, when roused, walks about and does not stagger, as some have asserted. The bat speedily takes wing and flies about with great activity, although exhaustion and death may subsequently result from the experiment. This is a very remarkable fact, and introduces the subject of reviviscence, or the renewal of active life. If an animal during its hibernation be kept in a state of excitement for any length of time, it will die. To explain this, it is necessary to revert to the fact, that during this lethargy a great irritability of the left side of the heart is induced; and this irritability co-existing with that high respiration which immediately follows any disturbance, and with arterialised blood, is found to be incompatible with life. In short, in a state of hibernation, respiration, suddenly restored and permanently excited, is as destructive as its privation in other circumstances. How

admirable then is that instinct which prompts hibernating animals to seek out such sheltered situations as caverns, burrows, lonely churches, deserted wells and the like, where they may be at once secure from the rapid changes and inclemencies of the weather, and from other causes of disturbance! A cold atmosphere excites them into activity as well as an augmentation of temperature.

By a very delicately managed and perfectly satisfactory experiment, Dr Hall ascertained that in hibernating animals the circulation of the blood proceeds uninterruptedly, but more slowly, the blood being what is called venous. Before it can be rendered arterial, it must be acted upon, by air drawn into the lungs in the ordinary process of breathing; but as this is almost entirely suspended during lethargy, there is of course no air to change the blood, so that it remains venous. When the hibernating animal is in its state of activity, the heart is precisely in the same condition as it is in all other mammalia; but it becomes quite altered, or what is technically called "veno-contractile," in lethargy. "This phenomenon," says Dr Hall, "is one of the most remarkable presented to me in the whole animal kingdom. It forms the single exception to the most general rule, amongst animals which possess a double heart. It accounts for the possibility of immersion in water or a noxious gas without drowning or asphyxia, and it accounts for the possibility of a suspended respiration without the feeling of oppression or pain, although sensation be unimpaired. It is, in a word, this peculiar phenomenon which, conjoined with the peculiar effect of sleep in inducing diminished respiration in hibernating animals, constitutes the susceptibility and capability of taking on the hibernating state."

Animals take very little food during the period of their lethargy, but much difference is observed amongst them in regard to the quantity which they do take, and the fact affords another proof of the admirable adaptation of animals to the situation in which they are placed. The bat, which feeds on insects, would awake in vain amidst the frost and snow of winter; no food could be found. Hence in the bat no disposition to awake from a desire to take food has been observed—it is only aroused by external warmth or by excitement. The hedgehog, again, as it feeds on snails and worms, might find a small supply of these savoury dishes if the ground be not baked into a pavement by the frost. Accordingly, it awakes after various intervals of two, three, or four days passed in lethargy, to take food, and again returns to its state of hibernation. The dormouse feeds on grain and fruits, which there is much less difficulty in getting than there is in finding any of the other articles of diet, and accordingly the dormouse awakes daily during hibernation. The operations of the stomach and viscera are found to be exactly proportionate to the disposition to awake and take food. This appears to increase after a time, and, in combination with the warmth of spring, again calls the animals from their winter quarters into active life. Between thirty and forty degrees of Fahrenheit seems to be the temperature best fitted to induce hibernation. Methods which secure moderation in temperature lead to this state. Thus, hedgehogs supplied with hay or straw, and dormice with cotton wool, make themselves nests, and become lethargic; when other animals of the same species, deprived of these materials, and exposed to a higher degree of cold, remain quite active.

Some animals in warm climates pass into a state of hibernation, as well as those of the colder zone. The tenrec, a species of hedgehog found in Madagascar, becomes lethargic for some months in the year, and is only to be found when the summer heat is felt, which being generally ushered in by an electric state of the atmosphere, the negroes (with whom they are a favourite food) say they are awakened by the peals of thunder which precede the summer storms.

Many cold-blooded animals are regarded as of the hibernating kind, although we doubt if the state of lethargy to which they are subjected be the true hibernation described by Dr Hall. But, at all events, the greater proportion of reptiles, insects, molluscous animals, &c., inhabiting both cold and hot countries, pass a part of the year in a state of lethargy, during which they usually take no food. Humboldt describes certain reptiles in South America which pass a portion of the year buried in the earth, and which are only aroused by the occurrence of rainy weather, or the excitement of violent means. "The manners of animals," says he, "vary in the same species, according to local circumstances difficult to investigate. We were shown a hut, or rather a kind of shed, in which our host of Calabozza, Don Miguel Cousin, had witnessed a very extraordinary scene. Sleeping with one of his friends on a bench covered with leather, Don Miguel was awakened early in the morning by violent shakes and a horrible noise. Clods of earth were thrown into the middle of the hut. Presently a young crocodile, two or three feet long, issued from under the bed, darted at a dog which lay at the threshold of the door, and missing him in the impetuosity of his spring, ran towards the beach to attain the river. On examining the spot where the bedstead was placed, the cause of this strange adventure was soon discovered. The ground was disturbed to a considerable depth. It was dried mud that had covered the crocodile in that state of lethargy, or summer sleep, in which many of the species lie, during the absence of the rains, amid the llanos. The noise of men and horses, perhaps the

smell of the dog, had awakened the crocodile. The hut being placed at the edge of the pool, and inundated during part of the year, the crocodile had no doubt entered, at the time of the inundation of the savannahs, by the same opening by which Mr Pozo saw it go out. The Indians often find enormous boas, which they call uji, or water serpents, in the same lethargic state. To re-animate them, they must be wetted with water, or irritated."

Taking all the foregoing facts together, it appears to us that hibernation is a wise provision of nature for preserving the lives of certain animals during a part of the year when they were likely to perish for want of a sufficient supply of their ordinary food.

FUGITIVE WRITINGS OF JAMES BOSWELL.

OF James Boswell as the biographer of Johnson, the merits and demerits have been amply discussed. Let us turn from the consideration of these, and think of him, for a time, as simply what he appeared to his friends in life, the drollest, most whimsical, and most mirth-exciting of mortals—a man, as we have heard a contemporary of his own* remark, in whose face it was impossible to look without laughing—an eccentric, but upon the whole an innocent and well-meaning man. While considering him in this aspect, the reader may allow us to revive and bring before him some specimens of the fugitive writings of Boswell. Many of these contain no small share of humour, and all are more or less characteristic of one who was certainly in most respects a singular, and in many an interesting person.

There is a curious and rare volume of light-headed letters, written partly by Boswell, which he published in London in 1763, the year in which he formed the acquaintance of Johnson. Few men have ever perhaps given such compositions to the world, with their name, even at the early age (twenty-three) which Boswell had now reached. And what makes the case the more singular, the title-page also exposed the full name of his correspondent, the Honourable Andrew Erskine, a younger brother of the well-known musical Earl of Kelly. Frivolity, unchecked by any just sense of the world's opinion, could alone have prompted such a publication; yet it is impossible now to read it without experiencing some sympathy with the genuine youthful overflow of spirits which may be said to form the matter of the book. In the first letter, Boswell to Erskine, dated from Auchinleck, August the 25th, 1761, the writer says:—"You see I retain my usual volatility. The Boswells, you know, came over from Normandy with William the Conqueror, and some of us possess the spirit of our ancestors the French. I do for one. A pleasant spirit it is. *Vive la Bagatelle* is the maxim. A light heart may bid defiance to fortune." Then, as if to prove how truly he possessed the spirit of bagatelle, he adds—"Write to me soon. Your letters, I prophesy, will entertain me not a little, and will besides be extremely servicable in many respects. They will supply me with oil to my lamps, grease to my wheels, and blacking to my shoes. They will furnish me with strings to my fiddle, lashes to my whip, lining to my breeches, and buttons to my coat. They will make charming spurs, excellent knee-buckles, and inimitable watch-keys. In short, while they last I shall neither want breakfast, dinner, nor supper. I shall keep a couple of horses, and I shall sleep upon a bed of down. I shall be in France this year, and in Spain the next, with many other particulars too tedious to mention."

The second volume of "A Collection of Original Poems by Scotch Gentlemen," published by Donaldson of Edinburgh in 1762, contains many light trifles by Boswell—amongst others, one upon himself, in which he lets out the leading principle of his literary life—

—"not a bent sixpence cares he,
Whether with him or at him you laugh."

We hasten from these *jeux-d'esprit*, many of which are dull enough, to a very curious poem which he is said to have aided in writing, some years later, in burlesque of the procedure of a criminal trial before the Circuit Court of Justiciary. Some other gentlemen, like himself advocates at the Scottish bar, are said to have also had a share in this whimsical composition. Unfortunately, no manuscript of the *Justiciary Opera* was preserved; and we have only some fragments of it, which were taken down, at a comparatively recent period, from the mouths of gentlemen who recollected hearing it recited. These were printed privately by the late Sir Alexander Boswell, eldest son of the bio-

* Irritability is a term used by anatomists to indicate that property peculiar to the muscles of the animal frame, by which they contract when touched, or when stimuli are applied. The power may be seen in the tremulous contraction of muscles when cut, or when separated from the body. Even after a body is dead, the power remains until the organisation yields to decay.

* The late Mr William Macfarlane, long the Judge of the Small-debt-court in Edinburgh.

grapher of Johnson—a man of not less lively faculties than his father, and of whom we shall have more to say afterwards. By Sir Alexander, a number of gaps in the original were very cleverly filled up. It is altogether a most grotesque composition, smacking strongly of the men and things of the last age. The best parts of it are here given from a volume quoted below,* in which Sir Alexander's set has been recently reprinted.

The trial is one for an assault upon an excise-officer, and Ayr is evidently the circuit town meant as the scene. The persons of the drama are—*Calendrosus Maximus*, the presiding judge; *Bombyx*, advocate for the crown, or public prosecutor; *Hystrix*, clerk; *John Black*, the pannel or culprit; *Bamboozle* and *Flawfinder*, advocates for Black; witnesses, *Pepperer*, a horse-dealer, *Bizz*, a blacksmith, *Peter Brown*, the exciseman; *Matthew Mutchkin*, *Widow Macleerie*, and a *Waiter*; likewise judges, jurymen, sheriffs, bailiffs, serjeants, macer, mob, &c. That the opening scene may be intelligible, we must premise, that the judges at a Scotch circuit town usually move from their inn to the court, in a species of procession, attended by the magistrates, and heralded by their own trumpeter.

SCENE.—An Inn.

CALIENDROSUS MAXIMUS, of HYSTRIX.

DURT.—Ayr, Saw ye my father?

Cal.—Saw ye my trumpeter?

Or saw ye my macer?

Or saw ye my man John?

Hyst.—I have not seen your trumpeter;

I have not seen your macer;

And drunk is your man John!

(Martial Music.)

Enter a waiter.

* Ayr, Hey Jenny come down to Jock!

Waiter. The bailies are waitin'—the provost is come—
Twa permanent serjeants, a sife and a drum;
Twa sherras, wi' swords (but they're peaceable men),
And some twa three mair—and the clock's clappit ten.

A Grand Procession.

SCENE.—A Hall.

Enter CALIENDROSUS MAXIMUS, BOMBYX, HYSTRIX, BAMBOOZLE, FLAW-FINDER, MACER, JURYMEN, MOB, &c.

* Ayr, Fye let us a' to the weidlin'.

Hyst. Ge—en—tlemen o' the jury.

Ye'll answer until a' your names—

Walter Balwhid o' Pidlurie.

Jurym. Here.—H. Matthew Powmuddle o' Kames.

J. Here.—H. Duncan Macwhay o' Todwiddock.

J. Here.—H. Jacob Bafour o' Howbrig.

J. Here.—H. John Macinda o' Glenpiddock.

J. Here.—H. Hew Gib in Bog o' Daljig.

J. Here.—H. Patrick Macrone o' Craig-gubbe.

J. Here.—H. George Yellowfloss in Cowshaw.

J. Here.—H. Ralph Muckelchase in Blindrubble.

J. Here.—H. Robert Macmurdock in Raw.

J. Here.—H. Andrew Mackissock in Shalloch.

J. Here.—H. Ingram Macleure in Benbole.

J. Here.—H. Gilbert Strathdee in Drummallock.

J. Here.—H. Gabriel Tam in Dirlhole.

J. Here.—H. Lowrie Macwill o' Powmuddle.

J. Here.—H. Daniel Losh o' Benskaik.

J. Here.—H. John Stoupie, writer, Kirkfuddle.

J. Here.—H. Baillie Bole, shoemaker there.

J. Here.—H. Samuel Macquairo in Craig gullion.

If present, sir, answer your name.

J. Here.—H. Quintin Maccoosh in Knoekdullion.

J. Here.—H. Gal-lery—si-lence—Ahem!

* Ayr, In the Garb of Old Gaul.

Macer. Hem!—Si-lence.

Cal. Officer, bring John Black to the bar.

(The pannel is brought in guarded, and petitions for banishment.)

Ayr, The Lee Rig.

Pannel.—O send me owre the lang seas,

My ain kind lordie O;

O send me owre the lang seas,

My ain kind lordie O.

O send me east, or send me wast,

Or send me south or nordie, O;

But send me owre the lang seas,

My ain kind lordie O.

* Ayr, Lass gin ye lo'e me tell me now.

Cal. Pannel, a halter must be your end.

The fiend, at your skirts, has now his prong;

Your days, that are number'd, in penitence spend;

But I'll lecture you, presently, half an hour long.

Mercy were folly, if lavish'd on him;

Robbing and thieving, the gallows shall check;

Our duty is plain, we'll proceed to condemn—

John Black, you shall presently hang by the neck.

Ayr, We're gayly yet.

Pannel. We're no guilty yet,

We're no guilty yet,

Although we're accused,

We're no guilty yet.

Afore ye condemn,

Ye maun hear us a bit,

For although we're accus'd

We're no guilty yet.

(Jury are chosen, and the Indictment read.)

Ayr, Grimaldi's Jig in Mother Goose.

Hyst. Whereas by the laws o' this realm,

And o' ev'ry well-governed land,

To seize on another man's gear,

(As the tangs ance a Highlandman fand.)

And whether the thief he be caught

In the fact, or be gruppit out-fang,

The law says expressly, and wisely,

That chiel by the thrapple shall hang.

And you, John Black, there, the pannel,

Ye robbit, assaulted, and a',

And sac, gang till an assize, sir,

And underlie pains o' the law.

* The Court of Session Garland. Stevenson, Edinburgh.

† The songs marked by an asterisk are by Sir Alexander Boswell.

* Ayr, Miss Macleod's Reel.

BOMBYX.

Painful the duty is, which I must now perform,
Stating a train of guilt uncommon and enorm—
Ous—calling my witnesses to make the fact out plain,
And if your verdict's guilty, my labour's not in vain.
Gentlemen, your feelings must with justice never jar,
The statutes of the land condemn the pris'ner at the bar;
The law most clearly indicates the gallows, as reward,
For culprits such as him between the soldiers of the guard.

John Black met Peter Brown, upon the king's highway,
With foul intent to rob—I fear intent to slay;
John Black, the pannel, did step up to Peter Brown,
And with his fist, or bludgeon, did knock said Peter down.

Ferocious, atrocious, felonious also,
Did then and there, with that or this, reiterate the blow;
Then seized Peter by the throat, to suffocate his cries,
And most outrageously exclaim'd "Your money, — your eyes."

Enter PETER BROWN.

* Ayr, The bonnie lass in a' the world.

Peter. The pannel's a regardless loon,

And brags that he defies man;

And bauldly threepit through the town

He'd do for the exciseman.

I thought 'twas nought but silly clash,

That sneevlin' gowks wad tell me;

Quo' I, my thum I winna fash,

It's no siclike can fell me.

Four cudgers rade through Halk-wood-stack,

I doubted Jean Macleerie;

I took the road, when up cam Black,

And dang me tapsalteerie.

He rypit, maybe, for his knife,

I thought I saw it glancin',

He took the ruc, and sav'd my life,

Syne, like a de'il, gaed dancin'.

Other witnesses are examined. Pepperer, the horse-dealer, relates, to the tune of Gala Water, that "coming frae the town o' Straiven, on his mare that had the spavin," he met the pannel near the Kirk of Shotts, and saw his assault upon the gauger. Matthew Mutchkin can only report, to the tune of Calder Fair, that, coming home drunk from Ruglen, he saw two fellows fall a-struggling, but was too far blinded by his favourite liquor to discriminate the assailant and the assaulted. Bizz the blacksmith gives a favourable view of Black's character, to the tune of Will ye gang and marry Katy? And Widow Macleerie speaks in the same strain. The prisoner's counsel then begin to plead for him:—

Ayr, De'il tak the wair.

Bamboozle.

Fye on the laws that hang a man for stealing.
Sure such penal statutes were savagely fram'd
By legislators devoid of human feeling.
Before divine religion mankind had tam'd.
Gentlemen, 'tis yours, with vigour,
To check the law's excessive rigour;
* Yours is the power, to you the choice is given,
A father—husband—bonds;
On you his fate depends:
'Tis yours to take or give,
To bid him die—or live!
Then here that mercy show, you hope from heaven.

Ayr, * * *

Flaw-Finder.

Gentlemen, now 'tis my turn to address you,
And with much speaking I need not oppress you;
The proof lies before you, in writine down taken,
All I do wish is to save this man's bacon.
But as it is usual some few things to mention,
I say, that to steal, it was not his intention;
So be not, I pray, like the Lords, in a fury,
But bring this man off, like a sensible jury.

(Charge to the Jury.)

* Ayr, Merrily Dance the Quaker.

Cal. If ever a case before me came,

That I could judge most clearly,

This is a case, I'll holdly name,

I've scrutinis'd it nearly.

To trace the truth through all its track,

No witch requires, or jugglers;

The witnesses are all a pack

Of drunkards and of smugglers.

The counsel for the Crown, with skill,

Extorted facts most glaring;

Black, when prim'd by stoup and gill,

You see, became most daring.

That Black put Brown in mortal fear,

The proof is clear—*clarissima*;

And that he rob'd, tho' not quite clear,

Presumptio est fortissima.

Gentlemen, 'tis my desire

To state the case precisely:

'Tis you to judge, so now retire,

And weigh your verdict wisely.

The proof is strong, a verdict bring,

Such honest men becoming;

I need not say one other thing,

And so I end my summing.

(Jury are enclosed.)

LOWRIE MACWILL O' POWMUDDLE, Chancellor.

JOHN STOUPIE, Clerk.

* Ayr, Ally Croaker.

Powmuddle. In this case there's nae argument,

Nae winner and nae major;

A shield had ta'en a glass, and had

A towzie wi' a gauger.

That there's nae proof o' robbery,

To see, I think, ye canna miss;

Sae we the pannel maun acquit—

No guilty, sirs—Unanimous.

Demi Chorus by

Fice Jurymen. } Unanimous, Unanimous.

Double Chorus by

Ten Jurymen. } Unanimous, Unanimous.

Grand Chorus by

the whole Fifteen. } Sae we the pannel maun acquit,

No guilty, sirs—Unanimous.

(The Verdict is returned, *Calendrosus Maximus* reads—in a passion.)

Ayr, Up and Down Frisky, and fire away Pot.

Calendrosus—

A plague o' such juries, they make such a pother,
And thus, by their folly, let pannels go free,
And still on some silly pretext or another,
Nothing is left for your Lordships and me.

Our duty, believe us,
Was not quite so grievous,
While yet we had hopes for to hang 'em up all;
But now they're acquitted,
O how we're outwidd,
We've sat eighteen hours here for nothing at all.

(Chorus by the whole Bench.)

Tol de rol, lol de rol, lol de rol, lol de rol,

Tol de rol, lol de rol, lol de rol, lol de rol,

But now they're acquitted, &c.

(Mob without huzza.)

In the same volume, under the name of the Justiciary Garland, we find some other fragments of a similar composition, in which James Boswell is said to have also had a hand. Here, however, the trial goes against the pannel, who is a Highland sheep-stealer, and he is accordingly condemned. His last speech is too serious a subject; but we give his unavailing petition for mercy to the king, which appears to be to the tune of "Let me in this ae night:—"

I am a chief of the M'Craws,
Knew nothing of your Lowland laws,
Which of my stealing was the cause,
But I'll not steal again, sir.

O let me aff this ae time,

This ae time, this ae time,

O let me aff this ae time,

I'll never steal again, sir.

A fencible I'll guard at home,

Or on the seas a sailor roam,

Even common soldier I'll become,

Or what else you incline, sir.

O let me aff this ae time, &c.

Here for the present we must conclude our notices of the whimsicalities of the Boswells: the remainder will appear on a subsequent occasion.

THE MONT DE PIÉTÉ OF LIMERICK.

It is perhaps not generally known that the sick in public hospitals, and likewise the destitute and houseless poor, in several continental countries, are mainly supported by the profits arising from pawnbroking establishments, locally or technically termed *Monts de Piété*, a phrase nearly equivalent to that of Benevolent Institution. This very remarkable, and, as it appears, highly advantageous method of raising funds for relief of the sick and destitute, originated two or three centuries ago in Italy, whence it gradually spread towards the north of Europe, and is now adopted in Germany, the Netherlands, France, and perhaps some other countries. Although thus well known on the continent for a considerable period, no attempt, as far as we are aware, was made to introduce it into the British dominions till 1837, when, by the active benevolence of a private gentleman, it was tried for the first time in the city of Limerick, in Ireland.

From the year 1831 there had existed in Limerick an hospital or infirmary for the sick poor, which was supported by donations, subscriptions, and collections in the churches and chapels; the constant difficulty experienced in raising the necessary funds by these casual means, suggested to one of its governors, Matthew Barrington, Esq. (whom we should suppose to be a relation of its founder or founders,* for it is called Barrington's Hospital), the propriety of inquiring by what method similar establishments are supported in other parts of Europe. The result of his inquiries satisfactorily proved the utility of *Monts de Piété*, and that the principal hospitals in France, Italy, Germany, and other parts of the continent, are sustained out of their profits. One of the most extensive and flourishing he found established at Bourdeaux, and a few particulars respecting it will give us an idea of the organisation of others on the continent. It was established by a law in the year 1804, which ordained L.24,000 to be raised by shares of L.160 each, the shareholders to be paid eight per cent. for their money, but the shares to be redeemable at any time by repayment from the surplus profits. With the capital so raised, the Mont de Piété commenced business by lending small sums on pledges to humble persons, but only to those of good character and in-

* This hospital was built, and presented to the city, by the family of Sir Joseph Barrington; and as some evidence of the extensive benefit conferred on the city by this institution, I may mention, that no fewer than 14,000 persons were relieved at the dispensary attached to the hospital, during the last six months. Important additions to the hospital are at present contemplated by Mr M. Barrington, who seems resolved not to stint his beneficence, but is willing rather that the capabilities of the institution shall keep pace with the wants of the city. Hospitals are frequently endowed with the wealth which the rich cannot carry into the grave with them; but to found an hospital during a man's lifetime, is an act that deserves to be recorded, and remembered.—*Ingli's Journey in Ireland, in 1834.*

dustrious habits. The interest of the money lent was on as low a scale as possible, and, after deducting expenses of management, and setting aside a fund for repaying shareholders, was applied to the benefit of the community at large, in charities and public works. All former pawnbrokers' establishments were at the same time superseded. So successful was the institution, that in a few years the shares of the subscribers were bought up, and destitute pauperism was banished from Bourdeaux and its neighbourhood. From the same fund, with the assistance of some donations, the hospital in that city, said to be the finest in Europe, has been lately completed and endowed.

Mr Barrington being satisfied of the great benefits to be derived from such institutions, exerted himself to establish one in Limerick, under the guidance and direction of the governors of Barrington's Hospital, and to be called the Charitable Loan Bank. At the opening of the institution in March 1837, Mr Barrington delivered an address, explaining its constitution, and the objects which were in view. In this Address, which has been published as a pamphlet, the speaker offered some observations and statements on the existing condition of pawnbroking in Ireland, which appear to us worthy of being quoted.

"And now, with regard to the British dominions, we shall find that these are the only countries of Europe in which lending money on pledges is allowed for private advantage exclusively, and in which the profits are not applied to some charitable or public purpose; and although various efforts have been from time to time made by the legislature to regulate the rate of interest, still it is found impossible to prevent the most dreadful excess in the charges. I admit pawnbroking to be an evil, but knowing, at the same time, that it is one which cannot be avoided, I propose (which is the next best thing to its suppression) to apply the profits of the trade to charitable and useful purposes. * * Let me add a word on the present system of pawnbroking. It cannot have escaped your observation how frequently the distress and improvidence of the poor compel them to have recourse to pawnbrokers, and that the advances they thus receive are made at a rate of interest ruinously usurious. It may be said that the rate of interest is regulated by law, as, by the 26th George III. c. 43 (Irish statute), pawnbrokers are allowed to take L.25 per cent. per annum, besides the allowance for duplicate tickets. This is on the supposition that the pledge is not redeemed before the expiration of a month; but the practice is otherwise, as the most distressed persons frequently redeem the pledges within the week. It is a common habit to deposit some article of apparel on the Monday morning, which is redeemed on Saturday night, to enable the individual to make a decent appearance on the Sabbath. But as the lowest charge of interest by that act (and the amendment thereof, 28th Geo. III. c. 29) is for a month, and as it is the habit to redeem in a week, the charge, including the price of the duplicate (without calculating compound interest, or the interest on a shilling where only a fractional part is given, and for which interest is charged as if the entire shilling had been lent), will amount in the cases of those in the greatest want, to L.650 per cent. per annum, and for every L.100 lent by the pawnbrokers in shilling loans, redeemed in the week, at compound interest, it will amount to the almost incredible sum of L.45,690, 7s. 0½d.!! per cent. per annum, which is paid by the poorest and most wretched class."

Mr Barrington proceeds to describe the condition of the charities in Ireland, and their means of support, with a view to the establishment of charitable loan or pawn offices throughout the country. We cannot afford room to follow him through his tabular statements, but give the result of his calculations, which is, that the sum of L.163,911 is expended annually on all the charitable establishments of Ireland—hospitals, infirmaries, poor-houses, dispensaries, lunatic asylums, &c. He next estimates the number of pawnbrokers in Ireland to be 700, each of whom, at the lowest calculation, realises L.900 of profit from his business.

700 at L.900 each, is	L.630,000
Deduct expenses of charities	163,911

L.466,089

Here is," he continues, "a surplus of nearly half a million, which may be applied in extending the benefits of these useful institutions, and establishing convalescent hospitals, besides saving to the public a large annual grant, to the counties and towns a heavy tax, and relieving from the unequal burthen of their subscriptions the charitable persons by whom (though not always the most wealthy) those establishments are at present chiefly supported.

But if to this surplus be added the amount of all fines, penalties, forfeited recognisances, &c., which are now almost unproductive in this country (and which on the continent are applied to the support of the

poor), the amount, if properly collected, may fairly be estimated at L.33,911, making the whole L.500,000. After supporting, as is seen, all the medical charities, this sum would go far in preventing the necessity of poor-laws, by supporting the aged and infirm, and affording employment to a large portion of the labouring population of the country."

From what follows on the subject of the Mont de Piété, or Charitable Loan Bank, established in Limerick, it appears that the required capital for the institution has been raised by debentures, varying in amount from five to one hundred pounds each, bearing interest at six per cent. "The profits of the establishment (he proceeds to state) shall, in the first instance, after defraying the expenses, be applied in paying the interest of the capital lent, and the surplus profits to be divided in equal shares, one in paying off the debentures, and the other (and when the debentures are paid, the whole) in the maintenance and extending the benefits of the hospital, the funds of which would be thus so much increased, that the governors could enlarge the sphere of its utility, not only in giving relief and comfort to the sick and indigent, but in assisting them after their recovery or during their convalescence. It cannot have escaped the observation of those who attend a public hospital, that there occur many circumstances of distress to be relieved besides the cause for which patients are admitted. Many persons are obliged to relinquish their trades, having consumed what they possessed in the hope of relief, and run into difficulties from which they are unable to extricate themselves; and how frequently does it happen that they are unavoidably dismissed from the hospital in a weak and infirm state, to return (perhaps to a large and wretched family) without the means of support or strength to seek employment, and often without a home, and thus frequently causing a relapse, or establishing a diseased and weak constitution! No small proportion of our commonest, and eventually most fatal diseases, are caused by the insufficient nutriment of convalescents. Dropsies, scrofulous diseases, and scurvy, are all imputable to the same predisposing cause. The benefits which may be insured by affording more wholesome diet to the sick and convalescent, are incalculable.

These are not speculative refinements, but truths drawn from experience and reality, and it is obvious that they must be felt with accumulated severity by such as have families dependent on them for support. Is not then the power of affording relief to such objects most desirable?

By the means proposed, benevolent persons will assist in a work of charity, without any injury to themselves, as the rate of interest is greater than they could receive in the public funds; the profits of such an establishment will insure ample security; and being merely lenders of the sums for which they take debentures, they incur no responsibility, nor have they any share in an establishment conducted under the direction of the governors of the hospital, who are a corporate body, and not individually responsible. Tradesmen and other persons may take debentures of even five pounds, and receive nearly double the amount of interest now received in the Savings' Bank, and be at all times enabled to raise money on such debentures, as they will be received as pledges, and money lent thereon.

The advantages of this establishment will be—

1st, The raising a capital by small debentures at a certain interest, and lending it on a greater interest, and applying the profits to the purposes of charity.

2dly, Receiving the debentures in pawn, thus giving to the depositors an advantage which they do not possess in the savings' bank.

3dly, Lending money at interest to poor persons of unimpeachable character and industrious habits, on personal security, as is done by the loan-banks.

4thly, Lending money on goods, as is now done by the ordinary pawnbrokers.

5thly, In case of deserving objects, to restore the article, such as implements of trade pawned in the hour of real want, without interest or charge.

6thly, Using every precaution against receiving stolen goods in pawn."

Such was this benevolent man's exposition of the objects designed to be accomplished by the Mont de Piété of Limerick. The idea seems to have been approved of, for already the capital has reached to the sum of L.15,350, 3s. 10½d., which has been gradually subscribed by the local gentry, or deposited by humble persons, for the laudable purpose of accommodating the industrious classes at half the expense to which they have heretofore been accustomed. The profits realised by the infant institution since its commencement, amount to the considerable sum of L.1736, 10s. 2½d., or about L.700 per annum.

The Dublin University Magazine,* whose notice of Mr Barrington's pamphlet has furnished us with the greater part of the particulars contained in the present article, makes the following justly deserved comment:—"We cannot conclude this brief and inadequate notice, without offering the tribute of our cordial admiration and respect to that true and exalted patriotism which neither dissolves in tears nor evaporates in sighs, but seeks, by acts of practical and singularly judicious benevolence, to remove the ills and sufferings which it deplores. It were faint praise to say that Mr Barrington has conferred upon his native

city a great and a lasting benefit: he has done more—he has planted there the germ of a system which, sooner or later, must extend itself over the whole of Ireland—making the necessities of the poor subservient to their relief, and diffusing blessings wherever it appears."

THE GOOD OF GRUMBLING.

"GRUMBLE and get on," is the favourite maxim with John Bull; and, strange as it may seem, it is by close adherence to this maxim that the British people have become the foremost in the world. The maxim must, however, be taken in the right sense; for grumbling, like every thing else, has a good side and a bad. We may be said to see grumbling on its right side, when we see a man grumbling at himself—that is, never satisfied with his exertions in any good cause, or his attainments in any laudable or generous pursuit. We see grumbling, again, on its less favourable side, when we see it exercised regarding the rest of the world, or at supposed deficiencies of bodily appetites or their gratifications. The disposition is one which may be said to be born with our nation, and it depends in a great measure on the general direction which is given to the mind in youth, whether it is to be exercised chiefly in a right or a wrong way. Our meaning will perhaps be in some degree illustrated by what we are about to relate:—A lady of the south of England, who possessed a considerable estate in land, was very fond of getting a name for kindness and liberality. One means to which she had recourse was annually to collect all the little boys of the parish, between certain limits of years, upon a conspicuous part of the lawn which opened to the high road, and there to feast them with as much beef and pudding as they could eat. We say nothing about the tendency of this yearly stuffing with good things, given to those who, in general, were pinched and poorly off, both as to the quantity and the quality of their victuals. In some cases it may have done harm, by simply creating a desire for beef and pudding, and a disposition to grumble, because this sort of cheer could not be had at home. In other cases it may have produced a better desire—a desire in the boys to be able to earn beef and pudding for themselves; and thus may have given them that stimulus towards learning, and rising in the world, which is so characteristic of the British people. We do not decide as to which of these tendencies it was likely to have in the greatest number, or to the greatest extent—we merely tell the story. The good lady continued the practice year after year; and one time, towards the close of the entertainment, when she was walking round to see how all went on, and to ask how they were satisfied with her bounty, she found the greater part full and also content. But at last she came to a little fellow upon whose plate there was a large lump of the third helping to pudding, and he was blubbering and crying as piteously as though he had not had a meal for four-and-twenty hours. "What is the matter with you, my little man?" asked the lady; "has any of them dared to ill use you in my presence?" The urchin sobbed and blubbered more desperately than ever; and when he gained breath to speak, he faltered out, "I can't eat any more pudding!" which brought the cause of his misery upon him afresh, and he cried more bitterly than before. The good lady patted him on the head, saying, "Do not cry, my good little man; for if you are not able to eat your pudding, you can put it in your pocket." A still more violent burst followed this kindly advice, and at the end of it came out the words, "But my pockets are both full already."

This little story, which we know to be perfectly true, needs no commentary, and would indeed be spoiled by one; and so we shall mention, in contrast to it, another which happened in the family of a friend of our own the very day before the writing of this paper. A little girl, between five and six years old, and her brother, the next older, had got each a slate to exercise themselves in drawing, which, by the way, is an excellent occasional amusement of children; as it teaches them to judge of form and magnitude more readily and also more agreeably than any other means. They were young artists, and the copy set them by their father was the outline of a simple leaf very neatly drawn. The boy executed his task, or rather enjoyed his amusement, with great care and attention, some success, and also some apparent self-satisfaction. The girl continued much longer over hers, equally intent upon it, and perfectly silent. She was kneeling before a sofa, on which lay the slate, with her back to her parents; and after about fifteen minutes of perfect silence, they observed her little neck turn as red as scarlet, and saw that her chest was heaving with strong emotion. Still, however, she worked away till the agitation extended over her whole body; then she quitted the slate, buried her face in the cushion of the sofa, burst into crying, and sobbed out, "I can't make it nearly so well as papa, though I have made a whole line." This is an instance of that grumbling which comes to good.

* For December 1836.

We may mention another instance which came under our own personal observation, though it is many years ago. There is at the present time a public character in the city of Edinburgh, who is one of its brightest ornaments, and whose name, though we shall not mention it, is known and honoured on both sides of the equator, who passed through his common school course with the rapidity of a little comet, and advanced forward to grapple with that most terrible of all elementary books, Euclid, while yet at a size at which few boys know their common multiplication table, at least in any other way than by rote, which is not knowing it at all. With very few exceptions, he was foremost, although some of his class-fellows were nearly double his height and size. On any occasion when he could not answer a question, he was truly dissatisfied with himself, and so miserable in consequence, that no one ever thought of rebuking him. On the dismissal of the class, home he went, bolted himself in his room, with his book and other requisite instruments, and neither would eat nor admit any body until he had mastered the difficulty. During his voluntary confinement, occasional fits of sobbing were heard for a greater or less time; and soon after these had ceased, he began to whistle, which was the trumpet-note of victory, similar in kind and not very different in degree from the celebrated "I have found it!" of Archimedes, when, descending into the bath, the mode of ascertaining the specific gravities flashed across his mighty mind, and revealed to him the means of detecting the quantity of basemetal which the fraudulent goldsmith had mixed with the crown. Every one who knows any thing about geometry, as it is treated by Euclid, and all those who follow Euclid in rejecting motion as an element of geometry, are well aware that there is a flaw in the demonstration of the twenty-ninth proposition of the first book in the Elements, which pure geometry cannot make up, though of the young men who study the science there is perhaps not one in a hundred by whom this flaw is felt. It is, in fact, the stopping at this nice little break in the demonstration which shows that exquisite analytical tact which is the surest indication and the noblest property of minds of a high order. Such being the case, we are not to suppose that the party in question would fail to stumble at it. It formed part of the exercise given out before dismissing the class on Friday, and our young philosopher had Saturday to study it, as that was the weekly holiday; a far better plan, by the way, than giving two half holidays in the week, and thus marring both learning and play upon each of them. Upon ordinary occasions he to whom we allude was as fond and forward in his boyish sports as any of the rest; and as far as his strength went, he was not inferior to the best of them. In such cases the whole lessons used to be managed and all the exercises performed before breakfast, and then the rest of Saturday was his own. But in the case of the weary twenty-ninth proposition, breakfast or dinner on Saturday there was none. The room door was bolted the day long, and it was a day of sighing and lamentation, until, when it was far advanced, he made his appearance, hastily ate a little supper, and went to bed in moody silence. Sunday morning was the same, until nearly church time, when he came out of his room, restored to his wonted cheerfulness and tranquillity; and upon the assembling of the class on Monday morning, he went up to the teacher with his Euclid, laid his finger on the flaw, and very modestly asked whether that part was wrong printed, as he had never met with any such want of deduction from the assumed principles in any former proposition. The teacher, who was and who is an excellent mathematician and first-rate instructor, prophesied the future mental greatness of the little boy, and his prophecy has been amply fulfilled, notwithstanding the occasional occurrence of adverse circumstances.

These trifling anecdotes must suffice for illustrative examples, in as far as the rudiments of the Art of Drawing and the Elements of Plane Geometry are concerned, but the reader will easily see that the same principle applies not only to the acquisition of every branch of art and science, but to that of property, reputation, and every thing else worthy of being acquired; and if mankind would only all do their best upon every occasion, but never be satisfied with it, the advancement of society, rapid as is its progress at present, might be greatly accelerated. We have said that this, to be the foundation and stamina of the character, must be encouraged from a very early age; and we may now add, that this grumbling which leads to greatness should be confined entirely to one's self. Grumbling at the world is an idle waste of time, because no one man, whatever he may be, can make the world much different from what it is; and though he could, his grumbling would operate as a means of disqualification. In the case of one's self, too, the grumbling must not be expressed, because it is familiar to every body's experience that they who speak much about any thing never do it well, and often neglect doing it altogether.

Thus, we can readily understand that there are two sets of grumblers—those who grumble at particular things or at things in general, or who grumble aloud at themselves, and those who grumble at themselves inwardly and silently, and make the expression tell in doing better for the future. The British people, as every one knows, are more addicted to the first kind of grumbling than any other nation under the canopy of heaven; but though it often proves unpleasant to a bystander, we have no doubt that it has the effect of

keeping the system of things alive, and is at once, in part at least, the foundation and defence of our national prosperity. But as the real greatness of a nation is only a general name for the total greatness of the individuals composing that nation, it is after all the silent grumbling of the individuals which is the vital principle. Thousands grumble upon precisely the same grounds as the boy grumbled, because he could not eat any more pudding after his stomach and his pockets were crammed. You shall hear a man whose house is a palace, whose wealth is a mine—and a singular sort of mine which works itself—whose table is loaded with every dainty, and by whose good management, whose inward grumbling, so to speak, things have all along gone well, and are in sure progress of going better—you shall hear this man, after he has feasted to the full, so that he can hardly quit his chair until his internal labour shall have so far advanced—you shall hear him complaining that the whole country is starving. As he takes his morning drive to the city, through streets and squares of handsome buildings which are rising up on each hand as if by magic, you shall hear him grumbling because the country is going to ruin and beggary. When he reaches his counting-house, where a single glance at the banker's book is the whole of the regular daily work which his well-trained clerks leave him to do, he takes up the newspaper, and reads of magnificent public works which are in progress in different parts of the country, such as a railway here, a canal there, in this place a harbour, in that a bridge, and so on, through the whole catalogue of those public-spirited undertakings, by means of which, taken in the aggregate, the extreme ends of the country are as it were brought together; and with respect to the transfer of man, and of merchandise, and information, a large country is actually brought into closer and easier contact than the different localities of a moderately sized parish were in former times. Reading these things, the man who is mournful in the utmost plenitude of abundance, simply because, like the boy, his pockets are full, and he "can eat no more pudding," takes up his lamentation like a very Jeremiah, and exclaims that the whole nation will be ruined in consequence of the enormous and most improvident expense of those speculations. With the actual cost or management of all or any of these, we have no concern, because it makes nothing for our point; nor are we called upon to condemn these projects, though the parties who embark capital in them may never receive an adequate dividend upon it, far less the capital itself. The great expense of all such works consists in labour, and in labour which, generally speaking, must be paid every week or every fortnight. Therefore, nobody, except a contractor who makes an injudicious bargain, can be ruined by any work of the kind; for the capital which they absorb is a surplus over what is necessary for the commercial and domestic purposes of the country; and as the works in question are always a public accommodation, whatever they may be to private individuals embarking money in them, the savings laid out in their construction are far better expended than if they were given in loans for enabling foreign quarrellers to carry on war against each other. Still, the man whom we have noticed grumbles at them; and though there may not be much philosophy or common sense in his grumbling, it is not without its use. It puts people on the alert, and thus leads them to canvass all measures of a public nature, and thus subjects them to the wholesome regulation of public opinion, without the formal, irritating, and expensive process of the collision of one small party with another. Indeed, in all public matters it is by grumbling that the British nation gets on; and were it not for this grumbling, the same fate would befall us which has befallen all passive nations, and we should retrograde even under favourable circumstances, instead of advancing under all circumstances, good or bad, as has been the case for many years, and more especially for the last seventy or eighty—since Watt and Arkwright, and a hundred others whom we could name, effected a far greater and more beneficial change upon society, and its accommodations and comforts, than all the swords that ever were drawn, or all the laws that ever were enacted.

A systematic history of grumblers, arranged into classes, families, genera, species, and varieties, just as the learned systematists arrange the productions of nature, animate or inanimate, would be a curious work, but it is one upon which for various reasons we cannot enter. There are, however, some general distinctions. There are grumblers at every thing; and these may be considered as the parties in whom the organ of discontentedness, which we believe no phrenologist has yet detected in the human cranium, must be most amply developed. Again, there are grumblers at nature, and grumblers at art—the former being more numerous in the country, and the latter in cities and towns. There are also positive grumblers, who complain because something is, and negative grumblers, who complain because something is not. In a word, there is scarcely any thing which can be done or not done, or any word which can be said or not said, but will afford food for a grumbler of one genus or another.

Now, although we have already said that this grumbling is in itself a waste of time, it all makes for usefulness, by keeping up the excitement of society. Thus, for example, we question if ever streets would have been paved, if citizens' wives had not

grumbled at getting ankle deep in mud when they went a-shopping. We also question whether the present unprecedented supply of reading, in which the amusing and useful are so happily blended, would ever have been obtained, if people had not grumbled because they had no excitement after the great war was at an end, and the vast stimulus which it gave to the mind was withdrawn. In this view of the matter, grumbling is an excellent quality, and commendable in all parties, at all times, and under all circumstances; only, in order that it may produce its proper effects, we must observe the maxim with which this paper began—we must "GRUMBLE AND GET ON."

THE HEIR OF THE ST GERANS.

STORY FROM THE CAUSES CELEBRES.

THE Marshal de St Geran, a French noble of ancient family and great possessions, had by his first lady, Anne de Tournon, one son and a daughter. His second wife was Susanne aux Epauls, a lady who had one daughter by a preceding marriage with the Count de Longaunay. When the parties arrived at a fitting period of life, a matrimonial union took place between Susanne de Longaunay, the daughter just mentioned, and the young Count Claude de St Geran, the marshal's son by his first spouse. The marshal's daughter by the same lady was married in due time to the Marquis de Bouillé. Such was the origin and connection of the principal parties in the following remarkable cause, which agitated all France for a long succession of years.

The union of the young Count de St Geran with Susanne de Longaunay took place in the year 1619, before either of the parties had attained their majority. To the great grief of all their friends, and especially of the old marshal, who died in 1632, no offspring appeared, to inherit the combined honours of the houses of St Geran and de Longaunay. But at the close of fully twenty years, when the countess was still comparatively a young woman, she presented every symptom of approaching maternity, to the delight of all around her, and particularly of a large bevy of noble matrons and ladies, whose attentions to the countess on the occasion are very naively described by the writer of the Causes Celebres. As may be imagined from the rank and distinction of the parties, the utmost care was devoted to the countess, and, in consequence of an accidental fall, it was even thought prudent that she should latterly keep her chamber altogether, attended by a nurse, and by her mother, old Lady St Geran, who was yet living. While all was joy and expectation in the Chateau de St Geran (situated close by Moulins), two persons alone, inmates of the same mansion, were filled with malice and spite, and plotted a demoniacal overthrow of the general hopes. The Count de St Geran's sister, mentioned as having been wedded to the Marquis de Bouillé, had separated from her aged husband, and had been received as a resident in the Chateau de St Geran. There, also, resided the Marquis de St Maixant, a nobleman of very doubtful character, who had been entertained out of pity by his relative the Count de St Geran, when obliged to fly from his own home, on account of various heavy charges which his conduct had brought upon him. The Marquis de St Maixant and the Marchioness de Bouillé were thrown much together at the Chateau de St Geran, and the result was, that they projected an union of their destinies, to take place when the old Marquis de Bouillé should have left the world. But the announcement of the condition of the countess threw a cloud on their plans and prospects. The Marchioness de Bouillé, in default of other heirs to her brother, would have succeeded to all the family property, and St Maixant's proposals to her were chiefly founded on this prospective inheritance. Urged by her fears of being deserted by the object of her passion, the Marchioness de Bouillé forgot the character of a sister so far as to enter on a scheme of making away with the expected infant, or at least of carrying it off and concealing the birth. For this purpose, by large bribes and still larger promises, St Maixant and the marchioness corrupted the fidelity of Baulieu the house steward, of the nurse Louise Goillard, and of two sisters named Quinet, the chamber-women of the countess. Through these agents, St Maixant and the marchioness carried into execution, in the following manner, their base and most ungrateful conspiracy.

On the 16th of August 1641, the Countess de St Geran had gone to the family chapel to attend mass, and, while there, became aware that the event so much longed for was likely soon to occur. She was conveyed immediately to her chamber; and such was the interest taken in the prospects of this noble pair, that, on her situation becoming known, service was performed in the churches of Moulins for her safe recovery. According to the old custom in distinguished houses, all the friends of the family were assembled in a chamber adjoining that of the countess, and the females of the mansion were present with her. But this state of things did not suit the plotters; and, therefore, on pretence of anxiety for the safety

of the countess, the Marchioness de Bouillé persuaded all to leave the vicinity of the chamber, with the exception of the nurse, and the two sisters Quinet, the bed-chamber women. The marchioness herself, of course, remained also; and thus the poor countess was left wholly in the hands of her enemies.

The illness of the countess was tedious, and the nurse, who in the accidental absence of a physician took charge of all things, declared that the lady's exhausted strength required repose. A prepared draught was given to her, which brought on a sleep like that of death, and which lasted from evening till morning. In that time the unfortunate lady was made a mother, and the child, a healthy boy, was immediately seized by the nurse, who at first treated it as if it was destined to live, but afterwards, thrown into terror by its first attempts to cry, enclosed its neck with her murderous fingers, and would have killed it on the spot. The house-steward Baulieu, however, was lurking near the room, and having been called in, he had reverence enough for his master's blood to save the child from her gripe; but, to its dying hour, it retained the marks of her cruel hand. Some persons afterwards thought that St Maixant wished the child preserved, to have a firm hold over the marchioness's future affections or fortunes. Perhaps—and this is the most likely conjecture of all—the marchioness could not consent to the death of the child, though she could ruin its prospects; and, besides, the murder was not, or did not seem, indispensably necessary. However this may be, Baulieu, according to instructions, put the half-clad child, at the risk of stifling it, into a basket, and conveyed it secretly from the castle by night. Whither he carried it, will be immediately related. In the meantime, let us proceed with the story of the countess.

Every quarter of an hour, inquiries were made at the door of the chamber by the anxious husband and his friends, and St Maixant also came and held stealthy conferences with the marchioness. To all interrogatories, the answer was returned that "all was well." In the morning the countess awoke. Instantly the poor lady asked for her child, assured that a change had taken place in her condition. She was assured of the contrary, and the conspirators now used all possible arts to convince her friends and herself that no particular event had taken place during the last twenty-four hours. It is needless to dwell on this part of the story. The plotters kept the lady still in expectation, and the farce was carried on for some days. The wretches kept her in their own hands entirely, to prevent others from detecting the truth.* The countess herself was totally unacquainted with such matters, yet she could not be quite convinced; and seeing this, the nurse barbarously resolved to sacrifice the lady to the maintenance of the secret, by ordering violent exercise out of doors in a carriage. Nothing but an excellent constitution could have made the lady, in such a situation, endure this treatment, in addition to violent medicines which the nurse administered to aid in completing the deception. The issue was, that, while still in a maze of doubt herself, the countess had the mortification to see all around her adopt the impression that the whole matter had been founded in error. She was obliged ultimately to be silent, and suppress her feelings, and betook herself, on her recovery, to the consolations of religion under her bitter disappointment.

The course of the steward Baulieu, after leaving the chateau with the child, was only discovered long afterwards. He spoke first for a time with the marquis, and then, using the private keys which were in his possession, issued into the park, and mounted a horse which he had placed in readiness. Upwards of two leagues from the chateau, he thought proper to rest for a moment at the cottage of a woman named Gautier, and made her act as a temporary nurse for the infant. After many further hours' travel, he did the same thing at the cottage of a peasant named Boucaud, giving always some plausible excuse for his journeying with such a burden. As the child was much incommoded in the basket, Baulieu entered a waggon, and sat down with the infant in his arms, tying his horse to the back of the vehicle. In this manner he journeyed till far on in the ensuing day, when he reached the village of Ché. At the lodging where he stopped, the child was again nursed, besides being washed, and receiving for the first time such other attentions as it stood in need of. Pursuing his journey in the waggon, Baulieu reached the neighbourhood of Riom, where he freed himself from the waggoner, mounted his horse again, and rode to the village of Descouteux, where the Marchioness de Bouillé had a chateau. A nurse named Gabrielle Moinot was here found, but the child remained with her only seven days, for she had the honesty to insist on knowing who were the parents, that she might communicate with them about the infant's progress. The child was therefore taken away from her

and from Descouteux. The particulars of its fate immediately afterwards were never known, but at the close of the same year, 1641, Baulieu placed a child in the house of a widowed sister-in-law of his own, named Marie Pigoreau or Baulieu, at Paris. She was in poor circumstances, and took charge of it readily, having received two thousand livres for its maintenance, through the hands of a Parisian grocer, Monsieur Raguenet. Being directed to use concealment about the child, Marie Pigoreau had it baptised, without giving the names of father or mother. She dressed it in the most handsome way, and placed it out at nurse in the village of Torcy-en-Brie, near the city. To the people with whom she placed it, she repeatedly boasted that it was the offspring of a great lord entrusted to her care, and Baulieu came frequently to visit it. When eighteen months old, Pigoreau took the boy home to Paris, and shifting her residence to a new part of the city, passed it off as her own son, she having had one born to her in 1639, but which had died immediately after.

Another year passed away, and the boy, who had been named Bernard, was two and a half years old, when Pigoreau, having expended all the money given to her, and finding no more forthcoming, threw the child upon Baulieu's hands. The colour for this was his relationship to it as uncle. Baulieu seems to have been left by this time much to his own guidance in the matter, the projected union between St Maixant and the Marchioness Bouillé having been given up. The steward, therefore, was in some measure obliged to bring the boy home, although he had a family of five children of his own. He boldly asked leave of the count and countess to bring up "his nephew Bernard" at the Hotel St Geran. They at first counselled him against taking on him such an additional burthen, but he pressed the matter, and they gave their consent. Either the resemblance to themselves—their parents—or the hidden sympathies of nature, caused the countess and her husband to feel an extraordinary attachment to this boy as soon as he entered their dwelling, although they never dreamed of his being aught but the nephew of Baulieu. The countess, in a short time, kept him constantly by her side, though her eyes filled with tears as she gazed on his fair regular features and large blue eyes. Such were the very characteristics which, being those of her own countenance and of her husband's, she had assigned in fancy to the child which she yet half believed herself to have borne! "Ah!" she would cry, "my child would have been now of this very age! and, perhaps, as beautiful!" The Marchioness de Bouillé, and her confederate St Maixant, trembled for the exposure of their guilt when they knew the son to be so near to his parents. But they could not remove him, since he had been brought there, without redoubling their danger. St Maixant, indeed, did not now reside with the St Geran family. Baulieu, however, was still more strongly moved on beholding the feelings inspired in the unconscious parents by the proximity of their child. He was filled with remorse for what he had done, and could not refrain from repeatedly uttering vague hints, which showed his wavering desire to undo the mischief. He often said to various persons that the count and countess had "more reason to love the child than they were aware of." He stated a case of conscience to a priest, asking, "if a person who had taken away a child from its parents had expiated the crime by restoring it to them, though they knew it not?" These and similar remarks were not understood or much noticed at the time, excepting by those who were cognisant of the mystery to which they applied. St Maixant and the marchioness, on some of these sayings being reported to them, came to the resolution of removing Baulieu by poison. The reader who is asked to credit such things must remember that this was an age in which a mortal poison was almost openly sold in Paris, under the title of the "Succession Powder," derived from its frequent use by impatient heirs. Baulieu was poisoned (says our authority) without scruple, to preserve the character of his guiltier confederates, and especially of the marchioness. Before he died, he prayed for an interview with his master and mistress, in order to "get their pardon for a great evil done to them." As yet wholly unconscious of the truth, they merely sent him some kind message in answer, and he died without having seen them, or revealed the secret. His decease took place in 1648, when the child was seven years old.

But the remorseful words of Baulieu were not thrown away. Conjoined with other circumstances, they had the effect of raising a whisper in the district around St Geran, relative to the cruel conspiracy of which the countess had been the victim. By slow degrees the rumour gained strength, and at length it reached the ears of the count and his lady; but as the actors in the plot were not at first named, and as the count and countess little thought that their child was still living, and a favourite page in their own family, they were not stirred to any decisive inquiries, until on one occasion the countess, when residing at the springs of Vichi with her family, surprised the Marchioness de Bouillé in conversation with a female, whom the countess instantly recognised as the nurse who had attended herself many years before. The countess spoke to them, and the obvious confusion into which both parties were thrown, roused new and strong emotions in the lady's mind. She appears never before to have had a doubt of the friendly feelings of the marchioness, but now such a doubt arose, and with such strength, that the guilty lady could not bear the victim's eye, but hastily retired from the count's family to her own chateau at Lavoinne,

and never saw them more. The countess spoke to her husband, and, after much anxious consideration, it was resolved to bring the nurse from Vichi, where she dwelt, to the Chateau de St Geran, and subject her to an examination, as quietly as possible, before a magistrate. This was done, and the first words of the woman put the fact of a conspiracy beyond doubt. She admitted that the countess had borne a child, but that it was still-born. On being asked where it had been put, she said that she herself had buried it. When pressed further, she named a spot under a stone in the courtyard as the place of interment. This locality was minutely searched, but no vestige of stone or child could be seen.

In fact, at the subsequent investigations of the woman before the judges of Moulins, she soon altered her story. At a second investigation, she averred that the countess had not had a child; at the third, that a monstrous birth had taken place; and at the fourth, that the lady had borne a son, whom Baulieu carried away. She denied this again, but finally confirmed it by a letter which she dictated and signed. The cause of these prevarications was soon discovered. The nurse, on her first being apprehended, sent her son to the Marchioness de Bouillé, praying for support, which that lady promised to grant, and set agents at work to fulfil the promise. As the woman's hopes were raised or depressed, so did she confess or deny at her examinations. But in her letter she conclusively admitted the birth, and described its circumstances. An agent of the marchioness betrayed some of her messages and machinations, and thus strengthened the truth. But the guilty lady contrived by money to close the mouths of the girls Quinet, the chamber-women of the countess. Nevertheless, other minor points of testimony came out rapidly after the main fact was once disclosed by the nurse. One servant had met Baulieu with the basket; and all the witnesses of Baulieu's journey, formerly alluded to, came forward one by one to strengthen the cause.

The fact that a child had been born, and carried by the steward to Descouteux, was now established so clearly, that the nurse was condemned to death; she came to a natural end, however, in prison. At Descouteux the track was lost, but it may be imagined that the joyful suspicions of the count and countess were by this time turned upon the boy whom they had received at the hands of Baulieu, and had loved so dearly, though unconscious of his relationship to themselves. And witnesses are long, being called forth by the growing publicity of the case, came forward to draw aside the veil from the rest of this cruel mystery, and permit the count and his lady to give the youth the title and the rank of a son, as he had long received the treatment of one. The fact of the nameless baptism by Marie Pigoreau was discovered, and the nurses whom she had employed identified the child, which was easily done by all who had ever seen him, on account of the indelible mark imprinted on the back of his head by the nurse's fingers. But the most important piece of evidence was that derived from a page of the Marquis de St Maixant, who had attended that nobleman when thrown into the Conciergerie at Paris, on account of certain crimes which he had been guilty of, and for which he was seized after quitting the St Geran family. He died in prison, but not until he had detailed the whole circumstances of the child's abduction to his page. Being allowed to leave prison occasionally under charge of an officer, the marquis had also taken the page with him to Marie Pigoreau's, where he pointed out the child as the one he had spoken of. When seized with a sudden illness, St Maixant had sent for a priest to make a full confession, but died before this took place. The page, however, identified the boy, and made the evidence complete. The death of the marquis took away the possibility of receiving the confession of one principal party concerned. The Marchioness de Bouillé also died soon after the first agitation of this cause. Vexation, shame, and fear, seem to have brought her to the grave. It required all the interest of her generous brother to prevent her being apprehended after the nurse's confession.

Without the evidence of the principals, nevertheless, one would have thought that no rational doubt could remain on the minds of any, after the testimony derived from the sources mentioned, and from many others which it is needless to recapitulate. The Count and Countess of St Geran, indeed, had no doubts. They and all their tenantry and dependents acknowledged the boy with great rejoicings, and gave him the title of the Count de Palice, that usually borne by the heir of the house of St Geran. But there were other parties not so easily satisfied. Immense property was at stake, and the next heirs of the Count de St Geran fought eagerly for the retention of their presumed rights. These heirs were the Duchess de Ventadour and the Countess du Lude, half sisters both to the Count de St Geran and his lady; or, in other words, daughters of the old Marshal de St Geran by his second lady. The main pillar upon which these ladies rested their claim was the evidence of Marie Pigoreau, an artful, interested, and determined woman, who, supported by them, and paid by them, averred the child to be hers, with an obstinacy worthy of a better cause. From between the years 1650 and 1660, up till the year 1666, this cause agitated the French tribunals, being moved from town to city, from court to parliament, and calling forth the skill and eloquence of all the ablest lawyers of the day.

* The original narrative admits the difficulty which arises here on account of the milk, which it would be necessary to conceal. There are two ways of explaining this point. It is possible that the case of the countess, happily for the plotters, was one in which the lacted supply was naturally deficient; and it is also possible, as is suggested in the text, that the nurse may have been skilful enough to check it by the use of drugs, locally applied as well as internally. Had the countess called in a medical man, the trick must have been discovered. To account for her not doing so, we must remember that the poor lady believed all around her to be loving friends; and that their unanimous counsels, with the fear of ridicule, and perhaps some undefined dread of a monstrous birth, had all a tendency to force her into silence.

Finally, the Countess de St Geran, who had in the mean time lost her husband, and who had maintained the contest with an unwearied perseverance, which in itself almost proved her to be a mother, was rewarded with the complete and unalterable decision of the law in her favour. When before the court, she made the affecting declaration to the judges, that if they did not recognise her son, she would go through the ceremonial of marriage with him, and thus assure him of all the wealth and estates of the house of Longau-nay. But the youth inherited the estates of both his parents. He espoused Claude-Madelaine, a young lady of the noble house of Monfreville, in the year after the conclusive establishment of his rights.

Marie Pigoreau, in reward for her false-witnessing, was condemned to the scaffold. We have enough of pity for human aberrations to hope that the sentence was not carried into effect, but cannot speak with certainty on this point. One thing is certain, that the Duchess de Ventadour and the Countess du Lude were not hanged. The question as to their deservings is a different thing. Marie Pigoreau, indeed, may have deceived them, but this is not probable; and our most charitable supposition must be, that interest blinded them to the baseness of the line of conduct they pursued.

QUACK ADVERTISEMENTS.

We perceive that the Glasgow Constitutional has announced its intention of refusing the insertion of advertisements of quack medicines. This is a piece of good taste and self-denial on the part of a newspaper proprietor, which deserves to be made widely known.—*Chambers's Edinburgh Journal for October.*

We are happy to acknowledge that there are other parties in Glasgow, besides ourselves (the Scotch Reformers' Gazette especially), equally well entitled to the praise here awarded—and it would afford us much pleasure to be able to say that it was deserved by every newspaper in the city. We are perfectly sure it would be for their benefit in the long-run, if it were so. On this subject we have always felt keenly, and have often been excessively astonished that some journals, otherwise as respectable as their neighbours, should, for any trifling pecuniary advantage, place themselves in the position of *socii criminis* to a parcel of vagabond quacks. The subject, in our opinion, is a very important one, involving, as we seriously believe it does, the interest and the health of a large portion of the most simple class of the community—that section of it which have the most need of protection and sound advice. We say nothing of the injury which the insertion of such advertisements as those alluded to must do to a reputable journal, because the fact of its being necessary, in every family, to put the papers containing quack advertisements out of sight, settles that point; but we speak of the misery, vexation, disease, and death, which are produced indirectly by the doses (so heartily recommended in some newspapers) administered by these reckless and unskilful empirics. We do not say that the pills and lotions of these fellows are always of the most deadly description—far from it. We believe that, in general, they are composed of dough and gamboge, and that the common excuse for taking the trash, "if they do no good, they can do no harm," is so far correct. This is all very well when a strong, healthy hypochondriac is the patient, but when a poor ignorant person applies for herself or her child, with a real disease, the consequence of a course of swallowing these harmless pills, while the complaint is going on in the system, without the check of active and proper medicine, must be dreadful. We hope these observations will be taken in the spirit in which they are offered, and that before long there shall not be an open paper in Glasgow for the reception of such abomination. The inconsistency attending the publication of these advertisements in some of the journals, is very ridiculous. Upwards of a year ago, we recollect the police of this city were very properly employed in apprehending and punishing a number of men, for distributing their objectionable handbills on the streets; yet while certain papers were loud in their praise of the authorities for acting as they were then doing, advertisements from the offending parties, far more liable to complaint, might have been found stuck into corners of their own sheet! It may be said, but proof it is not, because we know no real argument can be adduced in favour of the practice, that some of the London, and many of the provincial papers throughout England, give free admission to the most abominable of these productions. We acknowledge the fact; but "two blacks can never make a white," and the system has always been condemned, and considered as a disgrace to the press, by every right-thinking person. With the English press we have nothing to do, however. The practice is clearly wrong—and, in the opinion of many, a very serious evil. It cannot be defended; and were these advertisements repudiated in this city, it would at least be a beginning to a good custom, which we hope soon to see universal. It is needless to disguise our feelings on this subject. We consider the insertion of advertisements such as those complained of, a most dangerous imposture, and the persons who give in to it as little better than the more daring criminal. The quack and his newspaper agent are as necessary to each other, in order to dupe the unwary with complete success, as is the resetter to the thief. They act in concert, and they divide the spoil wrung from the

pallid hand of poverty, disease, and death.—*Glasgow Constitutional.*

These observations on the subject of admitting advertisements of quack medicines—pills, clixirs, ointments, cosmetics, and other trash of a similar description—into newspapers, suggested as it will be perceived by a brief notice of ours in October last, are from the Glasgow Constitutional; and it affords us pleasure to know that other news sheets are entitled to the same credit for rejecting matter so objectionable on the score not only of public morality, but of public safety. Besides these papers instanced in Glasgow, we may mention, what we did not know until lately, that the Dublin General Advertiser regularly rejects all advertisements of this infamous nature. Perhaps a hint is all that is required to bring about a reform on this subject, and it is for no other reason that we make the present observations. Before concluding, however, we may as well remark that there is another evil perpetrated by certain newspapers, which likewise calls for reproach and amendment. We allude to the very paltry practice of admitting paid puffs of books in the form of editorial paragraphs. These puffs issue chiefly from two or three publishing houses in London, and are written with the express design of misleading the reader into the belief that they embody the impartial opinion of the editor of the paper on the works of which they purport to be a notice. We could point out a number of respectable newspapers which stoop to the meanness of inserting these deceitful literary puffs, to the exclusion apparently of news paragraphs, or matter of original remark; thus pocketing a few sorry shillings at the expense of the degradation of their pages. This practice, as well as that of inserting advertisements of quack medicines, is surely deserving of a speedy and effectual reform.

MONUMENTS OF THE PACIFIC ISLES.

THE general impression respecting the numerous isles of the Pacific is, that they exhibit the elements and materials of a new continent, rising in parts and patches out of the deep, and the foundations of which are created by the labours of myriads of coral worms. This view of the matter, which we believe to be the correct one, has been doubted by some observers, and that chiefly on account of some remarkable architectural relics visible upon several of these isles, and which relies appear not only to be of great antiquity, but to be of a kind which the present inhabitants of these isles are seemingly incapable of producing. Based upon this fact, a conjecture has lately been advanced, that the isles of the Pacific are rather the remains of an old and submerged continent, than of a new one just emerging from the waters. A few particulars on this subject may interest our readers.

On the Marianne Isles, lying in 14 or 15 degrees of north latitude, and about two degrees to the eastward of the Philippine Isles, various remarkable ruins are found. The island of Tinian, we are informed by a late circumnavigator, though but twelve miles long by six in breadth, contains an immense number of rude gigantic ruins. "The stone is composed of sand, consolidated by cement," and their general shape is that of immense walls, with archways in them, and with rows of massive pillars surmounting them, the whole forming great open edifices, called by the inhabitants the Houses of the Ancients. But it seems more probable that their character was that of temples, as some of these Tinian buildings appear to have been fully four hundred paces in length—a size very unlike that suited for the residence of human beings. In some places they are formed merely of long rows of rough pillars, half of them strewed on the ground. You cannot go any where without finding such monuments. "The whole island of Tinian seems to be but one ruin." The neighbouring island of Rota presents similar characteristics. "Fragments of pillars, three feet in diameter, are still lying on the earth which has been raised around them. They certainly formed only a single circular edifice, more than eight hundred paces in circumference." Altogether, in their general character these ruins are very similar to those which we find to have been erected by the northern European nations, and by various others, at a period when they had grown numerous and powerful, but were still altogether unacquainted, or nearly so, with the arts of civilisation. The Druidical remains are the very rudest of this order. The Vitrified Forts, again, which are common enough in Scotland, indicate a more advanced state of refinement, and we may suppose the Tinian monuments, which exhibit no traces of sculpture, to have been erected by a people much in the same condition as those who erected the forts—namely, powerful as regarded numbers, and consequently capable of erecting massive piles by a concentration of their physical energies, yet quite unable to give these the polish and perfection of art.

It is because the Marianne Islands do not at this day present a population of the kind in question, that some observers have been inclined to think that these islands have been the scene of some great convulsion of nature, which has swept its former inhabitants from the face of the earth, and left the islands themselves but a wreck of what they were. But this is an erroneous supposition. Tinian has now but fourteen or fifteen inhabitants, but the case was very different about a century and a half ago. Anson, who visited the place in one of his voyages, relates that the island, not above fifty years before, had contained thirty thou-

sand inhabitants! The swords of the Spanish settlers, and the epidemics introduced by them, were the agents in converting Tinian from a well-peopled garden into a tenantless wilderness. This historical truth at once overturns the idea that the island has sustained any destructive convulsion of nature, and shows us that the immediate ancestors of the present race were a people quite capable, as regarded numbers, of erecting the monuments found there—and numbers, as has been observed, form almost the only creative agency required.

The same arguments apply to all the other Pacific isles, and the monuments upon them. There can be little doubt that these lands are literally the *newest* on the face of the globe.

DRAWING THE LINE.

Just as this change had been effected, there presented himself for shaving a big, burly, good-humoured coal-heaver, with a pipe in his mouth, who, drawing his hand across his chin, requested to know when a shaver would be disengaged. The journeyman to whom this question was put, looked doubtfully at the young proprietor, and the young proprietor looked scornfully at the coal-heaver, observing, at the same time, "You won't get shaved here, my man." "Why not?" said the coal-heaver. "We don't shave gentlemen in your line," remarked the young proprietor. "Why, I seed you a-shaving of a baker when I was looking through the window, last week," said the coal-heaver. "It's necessary to draw the line somewhere, my fine feller," replied the principal. "We draw the line there. We can't go beyond bakers. If we was to get any lower than bakers, our customers would desert us, and we might shut up shop. You must try some other establishment, sir. We couldn't do it here." The applicant stared, grinned at Newman Nogg, who appeared highly entertained, looked slightly round the shop, as if in depreciation of the pomatum pots and other articles of stock, took his pipe out of his mouth, and gave a very loud whistle, and then put it in again, and walked out.—*Nickleby.*

WASHINGTON.

One of the most striking things ever said of him is, "that he changed mankind's ideas of political greatness." To commanding talent, and to success, the common elements of such greatness, he added a disregard of self, a spotlessness of motive, a steady submission to every public and private duty, which threw far into the shade the whole crowd of vulgar great. The consequence is, that his fame is as durable as his principles, as lasting as truth and virtue themselves.—*Daniel Webster's Speeches.*

PHYSICAL AND MORAL PURITY COMPARED.

Between physical and moral delicacy a connection has been observed, which, though formed by the imagination, is far from being imaginary. Howard and others have remarked it. It is an antidote against sloth, and keeps alive the idea of decent restraint, and the habit of circumspection. Moral purity and physical are spoken of in the same language. Scarce can you inculcate or commend the one, but some share of the approbation reflects itself upon the other. In minds in which the least grain of Christianity has been planted, this association can scarce fail of having taken root: scarce a page of Scripture but recalls it. Washing is a holy rite. Those who dispute its spiritual efficacy will not deny its physical use. The ablution is typical: may it be prophetic! Alas! were it but as easy to wash away moral as corporeal foulness! —*Bentham's Panopticon.*

A TALE OF ROMANCE.

After Elbeuf, which is about twelve English miles from Rouen by land, there is no town of much size until you arrive at Vernon; but the scenery on the route is pretty, particularly towards a ferry-place called Pose, at which the traveller's attention is usually directed to a steep hill, called La Cote des deux Amants, respecting which the following tradition has been handed down:—It appears that formerly there was a strong castle on the top of this hill, the owner of which was a tyrannical baron, who was at once the envy and hatred of his neighbours. He was rich and powerful, but cruel and avaricious. He had an only and beautiful daughter, whose hand was sought by many of the rich barons of the neighbourhood, for one of whom the father had destined her; but this young lady, like many ladies of more modern days, thought she had a right to choose for herself, and responded to the affections of the son of one of her father's tenants, a youth possessing much attraction to a female eye, but who wanted the birth and fortune necessary in the mind of the parent. At first, the baron, when he had discovered the attachment, resolved to sacrifice the young man to his offended pride, but he contented himself afterwards by observing, that none but a knight at least should wed his daughter, as he little supposed that his tenant's son could ever arrive at this distinction. But he was mistaken: love prompts to enterprise, and surmounts great obstacles. The youth accompanied a neighbouring baron as his squire to the field of battle, and his own conduct there was of so daring a character that he was knighted by the sovereign. He returned to claim, as his bride, the object of his affections, but met with the most chilling reception from the baron. At length, in rallery, the baron said that if he could carry his daughter from the foot of the steep hill on which his castle was situated, to the castle porch, running the distance, and never stopping to recover his breath, he would not oppose his wishes. Desperate as the undertaking appeared, the noble youth accepted the offer. The story says that he arrived, with his lovely burthen, at the spot in question, but that nature was exhausted; and as he laid her down at her father's feet, he fell himself, and gave his last sigh. The maiden, frantic with grief, drew a dagger from her side, with which she stabbed herself, and immediately expired upon her lover's body.—*The Hand-Book to Paris.*

PRICE THREE HALFPENCE.

OPPOSITE GOOD QUALITIES NOT TO BE EXPECTED.

SIR WILLIAM TEMPLE, in his *Treatise on Ancient and Modern Learning*, has the following remarks:—"Few men or none excel in all the faculties of the mind. A great memory may fail of invention; both may want judgment, to digest or apply what they remember or invent. Great courage may want caution; great prudence may want vigour; yet all are necessary to make a great commander. But how can a man hope to excel in all qualities, when some are produced by the heat, others by the coldness, of the brain and temper? The abilities of man must fall short on one side or other, like too scanty a blanket when you are a-bed: if you pull it upon your shoulders, you leave your feet bare; if you thrust it down upon your feet, your shoulders are uncovered." Allowing for the obsolete views as to mind which mark these sentences, they appear to us to express a very interesting truth—that all good intellectual and moral qualities are not to be expected in the same character, but that precisely as we have much of any one quality in any one character, so must we look for a deficiency of some other; an arrangement which, like all others in nature, must of course be intended for some end upon the whole beneficial. It is worth while to make some effort to impress this doctrine, because, from its not being sufficiently taken into consideration, very unreasonable expectations are sometimes formed, and very unreasonable complaints made, respecting individuals.

Respecting historical persons, for instance, we find these unreasonable expectations very frequently expressed. Some man has achieved great glory in war, and his military talents continue ever after to be readily allowed; but then, it is remarked, he showed, throughout his career, no true regard for the interests of his country, or those of his species. He was merely ambitious of personal distinction or power. His aims were purely selfish. Now, it is not wonderful that such a man should have displayed such features of character, for, though great military services are often rendered for patriotic and philanthropic reasons, the general case is otherwise. Desire of admiration is the ordinary motive of the hero, and this is generally the chief feature of his character. Accordingly, it is only what might be fairly expected, if, when his military services are crowned with splendid success, he endeavours to become the master of the liberties of his fellow countrymen. Such men first do great feats and endure great hardships for the sake of being admired, and then they are eager for high rank and great power, also for the sake of being admired. A desire of shining in the eyes of mankind alike prompts a Bonaparte to meet the shot-storm on the Bridge of Arcole, and to overturn the remains of representative government in the Orangery. It is comparatively rarely that such heroism is displayed for the sake of a great and good public cause; but when it is so, as it was in Wallace and in Washington, then we of course do not see the case end in mere personal aggrandisement, for the feeling which leads to the desire of such aggrandisement never was present, at least as a leading feeling, at any part of the career of the individual. He was animated by higher objects in his warrings, and he continues to be so when these are past. With respect to those who show in their triumphs a thirst of power and external marks of greatness, it may be concluded that their greatest doings and sufferings were prompted by motives chiefly selfish, and that for these, accordingly, a cooler praise should be bestowed.

There is a class of historical persons who are brought

into notice as vigorous contenders with existing systems, and who continue afterwards to be revered by at least the party who sympathise in their views. Of such men we may cite Luther and Knox as notable examples. These men undertook respectively a tremendous task, and they certainly in a great measure accomplished it. We hear them often referred to with gratitude and admiration by persons who at the same time lament the rudeness of their character. Knox, in particular, is blamed for his uncourteous treatment of Queen Mary, and his encouraging the popular violence to which so many beautiful specimens of Gothic architecture fell a sacrifice. Those who bestow this blame do not reflect that perhaps, in such an age, no other than a man capable of beholding beauty's tears unmoved, and seeing temple and tower ruthlessly cast down, was capable of performing those public services which are now spoken of with so much gratitude. Gentleness of nature, politeness to the fair sex, and regard for elegant remains of antiquity, are agreeable and estimable qualities in their way; but had Knox possessed them, he would have been disqualified for the task which he undertook, and never would have undertaken it. There is no alternative. Either the rudeness must be taken for the sake of the necessary boldness, or the boldness must be wanted also, and the services remain unperformed. It is here as it is with those who perform the various offices called for in the ordinary world. We are not to expect butchers to be men of refined feelings, or carmen to have the delicacy of gentlemen. Those who bewail the want of soft and courteous qualities in a Luther, might as reasonably expect to see the hurricane pause in its tremendous but perhaps necessary mission, in order to waft a pleasure bark across some fairy lake, or fan the cheek of beauty in her rosy bower.

As Sir William Temple remarks, and, indeed, as remarked every day in the ordinary world, few individuals excel in all the departments of mental greatness. Where there is much aptitude for observation and the acquisition of facts, often we find there is little of that thought which comes from reflection and meditation. Where there is a great bent to mathematical science, there we are likely to find little imagination, and small powers of expression. One is a solid man, but not a shining one. Another is a shining man, but not solid. On the one hand, a senator is laughed at because his whole soul is absorbed in arithmetical calculations; on the other, we find several of his fellow-statesmen who never look for a moment at figures, but delight to launch out into declamations, for which there may not be the slightest foundation in truth. Now, it certainly does sometimes happen that a human being is endowed with so fair an assortment of the faculties, that he displays tolerable ability in most walks in which he may be called to appear; but these are rare cases. The rule seems to be, that each mind is endowed disproportionately with the various faculties, or has been reared in circumstances which have chiefly called out one set, and left the rest comparatively dormant. It is equally true, that, with most people, the frequent or habitual exercise of one set of faculties tends to make the rest laggard: thus a poet will scarcely be a mathematician, and a meditative sage will scarcely be found acting the part of a prompt and sprightly instructor of youth. The extremely active man will think little and do a great deal; the thinking man will do nothing but wish that something should be done. If these be truths in nature, as we think they are, it follows that we should be guilty of a certain absurdity in finding fault with any one person for not being something else, or exhibiting his powers in a different way from that in which

he does exhibit them. We ought first to ascertain, as far as our knowledge of human nature enables us to judge, if that something else be compatible with what the individual at present is, or if it really be possible in ordinary cases to exhibit mental ability in two ways diametrically opposite.

It is always a critical matter to seek to excuse great faults. Yet of many persons remarkable for such blemishes, and at the same time eminent for intellectual ability, we shall find, on a candid view, considerable reason for believing that the two things were not separable. Alexander Pope, with exquisite powers as a moral poet, possessed a degree of irritability which certainly amounted to a fault, since it led him into a puny and unworthy warfare with the whole of the subalterns and privates of the literary corps. Yet who can say that this very irritability of temper was not something intimately allied to, if not absolutely identical with, the fine genius which we so much admire in the *Rape of the Lock* and the *Essay on Man*? The uncontrollable passions of Burns can never be thought of without regret, not only because we must deplore such things on their own account, but more particularly as clouding a name so brilliant, and helping to hurry their gifted possessor to a premature end. Yet it is not unlikely that the burning eloquence which shines in Burns's page, and the headlong fervours which hurried him over the brink of moral propriety, were one thing in his nature, or at least had some common root, so that, had we been spared the contemplation of his errors, we might have also lost the enjoyment of his powers. Scott was ambitious of baronial state and family honours, and ruined himself by his eagerness for these objects; yet this weakness clearly was the same peculiarity of mind which, by throwing the poetry of mediæval and feudal allusion into his writings, has rendered them the delight of the civilised world. He might therefore have been happier if he had wanted this ambition; but we, at the same time, might have been less regaled by his literary productions. We deplore the gloomy superstition of Johnson, as it rendered his own life miserable; yet had he been otherwise, it is odds but we should have never had occasion to follow him through that magnificent strain of melancholy music, the *Vanity of Human Wishes*. The faults of all literary men are not to be thus palliated, if palliation it can be called—for in most cases they possess their superior intellectual endowments without any such constitutional infirmity as seems to have existed in most of the persons here enumerated. Some careful discrimination is here necessary. A man of talent, whose nervous system is perfectly sound, is a very different being from one in whom there is a structural or functional infirmity. In the former, there can be no claim for a light consideration of errors, except where the exclusive devotion to some single pursuit may have, as in ordinary cases, led to a sort of unsoundness. In the latter, on the other hand, we must be content to take any beautiful or interesting results that arise, with the faults that seem equally to emanate from the same source. In the one case, we have a sound plate of glass, calculated to form a perfectly transparent medium in the window into which we fix it. In the other, we have a clump, which transmits prismatic rays of exquisite beauty, covering even the cottage floor with glory, but which only does so by virtue of a blemish, and could not do it otherwise.

The sense of these remarks, if they possess any, may be applied, we think, with good effect in the ordinary domestic world. When we feel disposed to condemn any one near us for a particular prevailing fault of character, let us consider if he could have

been fairly expected, with his good qualities, to have been altogether free from the noxious one. We shall often find reason to conclude that he could not. Surliness and honesty are, for example, sometimes found together. When we encounter such a case, and experience the benefit of the honesty, let us ascertain, before condemning the surliness, if it be not in fact an essential element of the character of the individual, which could not have been absent without the other also. Do we again appreciate the benign nature of some one associated with us, but feel disposed to regret that it is attended by a certain want of vigour and activity, let us reflect if we could reasonably expect two good qualities so opposite to each other to be largely developed in the same character. By taking such calm philosophic views of our friends and fellow-creatures in general, we shall be apt greatly to increase our own peace of mind.

RECOLLECTIONS OF AN AUTHORESS.

BY A. OPIE.

THE COUNTESS DE GENLIS.

How pleasant it is, as one advances in life, to recal to remembrance the books in which we delighted in childhood, especially those in which instruction was blended with amusement! Foremost in my recollection amongst books of this nature are the early works of the Countess de Genlis.* I went to a French school at a very early age, and I was never tired of reading her *Theatre of Education*, and *Tales of the Castle*. At a later period, some of her subsequent works fascinated my attention, and gave me a strong desire to see a writer of powers so varied; but though I once received from her a flattering message by an American gentleman, I was not able to procure admittance to her presence when I visited Paris in 1829. In the succeeding year, however, I was more fortunate, and my kind friend Cesar Moreau, the founder and secretary of the *Société Statistique Universelle*, brought about a meeting between us, when I ventured to the French metropolis in the winter of 1830.

I was conducted one afternoon in a carriage to her residence, with the hope that she would accompany us to dinner to the house of my friend, but it was in vain that I tried to work myself up to my once exalted height of enthusiasm respecting this wonderfully gifted person, and it was not till we drove up to her door that I forced myself to remember nothing but that her first works had charmed and instructed my early days, and that the ardent wish of bygone years was about to be gratified. She received us very courteously, but said she could not go with us, as she had already dined; and as it was late, it was not worth while for her to put on her best gown. We, however, eagerly assured her that she would be welcome to us in any dress, and she at last smilingly consented to accompany us. Her arrangements were speedily made, and I soon found myself seated in the carriage with the object of my earliest admiration. She talked incessantly, but in so low a voice, and the carriage made such a noise, that I could not hear above half what she said; therefore, as I found that what she said required no answer, I amused myself in studying her person. At this period she was in her eighty-fifth year, and had therefore lost the graceful contour which she at one time possessed; but her face was attractive, and the still existing beauty of her hands struck me with surprise as well as admiration; youth evidently lingered there, as also in her dark expressive eyes; and I thought, as I sat beside her, that she was the prettiest old woman that I had ever seen. She looked the better from the total absence of pretension in her dress; she wore a slate-coloured silk gown, a white crape bonnet and frill, and the quilling round her cap did not come so low on her forehead as to hide the silver hair which faintly curled beneath it.

The party at the house of my friend was composed of a large number of gentlemen, a circumstance which neither Madame de Genlis nor myself had anticipated. However, my attention was entirely absorbed by the aged guest, and as I seated myself beside her in the attitude of an eager listener, she was willing to gratify the desire which she was flattered by exciting.

* Felicité Stephanie Ducrest de St Aubyn was born January 25, 1746, at the estate of her family in Burgundy. At an early age she married the Count de Genlis; and a few years afterwards she became an inmate of the family of the Duke de Chartres, and took charge of the education of his children, one of whom is the present Louis Philip, king of the French. At the outbreak of the revolution she took refuge in England, and her husband, who had become *Marquis de Sillery*, perished by the guillotine. After this period, the Countess de Genlis experienced many vicissitudes, for an account of which I beg to refer to her *Memoirs*.

She related anecdotes, and made observations, with a degree of graceful playfulness which I had never seen excelled. I was gratified to observe the simple dignity with which she replied to the many compliments paid to her, and to the flattering speeches made by several of the gentlemen present when her health was given, followed by that of the king. This health was accompanied by earnest wishes from the gentleman who gave it, that Louis Philippe might act up to those correct principles which had been instilled into him by the noble lady then present.

When the dinner party broke up, and we returned to the drawing-room, we found a large company rapidly assembling, and in a short time my companion and myself saw ourselves surrounded by a crowd of new comers. I am here tempted to present some extracts from an account of this evening, given shortly afterwards in the *Morning Post*, but omitting certain passages which I think were too flattering to myself.

"Leaving politics and parties for a while, I cannot resist describing to you a scene which afforded me an evening of most unminged gratification. I have already made you acquainted with the *Société Française de Statistique Universelle*. A few days ago occurred the first anniversary of its establishment. On this occasion, Monsieur Cesar Moreau, the founder, entertained a party of friends, for the most part members of the society. Many individuals from various countries were present; among whom I may cite Count Mikorski, deputy of the nobles of the Polish diet, and his son the Marquis de St Croix, the Count de Bouillé, General Baron de Bardin, Colonel Amoros, &c., all men esteemed for their literary and other acquirements. Our countrywoman Mrs O—, arrayed in all the primitive simplicity of Quakerism, and contrasting singularly and pleasingly with the fashion reigning about her, formed one of the party; not, I assure you, the least delighting or delighted. But the great attraction over all was the celebrated Madame de Genlis, looking like the venerable representative of the literary remembrances of a bygone age.

At the age of about eighty-five, Madame de Genlis does not look more than seventy; her sharp angular visage, relieved by dark sparkling eyes, and her attenuated form, making up a figure and features which were never otherwise, probably, than slight, or 'petite.' Her white, delicate, and even plump hands, viewed apart from herself, would never have been believed to belong to a person of more than forty years of age.

These vividly recal to recollection the days of which we have read, of which few perhaps of her contemporaries remain to testify, when, full of youth and beauty, and conscious accomplishments, she was the grace and ornament of admiring circles, as those waxen fingers swept the strings of her harp, or aided the soft breathings of her lute, in that polished era when the lovely Marie Antoinette and the Graces presided over the court of France. This was, I am informed, the first time for many years that Madame de Genlis had appeared in public society. She sometimes quits her seclusion to visit her royal pupil, King Louis Philippe, and his family, at the Palais Royal. Her industry is still surprising. She had finished only the day before, she said, her popular *History of France*, in one volume, commenced originally, as I understood, at the instance of Prince Polignac, with a laudable view to have a pure elementary work on the national history, that the morals of the youth of the respectable classes of society might be guarded by it from the contamination incident upon contact with the works which the French Revolution produced in deleterious abundance. Madame de Genlis has also in manuscript a romance of real life, founded on a princess of the illustrious house of Bourbon Condé, by all accounts a most beautiful, talented, as well as amiable personage, who died somewhere about the revolution, at thirty years of age."

From four until eleven o'clock, when she retired, Madame de Genlis supported, with great vivacity and an extraordinary physical energy, an uninterrupted and animated conversation, with by turns almost every individual in this crowded assembly; an exertion demanding certainly, as she exhibited, colloquial talents and powers of memory of a vigorous and varied order. On my taking leave of her for the night, she expressed a wish that I should again see her, an invitation which I was not slow to profit by. I called on her next day, and found her reading her *Book of Prayers*; but she assured me I did not disturb her, and that she was very glad to see me again. The conversation that morning had quite a graphic power; the scene and persons whom she described were before me. She possessed *l'art de raconter* (the art of relating) ascribed to Bonaparte, but I was surprised at the want of sweetness in her tones; her voice was deep, and what the French call *rauque*, of which the term "croaking" will be a fair translation; but perhaps this was in some measure owing to her advanced age. She was full of the praises of *Mademoiselle d'Orleans* (now called Madame Adelaide), her beloved pupil of former times. She told me that in a recent illness of hers, which had lasted six weeks, Madame Adelaide had been her daily attendant. She also spoke with much gratitude and affection of the king of the French himself, but did not seem unbecomingly elated by the exaltation of her pupil to the throne. She assured me that since his elevation he had offered to make her a duchess, but that she had refused his kindness; "for what," said she, "under my circumstances, would an increase of worldly titles be to a woman on the verge of the grave?"

She had great apparent pleasure in relating the following anecdote of her royal pupil:—"When the people in the month of October," said she, "paraded the streets of Paris as in the Reign of Terror, with torches in their hands, and crying aloud for the blood of the ex-ministers, they went at length to the Palais d'Orleans, and surrounding the gates, demanded to see the sovereign, shaking their torches, as if in menace, and exclaiming, 'Justice! vengeance!' Their frightful cries soon reached the ear of the king, who was at dinner with the queen and his family. Instantly, disregarding the earnest solicitations of his beloved wife and children, he persisted in going out to the intruders, and in going alone. Accordingly, he presented himself to them, and demanded to know their business. Again were the torches waved, as if in threatening, over their heads; again they renewed their cry for 'Justice,' and for 'Vengeance!' 'Justice toujours!—vengeance jamais!' replied the undaunted Louis Philip, and slowly re-entered the palace; while the angry multitude retired in silence from the gates, awed, no doubt, by a display of that moral dignity, and that unshaken courage, which the lowest of men are capable of appreciating, and which, even while it disappoints and defies them, they in their hearts admire."

This was my last interview with Madame de Genlis. I was intending to go to her apartments, as usual, on my way from the house in the Champs Elysées, where the few Friends who were in Paris used to meet together on the Thursday, as well as on the Sabbath morning, when that day's post brought me news from England, which unfitted me for going any where. I heard of the sudden death of the dearest of my surviving friends, the friend of my childhood and of my whole life, and I desired my servant to say to all visitors that I could see no one. I had been thus denied three days, when, to my surprise, on the evening of the third, my friend Cesar Moreau, unannounced, entered the room! He told me that he had ventured in in spite of my prohibition, because he came to inform me that his revered friend the Countess de Genlis had been found that morning dead in her bed! M. Moreau was surprised and hurt at my being so little affected, though I owned I was shocked by his intelligence, and I therefore hastened to tell him that my cup of grief was so full already, I had no tears for any new affliction; on which he kindly left me to myself, but not before he had made me reluctantly promise to go with him the next day but one, to see his lamented friend in her coffin. And I went with him to the Fauxbourg du Roule at the appointed time. The coffin was standing in the courtyard, and not screwed down; but nothing was visible, save the sawdust, copiously heaped up over the body, as it was so changed, and the face so disfigured, that it was necessary to hide them as soon as possible from the view. This was, I own, no disappointment to me; and with rather a relieved heart I accompanied my companion to the apartments of Madame d'Anquetil, and her daughter the Countess Helena, Chanoinesse de Baviere, who lived under the same roof with Madame de Genlis, and were her friends and companions.

From the Chanoinesse I learnt the following particulars:—Madame de Genlis had, as was her custom, sat up dictating to her amanuensis till three in the morning. She then went to bed, apparently in perfect health. At six she called her servant to her; and when she dismissed her again, she said, "You may call me at eleven o'clock as usual!" The servant did so, but could not awake her; she therefore called the Countess Helena into the room, saying, "If Madame would be so good as to wake my mistress, she will not be angry; but if I do, perhaps she will scold me;" and the countess complied with her request. She found her leaning on her hand in an easy position; and taking her in her arms, she spoke caressingly to her, and kissed her yet warm cheek—but in vain; when, seeing a physician pass the door, she called him in, as by this time she was in considerable alarm. He desired that the curtains should be undrawn, and light let into the room. He was obeyed, and saw immediately that death had stolen on her sleep, and that all efforts to restore her would be fruitless! However, all possible means were tried for her recovery, but without effect. Thus, at the age of nearly eighty-five years,* the Countess de Genlis passed, unconsciously perhaps, from time into eternity!

Before I quitted these ladies, I was informed that, in consideration of the regard which Madame de Genlis had expressed for me, I was to be invited to her funeral. As I am "an inquisitive and sentimental traveller," I considered it so far fortunate for me that this distinguished lady died while I was at Paris, as the event enabled me not only to see the funeral of a French lady of high birth, but also to make one of the cortege. I was therefore gratified to receive in due time the long printed paper usually sent on such occasions, inviting me in the name of the relatives of the deceased to the mournful ceremony. While I read, it seemed as if I was in a dream. The little girl who used to think of this extraordinary lady with such humble admiration, and at so great a distance, in the beginning of life, was, in comparatively her life's decline, invited as a favourite friend to unite with that lady's friends and relations in paying her the last duties!

We found the coffin standing in the doorway, surrounded by tapers, and covered by a black velvet

pall embroidered and fringed with silver. On one end of it stood some silver cups, or vases, and at the other there was, I think, a crucifix, but the rapid manner in which we passed prevented me from taking an accurate survey. We were ushered into the apartments of Madame d'Anquetil, as those of the deceased were not large enough to receive the company. I am unable to give the names of all the persons who composed the funeral train, but the Marechal-General Gerard, he who had distinguished himself by his conduct during "the three days," was one of the chief mourners, as the husband of the granddaughter of the deceased lady.

He wore the ruban rouge (the red ribbon) and other decorations over his dress. I was made known to him, but he had only just been led up to me when we were summoned to proceed to the church of St Philippe du Roule. The corbeillard which contained the body was covered by a black velvet canopy, fringed with silver, and we followed it, to my surprise, not in procession. No women attended besides myself, except the Countess Helena, and the two demoiselles Ducrest, the great-granddaughters of Madame de Genlis. The church, as she was a lady of rank, was hung with black; the coffin was placed in the middle aisle on which the door of entrance opened, and we stood around it behind the priests and the acolyths (or boys who officiate at the altar). Both priests and acolyths held lighted tapers, and sang a mournful chaunt. Half way up the aisle was what is called a catafalque, which lofty erection was of black velvet and silver, over which hung draperies of white crape, ornamented with silver embroideries; and when the chaunt and other ceremonies over the coffin had ceased, it was carried under the catafalque, and disappeared from our sight. We then went to the seats prepared for us near the altar, which were covered with black cloth; and by this time the church was full of well-dressed persons, probably friends of the deceased, or who wished to pay her the last tribute of respect. After a long mass had been performed, and some ceremonies gone through at the altar—such as an offering of money, by General Gerard and another chief mourner, as I believe—the coffin was drawn out from under the catafalque, and sprinkled with holy water by those who passed by it. We then entered our carriages and followed the corbeillard in procession, to the mountainous hill called Mont Calvaire (Mount Calvary), about three miles from Paris. I had visited it before in the autumn of 1829, in what was called the week of the Pilgrims. During that week devout Catholics went, some barefooted, as I have been told, up its steep and sometimes rocky sides; and Charles the Tenth, with the dauphin and dauphiness, had been there on a pilgrimage a few days before I visited this beautiful spot, which was, however, disfigured in my eyes by the three crosses on the top of it, representing the Saviour and the two thieves, as big as life, and painted the colour of it. As the ascent to Mount Calvary is very steep, we were obliged to alight when we reached the foot of the hill. The first carriage, which was the king's, contained the king and queen's aide-de-camps, and Madame Adelaide's gentleman; the next was General Gerard's; and by the time each carriage had set down its occupants, we were a large assembly; and when in procession, winding up the hill then glittering with frost, we formed, I may say, a beautiful show. First went the acolyths in their scarlet and white robes; next the priests in their black and white ones; then followed the splendid corbeillard, surrounded by men in mourning habits, carrying lighted torches, which, dropping flame as they went along upon the white and frozen ground, strewed our path, as it were, with burning crocuses; then came the chief mourners, noblemen whose names I have forgotten, and General Gerard; the green and gold uniforms of the former adding to the variety of the colouring which the scene exhibited, while over our heads was a bright blue wintry sky. Beneath us lay the lovely valley of the environs of Paris, covered with a soft reddish mist, by which every thing was embellished rather than veiled, and whence the outlines of the white buildings below us came out more beautifully defined, while the Seine flowed transparently along, sometimes reflecting the red tints of the atmosphere, and adding to the loveliness of the view. I forgot the dead in contemplation of the living objects, if hill, vale, and water, may be so called; and was secretly rejoiced that the will of the deceased, who had desired to be buried at Mount Calvary, had ensured me a second visit to this my favourite hill. We had to go more than half way down the other side of the mountain to reach the grave; and as we stood there, grouping as we best could on its steep sides, it seemed to me a scene fit for a painter. But there was no solemnity; the service was hastily muttered to the accompaniment of directions from the assistants how the body was to be lowered, and there were no tears but those shed by the poor Chanoinesse, who in Madame de Genlis seemed to lament a second mother.

In turn, the relatives and friends (myself excepted) took the brush offered by the priest, dipped in holy water, and sprinkled the grave with it. But when I thought all was over, three gentlemen stepped forward, and severally paid a tribute to their departed countrywoman. The first, after justly eulogising the deceased, read a letter which she had recently written to Cæsar Morcau, in which she expressed her approbation of the late political changes, and avowed her intention

to write a History of the last Revolution, and the events of "THE THREE DAYS." The second observed, that it was unnecessary to praise the noble and celebrated lady whom we had just interred, "because," said he, "son éloge est sur le trône de France!" The third speaker repeated some extempore verses in her praise. I remarked that not one of the three introduced a single reflection of a religious character.

We then resumed our lovely walk; and as I wandered on before my companions, slowly descending the precipitous though winding path, I could not help comparing the interment which I had witnessed with the simple solemn funerals of Friends; but as this comparison awakened in me too powerfully the remembrance of the interment which had so recently taken place in our grassy grave-yard in my native city, I was glad to take refuge from painful regrets in the contemplation of the scene before me; for the descent from Mount Calvary was rendered as beautiful as its ascent, by the deepening tints shed by the declining sun over the valley of the Seine, which made it every moment increase in loveliness, and I was sorry when we re-entered our carriages.

Two days only after the Countess de Genlis had been buried on Mount Calvary, it was notified in the public papers, that the government had resumed to itself the land granted on Mount Calvary to the Priests and the Society for Missions, and forbade any future interments there; and that, instead of being called Mount Calvary, it was to resume its original name of Mont Valerien. I conclude it was out of respect to the wishes of the highly gifted instructress of his youth, that the king did not issue this order sooner. A considerable part of this hill is full of white marble monuments, picturesquely arranged, while willows and acacias profusely wave their graceful branches over them. Perhaps a monument is by this time erected to the memory of the Countess de Genlis, by the hand of affectionate gratitude; but be that as it may, she has, in my opinion, an enduring monument already in her works; and some of them at least will, I trust, always be considered as an ornament to the literature of her country, and endear her name to future generations.

SKETCHES OF SUPERSTITIONS.

ALCHEMY.

ALCHEMY, like many other chimeras and superstitions, had its origin in the fanciful imaginations of the ancient Egyptians, and other African as well as Asiatic sages. It was introduced into Europe, as is believed, by the Arabians during their residence in Spain; the prefix *al* is at least Arabic, and, with the Greek term *chemia*, signifies the chemistry, or process of analysing the properties of matter. The modern and respectable science of chemistry had thus no other origin than in the researches of a set of impostors or self-deceived dupes, who pursued the craft of alchemy in quest of some mysterious and highly valued qualities in nature.

The ancients, as we have seen in the preceding sketches, had no just knowledge of the laws which regulate the phenomena of the universe. To them, every thing was a result of direct supernatural agency—the whole earth, and the starry firmament around it, were supposed to teem with spiritual essences, invisible to the eye of man, but yet serving as the immediate cause of every appearance in nature, and of almost every event of public or individual interest. The notion that these spiritual essences could be roused from their latent or hidden state, and be coaxed or compelled to alter the appearances and course of nature, was the foundation of innumerable superstitions, and among the rest that of alchemy. This delusion, also, like some others, was united with religious veneration, and long held its place as one of the qualities of a pious mind.

Two things from the earliest ages were anxiously sought for by mankind—gold, and the means of protracting life to an indefinite limit. Seeing the high estimation set on gold, and not reflecting that its value was chiefly an accidental circumstance in commerce, arising from the scarcity of the article, it was held as a sublimation of certain hidden excellences in nature, and therefore an object which could be made by a particular process in art, provided it pleased the Deity or some of nature's attendant spirits to favour the pursuit. The doctrines by which philosophers reasoned themselves into the belief that gold, as well as the elixir vitæ, or elixir for extending the duration of life, could be elaborated from the common materials around them, were exceedingly abstruse. According to Paracelsus, "philosophy is nothing but the study of wisdom considered in a created nature, as well subject to sense as invisible, and, consequently, material; and wisdom's central body is the shadow of wisdom's central essence; and the moral interpretation can never exclude the real effects from ocular

demonstration: but when reason hath experience, faith hath no merit; and without faith there is no knowledge of any excellent thing; for the end of faith is understanding." By this piece of learning we suppose it is meant that to obtain the treasures in nature we must patiently investigate and have faith in the result. But what was to be investigated? Why, nature, and for the following reason:—The whole universe (according to the alchemists) at first consisted of molecules, or atoms, partaking of body, soul, and spirit, under the control, more or less, of certain spiritual agency. Creation was the determination or arrangement of these elementary atoms by certain established laws; and the grand arcana were, by the investigation of these laws, to ascertain the features of this primitive organisation, and imitate nature by the perfection of art. In other words, it was believed that philosophers, by close application, would be able to come at the elementary molecules of nature, and to re-arrange them in the form of the two best things that fancy could suggest, gold and the elixir vitæ. This elixir of life came indeed to be identified with gold, because, as gold was the most valuable substance in nature, it was most suitable to preserve that which we set a high value upon, namely, health, or the principle of life; tincture of gold, therefore, was long esteemed a cure for all bodily diseases, and an elixir for the extension of life beyond the ordinary limits of mortality.*

Pursuing these philosophic reveries, many men of otherwise sagacious understanding devoted years and years of their existence to delusive investigations into the nature and quality of the animal, mineral, and vegetable kingdoms. Shut up in laboratories, they pored over crucibles and retorts, analysing all kinds of substances with the hope of at last hitting upon the great secret. During the thirteenth, fourteenth, and fifteenth centuries, the study of alchemy was steadily pursued by several eminent practitioners; among whom were Roger Bacon, an English monk; Raymond Lully; Hollandus; Peter John Faber; Michael Sandovigius; Paracelsus; Basil Valentine, a German monk; and Van Helmont. The shrewdness and industry of some of these men were the means of eliciting several chemical principles of great value, and it is difficult to believe of such persons, that they could seriously entertain the notion that gold, either in the form of its own substance, or as a tincture, could be produced from matter of an entirely different quality; yet their respective writings prove beyond a doubt that they spent no small part of their time in searching for this illusive material.

The alchemists in general regarded three things as above all others containing the essential element they were in quest of; these were salt, sulphur, and mercury, which they alleged were invested with a mystic character, having a relation to "the calorific or vivifying spirit" of matter. Take, for instance, the following jargon from Sandovigius in explanation of this mystic relationship between spirit and substance:—"Sal (or salt) is the key and beginning of this sacred science, is that which openeth the gates of justice, and is that which hath the keys of the infernal prisons, where sulphur lies buried. * * The sun and moon are the parents of all inferior bodies and things. The sun's motion and virtue doth vivify all inferior bodies, and those things which come nearest in virtue and temperature are more excellent; and the pure form of the terrestrial sun is said to be all fire, and, therefore, doth the celestial sun communicate most virtue; therefore, the incorrupted quality of pure sulphur being digested in eternal heat, hath also regal power over all inferior bodies, for the sun doth infuse his influence into all things, but especially into gold; and those natural bodies do never show forth their virtues till they be made spiritual." Lastly, as for mercury (continues this paragon of learning), it contains "in itself the perfections, power, and virtue of Sol, and runneth through the houses of all the planets, and in his regeneration acquirith the virtues of superiors and inferiors; and by the matrimony thereof appeareth clothed in their candour and beauty;" and being of gaseous origin, "crude mercury is originally a vapour from a clear water and air, of most strong composition, coacted of air itself, with a mercurial spirit by nature, flying ethereal and homogenous, having the spirits of heat and cold; and by exterior and inferior heat doth congeal and fix." We do not for a moment imagine that any reader in the present dull age of the world can understand this very logical explanation of the properties of salt, sulphur, and mercury—at least we acknowledge that it is far past our comprehension. The general drift of the argument, however, seems to be, that in these materials are to be found the germs or seeds of metals, which, by being brought into union, are to form the philosopher's stone, or a substance which is to turn all baser metals into gold. Sandovigius alleges that "the first matter of metals is the humidity of the air, mixed with heat." Again, the "generation of metals is this: the four elements [fire, air, earth, and water] in the first operation of nature, do, by the help of the archæus [divine head] of nature, distil into the centre of the earth a ponderous or heavy vapour of water, which is the seed of metals."

With respect to the manner of imitating nature by an alchemical process, we are told to "take ten parts of air, one part of living gold, or living silver; put all these into thy vessel: boil this air first until it be

* Her eulogy is on the throne of France.

* Retrospective Review, vol. xiv, article Alchemy.

water, and then no water. If thou art ignorant of this, and knowest not how to boil the air, without all doubt thou shalt err; seeing this is the matter of the ancient philosophers. For thou must take that, which is, and is not seen, until it be the artificer's pleasure; it is the water of our dew, out of which is extracted the saltpetre of philosophers." Having thus presented a recipe for boiling air, and turning it into water, and then manufacturing the water into saltpetre, he proceeds to speak of the art of making mercury out of sea-water, on which, however, he is particularly mysterious. "I have not (says he) so clearly showed the extraction of our sal ammoniac, or the mercury of philosophers, out of our sea-water, and the use thereof, because I had from the master of nature no leave to speak any further; and this only God must reveal, who knows the hearts and minds of men."

The same learned writer, in the course of his expostitions of the arcana of alchemy, makes the profound remark, which doubtless will be new to many of our readers, that, as all animals are produced from two sexes, so, to fulfil an universal and blessed scheme of the Creator, metals also must be produced in the same manner. Thus, the germinating principles of mercury deposited in mother earth remain for a thousand, five hundred, or one hundred years, till matured for birth, and then the said principles assume the appearance of gold, silver, or baser metal. On a similar principle diamonds are produced, for they are "the offspring of the vapours of nature, escaping from the fatness of sulphur, with pure salt water."

This, it will be said, was all very fine in the way of theory; but the question still remains, how was gold or the golden tincture of life to be produced by an operation in art? Unfortunately on this point the alchemists were more than usually dark. We can only learn from their vague jargon, that the main difficulty consisted in reducing metals to their elementary principles, or we may call it dissolving the body to find the spirit. In this grand art, fire was the purifying agent; and the process, after all, was to be lucky or unlucky according to the frame of mind of the operator. Seeking to dive into such a mighty mystery, it was indispensable to obtain the blessing of the Almighty on the undertaking. "Those, therefore," says Sandovigius, "that desireth to attain to this art, in the first place put thy whole trust in God thy creator, and urge him by thy prayers, and assuredly believe that he will not forsake thee; for if God shall know that thy heart is sincere, and thy whole trust is put in him, he will, by one means or another, show thee a way, and assist thee in it, and thou shalt obtain thy desire." Having on these grounds commenced the operation, and at length resolved the metallic and saline substances in the crucible to their primitive elements, all the rest was easy, and so the philosopher's stone was produced. Lully, in speaking of this sublime operation, observes, that by casting "no more but the quantity of a pea into a mass of metal, the mass shall be turned into the finest gold that may be in the world," and such will be its virtue, that it "heals all inconveniences of men's bodies, as one grain being drunk with wine, and taken hot, and then the party go to a warm bed, and to sweat like as though he did lie in water, in three days he shall be made whole of the sickness soever he have."

An account is given by Sandovigius of the mode of transmuting metals, which is of course quite unintelligible; and to show what efforts nature of herself will make to elaborate gold from mercury, we are presented with the following instance of a piece of that valuable metal being found between a man's teeth after death: it affords an instructive example of the manner in which facts are compelled to bow down and accommodate themselves to preconceived theories. "Now," proceeds the narrative, "the reason why gold was found and generated betwixt the teeth of the dead man, is this, because in his lifetime mercury was by some physician conveyed into his infirm body, either by unction or by turpitude, or some other way, as the custom and manner was, and it was the nature of mercury to go up to the mouth, and through the pores thereof. If, therefore, in time of such a cure, the sick man died, that mercury, not finding any egress, remained in his mouth betwixt his teeth, and that carcass became the natural vessel of mercury, so, being shut up fast for a long time, was congealed into gold by its own proper sulphur being purified by the natural heat of putrefaction; but if mineral mercury had not been brought in thither, then could gold never have been produced. And this is a most true example, that nature in the bowels of the earth doth of mercury alone produce gold and silver, and other metals, according to the disposition of the place or matrix."

How the rogue who put the piece of gold into the dead man's mouth must have secretly laughed at this blast of learning!

The early race of alchemists, who laboured conscientiously in the vain endeavour to find the philosopher's stone, were followed by numberless imitators, who by their pretences and tricks imposed on all classes of persons. A belief in the tincture of gold, or elixir vite, was universal throughout Europe in the fifteenth and sixteenth centuries. "The common people in some countries, particularly Italy, Germany, and France, often denied themselves the common neces-

saries of life, to save as much as could purchase a few drops of the tincture of gold, which was offered for sale by some superstitious or fraudulent chemist: and so thoroughly persuaded were they of the efficacy of this remedy, that it afforded them in every instance the most confident and only hope of recovery. These beneficial effects were positively promised, but were looked for in vain. All-subduing death would not submit to be bribed with gold, and disease refused to hold any intercourse with that powerful deity [Mercury], who presides over the industry and commerce of all nations."

M. Geoffroy, in the *Memoirs of the Academy of Sciences* for 1772, published an account of the various modes in which the frauds of the alchemical adepts were carried on. "He observes, that, instead of the mineral substances which they pretended to transmute, they put oxide of gold or silver at the bottom of the crucible, the mixture being covered with some powdered material and gum-water or wax, so that it might look like the bottom of the crucible. On other occasions they made a hole in a piece of charcoal, filled it with powdered gold or silver, and closed the hole with wax: or they soaked charcoal in a solution of these metals, and threw the charcoal, when powdered, upon the material to be transmuted. They used, also, small pieces of wood, hollowed at the end, put filings of gold or silver into the cavity, and stopped it with fine sawdust of the same wood, which, on burning, left the metal in the crucible. Sometimes they whitened gold with mercury, and made it pass for silver or tin; and the gold, when melted, was exhibited as gold obtained by transmutation. They had a solution of nitrate of silver, or of muriate of gold, or an amalgam of gold and silver, which being adroitly introduced into the crucible, furnished the necessary quantity of metal. A common exhibition was to dip nails into the liquid, and to take them out apparently half converted into gold: these nails consisted of one half iron, neatly soldered to the other half, which was gold, and covered with something to conceal the colour, which the liquor removed. Sometimes they had metals made of gold and silver soldered together; the gold side was whitened with mercury, dipped into some transmuting liquid, and then heated; the mercury being dissipated, the gold portion of the metal appeared."† By these various tricks the pretended discoverers of the philosopher's stone induced individuals to employ them, and to venture sum after sum on the chance of realising unbounded wealth.

Alchemy, as a professed art, latterly sank with astrology into contempt, and has long since been abandoned as an absurd and positively vicious delusion. Fortunately the experiments of the philosophers, and the quacks who succeeded them, were not utterly valueless. Inasmuch as astrologers in endeavouring to read the stars made discoveries in the planetary system, so did alchemists, in the equally vain attempt to resolve metals and salts, or their supposed elementary principles, into gold, discover a number of acids and preparations, now used in medicine and in various useful arts, which might otherwise have remained for a time unknown. "As the alchemists," observes Dr Thomson,‡ "were assiduous workmen—as they mixed all the metals, salts, &c., with which they were acquainted, in various ways with each other, and subjected such mixtures to the action of heat in close vessels, their labours were occasionally repaid by the discovery of new substances, possessed of much greater activity than any with which they were previously acquainted. In this way they were led to the discovery of sulphuric, nitric, and muriatic acids. These, when known, were made to act upon the metals; solutions of the metals were obtained, and men were thus gradually led to the knowledge of various metalline salts and preparations, which were introduced with considerable advantage into medicine. Thus, the alchemists, by their absurd pursuits, gradually formed a collection of facts, which led ultimately to the establishment of scientific chemistry." It is also undeniable that modern views in chemical science in some degree favour certain of the theories on which the errors of the alchemists proceeded. Their theory of molecules is a dream-like prediction of the atomic theory of the revered Dalton, now universally received. Their notions as to the possibility of converting one substance into another by tracing it back to its constituent elements, and reconstituting these in a different way, in like manner almost appear revived as serious and sober truth, when we hear of the hypotheses of modern chemists as to the nature of the simple substances. That the fifty-five of these now discovered are not the elements of material nature, but are likely yet to prove only various compounds of a smaller number, may be almost concluded upon from facts which have been observed. It is therefore not impossible that results which were sought for on mere supposition, or under the influence of roguish imposition, in the sixteenth century, may, in the nineteenth or twentieth, be the objects of serious philosophical investigation—but not, we hope, for so paltry a purpose as the conversion of the ordinary into the rarer metals. We conclude with the remarks which Gibbon made on the alchemists: "Congenial to the avarice of the human heart, it was studied in China as in Europe, with equal eagerness, and with equal success. The darkness of the middle ages insured a favourable reception to every

tale of wonder; and the revival of learning gave new vigour to hope, and suggested more specious arts of deception. Philosophy, with the aid of experience, has at length banished the study of alchemy; and the present age, however desirous of riches, is content to seek them by the humble means of commerce and industry."

LAST CENTURY ANECDOTES.

FOOTE THE COMEDIAN.

In the 341st number of the *Journal*, appeared a notice of Samuel Foote, as one of the odd London characters of a former age. The article contained an original anecdote of the mimic, respecting his detention by a snow-storm at Moffat, when travelling from Dumfries to Edinburgh. This anecdote had been picked up in conversation by the author of the article, and, though generally correct, was not so in every circumstance. We have been supplied with the following more minute and curious, as well as correct particulars, by a gentleman whom advanced age and family connections could alone have made acquainted with circumstances of so private a nature, and so far removed from our own time.

In the winter of 1775-6, Mr McCulloch of Ardwell, in the stewartry of Kirkcudbright, who held a situation in the Leith Custom-house, visited his country mansion, in company with a friend named Mouat, in order to be present at an election. Mr McCulloch was a man of joyous temperament, and a good deal of wit, and used to amuse his friends by spouting half-random verses. He and his friend spent a week or two very pleasantly in the country, and then set out on their return to Leith; Mr McCulloch carrying with him his infant son David, familiarly called *Wee Davie*, for the purpose of commencing his education in Edinburgh. To pursue the narrative of our correspondent:—"The two travellers got on pretty well as far as Dumfries; but it was with difficulty, occasioned by a snow-storm, that they reached Moffat, where they tarried for the night."

Early in a January morning, the snow having fallen heavily during the preceding night, they set off in a post-chaise and four horses, to proceed on their perilous journey. Two gentlemen in their own carriage left the King's Arms Inn (then kept by James Little) at the same time. With difficulty the first pair of travellers reached the top of Erick-stane, but farther they could not go. The parties came out of their carriages, and, aided by their postillions, they held a consultation as to the prudence of attempting to proceed down the vale of Tweed. This was considered as a vain and dangerous attempt, and it was therefore determined on to return to Moffat. The turning of the carriages having become a dangerous undertaking, Wee Davie had to be taken out of the chaise, laid on the snow, and wrapt in a blanket, until the business was accomplished. The parties then went back to Moffat, arriving there between nine and ten in the morning. Mr McCulloch and his friend then learnt, that of the two strangers who had left the inn at the same time, and had since returned, one was the celebrated Foote, and the other either Ross or Souter, but which of the two favourite sons of Thalia I cannot remember at this distant period of time. Let it be kept in mind, that Foote had lost a leg, and walked with great difficulty.

Immediately on returning, Foote had entered the inn, not in good humour, to order breakfast to be got under way. His carriage stood opposite the inn door, in order to get the luggage taken off. While this was going on, a paper was placarded on one of the panels. The wit came out to see how all matters were going on, when, observing the paper, he in wrath exclaimed, "What rascal has been placarding his ribaldry on my carriage?" He had patience, however, to pause and read the following lines:—

While Boreas his flaky storm did guide,
Deep covering every hill, o'er Tweed and Clyde,
The north-wind god spied travellers seeking way;
Sternly he cried, Retrace your steps, I say;
Let not one foot, 'tis my behest, profane
The sacred snows which lie on Erick-stane.

The countenance of our wit now brightened, as he called out, with an exclamation of surprise, "I should like to know the fellow who wrote that; for be he who he may, he's no mean hand at an epigram." Mrs Little, the good but eccentric landlady, now stepped forward, and spoke thus:—"Trough, Maister Fut, it's mair than likely that it was our frien' Maister McCulloch of Ardwell that did it; it's weel kent that he's a poyet; he's a guid enough sort o' man, but he never comes here without poyet-teasing mysel', or the gude-man, or some ane or other about the house. It wud be weel dune if ye wud speak to him." Ardwell now came forward, muttering some sort of apology, which Foote instantly stopped by saying, "My dear sir, an apology is not necessary; I am fair game for every one, for I take any one for game when it suits me. You and I must become acquainted, for I find that we are brother poets, and that we were this morning companions in misfortune on 'the sacred snows of Erick-stane.'" Thus began an intimacy, which the sequel will show turned out to be a lasting one. The two parties now joined at the breakfast table, as they did at every other meal for the next twenty days.

Foote remained quiet for a few hours after breakfast, until he had beat about for game, as he termed it, and he first fixed on worthy Mrs Little, his hostess.

§ History of Chemistry.

By some occult means he had managed to get hold of some of the old lady's habiliments, particularly a favourite nightcap, provincially, a *mutch*. After attiring himself a la Mrs Little, he went into the kitchen and through the house, mimicking the garrulous landlady so very exactly in giving orders, scolding, &c., that no servant doubted as to its being the mistress in propria persona. This kind of amusement went on for several days for the benefit of the people in Moffat. By and bye, the snow allowed the united parties to get on as far as the Crook, upon Tweed, and here they were again storm-stayed for ten days. Nevertheless, Foote and his companion, who was well qualified to support him, never for a moment flagged in creating merriment, or affording the party amusement of some sort. The snow cleared away at last, so as to enable the travellers to reach Edinburgh, and there to end their journey. The intimacy of Foote and Ardwil did not end here, but continued until the death of Foote.

After this period, Foote several times visited Scotland; he always in his writings showed himself partial to Scotland, and to the Scotch. On every visit which he afterwards made to the northern metropolis, he laid aside a night or two for a social meeting with his friend Ardwil, whose family lived in the second house from the head of that pretty row of houses more than half way down Leith Walk, still called Springfield. In the parlour, on the right-hand side in entering that house, the largest of the row, Foote, the celebrated wit of the day, has frequently been associated with many of the Edinburgh and Leith worthies, when and where he was wont to keep the table in a roar.

The biography of Foote is well known. However, I may add that Mr Mouat and Mr McCulloch died much lamented in the year 1793. David McCulloch (Wee Davie) died in the year 1824, at Cheltenham, much regretted. For many years he had resided in India. In consequence of family connection, he became a familiar visitor at Abbotsford, and a favourite acquaintance of Sir Walter Scott.* Mr Lockhart tells us, that, next to Tom Moore, Sir Walter thought him the finest warbler he had ever heard. He was certainly an exquisitely fine singer of Scotch songs. Sir Walter Scott never heard him sing until he was far advanced in life, or until his voice had given way to a long residence in India. Mr Lockhart also tells us that David McCulloch in his youth was an intimate and favourite companion of Burns, and that the poet hardly ventured to publish many of his songs until he heard them sung by his friend. I will only add, that the writer of this has more than once heard Burns say that he never fully knew the beauty of his songs until he heard them sung by David McCulloch.

We have only to add, with reference to this pleasant chat of our respected correspondent, that, after all, we have some doubt of the correctness of his date. No election took place in the stewardry of Kirkcudbright at the time specified, but one did at the close of 1774, which is probably the true date. Besides, Foote died in October 1777, which leaves too little space for his several times visiting Scotland, though he might have done so after 1774.

ROBERT BURNS.

The following is an original anecdote of Burns, related, like the above, by a gentleman whose years enable him to recollect the circumstances, in which indeed he himself bore an important part:—

"In the month of September 1787, my native town of Banff was honoured by a visit of the illustrious poet of our country, Robert Burns. He and his friend William Nicol, then one of the teachers in the High School of Edinburgh, had been enjoying a jaunt of pleasure in Nicol's vacation time through the Highlands. Returning through the province of Moray eastward, they had spent the day previous to their arrival in Banff at Fochabers and Gordon Castle, where Burns at least had been most hospitably entertained and greatly courted by Jane Duchess of Gordon, who then was the presiding deity of the castle.

On reaching Banff, Mr Nicol called on Dr George Chapman, then rector of the Academy of Banff, well known as a distinguished classical scholar, and an eminent and successful teacher of the learned languages, as well as author of several works on educational subjects. The worthy doctor had for several years, at an antecedent period, been rector of the High School or Academy of Dumfries, where his friend Mr Nicol had, as one of his ushers, commenced his career as a teacher. Like all who had ever been in a similar situation under the fostering guidance of Dr Chapman, Mr Nicol looked up to him with almost filial veneration.

Mr Nicol and his interesting travelling companion were invited to breakfast next morning with Dr Chapman, at his house in Banff; and the writer of this, then a youth about thirteen years old, and a scholar in the doctor's morning Greek class, was asked by his revered teacher to stop to breakfast, as being rather a pet scholar, and dux of the class, which got a *drill* on their 'Homer' from Mr Nicol until the breakfast bell rang. During breakfast, Burns was playing off some sportive jests at his touchy *compagnon de voyage*, about some misunderstanding which took place between them at Fochabers, in consequence of Burns having visited the castle without him; and the good old doctor seemed much amused with the way the

poet chose to smooth down the yet lurking ire of the dominie. After breakfast, Dr Chapman sent me to the bookseller's shop for a new copy of the 'Antiquities and Scenery of the North of Scotland, by the Reverend Charles Cordiner, Minister of the English Chapel in Banff,' which he presented as a mark of his regard to Mr Nicol, and for a useful guide-book to the travellers in their progress. As they were to visit Duff House, the splendid mansion of the Earl of Fife, and drive through the park on their way south, after delivering the book to Mr Nicol I accompanied the two gentlemen from the town to the house, carrying a note to the steward there from my father, that they might see the interior of the house, the paintings, and valuable library. In driving through the park, Mr Nicol, while engaged in looking at the plates of the book, asked me whether I was aware that the gentleman who was speaking to me about the park was the author of the poems I had no doubt heard of. 'Yes,' I replied; 'Dr Chapman told me so when he asked me to breakfast.' 'Then have you read the poems?' 'Oh yes; I was glad to do that,' was my reply. 'Then which of them did you like best?' Nicol asked. I said 'I was much entertained with the Twa Dogs and Death and Dr Hornbook; but I like best by far the Cottar's Saturday Night, although it made me *greet* when my father had me to read it to my mother.'

Burns, with a sort of sudden start, looked in my face intently, and, patting my shoulder, said, 'Well, my callant, I don't wonder at your *greeting* at reading the poem; it made me *greet* more than once when I was writing it at my father's fireside.'

I recollect very well that while Mr Nicol loitered in the library, looking at the fine collection of old classics there, Burns, taking me with him for a guide, went a second time through some of the rooms to look at the old paintings, with the catalogue in his hand, and remarked particularly those of the Stuart family in the great drawing-room, on which he seemed to look with intense interest, making some remarks on them to his boy-guide, which the man fails to recollect. But the face and look of Robert Burns were such as, either boy or man, he never could forget. He may add, that he has never seen them so forcibly portrayed or brought so fully to his mind's eye, as by Flaxman's noble statue of the poet in the monument in Edinburgh, especially when viewed in a particular way."

BIOGRAPHIC SKETCHES.

M. TURGOT.

WHEN Mr Canning, in 1827, spoke in the House of Commons of M. Turgot, as "the model of a statesman," there was a general expression of surprise: scarcely any one remembered having ever before heard the name. It was nevertheless true that M. Turgot, comptroller-general of the finances of France in 1775, was one of the most enlightened and well-aiming statesmen who ever lived, and fully entitled to be held up as a model for that class of men. His administration lasted only twenty months; his views were appreciated in his own day only by an enlightened few; he also died early. These are probably the reasons why he is little known in England, and perhaps not much even in France. His history, however, is one which cannot be made known without general benefit. M. Turgot was not a reformer of the authoritative part of government, which few thought of touching in his day. He took the less questionable walk of an administrative reformer, in which capacity he never perhaps had his equal. His great mind had ascertained, almost for itself, the few simple fundamental principles on which national wealth, and the social happiness of states, depend; and these he applied, first to the concerns of a little district, and afterwards to those of the whole kingdom, with that success which right principles never fail to command. His whole life, indeed, is an exposition of the irresistible tendency of just philosophical maxims to the diminution of evil and the creation of good. Having happened lately to obtain a perusal of the biography of this excellent man, we were strongly impressed with the idea that an abridgement of it might be an acceptable present to our readers, as tending to give them just views on many points in political economy and arrangement. We have therefore applied ourselves to the task, not using the French original, which we have never seen, but an English translation published in 1787. The author of this work was the eminent but signally unfortunate Marquis of Condorcet.

M. Turgot was born at Paris, May 1727, in a respectable grade of society, his father, who was descended from a line of Norman noblesse, being for a long time at the head of the corporation of merchants. He received the best education which the country and age could afford. A little anecdote of his school days shows that the benevolence, governed by good sense and a regard to useful ends, for which his mature years were remarkable, was a principle implanted in his nature from the beginning. The little allowance of money which his parents made him when at school, repeatedly disappeared as soon as it had been received, without any one being able to guess the manner in which it had been employed. At last they discovered that he distributed it to some poor scholars, to enable them to purchase books. As the youngest of three sons, and in consideration of his studious, simple, and somewhat pensive character, he was designed for the church, and he actually proceeded so far in the proper

education for that profession as to be elected prior of the Sorbonne. But scruples respecting the propriety of making engagements and professions in which he might not be able to persevere, had already beset his mind, and he finally resolved to adopt a different course. At this time, though only about twenty-three years of age, he was not only a proficient in the belles lettres, but had studied the elements of every science, had made himself master of many, and had drawn out a list of a great number of works which he had planned, including poems, tragedies, philosophical romances, and extensive treatises on natural philosophy, history, geography, politics, ethics, metaphysics, and grammar. Such of the plans of these works as survived to fall into the hands of his biographer, discovered, we are told, "information the most various and extensive, and views the most novel and profound."

In the choice of a profession M. Turgot was governed by but one consideration—how shall I make myself most useful, with the least sacrifice of conscientious principle? He chose the law, and besought the appointment of a master of requests, which he soon obtained. For this office, which was simply that of a provincial judge under the government, he prepared himself by particular application to those parts of science which are most connected with its functions and duties; namely, the study of natural philosophy as far as it relates to agriculture and manufactures, to the subjects of merchandise, and the execution of public works; as also the principles of legislation, politics, executive government, and commerce. One anecdote respecting this early part of his career will show the high sense of justice by which he was animated. He was commissioned to examine the cause of a person employed in the office of the farmers-general; and conceiving the man to be guilty, and feeling the necessity of rigour in such a case, he put off the investigation from time to time. At length, after long delays, taking the case under his cognisance, he found, unexpectedly, that the defendant was innocent. Immediately he felt himself obliged to repair the injury which might have arisen from the delay. He inquired into the amount of the appointments, of which the party had been deprived during the pendency of the cause, and paid the exact sum, taking care to make it appear an act, not of generosity, but of justice.

M. Turgot contributed to the celebrated Encyclopédie the articles "Etymology," "Foundation," and some others; but when the work was prosecuted for its liberal opinions, he ceased to support it, not from any timidity in assertion of the right of free discussion, but because he saw that the writers of the work had become a sect or party, as much as those who prosecuted them. He conceived that sound views, which, published by an independent person, would attract respectful attention, are apt to lose all force when they come out under the sanction of a party, for then they are confounded with whatever is erroneous or unpopular in the professions of that party, and accordingly are rejected without examination.

The friendship of M. Gournai, a merchant, and intendant of commerce, proved of great advantage to M. Turgot. Experience and reflection had shown to Gournai the truth of principles at that time little known in the administration of commerce. In the words of Turgot's biographer—"Gournai had learned, or rather he had seen, that the laws prohibiting the importation of foreign commodities, and the exportation of domestic raw materials, though having for their pretext the encouragement of national industry, in effect deranged its natural course; that the protection afforded to any particular species of commerce, is prejudicial to commerce in general; that privileged monopolies, whether for buying, for selling, or for manufacturing, far from giving vigour to industry, in effect deranged its natural course; that the protection stifle it in all but privileged persons, and in them convert it into a spirit of intrigue. He went farther. He found that the regulations which are, or are pretended to be, formed, to prevent a scarcity of necessities, to fix them at a moderate price, insure their goodness, or the excellence of manufactures, at once diminish and render uncertain their quantity, enhance their price, and almost always reduce their quality." All these views were adopted by M. Turgot, and thenceforward were acted upon by him, as far as he was enabled to put them in force.

In 1761, the subject of our memoir was appointed Intendant of Limoges—an intendant being a provincial officer under the government, designed to execute its orders, and carry out all its views, within his own particular district. At this time, although no one dreamt of an improved government for France, there was a disposition towards an improved administration of that which really existed. It had become, as it were, fashionable to adopt and favour measures which appeared calculated to improve the condition of the mass of the people. "Turgot profited by these dispositions to give activity to the society of agriculture established at Limoges; to direct their efforts to important objects; to open a mode of instruction by public lectures to the female professors of midwifery who were scattered about the country; to procure for the people the attendance of able physicians in epidemic diseases; and to establish houses of industry, supported by charity, the only species of alms-giving which does not encourage idleness, and which affords at once relief to the poor and advantage to the public. He introduced at the same time into his province the cultivation of potatoes, a very valuable resource for

* Sir Walter's brother Thomas was married to a sister of Mr McCulloch.—F.N.

the poor. The people at first regarded this food with disdain, as beneath the dignity of the human species; and they were not reconciled to it till the intendant had caused it to be served at his own table, and to the first class of citizens, and had given it vogue among the fashionable and rich."

In due time, he extended his views to higher objects. The *taille*, or land-tax, had hitherto been levied in an oppressive manner, solely in consequence of the ignorance of administrators: Turgot made arrangements by which it was raised on correct principles, and consequently to the great relief of the parties concerned. His next object was the roads. These were formed and kept in repair according to a system called the *corrées*, the main feature of which was compulsory and unpaid labour exacted from the humbler classes. These persons having nothing but their wages to depend upon, were reduced to the greatest misery when forced for weeks at a time to labour at a distance from their homes, where their families were in the mean time left utterly destitute. M. Turgot proposed to those districts which bordered upon the principal roads, that they should execute the task imposed upon them, by means of hired labour, the cost of which was to be levied by a rate proportioned to the rate of the land-tax, an abatement being made in the latter corresponding to the amount they expended. The preservation of the roads was in like manner settled by smaller assessments. When about to introduce these reforms, M. Turgot found it necessary to take a step which must be regarded as strikingly illustrative of the condition of France at that time. He addressed minute explanations of the measure to the curates of the different parishes throughout his intendantcy, to be read by them to the people, who, he knew, would otherwise have regarded even the benefits he proposed to confer upon them with jealousy, having hitherto known their superiors only as oppressors. M. Turgot brought about some similar reforms in the militia, which had previously been nearly as oppressive to the people as the *corrées*.

During the administration of Turgot, Limousin experienced two successive years of scarcity. In his management on that occasion within a limited district, we see him acting upon the same great principles which he afterwards exemplified on a wider theatre. He was convinced that "unrestrained liberty, and protection to magazines and to the speculations of commerce, were the only means to prevent or repair the evil." To pursue the language of his biographer—"The scarcity of provisions, by raising their price, augments the interest which each proprietor has to carry them where the scarcity is greatest; while laws of police, forced sales, and regulations of price, only oppose barriers to this natural impulse, and deprive the public of this resource. Besides the evil they produce of themselves, they contribute to expose the trader to the vexations of petty officers, and to the violence of the populace, whose terror and disquietude are excited or kept up by the spectacle of a restless and turbulent legislation. They falsely impute the calamity to the dealers, who come to the public succour; because they regard them as the agents of government, or because they see them to be the objects of suspicion to the magistrates. They ascribe their distresses to their chiefs, because the conduct of those chiefs proclaims that they believe themselves to have the power of repairing it. M. Turgot knew likewise that these fatal precautions in times of scarcity have the more lasting, the more general, and the equally mischievous effect of preventing the establishment of a regular commerce in grain, and by that means rendering the subsistence of the people for ever precarious."

His only object therefore in this period of calamity was to give every extension in his power to the freedom of trade with respect to provisions. He took care not to discourage that trade, by supplying the wants of the people from any other source, and employed the powers of government for no other purpose than that of protecting that trade from the prejudices of the populace. He had accordingly the consolation to see this commerce, thus abandoned to itself, provide for the public subsistence, in spite of the obstacles which the situation of the province opposed to his operations.

But the freedom that was requisite was not yet complete. The custom of fixing the price of bread was established in the towns. M. Turgot perceived that the bakers, who possessed an exclusive privilege, and who were subject to this regulation, took advantage of it to raise the bread to a price beyond what it ought to bear, compared with that of corn. He suspended the exercise of their privilege, but allowed them the liberty of selling bread at any price they pleased. The price soon fell, and the country communities, even from the distance of five leagues, brought bread to the town, made under the auspices of liberty, and consequently sold at a cheaper rate."

These principles were in the present instance acted upon only on a small scale. Soon after, M. Turgot found an opportunity of explaining to the minister of finance that they were equally applicable to the whole kingdom; but the time had not arrived for their force being readily seen by statesmen. His anxiety that every one should have the free use of his property, was soon after exercised with regard to the laws restricting interest on money. It was criminal at this time in France to take more than five per cent.; yet to give and take more was so unavoidable from the existing condition of things, that the law was generally in a

state of dormancy. It was nevertheless occasionally called into activity at the instigation of debtors; the consequence of which was, that, being exposed to this additional danger, money-lenders heightened, instead of diminishing, the rate of interest. Nor was this all. A single prosecution by a fraudulent debtor was sufficient, by the terror it created, to suspend the commerce of a whole town, or even a province. In 1770, some bankrupts at Angoulême, in order to escape a just condemnation, formed a plan of charging their creditors with the crime of usury; a number of debtors, of no better principles, followed the example, and threatened to inform against their creditors, if they did not remit their demand of interest, and even in some cases a part of the principal. The mercantile affairs of the province were consequently thrown into a state of complete disorder; its trade seemed at a stand-still; the alarm reached other parts of the kingdom; and the king's ministry were obliged to consult the intendant of the province where it began. Turgot returned to them a report, which his biographer describes as "a complete treatise on loans." "The liberty of making loans upon what terms men please, is a natural consequence of the establishment of property; and a very moderate share of understanding is sufficient to discover, that though the lender may, by exacting too rigorous conditions, show himself to be wanting in humanity, yet he cannot be guilty of a violation either of law or justice, by exercising his natural right of disposing of his own property upon what terms he pleases. But although the question of right in this business is so exceedingly simple, the paper of M. Turgot is only on that account the more calculated to display his genius and his character. He did not think he could degrade himself by combating seriously opinions the most absurd, when he considered them as dangerous." * * He presents us in this treatise with an idea equally perspicuous and novel, respecting legal interest, which is not and cannot be any thing else than the average price of interest calculated, like that of any common commodity, upon actual observation. The business of law, therefore, is the same in both cases; that is, to fix a price only where it has not been and could not be fixed by particular contracts."

M. Turgot held his intendantcy for thirteen years, during which, notwithstanding the great attention he paid to the duties of his office, and the efforts he made to introduce beneficial reforms, he never resigned his early habits of study. Towards the end of this period he composed a work on the "Formation of Wealth"—usually considered as the germ of Dr Smith's celebrated treatise on the Wealth of Nations—and also one upon Mines and Quarries, both being remarkable for the clearness with which the matters concerned are brought into relation to a few simple principles. The time was now arrived when Turgot was to bring his enlightened views into a wider field of operation. But our present paper is already of sufficient length, and the future history of this illustrious person must be reserved for another, which will speedily appear.

THE ABENCERRAGE,

A SPANISH TALE, BY WASHINGTON IRVING.

[From the Knickerbocker for June 1839.]

On the summit of a craggy hill, a spur of the mountains of Ronda, stands the castle of Allora, now a mere ruin, infested by bats and owlets, but in old times one of the strong border holds of the Christians, to keep watch upon the frontiers of the warlike kingdom of Granada, and to hold the Moors in check. It was a post always confided to some well-tried commander; and, at the time of which we treat, was held by Rodrigo de Narvaez, a veteran, famed, both among Moors and Christians, not only for his hardy feats of arms, but also for that magnanimous courtesy which should ever be entwined with the sterner virtues of the soldier.

The castle of Allora was a mere part of his command; he was Alcayde, or military governor, of Antiquera, but he passed most of his time at this frontier post, because its situation on the borders gave more frequent opportunity for those adventurous exploits which were the delight of the Spanish chivalry. His garrison consisted of fifty chosen cavaliers, all well mounted and well appointed: with these he kept vigilant watch upon the Moslems; patrolling the roads, and paths, and defiles, of the mountains, so that nothing could escape his eye; and now and then signalling himself by some dashing foray into the very Vega of Granada.

On a fair and beautiful night in summer, when the freshness of the evening breeze had tempered the heat of day, the worthy Alcayde sallied forth, with nine of his cavaliers, to patrol the neighbourhood, and seek adventures. They rode quietly and cautiously, lest they should be overheard by Moorish scout or traveller; and kept along ravines and hollow ways, lest they should be betrayed by the glittering of the full moon upon their armour. Coming to where the road divided, the Alcayde directed five of his cavaliers to take one of the branches, while he, with the remaining four, would take the other. Should either party be in danger, the blast of a horn was to be the signal to bring their comrades to their aid.

The party of five had not proceeded far, when, in passing through a defile overhung with trees, they heard the voice of a man singing. They immediately concealed themselves in a grove, on the brow of a declivity, up which the stranger would have to ascend.

The moonlight, which left the grove in deep shadow, lit up the whole person of the wayfarer as he advanced, and enabled them to distinguish his dress and appearance with perfect accuracy. He was a Moorish cavalier, and his noble demeanour, graceful carriage, and splendid attire, showed him to be of lofty rank. He was superbly mounted on a dapple-grey steed, of powerful frame and generous spirit, and magnificently caparisoned. His dress was a mariota or tunic, and an Albernoz of crimson damask, fringed with gold. His Tunisian turban, of many folds, was of silk and cotton striped, and bordered with golden fringe. At his girdle hung a scimitar of Damascus steel, with loops and tassels of silk and gold. On his left arm he bore an ample target, and his right hand grasped a long double-pointed lance. Thus equipped, he sat negligently on his steed, as one who dreamed of no danger, gazing on the moon, and singing, with a sweet and manly voice, a Moorish love ditty.

Just opposite the place where the Spanish cavaliers were concealed, was a small fountain in the rock, beside the road, to which the horse turned to drink; the rider throwing the reins on his neck, continued his song.

The Spanish cavaliers conferred together; they were all so pleased with the gallant and gentle appearance of the Moor, that they resolved not to harm, but to capture him, which, in his negligent mood, promised to be an easy task; rushing, therefore, from their concealment, they thought to surround and seize him. Never were men more mistaken. To gather up his reins, wheel round his steed, brace his buckler, and couch his lance, was the work of an instant, and there he sat, fixed like a castle in his saddle, beside the fountain.

The Christian cavaliers checked their steeds, and reconnoitred him warily, loth to come to an encounter, which must end in his destruction.

The Moor now held a parley: "If you be true knights," said he, "and seek for honourable fame, come on, singly, and I am ready to meet each in succession; but if you be mere lurkers of the road, intent on spoil, come all at once, and do your worst!"

The cavaliers communed for a moment apart, when one, advancing singly, exclaimed: "Although no law of chivalry obliges us to risk the loss of a prize, when clearly in our power, yet we willingly grant, as a courtesy, what we might refuse as a right. Valiant Moor! defend thyself!"

So saying, he wheeled, took proper distance, couched his lance, and putting spurs to his horse, made at the stranger. The latter met him in mid career, transpierced him with his lance, and threw him headlong from his saddle. A second and a third succeeded, but were unhorsed with equal facility, and thrown to the earth, severely wounded. The remaining two, seeing their comrades thus roughly treated, forgot all compact of courtesy, and charged both at once upon the Moor. He parried the thrust of one, but was wounded by the other in the thigh, and, in the shock and confusion, dropped his lance. Thus disarmed, and closely pressed, he pretended to fly, and was hotly pursued. Having drawn the two cavaliers some distance from the spot, he suddenly wheeled short about, with one of those dexterous movements for which the Moorish horsemen were renowned; passed swiftly between them, swung himself down from his saddle, so as to catch up his lance, then, lightly replacing himself, turned to renew the combat.

Seeing him thus fresh for the encounter, as if just issued from his tent, one of the cavaliers put his lips to his horn, and blew a blast, that soon brought the Alcayde and his four companions to the spot.

The valiant Narvaez, seeing three of his cavaliers extended on the earth, and two others hotly engaged with the Moor, was struck with admiration, and coveted a contest with so accomplished a warrior. Interfering in the fight, he called upon his followers to desist, and addressing the Moor, with courteous words invited him to a more equal combat. The latter readily accepted the challenge. For some time their contest was fierce and doubtful, and the Alcayde had need of all his skill and strength to ward off the blows of his antagonist. The Moor, however, was exhausted by previous fighting, and by loss of blood. He no longer sat his horse firmly, nor managed him with his wonted skill. Collecting all his strength for a last assault, he rose in his stirrups, and made a violent thrust with his lance; the Alcayde received it upon his shield, and at the same time wounded the Moor in the right arm; then closing, in the shock he grasped him in his arms, dragged him from his saddle, and fell with him to the earth: when putting his knee upon his breast, and his dagger to his throat, "Cavalier," exclaimed he, "render thyself my prisoner, for thy life is in my hands!"

"Kill me, rather," replied the Moor, "for death would be less grievous than loss of liberty."

The Alcayde, however, with the clemency of the truly brave, assisted the Moor to rise, ministered to his wounds with his own hands, and had him conveyed with great care to the castle of Allora. His wounds were slight, and in a few days were nearly cured; but the deepest wound had been inflicted on his spirit. He was constantly buried in a profound melancholy.

The Alcayde, who had conceived a great regard for him, treated him more as a friend than a captive, and tried in every way to cheer him, but in vain; he was always sad and moody, and, when on the battlements of the castle, would keep his eyes turned to the south, with a fixed and wistful gaze.

"How is this," exclaimed the Alcayde, reproachfully, "that you, who were so hardy and fearless in the field, should lose all spirit in prison? If any secret grief preys on your heart, confide it to me, as to a friend, and I promise you, on the faith of a cavalier, that you shall have no cause to repent the disclosure."

The Moorish knight kissed the hand of the Alcayde. "Noble cavalier," said he, "that I am cast down in spirit, is not from my wounds, which are slight, nor from my captivity, for your kindness has robbed it of all gloom; nor from my defeat, for to be conquered by so accomplished and renowned a cavalier, is no disgrace. But to explain to you the cause of my grief, it is necessary to give you some particulars of my story; and this I am moved to do, by the great sympathy you have manifested towards me, and the magnanimity that shines through all your actions."

Know, then, that my name is Abendarez, and that I am of the noble but unfortunate line of the Abencerrages of Granada. You have doubtless heard of the destruction that fell upon our race. Charged with treasonable designs, of which they were entirely innocent, many of them were beheaded, the rest banished; so that not an Abencerrage was permitted to remain in Granada, excepting my father and my uncle, whose innocence was proved, even to the satisfaction of their persecutors. It was decreed, however, that, should they have children, the sons should be educated at a distance from Granada, and the daughters should be married out of the kingdom.

Conformably to this decree, I was sent, while yet an infant, to be reared in the fortress of Cartama, the worthy Alcayde of which was an ancient friend of my father. He had no children, and received me into his family as his own child, treating me with the kindness and affection of a father; and I grew up in the belief that he really was such. A few years afterwards, his wife gave birth to a daughter, but his tenderness towards me continued undiminished. I thus grew up with Xarisa, for so the infant daughter of the Alcayde was called, as her own brother, and thought the growing passion which I felt for her was mere fraternal affection. I beheld her charms unfolding, as it were, leaf by leaf, like the morning rose, each moment disclosing fresh beauty and sweetness.

At this period I overheard a conversation between the Alcayde and his confidential domestic, and found myself to be the subject. "It is time," said he, "to apprise him of his parentage, that he may adopt a career in life. I have deferred the communication as long as possible, through reluctance to inform him that he is of a proscribed and an unlucky race."

This intelligence would have overwhelmed me at an earlier period, but the intimation that Xarisa was not my sister, operated like magic, and in an instant transformed my brotherly affection into ardent love.

I sought Xarisa, to impart to her the secret I had learned. I found her in the garden, in a bower of jessamines, arranging her beautiful hair by the mirror of a crystal fountain. The radiance of her beauty dazzled me. I ran to her with open arms, and she received me with a sister's embraces. When we had seated ourselves beside the fountain, she began to upbraid me for leaving her so long alone.

In reply, I informed her of the conversation I had overheard. The recital shocked and distressed her. "Alas!" cried she, "then is our happiness at an end!"

"How!" exclaimed I; "wilt thou cease to love me, because I am not thy brother?" "Not so," replied she; "but do you not know that when it is once known we are not brother and sister, we can no longer be permitted to be thus always together?"

In fact, from that moment our intercourse took a new character. We met often at the fountain among the jessamines, but Xarisa no longer advanced with open arms to meet me. She became reserved and silent, and would blush, and cast down her eyes, when I seated myself beside her. My heart became a prey to the thousand doubts and fears that ever attend upon true love. I was restless and uneasy, and looked back with regret to the unreserved intercourse that had existed between us, when we supposed ourselves brother and sister; yet I would not have had the relationship true for the world.

While matters were in this state between us, an order came from the king of Granada for the Alcayde to take command of the fortress of Coyn, which lies directly on the Christian frontier. He prepared to remove, with all his family, but signified that I should remain at Cartama. I exclaimed against the separation, and declared that I could not be parted from Xarisa. "That is the very cause," said he, "why I leave thee behind. It is time, Abendarez, that thou shouldst know the secret of thy birth; that thou art no son of mine, neither is Xarisa thy sister." "I know it all," exclaimed I, "and I love her with tenfold the affection of a brother. You have brought us up together; you have made us necessary to each other's happiness; our hearts have entwined themselves with our growth; do not now tear them asunder. Fill up the measure of your kindness; be indeed a father to me, by giving me Xarisa for my wife."

The brow of the Alcayde darkened as I spoke. "Have I then been deceived?" said he. "Have those nurtured in my very bosom, been conspiring against me? Is this your return for my paternal tenderness!—to beguile the affections of my child, and teach her to deceive her father? It was cause enough to refuse thee the hand of my daughter, that thou wert of a proscribed race, who can never approach the walls of Granada; this, however, I might have passed over; but never will I give my daughter to a man who has endeavoured to win her from me by deception."

All my attempts to vindicate myself and Xarisa were unavailing. I retired in anguish from his presence, and seeking Xarisa, told her of this blow, which was worse than death to me. "Xarisa," said I, "we part for ever! I shall never see thee more! Thy father will guard thee rigidly. Thy beauty and his wealth will soon attract some happier rival, and I shall be forgotten!"

Xarisa reproached me with my want of faith, and premised me eternal constancy. I still doubted and desponded, until, moved by my anguish and despair, she agreed to a secret union. Our espousals made, we parted, with a promise on her part to send me word from Coyn, should her father absent himself from the fortress. The very day after our secret nuptials, I beheld the whole train of the Alcayde depart from Cartama, nor would he admit me to his presence, or permit me to bid farewell to Xarisa. I remained at Cartama, somewhat pacified in spirit by this secret bond of union; but every thing around me fed my passion, and reminded me of Xarisa. I saw the windows at which I had so often beheld her. I wandered through the apartment she had inhabited, the chamber in which she had slept. I visited the bower of jessamines, and lingered beside the fountain in which she had delighted. Every thing recalled her to my imagination, and filled my heart with tender melancholy.

At length a confidential servant brought me word that her father was to depart that day for Granada, on a short absence, inviting me to hasten to Coyn, describing a secret portal at which I should apply, and the signal by which I would obtain admittance.

If ever you have loved, most valiant Alcayde, you may judge of the transport of my bosom. That very night I arrayed myself in my most gallant attire, to pay due honour to my bride; and arming myself against any casual attack, issued forth privately from Cartama. You know the rest, and by what sad fortune of war I found myself, instead of a happy bridegroom, in the nuptial bower of Coyn, vanquished, wounded, and a prisoner within the walls of Allora. The term of absence of the father of Xarisa is nearly expired. Within three days he will return to Coyn, and our meeting will no longer be possible. Judge, then, whether I grieve without cause, and whether I may not well be excused for showing impatience under confinement."

Don Rodrigo de Narvaez was greatly moved by this recital; for, though more used to rugged war than scenes of amorous softness, he was of a kind and generous nature.

"Abendarez," said he, "I did not seek thy confidence to gratify an idle curiosity. It grieves me much that the good fortune which delivered thee into my hands should have marred so fair an enterprise. Give me thy faith, as a true knight, to return prisoner to my castle within three days, and I will grant thee permission to accomplish thy nuptials."

The Abencerrage would have thrown himself at his feet to pour out protestations of eternal gratitude, but the Alcayde prevented him. Calling in his cavaliers, he took the Abencerrage by the right hand in their presence, exclaiming solemnly, "You promise, on the faith of a cavalier, to return to my castle of Allora within three days, and render yourself my prisoner?" and the Abencerrage said, "I promise."

"Then," said the Alcayde, "go! and may good fortune attend you. If you require any safeguard, I and my cavaliers are ready to be your companions."

The Abencerrage kissed the hand of the Alcayde in grateful acknowledgment. "Give me," said he, "my own armour and my steed, and I require no guard. It is not likely that I shall again meet with so valorous a foe."

The shades of night had fallen when the tramp of the dapple-grey steed resounded over the drawbridge, and immediately afterwards the light clatter of hoofs along the road bespoke the fleetness with which the youthful lover hastened to his bride. It was deep night when the Moor arrived at the castle of Coyn. He silently and cautiously walked his panting steed under its dark walls, and having nearly passed round them, came to the portal denoted by Xarisa. He paused, and looked round to see that he was not observed, and then knocked three times with the butt of his lance. In a little while the portal was timidly unclosed by the duenna of Xarisa. "Alas! senor," said she, "what has detained you thus long? Every night have I watched for you; and my lady is sick at heart with doubt and anxiety."

The Abencerrage hung his lance and shield and scimitar against the wall, and then followed the duenna, with silent steps, up a winding staircase, to the apartment of Xarisa. Vain would be the attempt to describe the raptures of that meeting. Time flew too swiftly, and the Abencerrage had nearly forgotten, until too late, his promise to return a prisoner to the Alcayde of Allora. The recollection of it came to him with a pang, and suddenly awoke him from his dream of bliss. Xarisa saw his altered looks, and heard with alarm his stifled sighs; but her countenance brightened when she heard the cause. "Let not thy spirit be cast down," said she, throwing her white arms around him; "I have the keys of my father's treasures; send ransom more than enough to satisfy the Christian, and remain with me."

"No," said Abendarez; "I have given my word to return in person, and, like a true knight, must fulfil my promise. After that, fortune must do with me as it pleases."

"Then," said Xarisa, "I will accompany thee. Never shall you return a prisoner, and I remain at liberty."

The Abencerrage was transported with joy at this new proof of devotion in his beautiful bride. All preparations were speedily made for their departure. Xarisa mounted behind the Moor, on his powerful steed; they left the castle walls before daybreak, nor did they pause until they arrived at the gate of the castle of Allora, which was flung wide to receive them.

Alighting in the court, the Abencerrage supported the steps of his trembling bride, who remained closely veiled, into the presence of Rodrigo de Narvaez. "Behold, valiant Alcayde!" said he, "the way in which an Abencerrage keeps his word. I promised to return to thee a

prisoner, but I deliver two captives into your power. Behold Xarisa, and judge whether I grieved without reason over the loss of such a treasure. Receive us as your own, for I confide my life and her honour to your hands."

The Alcayde was lost in admiration of the beauty of the lady, and the noble spirit of the Moor. "I know not," said he, "which of you surpasses the other; but I know that my castle is graced and honoured by your presence. Enter into it, and consider it your own, while you deign to reside with me."

For several days the lovers remained at Allora, happy in each other's love, and in the friendship of the brave Alcayde. The latter wrote a letter, full of courtesy, to the Moorish king of Granada, relating the whole event, extolling the valour and good faith of the Abencerrage, and craving for him the royal countenance.

The king was moved by the story, and was pleased with an opportunity of shewing attention to the wishes of a gallant and olivaceous enemy; for though he had often suffered from the prowess of Don Rodrigo de Narvaez, he admired the heroic character he had gained throughout the land. Calling the Alcayde of Coyn into his presence, he gave him the letter to read. The Alcayde turned pale, and trembled with rage on the perusal. "Restrain thine anger," said the king; "there is nothing that the Alcayde of Allora could ask, that I would not grant, if in my power. Go thou to Allora; pardon thy children; take them to thy home. I receive this Abencerrage into my favour, and it will be my delight to heap benefits upon you all."

The kindling ire of the Alcayde was suddenly appeased. He hastened to Allora, and folded his children to his bosom, who would have fallen at his feet. The gallant Rodrigo de Narvaez gave liberty to his prisoner without ransom, demanding merely a promise of his friendship. He accompanied the youthful couple and their father to Coyn, where their nuptials were celebrated with great rejoicings. When the festivities were over, Don Rodrigo de Narvaez returned to his fortress of Allora.

After his departure, the Alcayde of Coyn addressed his children: "To your hands," said he, "I confide the disposition of my wealth. One of the first things I charge you, is not to forget the ransom you owe to the Alcayde of Allora. His magnanimity you can never repay, but you can prevent it from wronging him of his just dues. Give him, moreover, your entire friendship, for he merits it fully, though of a different faith."

The Abencerrage thanked him for his generous proposition, which so truly accorded with his own wishes. He took a large sum of gold, and enclosed it in a rich coffer; and on his own part sent six beautiful horses, superbly caparisoned, with six shields and lances, mounted and embossed with gold. The beautiful Xarisa, at the same time, wrote a letter to the Alcayde, filled with expressions of gratitude and friendship, and sent him a box of fragrant cypress wood, containing linen, of the finest quality, for his person. The valiant Alcayde disposed of the present in a characteristic manner. The horses and armour he shared among the cavaliers who had accompanied him on the night of the skirmish. The box of cypress wood and its contents he retained, for the sake of the beautiful Xarisa; and sent her, by the hands of the messenger, the sum of gold paid as a ransom, entreating her to receive it as a wedding present. This courtesy and magnanimity raised the character of the Alcayde Rodrigo de Narvaez still higher in the estimation of the Moors, who extolled him as a perfect mirror of chivalric virtue; and from that time forward there was a continual exchange of good offices between them.

GRAVE LITERATURE.

LONDON, as is perhaps known to some of our readers, is now furnished with at least two extensive out-of-town cemeteries, one in the north and the other in the south-western part of the environs; they are the property of joint-stock companies, and should, we think, "if properly supported," relieve the metropolis of some part of that pressure of mortality which Mr Walker has lately been so pathetically bewailing. As mercantile concerns, these cemeteries are of course managed with that business-like nicety which governs all such things in the great city. They have each a handbill, in which all desirable particulars are given, both as to accommodation and pecuniary charges. The odd association of commercial and sepulchral ideas thus produced has given occasion to an amusing commentary on the bill of the "North London Kentish Town and Highgate Cemetery Company," in a late number of *The European*, a new weekly journal of British and Continental literature, which has already been quoted in these pages. The following is a part of this whimsical paper:—

"This singular piece of Cemeterial literature teems with passages of the most captivating kind. It tells us of 'Public Vaults' where the 'adult' dead may rest sociably and orientally ('in the Eastern') at an eternity price of six guineas, and centrally ('in the Centre') at that of ten; and the infant departed at the respective rates of five pounds twelve shillings and six pounds six: of 'Terrace Catacombs,' where 'Private Vaults,' capable of from one to one score confined inhabitants, may be had, by family folk, at prices humble as fourteen, and ambitious as one hundred and ninety-nine pounds sterling: of 'Cedar of Lebanon Circle Catacombs,' and 'Egyptian Avenue Catacombs,' where 'Private Tombs' are to be appropriated by those disposed to everlasting loneliness for the very moderate consideration, more or less, of a twenty-pound note: of the 'Open Ground,' where 'Family Vaults,' 'Pecu

liar Vaults," "Peculiar Brick Graves and Flat Stones," and "Private Graves, seven feet deep," in brickwork cemented, and brickwork mortared, are to be purchased at cash-prices of all sorts, according to length, breadth, depth, finish, and number: of "Common Interments," which the unambitious "adult" may enjoy for one pound five, and the adult in embryo for seventeen shillings! But beware of being "embowelled" in the "mother earth" of Highgate Cemetery "before three o'clock P.M.," or "after sunset;" it will cost you, else, an additional seven shillings and sixpence. Funeral officials are asleep, or busy, betimes in the morning, and after "sundown" they catch cold. If there be a keen north-easter astir, you may have the "use of a large Weather-Screen" for the small charge of half a sovereign and one sixpence. If you want "extra ground," "beyond the size" of your vault or your grave, or are desirous of revelling in the "Privilege of placing a Head and Foot Stone to a Grave" (our quotations are exact—italics, capitals, and all!) you must see after the vampire "powers that be" and with them mutually sign, seal, and deliver, "a Special Agreement." In a line of very small letters you are told that

"Flat Stones are Better and Cheaper—"

and immediately after, in larger type, that for the "Privilege of putting a Flat Stone to a Grave" you must cash up seven shillings! If you desire to have a "Copper-cramp'd" Monumental Tablet stuck against the wall—mind, a copper-cramp'd one—it will cost you a dozen shillings "per foot;" you will, therefore, do well not to employ a very voluminous poet for your epitaph. There is the item—"Hanging the Chapel and Gallery with Black Cloth;" but no price is appended to it, which leaves it an *ad-libitum* affair with the Directors, and should be approached with caution by those dying in the pleasures of but a limited income. If you want your grave to be "maintained," you may have it fed at the rate of a three-and-sixpenny expenditure "per annum," or for four guineas "in perpetuity;" but if you wish its food to be delicate and romantic—"flowers," in short—you will not be able to achieve the epicurianism under an additional four shillings yearly, or an extra three guineas on the "perpetuity" point. If you be of the profane, and prefer an "unconsecrated" ceremonial, "the Company" kindly pledge themselves to "provide" you with "a Dissenting Minister, if required." If you entertain any special craving, arising from some unaccountable idiosyncrasy, of eternally reposing in lead, a "Vault" or a "Catacomb" must be your place of permanent residence; because in "Common Graves" Wooden coffins "only are used"—an evidence of foresight most remarkable in men who are for ever witnessing the blank and black results of the past and the present. The "common graves" are designed for generation upon generation. Wood decays as kindly almost as the flesh of "us sinners." Lead is *quasi*-perdurable. The conclusion is self-evident. If you have any fear of being posthumously pilfered, the "Company" assures you that "armed retired soldiers, approved by the Horse-Guards (!) guard daily the Cemetery," and that at night you have the additional security of "Dogs"—of the identical breed, perhaps, which hunted down the rebel slaves of Jamaica, and of which the human sympathies must, consequently, be inherited, and to manhood most comfortable.

But it is not for the dead alone that the "Company" shows its concern. The living *pay* for the dead, and for themselves. To say nothing of the friendly information as to "distances," how to avoid "hills," and of the precise minutes at which "Kentish Town" and "Holloway" Omnibuses depart from the regions of life towards those of death, which the Directorial Circular contains, it tells us, in the divinest Christian spirit of a sympathising mortality, that "the use of a large secluded Room, opening into a Private Gallery of the Chapel during the Funeral Service," is "reserved for infirm Mourners and Invalids," who may feel "unequal to the fatigue and excitement of a long Funeral procession to the Cemetery;" or, "for Ladies or Friends wishing to attend the Funeral service only in the Chapel, without joining any procession"—and all this for the mere *masquerade*-price of a guinea! The sense of charity which this last-mentioned instance of the Company's benevolence fills us with, is overpowering. The "grave" is no longer "cruel;" seraphic clouds veil the "Skeleton;" the Sexton's spade becomes an enchanter's wand; and the coffin a roseate bower of poetic immortality!

We have done. The Highgate Cemetery and its "literature" have but made us more in love with the pleasant grave of the "Country Churchyard." Better, far better, to be warmly "tucked up" in the earth, with the sweet flowers and "the glory of the grass" springing and breathing incense, and the merry birds singing above us, than to be caged and denned in vaulted "catacombs"—dark, damp, and silent; where the voice and the smile of nature never comes, and nothing ever audibly or visibly speaks to us of life that dies not and joy which endures for ever.

TRUE WISDOM.

Though sometimes small evils, like invisible insects, inflict pain, and a single hair may stop a vast machine, yet the chief secret of comfort lies in not suffering trifles to vex one, and in prudently cultivating an undergrowth of small pleasures, since very few great ones, alas! are let on long leases.—*Newspaper paragraph.*

LABOUR NOT HOSTILE TO MENTAL IMPROVEMENT.

Are labour and self-culture irreconcilable to each other? In the first place, we have seen that a man in the midst of labour may and ought to give himself to the most important improvements, that he may cultivate his sense of justice, his benevolence, and the desire of perfection. Toil is the school for these high principles; and we have here a strong presumption, that in other respects it does not necessarily blight the soul. Next, we have seen that the most fruitful sources of truth and wisdom are not books, precious as they are, but experience and observation; and these belong to all conditions. It is another important consideration, that almost all labour demands intellectual activity, and is best carried on by those who invigorate their minds; so that the two interests, toil and self-culture, are friends to each other. It is mind, after all, which does the work of the world; so that the more there is of mind, the more work will be accomplished. A man, in proportion as he is intelligent, makes a given force accomplish a greater task, makes skill take the place of muscles, and, with less labour, gives a better product. Make men intelligent, and they become inventive; they find shorter processes. Their knowledge of nature helps them to turn its laws to account, to understand the substances on which they work, and to seize on useful hints, which experience continually furnishes. It is among workmen that some of the most useful machines have been contrived. Spread education, and, as the history of this country shows, there will be no bounds to useful inventions.—*Dr Channing's Pamphlet on Self-Culture.*

LIEUTENANT LUFF.

All you that are too fond of wine,
Or any other stuff,
Take warning by the dismal fate
Of one Lieutenant Luff.
A sober man he might have been
Except in one regard—
He did not like soft water,
So he took to drinking hard.
Said he, let others fancy slops,
And talk in praise of tea,
But I am no Bohemian,
So do not like Bohemia;
If wine's a poison, so is tea,
Though in another shape;
What matter whether one is killed
By canister or grape?
According to this kind of taste
Did he indulge his drouth,
And being fond of port, he made
A port-hole of his mouth!
A single pint he might have slipped,
And not been out of sorts;
In geologic phrase, the rock
He split upon was quartz!
To "hold the mirror up to vice"
With him was hard, alas!
The worse for wine he often was,
But not "before a glass!"
No kind and prudent friend he had
To bid him drink no more:
The only *chequers* in his course
Were at a tavern door!
Full soon the sad effects of this
His frame began to show,
For that old enemy the gout
Had taken him in tow!
And joined with this an evil came
Of quite another sort.
For while he drank, himself, his purse
Was getting "something short."
For want of cash he soon had pawned
One-half that he possessed;
And drinking showed him *duplicates*
Beforehand of the rest.
So now his creditors resolved
To seize on his assets,
For why, they found that his *half-pay*
Did not *half pay* his debts.
But Luff contrived a novel mode
His creditors to chouse,
For his own execution he
Put into his own house!
A pistol, to the muzzle charged,
He took devoid of fear,
Said he, "This barrel is my last,
So now for my last beer."
Against his lungs he aimed the slugs,
And not against his brain;
So he blew out his lights, and none
Could blow them in again!
A jury for a verdict met,
And gave it in these terms:
"We find as how as certain *slugs*
Has sent him to the worms."

—*Hood's Comic Annual, 1830.*

PRIVATE FORTUNES OF SOME OF THE GREAT PERSONAGES OF ANCIENT TIMES.

CÆSAR possessed in landed property a fortune equal to £1,700,000, besides a large sum of money, slaves, and furniture, which amounted to an equal sum; he used to say, that a citizen who had not a fortune sufficient to support an army or a legion, did not deserve the title of a rich man. The philosopher Seneca had a fortune of £2,500,000. Lentulus, the soothsayer, had £3,500,000. Tiberius, at his death, left £23,625,000, which Caligula spent in less than twelve months. Vespasian, on ascending the throne, estimated all the expenses of the state at £3,500,000. The debts of Milon amounted to £600,000. Cæsar, before he entered upon any office, owed £2,995,000; he purchased the friendship of Curio for £500,000, and that of Lucius Papius for £300,000. At the time of the assassination of Julius Cæsar, Anthony was in debt to the amount of £300,000; he owed this sum in the Ides of March, and it was paid before the Kalends of April; he squandered £147,000,000 of the public treasures. Appicus expended in debauchery £500,000; and finding, on examination of the state of his affairs, that he had no more than £60,000 left, he poisoned himself, because he considered that sum insufficient for his maintenance. Julius Cæsar gave Servilla, the mother of Brutus, a pearl of the value of £40,000. Cleopatra, at an entertainment,

gave to Anthony, dissolved in vinegar, who swallowed it, a pearl worth £80,000. Claudius, the son of Esopus, the comedian, swallowed one worth £8000. One single dish cost Esopus £80,000. Caligula spent for one supper £80,000, and Heliogabalus £20,000. The usual cost of a repast for Lucullus was £20,000. Misalla gave £40,000 for the house of Anthony. The fish from Lucullus's fish ponds were sold for £35,000. Scarus's country-house was destroyed by fire, and his loss was estimated at £850,000. Otho, to finish a part of Nero's palace, spent £487,500.—*Newspaper paragraph.*

AN INFORMER'S LETTER TO A FRIEND.

London, May —, 1835.—DEER TOM, This kums opin you are Well as it leaves Us at present. We are kum to town from a most delicious trip to Cheltenham: can't say much for the Waters, and the brandy had the Hinn, the — was not the best as you and me ave had on the costs of Sussecks. However, thank God! things is turned up well on the Ole; i did the post-shayse touch agin primely. We tooke babby with us to give things a colour, my missus looked as delicate as she coude, and, as luck wolde ave it, babby warnt very well. The Landlord thoughte me hinnocent as Milke, and so missus and me and gal lived like fitin cocks, and evry day, the old oman and childe and gal goes out in a po-shayse for, as i sayde, a hairing. Well, the two fust days the landlord gives the poste ticket, and I begun to thinke him two downe for Cannibal; howsemever, as he founde out that the chay never went as far as the turnpike, and that missus and babby only wanted a short hairing, he drops the ticket, and then, "Now I has him," says I, "downe as a ammer!" How we did putt bye the Shampayne that day a dinner. Well, tom, so we lives for aboutt six weeks, and God be praist for it, the hair did us alle a morte o' good; but now the fun's cumin. Six Weeks bein gone, the landlord walks up one day at breakfast, and says, rubbin his ands, hand smilin like a streete door nocker, "My little bill, Sir," says he, "if quite konvenient." "To be sure," says I, brakin a hegg and a winkin at him, "two be sure—the bill." "ear it is, Sir," says he, i looks at it, and it mayde my hart beet for joy, it was sich a long un. "Wery eye prices ear," says i, lookin at the bill. "it's a eye hinn," says the landlord, tryin to kum grand; wherehupon i gets up, and givein him an office look, i says, says i, "mr landlord, do you love your kuntrey?" "i hope i do," says he. "Then," says i, "if you ave the buzum of a Patryot, how dare you think to rob and swindle his most greysus mageste, God bless him?" "what do you meene?" says the landlord, turnin pailer than his nekkloth—"what do you meene?" "where's them tickets, the po-chayse, the dooty, eh?" and i looks at him terrible. "It was alle a mistake, sir," says he—"can't help it," says i, "the Xize prospers on mistakes." "i trust, sir," says boniface, "i'm dealin with a gen'l-man," and then he looks verry dowtful. "you are," says i, "but the hinstytewshuns of the kuntrey must be supported: what's to be kum of the krown, and the establiht Church, and tryal by Joory, and abeas korpuss, if there's no patryotism—if men shirk the Xize?" then he begins to knowe his customer, and says, "well, sir, you wont be ard with me?" "God forbid," says i, "so i tell you what, old fellar, write me a reecat for this sixty pound, and, to make it all smoth, and us over a bit o' rag for twenty, to take us to lundun to our peacefull home." oh! tom, you should ave seen how he jump! and swore so, missus and babbye was forced to leave the roome. "well," says i, at last, "it's no matter," and i makes a fumblin in my pocket as if i was goin to take out my pus, "you know the penaltys," says i—and they was swingin, for we had the po-chayse often three times a-day—"you know the penaltys?" i repeats, when he says nothin, but takin out his pocket-book, black in the face, raps me out. a twenty, rites a reecyte, abooses me when he's on the staycrease for a willainly informer; when, not chusin to be insulted in our owne hinn, we packt up our trapps and started for towne. i made two pounds out of a farmer on the roade: i askt him for a lifte in his cart, made him tak a shillin, and then frighten him with information for carryin passengers in a untaxt weicle—yours, deer tom, till deth, EBENEZER CANNIBAL.

P. S. Mugs, the landlord of the Feythurs, rides rusty, and is slo with the hush-money; i'm told he hadde a dance and two fiddlers on Friday—and in Lent, two—in his backe parlour. This must be seed into.—*Heads of the People.*

GRAHAM OF CLAYHOUSE.

This singular person united the seemingly inconsistent qualities of courage and cruelty, a disinterested and devoted loyalty to his prince, with a disregard of the rights of his fellow-subjects. He was the unscrupulous agent of the Scottish privy council in executing the merciless severities of the government in Scotland during the reigns of Charles II. and James II.; but he redeemed his character by the zeal with which he asserted the cause of the latter monarch after the revolution, the military skill with which he supported it at the battle of Killiecrankie, and by his own death in the arms of victory. It is said by tradition that he was very desirous to see, and be introduced to, a certain Lady Elphinstoun, who had reached the advanced age of one hundred years and upwards. The noble matron, being a staunch Whig, was rather unwilling to receive Claverhouse (as he was called from his title), but at length consented. After the usual compliments, the officer observed to the lady, that having lived so much beyond the usual term of humanity, she must in her time have seen many strange changes. "Hout na, sir," said Lady Elphinstoun, "the world is just to end with me as it began. When I was entering life, there was ane Knox deaving us a' with his *clavers*; and now I am gangin out, there is ane Claverhouse deaving us a' with his *knocks*." *Clavers* signifying, in common parlance, idle chat, the double pun does credit to the ingenuity of a lady of a hundred years old.—*Waverley Novels, new edition.*

PRICE THREE HALFPENCE.

ENGLISH INGENUITY AND ENTERPRISE IN A NEW POINT OF VIEW.

WE have often thought that British ingenuity and British enterprise are in nothing shown more conspicuously than in the advertising columns of our newspapers, and the similar sheets slipped under the covers of our magazines and reviews. There, if you give any attention to the matter, you see various mechanists, traders, and others, incessantly lifting up their voices before a we-fear-far-too-negligent public, in the hope of making the said public acquainted, as far as can be done "within the limits of an advertisement," with scores of ingenious inventions for human comfort and convenience, for the supply of natural defects, and the cure of natural ailments, or, what is of not less consequence, with places where clothes and other necessities of life can be purchased on terms so extremely economical, that it would appear as if the humblest person would henceforth be quite inexcusable in not living and dressing like a gentleman. There is an ingenuity in the preparation of many of the articles advertised, an ardour and pathos in the diction of many of the advertisements, and an untiring perseverance in the act of advertising itself, which in our opinion reflect a strong light on the character of *la nation britannique*, or shop-keeping nation, as Bonaparte, by way of ridicule, but in reality in compliment, called us. Advertisers are in their way enthusiasts. They are generally men who have taken up a strong prepossession in behalf of something, with the virtues of which they are determined to make mankind acquainted. To this purpose they devote their whole being. No obstacles daunt them. Whether a column cost three guineas or three shillings, it matters not. The John o' Groat Journal is as sure of their custom as the Times and Chronicle. They also go forth into the highways to proclaim the truths which burden their minds. Mr Warren has preached the virtues of his blacking through all Christendom—nay, even proclaimed it on the exterior of the Great Pyramid! Such a man may be considered as a kind of Peter the Hermit. It is, indeed, the same truly English ardour of mind which fought at Cressy, Poitiers, and Agincourt—which sent out Raleigh and Drake as explorers of a new world—which ranked up the Long Parliament against the king, and drove James II. into ignominious banishment—which now fills every newspaper, puffs up the sides of every magazine and review, and gives speech to every dead wall throughout the country. Such are simply the new shapes into which the same mental characteristic has been thrown, in accordance with the new forms of society. Strange that the same thing should at one time make a man cover his head with an iron pot and his breast with an iron corset, that he might go out to fight his neighbours, and at another only induce him, perhaps, to placard the head and front of some poor fellow with the virtues of his cutlery or his silver goods, and send him forth to parade the Strand as a sign to the people.

Another curious consideration arises from a survey of English advertisements. Many of them refer to matters of such nicety, both in themselves and in their application to human comfort and convenience, as to mark very strikingly the highly advanced state at which we are arrived.

With respect to the very act in which we are at this moment engaged, how many curious appliances are now at our command! There the Perryian metal pens, "protected by five patents"—first "the Patent Perryian Under Spring Pen," then "the Double-Patent Perryian Pen," the flexibility of which is "so

absolutely natural" that its action "cannot be distinguished from that of the goose-quill," and which moreover "accommodates itself to writers of all descriptions, to those who write fine, as well as to those who write coarse [we think we know one or two who could defy it], to the smallest character of the current, as well as to the largest of the text hand." There is also the "Patent Perryian Flat Spring Pen," the "India Rubber Spring Pen," and the "Patent Three-Pointed Pen," as well as the Drawing and the Mapping Pens, with many others. Well may Mr Perry head his advertisements with "Important to all who write!" Nor is he the only ingenious mechanist who has devoted himself to facilitate the act of writing. There is Mr Mordan, with his steel pens, so improved as to "remove the almost universal complaint, the uncertainty of depositing the ink in rapid writing, and the want of firmness and smoothness at the point." The same gentleman has invented an "oblique steel pen," that is to say, one with a slit directed slantingly, or "parallel to the usual slope of writing, whilst the point is preserved central to the holder;" the result of which is that the pen "may be used freely." We would humbly submit that this is an object not desirable, and that it would be a great obligation to mankind, if at least the editors of party newspapers were furnished with a pen which could not be used without some restraint. Mr Mordan advertises "Portable Leather Travelling Ink," an article of which we can form no definite idea. If he means an actual liquid for writing in which leather is an ingredient, and which is particularly calculated for use in travelling, we would say that the name is decidedly one of evil omen, and that the article ought to be avoided in particular by all authors of travelling journals who wish their works to keep clear of the trunk-makers. Of improved inks there is now, however, no lack, as witness the compositions of Morison and many others. One manufacturer of this article announces a kind prepared on a scientific principle of great plausibility. The basis, he says, is manganese, which, on oxidising by exposure, becomes a jet black—a great improvement certainly on the rusty colour which the iron of most inks produces on undergoing the same change.

For personal comfort and general convenience, the inventions of English tradesmen are infinite. Nothing is too minute for their attention, if it promise the slightest relief from uneasiness or inconvenience, or make any thing answer its end in the least more patly. It would be worth while, as an illustration of the inventiveness of the nation, to inquire of how many patents the cork-screw has been the subject. We well remember the Nonpareil, which reigned a long time, to the great contentment of old gentlemen to whom rising from their chairs after the second bottle of port was more of a duty than a pleasure; but at length there was an *Improved* Nonpareil, which we suppose continues to be infallible. Mr Mordan has applied his genius to the kindred subject of stoppers, and produced an article which makes all kinds of bottles perfectly air-tight, "with scarcely any additional expense on the usual charge." Not even the strongest volatiles escape Mordan's Improved Stopper. Some years ago, there was a serious litigation before one of the supreme English courts, respecting the infringement of a patent for the improvement of hair-brushes—the improvement consisting of an arrangement of the little bundles of bristles, by which each bundle terminated conically, so that the whole took a better hold of the hair when applied to it. A patent Pedometer is advertised frequently, being, we presume, merely a thing for taking measure of the foot,

On the single subject of domestic comfort and security, the number of inventions is very great. For the warming of buildings we have many plans—one being described as "founded on certain principles of natural philosophy, now first discovered," and attended with great advantages "in regard to economy, diminution of danger of fire, convenience, cleanliness, and the preservation of health." Another is the "Chunk Patent Stove," in the shape of a small upright cylinder, which requires no attention of any kind for twenty-four hours, which will not set gunpowder on fire even though in contact with it, and "may stand on the most delicate carpet without injuring it." There is also Pearce's Economical Radiating Stove, which "retains the heat for many hours after the fire is out," and "may be executed in any style of architecture, Grecian, Elizabethan, Louis Quatorze, or Gothic." Lastly, there is Perkin's and Heath's plan by hot-water pipes. For securing doors, chests, drawers, and so forth, we have various clever inventions besides Bramah's Locks. Here Mr Mordan again comes forward. He offers us a lock of seven guards, the key of which can be varied infinitely, and cannot be imitated, and which defies all tampering with other keys. Mr Charles Chubb, of St Paul's Churchyard, holds out an "Improved Patent Detector Lock, for all kinds of doors, iron-safes, drawers, desks, jewel-cases, dispatch boxes, &c.," and, like the above, not to be picked. One gentleman is extremely pathetic on the subject of locks. "Look to your locks!" he first cries at the head of the placard, and then he proceeds to show what fatal effects often arise from the imperfection of these articles. Not only is money abstracted, but valuable documents are removed, erasures made, and the documents then replaced, the evil not being discovered till it is too late to repair it, by which a whole family is perhaps involved in ruin! He follows up the appeal with a selection of police cases, detailing the particulars of successful attacks on plate-chests and jewel-cases. With regard to the lighting of houses, ingenuity has not been so prolific of expedients. We have, however, Palmer and Company's Patent Candle Lamps and Patent Metallic Wick Candles, the first being remarkable as a neater, more economical, and less troublesome way of burning candles, than the ordinary plan, while the candles themselves are described as of superior manufacture. We must confess, however, that we read with scepticism of "Night-Lamps with Self-Extinguishers," and "candles which must never be snuffed, but the wicks placed apart from each other, and they will then snuff themselves!"

And yet these phenomena are not more wonderful than one which apparently attends Mr G. Minter's Easy Chair, for this, we are told, "will recline and elevate, of itself, into an innumerable variety of positions, without the least trouble or difficulty to the occupier; and there being no machinery, rack, catch, or spring, it is only for persons sitting in the chair to rise to recline or elevate themselves, and the seat and back take any desired inclination, without the least assistance or exertion whatever, owing to the weight on the seat acting as a counterbalance to the pressure against the back by the application of a self-adjusting leverage." One word we would here object to most particularly. Has the Frankenstein-like mechanist ever heard of one who was

"Lulled on the rack of a too-easy chair?"

Surely if any chair ever had such a "rack" connected with it, it must be this piece of inspired upholstery. When we read of such wonderful conveniences, we almost fear that things are now-a-days made too nice

for us. Life seems threatened with an utter deprivation of the element of discomfort, the consequence of which will probably be something quite as fatal as would be that of an abstraction of the carbonic acid gas from the atmosphere, or a restraining of hens from picking up gravel. There, for instance, are Hall and Co.'s "Leather Cloth Shoes and India-Rubber Goloshes for Tender Feet." We tremble at the idea of the luxurious ease they must afford. "The Pannus-Corium, or Leather Cloth Shoe, combines with the appearance of leather the greatest softness, ease, and elegance; is light, elastic, and durable, and will never draw the feet. [An important assurance this, for one might almost expect that such shoes would go of themselves, a peculiarity which could not fail often to lead their wearers into scrapes.] The Patent India-Rubber Golosh resembles the finest morocco, is lined with the softest materials, namely, velvet, kerseymere, or kid, and, whilst thoroughly waterproof, is so light, that, when worn over the Cloth Shoe, no sensible addition is felt to the weight, both articles being as light as an ordinary shoe." The luxury of these articles is, we would say, decidedly dangerous. People will forget that they have feet at all. Besides, the chiropodists, having a vested interest in the corns of mankind, will have good reason to consider themselves aggrieved. Franks and Co. are, in our opinion, not less to blame, for they hold out hats not more than three and a half ounces in weight, and "so porous and elastic as to admit of a free circulation of air, thereby preventing the headache or pain consequent on the wear of ordinary new hats." Wearing such articles, people will forget that they have heads, and what is then to become of them? We have the same fault to find with the ingenious men who address themselves to the beards of the Christian world. In this matter, formerly, we had a thing eminently calculated to sadden and subdue the human heart. A man rose in a cold morning to a bad razor and an acre-breadth of intractable brush-wood, and knew that he was mortal. But now Mr Packwood comes in with his razor-strop, and Mr Rigge of Cheapside with his "Magnetic Razor Tablet, termed the Double Action, combining, in its late improvements, the properties of both hone and strop," and lo this trouble is removed from before the face of man; he kicks up the heels of his mind, and in his joy becomes open to all those temptations which so peculiarly beset the heart which is free from care.

This leads us to reflect how far, now-a-days, even the defects and blemishes which befall the human person are compensated and removed by the ingenuity of tradesmen. Loss of teeth is now scarcely a misfortune. We have the Mineral Succedaneum, "so universally recommended by the faculty of London and Paris;" also the "Improved Terro-Metallic Teeth," covered with "an enamel formed of metallic oxides, of every shade of colour, so as to match exactly with the teeth remaining in the mouth." Loss of hair is of less importance than loss of teeth; but there are not less anxious efforts to prevent the calamity from occurring, and repairing it when it has occurred. "Thine incomparable oil, Macassar," is now rendered classic by Byron, who, however, made a strange mistake in his allusion to it, seeing that Macassar is not the name of the inventor or preparer, but that of a place, from which the oil takes its name. The noble poet's mistake is a sad proof of the inattention of the public to even the most frequently-repeated advertisements. The honours of the oil are in reality due to a gentleman who is perhaps the most persevering of all British advertisers, though doomed like Cassandra to have his advertisements but little regarded. The oil, we are told, "nourishes the hair—prevents it from falling off or turning grey—changes grey hair to its original colour—and produces and restores hair." In children (hear, ye mammas!) it "lays the foundation for a beautiful head of hair." There are several other preparations equally mirific held out to the grey and bald; but should any gentleman not chuse to become the subject of so strange a phenomenon, he may take up with the "Improved Peruke," the inventor of which justly remarks—"The great dislike to perukes in general arises from the altered air they give the countenance, occasioned by makers paying no regard to the manner of the natural hair growing on the forehead, which, being different in every different individual, requires a corresponding difference in the peruke." He adds, that, by his system, "the peruke is made to describe exactly the same angle on the forehead as the natural hair; and being completely carried off from the temples, defies the

closest scrutiny of the most proficient connoisseur to distinguish it from a natural head of hair." This advertiser is also one of those who err on the side of making mankind rather too comfortable. He offers a spring for perukes "weighing only three drachms!" His perukes, thus furnished, would be found, he says, by captains of vessels and settlers in warm climates, "less objectionable than even the natural hair!" This is too much—it is almost, we fear, profane. To put nature into her best trim is allowable; but to propose altogether to supplant one of her works with something prettily superior, is a kind of treason against her. Our perurquier should have the fate of Prometheus before his eyes. Defective hearing is another thing which modern ingenuity has made less of a misfortune than it used to be. There is a little utensil called the "Voice-Conductor," which "enables deaf people to hear conversation," and "can be put on and off like a pair of spectacles." There is also "the Otaphone," "formed from a correct model of the back of the ear," and designed, "by fitting all the irregularities of that very uneven and elastic surface," to gently "press forward the parts, so as to produce a more perfect orbit and fuller recipient of sound." Is it sight which is defective? then spectacle-makers innumerable start up with their wares, some professing to have their glasses "ground on a particular principle," others pluming themselves on presenting "frames peculiarly adapted to the face of the wearer, so that the centre of each glass is brought exactly opposite the pupil of the eye—which is of great importance, although entirely neglected by many opticians." Then as to personal beauty, how many expedients are at command for ensuring it, from the Baron Dupuytren's *Tamrukeyhu*, which "removes from the *rete mucosum* of the skin (that tissue upon which its colour depends) all sallowness, wanness, and tan; causes a circulation of blood in the minute capillaries of the skin; and gives to the countenance, neck, and arms, a beautiful clearness, softness, and healthy aspect;" to the well-known Liquid Bloom of Roses, an extract from the flower whose name it bears, calculated "to remove the injuries sustained by the use of deleterious compositions, and replace beauty on its native throne, the countenance!" There are still, we believe, a good many plain people in the world; but there is no reason why there should be any such any longer. Ugliness has evidently been for some time past altogether inexcusable.

There is another thing which we have stated at the beginning of this paper to be inexcusable: that is, being ill dressed. How any man of the most ordinary means, or the simplest regard to decorum, can now allow himself to be shabby, is totally incomprehensible. Under the cover of every review and magazine which meets his eye, he sees announcements from clothing houses, of habits ultra-cheap, with portraiture of specimen gentlemen such as might rouse a stoic to a desire of being equally well fashioned. There is an old superstitious notion that good clothes are dear, under the influence of which many gentlemen continue to make the old serve far longer than they ought to do. If they were only to pay a proper attention to the advertisements in question, they would discover that the maxim is now quite obsolete. A full superfine suit, "of superior style of cut," can be obtained in one house for only L.4, 5s.; in another, a suit of "Extra Imperial Saxony, the best that is made," is held forth at L.4, 4s. Gentlemen may contract for three suits per annum, giving back each at the end of four months, for twelve pound six; or for five suits, giving back the used garments every ten weeks, at seventeen pound ten; and so on in proportion. Nor let the fear of unfitting suits harass the mind of the child of Adam. He can be measured by an instrument, "on principles mathematically certain." This instrument, "simply taking for its standard the figure it is applied to, ascertains the real proportions of it, and is enabled to make such additions as are necessary for improvement, without the danger of their becoming distortions—while the universally adopted systems measure only the lengths and circumference of the body, without reference to its shapes or positions, then draw their proportions from an ideal figure, and therefore inevitably fail to fit all whose symmetry is not in accordance with that standard." With so considerate an instrument for measuring, tailoring has certainly reached its acme. To add another word, of remark or advice, would only diminish the impression which must already have been made.

We had a number of other curious appliances to bring before the notice of our readers, but our limits are exhausted; and if these are ever to be commented upon, it must be on another occasion.

BIOGRAPHIC SKETCHES.

M. TURGOT.

Second Article.

WE are now to behold our philosophical statesman in a field truly worthy of his abilities. To quote the words of his biographer—"So many labours—a love of justice ever accompanied by compassionate goodness—a mind incapable of yielding to seduction or fear—and a zeal for the public good, as distinct from the love of fame, and from personal ambition, as human nature can permit—entitled M. Turgot not only to the blessings of the people of his province, but gained him general approbation; and at the death of Louis XV., the public voice called him to the first offices of the government, as a man who, to all the improvements that study could procure, united the experience which results from habits of business." At this time the finances of the state were in the utmost confusion: there were great resources, but no credit. These were the natural consequences of a long-enduring system of error and oppressive exaction. It was in consequence of a general wish for reforming measures, that M. Turgot was called forward from his province, and made minister of marine.

This office, for which he had no special qualifications, was exchanged after a single month for that of controller of finances, the most difficult at that time, but the one for which M. Turgot was best qualified. He entered upon this function, under a decided understanding with the king, that there should be no national bankruptcy, no increase of taxes, and no new loans; and he immediately proceeded to explain, that, to make these objects practicable, the only resource was a rigid economy in every department of the state, in connection with regulations for improving agriculture and facilitating commerce, and a more equitable distribution of the taxes. He at the same time informed his majesty, that he was quite aware of the difficulties of the task he had undertaken, from the interested views of many, the prejudices of others, and even from the people themselves, who might misinterpret the very measures adopted for their express benefit.

In France, legislation in matters of finance had long had but one principle, a desire of augmenting the revenues of the sovereign, without exciting clamours dangerous to the minister. The consequence was, that the regulations which were made, bore hard only on the people, and principally upon the country people, who, being always scattered, could neither force an audience nor inspire terror. Commerce had been constantly sacrificed to views of revenue, or to the interests of petty corporations and powerful individuals. The industry of the nation was fettered by vexatious regulations and the privileges of particular bodies. The work upon the high-roads by the system of *corvées*, twice a-year brought slavery, misery, and despair, to the rural labouring class. The internal navigation of the kingdom languished in the midst of a thousand vain projects. The incomes of the towns were spent in selfish luxury by the richer citizens. The produce of the national taxes, small as its amount necessarily was in such circumstances, was further diminished by the enormous expense of collection; and the finance minister had often been obliged to have recourse to compulsory loans, and to the accommodation of private bankers, who profited greatly by his embarrassments.

"It was out of this chaos," says our authority, "that a new administration was to be created, founded upon justice, and directed to the good of the people. A virtuous man dared to undertake the task; equally convinced that to exterminate the evil, it was necessary only to pursue the simplest principles (which he was astonished to find were little known), and feeling also in the goodness of his heart an energy which enabled him to set outward obstacles at defiance, though he disguised none of them to himself."

M. Turgot readily saw that it was not so much by reducing burdens, as by enabling the people to bear them better, that he could, in existing circumstances, hope to attain his end. "His first regulations gave freedom to the commerce of corn within the kingdom. The benefit which this law was calculated to produce was that of giving new life to agriculture, by the encouragement resulting from the proprietors being sure of disposing of its produce at their own discretion. It tended to augment at once the quantity of the necessities of life, and the net produce of the land; to prepare for the people the resource of such a stock of corn as commerce might provide against unfavourable seasons and local scarcity; and to render wages at all times sufficient for the support of those who received them, by making less frequent and less considerable the variations in the price of corn: in fine, by the establishment of a constant and certain commerce, to place the landlord and farmer, the government and people, out of the reach of a real decline of necessities, of vexatious and oppressive laws, and of disquiet and intestine troubles; the cruel and infallible result of every kind of prohibitory system."

The freedom given by M. Turgot did not extend to the exportation of corn, for, strange to say,

this was the subject of a strong prejudice among the French of that age, as it was amongst the English at a somewhat earlier period; and he more-over calculated, that, till internal commerce was on a right footing, that which was external could not be greatly improved, and was therefore the less to be regarded. He spared, however, no local restrictions. "The exclusive privileges of bakers, the assize of bread, the obligation to grind corn at particular mills, and the several market-dues upon corn when sold, were so many fetters which it was necessary to break. They were all abolished during the administration of M. Turgot, except indeed the manorial privileges as to mills, which he suffered still to subsist; because he was unwilling either to take away without compensation a claim founded on prescription, and sometimes even on a voluntary compact, or to make the nation purchase, at too high a price, rights which would never have been valuable, if fraud supported by power had not made them so." He also suspended the tolls exacted by corporations and individuals at markets, with the design of buying them up, for, though he looked on these not as property, but unrighteous privileges, which, having been given by the state, could be withdrawn by it, yet he was disposed to compensate the holders, from the consideration that they had in many cases been purchased as property. He at the same time afforded to the commerce in wine as entire a liberty as the defective mode of collecting the tax upon it would allow. He was to have given the same freedom to brandy, and to have abolished the regulations preventing that liquor from being distilled from the husk of the grape, and cider and perry from being sold out of the province where they were manufactured; but these improvements he did not succeed in effecting.

The direct advantage of all these proceedings was confined to such as had property to dispose of. He now addressed himself to a great measure for the direct benefit of the people. The regulations as to the making of roads which he had formerly introduced into his particular province, he now extended over the kingdom. The labouring class, who had formerly been compelled to make them without nominal remuneration, but who in reality became a burden upon the farmers, were now paid from a tax on land, which the landholders generally submitted to without impatience, reflecting that their lands must now bring higher rent, since the burden of supporting the labourers was taken off the shoulders of the farmers. Our minister was obliged, however, to exempt from this tax the lands belonging to the clergy, which at this time were a sixth part of the whole of the lands in France. By the new regulation, it was provided that land required for roads should be paid out of the fund raised by the tax, instead of being, as formerly, taken without remuneration.

M. Turgot now turned his attention to the industrious classes living in towns. Here, none "who had not been able to comply with certain formalities, frequently absurd, and always expensive, by which the title of *Masters* in the companies of tradesmen or artisans is acquired, were allowed to employ their strength and abilities as they pleased. These masters formed a little republic, the leaders of which, under the pretence of a police, had carried to a height that it would have been difficult to have foreseen, the art of rendering still more grievous the chains of the unhappy workmen, of loading the communities with useless expense, and of rendering even the rank of masters insupportable to those who had nothing but their industry to depend upon." When M. Turgot abolished this odious and ridiculous slavery, "the inhabitant of the towns at length found himself at liberty to use his limbs and his labour as he pleased; a right which at this time was enjoyed in no other country of Europe." * * This right, which is one of the first that nature has given us, and which may be considered as a necessary consequence of that of existing, seemed to have been effaced from the recollection and the hearts of men." From the unlimited freedom now given to artisans of all kinds, "there resulted a reduction in the price of bread, meat, and every kind of necessary, as well as of the productions of art: moreover, the practice of fixing the price of the necessities of life disappeared with the exclusive privilege of vending them, which furnished the only specious pretext for the practice. M. Turgot, by means of a compensation, suppressed a multitude of petty offices, the very names of which were ridiculous and absurd, but which enjoyed privileges oppressive to the people." * * The manufactures of France were also rescued from the tyranny which Colbert* imposed upon them when he prescribed by law the size of different stuffs, and the modes of weaving and dyeing them, under pain of confiscation, penalties, and even corporal punishments. Such regulations could only have been dictated to this minister by ignorant manufacturers, who considered their ingenuity and practice as the boundaries of the progress of the arts, and imagined that they could subject the necessities and the taste of all future ages to the fashion of their own. Some of these directions had even the inconvenience of being physically impracticable; though there was not on that account the less rigour in the punishments imposed. Finally, this edict of M. Turgot permitted industry, which had hitherto been almost wholly shut up in towns, or obliged to pay a tribute to their inhabitants, to esta-

lish itself at pleasure in the country, and to fix upon those places where the low price of subsistence, or the facility of procuring the materials, seemed to have marked out for its true residence.

These general laws were accompanied with some particular ones, which had the same object. A law made under the pretext of the public good, compelled the butchers of Paris to borrow of a particular fund even money that they did not want, and the interest required for it was very exorbitant. Another law, still under the same pretext, which has been so much abused, and whose real object was the advantage of certain individuals, deprived the butchers of the free disposal of their tallow. They were delivered from these fetters, which forced them to sell dear; and at the same time the people were relieved from all the little exactions, of which the regulations put upon the butchers rendered them the victims, and obtained by the introduction of liberty and rivalry the advantage of having meat of a middling but wholesome quality, at a price proportioned to their ability.

Another law had given the *Hôtel Dieu* or *Hôpital* of Paris the exclusive privilege of selling meat during Lent, that is, during an eighth part of the year. The people, unable to live upon fish on account of the duties that enhanced the price, were, for a similar reason, deprived of flesh provisions, and condemned to feed on unwholesome and disgusting food. M. Turgot abolished this privilege of the *Hôtel Dieu*, and substituted in its place a tax more than its equivalent. Thus he saved to the people the expense of an ill-administered regulation, at the same time that he encouraged the fisheries by suppressing the duties upon salt fish, and half of the duties upon fresh sea-fish; and introduced cheapness and abundance into the capital."

M. Turgot abolished the military *corvées*, a system by which individuals residing near roads were obliged to support the troops on their marches, and substituted a general tax for the same object. The tax called the *taille*, levied from the working-classes, was collected under favour of a peculiar arrangement. The collector for each little district, himself a compulsory agent, had a right to call upon the four persons of the district whose proportion of the tax was the greatest, to pay up all deficiencies. This oppressive regulation was now abolished. "The proprietors of woods in one of the districts of *Franche Comté* were subjected to a singular kind of slavery. They were not only obliged to supply the manufacturers of saltpetre with all the wood they wanted at a low price, but they were also prohibited from selling their wood to any persons except the farmers-general* for the use of the salt-works. This oppression had subsisted a long time, and individuals as well as communities had been prosecuted for having violated one or other of these laws, which could not both be obeyed at the same time. The first was abolished by an operation in the farm of gunpowder; and M. Turgot destroyed the privilege of the farmers-general by removing their manufactures into the midst of a forest belonging to the king, to which the waters of the salt-mines were conducted by a new canal."

Turgot increased the number of ports which were allowed to trade directly to the West India islands. He allowed a free vent to the oil of poppies, which had hitherto been forbidden, though it was sold under a different name. The glass-manufactories of Normandy had hitherto been under an obligation to furnish at a low price a certain quantity of glass to the towns of Paris and Rouen: they had thus no incentive to improve the article, but were on the contrary kept down at a certain point of mediocrity, in order to comply without injury with the regulation imposed upon them. This regulation was now abolished.

Of the many other lesser reforms of M. Turgot, we only can notice a few. He introduced new regulations respecting waste lands, for the protection of the people from the proprietors of tithes. He set apart a fund for the construction of canals, and commissioned three eminent geometers to aid him in giving directions for such works. The public conveyances for passengers and parcels throughout the kingdom he put upon a new footing, in which they were comparatively subjects of fair competition. He did much to encourage the arts and sciences; but it was generally by the purchase of the things invented or made, which, being distributed judiciously by the government, proved of service to others. "He had formed a plan of substituting one direct tax, instead of that multiplicity of indirect taxes of every kind which are the scourge of industry and of commerce, and the prime source of the misery and poverty of the people;" but he was able to go but a little way in realising the scheme. The privilege of making powder, and the sale of saltpetre, had been leased to a company. The profits arising to government were reduced almost to nothing, in consequence of the many petty concessions exacted upon different pretexts. The farmers of the manufacture had many rights—for instance, that of taking wood wherever they chose at a low price. This was intended to encourage the making of powder in the country. In reality, it had the contrary effect. The farmers were more anxious to make money by what they wrung from land-proprietors, as bribes to induce them to

spare their timber, than by furnishing the public with a good article. M. Turgot abolished the monopoly, and the instant effect was an increase in the manufacture to so great an extent, that the tax on the article produced a million livres more than formerly. Heretofore, in all disputes between the administration and the payers of taxes, it was an understood matter that the revenue was to have the benefit of every doubt. Accordingly, no one who felt himself aggrieved had the least chance of redress, without incurring more expense than the money in dispute amounted to. M. Turgot exactly reversed this cruel practice, and also favoured the private party in all cases where he had general and public laws on his side, and was only opposed by secret and surreptitious ones. The payment of pensions had been stopped for three years: M. Turgot now paid an arrear of two years on such as did not exceed four hundred livres (L.16, 13s. 4d.), that is, upon all those which, furnishing mere subsistence, had been given as a just reward, or at least as real charity. The payment of the others he accelerated as much as possible. The other and more important obligations of the state were also attended to; the revenue was increased; and so much was the national credit restored, that the stocks rose to par, and the minister was offered a loan in Holland of sixty millions, at the unprecedentedly low rate of something less than five per cent.

All these reforms were the work of twenty months, during which Turgot had two severe attacks of gout, a disease hereditary in his family, and which usually cut off its members at a premature age. It cannot be matter of wonder that proceedings affecting the interests of many individuals in what they thought an unfavourable manner, raised up a large party against the philosophical minister. The season having been bad, these persons were enabled to make a great impression by their publications on the minds of the common people both in the capital and in the rural districts. They described M. Turgot and his friends as men employed in wild systems, who wished to govern from the recesses of the closet upon speculative principles, and who sacrificed the people to the experiments which they were desirous of making to ascertain the truth of their system. A great and dangerous riot took place in consequence, and was not put down without the employment of very vigorous measures.

This virtuous man had managed the immediate affairs of his office with great self-denial and the strictest regard to economy, and at the same time to justice. He diminished its appointments one-fourth, and asked nothing for himself. Pensions upon places were strictly prohibited. Many gifts extorted from the towns were restored. The deputies of a certain town, in giving him an account of their administration, spoke to him of some emoluments which had formerly been sold at a price, that, from their subsequent increase, had become much below their real value. The minister replied that "the differences should be made up." "But, sir, a part of these emoluments now belong to yourself." "The necessity," said he, "is so much the stronger." The owner of a new negro vessel proposed to call it after Turgot: he forbade the compliment, and publicly avowed his reprobation of the horrible traffic. Every person who cultivated literature, science, or the arts, who had talents and made a right use of them, was treated by Turgot with distinction. They were sure to be listened to, and cordially received, if they had any thing to propose that might contribute to the public welfare.

All these virtues failed to save M. Turgot from the effects of interested clamour, and early in 1776, the king, though he admired the man, was obliged to ask his resignation. Many of his edicts were also repealed, so as to shut out the hope that, though he was not himself in office, his plans would come into operation and benefit the people. He sustained the disappointment with magnanimity, and quietly betook himself to philosophical pursuits, as the next best means of rendering himself useful. He also amused himself by composing in verse, and it is not unworthy of notice that he was the author of the celebrated line respecting Franklin—

Eripuit cœlo fulmen, mox sceptris tyrannis:

That is, "He drew lightning from the sky, and took sceptres from kings." When war was declared between France and England, he saw how honourable it would be in the French nation that the vessel of Captain Cook should be treated with respect at sea. He composed a memorial, in which he proved that honour, reason, and even interest, dictated this act of respect for humanity; and it was in consequence of this memorial, the authorship of which was unknown during his lifetime, that an order was given not to treat as an enemy the common benefactor of every European nation.

"The friends of M. Turgot loved him as he deserved to be loved. The mildness of his nature made them excuse a superiority which they were obliged to acknowledge, though he did not intrude it upon them, but concealed it without labouring to conceal it." * * With employments so attractive and various; with the happiness of loving and being tenderly loved; with the testimony of an unsullied conscience; with the feeling so seldom experienced by a minister, of having never disguised the truth to his prince, and never subscribed his hand to one act of oppression or injustice; and, in short, of having never merited enemies, but by defending the nation against the prejudices and the interest of powerful individuals, and the public treasury against the avidity of intriguers of every kind; with enjoyments like these, that afford to a strong and comprehensive

* Persons who at that period managed departments of revenue, on an agreement to pay a certain fixed annual amount, beyond which all was profit to themselves, or remuneration for management. Farm is properly a thing taken on lease, though now with us exclusively applied to a leased piece of ground.

* Finance minister of Louis XIV.

mind the pleasure of contemplating and enjoying truth, M. Turgot might have promised himself a happy career; his friends might have indulged themselves in the hope of enjoying for a time a man whose superior information, whose amiable society, whose tender friendship, were one of their first blessings." It proved otherwise. "Before his administration, his attacks of the gout had been merely painful. The forced application to which he gave himself up in the midst of these attacks, had changed their nature; and in his retirement repose could not repair the disorders which a zeal for his duty had occasioned. The attacks were more and more dangerous, and he became at last the victim of his patriotism and his courage. His last attack, which was long and painful, altered neither his mind nor his temper. Always employed, in the intervals of pain, sometimes with a work that one of his friends had published, and in which he took an interest, sometimes in the fate of a literary man who was at that time unfortunate, and sometimes in the pursuit of his own thoughts, and in collecting metaphysical observations upon the connection of our ideas with the state of our organs, his friends could perceive no other effect than that of a sensibility so much the more affecting, as it appeared to be excited merely by their cares for him; and his soul saw with tranquillity the moment approach [March 20, 1781], when, in conformity to the eternal laws of nature, he was going to fill, in another order of beings, the rank which these laws had destined to him."

REMARKABLE CASES OF CIRCUMSTANTIAL EVIDENCE.

THE SHOP BOY.

CASES exhibiting the precarious nature of circumstantial evidence, independently of the deep interest which generally attaches to them as mere narratives, are calculated to work so beneficial an effect on the public mind, that they cannot, it seems to us, be too frequently or too prominently brought forward in pages adapted for popular reading. By no other means can mankind be so strongly impressed with a salutary conviction of the necessity of making the strictest and most minute investigations, ere the life of a fellow creature be arbitrarily shortened, or guilt of whatever kind be decisively laid to any one's charge. The following cases of circumstantial evidence are collected from various sources. The first we find in the able notes to the new edition of Bentham (Tait, Edinburgh), and the authority adduced is one of the collections of French criminal causes, that have been published at various times. The case is given in the original French, of which the following is a literal translation.

Previously to the rebuilding of that long range of houses which line the Place St Michel at Paris, in front of the Rue St Hyacinth, an aged widow lived near that spot, being the occupant of a small shop, to which was attached a back-parlour where she slept. She was believed by the neighbours to have amassed a considerable amount of money. One young lad constituted, for a long time, her entire household. He slept on the fourth floor of the same building, but the staircase leading to his apartment had no communication with the dwelling of his mistress. The lad was obliged to go round by the street, when he had to enter the shop, and when he left it to go to bed, he shut the outer door, and carried away the key, of which he was the sole depositary. One morning, the shop door was noticed to be earlier open than usual, while at the same time no movement indicated that either the old shopkeeper or her assistant had arisen. This quietness alarmed some of the neighbours. On entering, they perceived no marks of violence about the door, but they found a bloody knife lying in the middle of the shop, and on her bed, in the back apartment, lay the shopmistress, dead—stabbed, to all appearance, by the weapon mentioned. The corpse held in one hand a small handful of hair, and in the other a cravat or neckcloth. Near the bed was the money-box, which had been forced and pillaged. The young shop-assistant was immediately seized, and he admitted that the bloody knife belonged to him. The cravat which the murdered woman held in her hand was his. They compared his hair with that grasped in the other hand; the two were the same, in colour and every other respect. Finally, the key of the shop was in his possession; he alone had the power, by means of that key, of entering the shop without resorting to force. On the strength of this accumulation of evidence he was put to the torture (*on lui fait subir la question*); under its agonies, he admitted the crime, and was broken on the wheel (*rompu*).

Shortly afterwards, a tavern boy was taken up for some crime of a different nature. In the declaration emitted by him after conviction and condemnation, he confessed that he was the sole actor in the assassination of the old woman in the Place St Michel. The tavern where he served adjoined her shop, and he was on familiar terms with her shop-boy. To the latter he acted as hair-dresser, so far as regarded the periodical arrangement of the lad's hair *en queue*; and always when he used the comb, he carefully gathered those hairs which the instrument detached. By little and little he had thus collected the handful which was found in the grasp of the murdered woman. The knife, and one of the cravats of the lad, he had procured without difficulty, and the terms of intimacy on which they were, enabled him with equal ease to take an impression in wax of the shop-key, for the fabrica-

tion of a false one. By these means he entered and committed the deed, leaving things in the state which has been related.

Such is the story as told by the French writer. Seldom has there been a piece of villany so coolly planned, and so ruthlessly executed, at the foreseen and expected cost of existence to two unfortunate beings. The succeeding two cases are of a similar order, exhibiting the fall of innocence before premeditated villany, and are from the *Causés Celebres*, first series, volume third (Amsterdam edition of 1775).

THE JEWS.

In a hotel or lodging-house at Milan, a Frenchman and two Jews were resident at one and the same time. The Jews occupied a chamber adjoining that of the Frenchman, who formed an acquaintance with them in consequence. He observed them to be very rich, as they often counted great bags of Spanish pistoles in his presence. This led him to the following guilty device. He cut or tore off a considerable portion of a night-wrapper or gown belonging to him, and contrived not only to leave it in the chamber of the Jews, but to watch the use which they made of it. They employed it to wrap up a parcel of one hundred pistoles. On the morning after observing this, the Frenchman, as soon as he arose, alarmed the house with cries of "robbery!" Every body ran to his chamber, and there heard him tell a melancholy tale of the loss of one hundred pistoles, which he had wrapped up in the front of his gown. He asserted that some one must have entered while he slept, and cut away the part of the gown with the money. The officers of justice were called in to examine the house. In the chamber of the Jews was found the portion of gown, and the Frenchman instantly called out, "There is my money!" The Jews were timorous men, and were thrown into confusion. This strengthened the case against them, and the consequence was, that they were executed. At an after period, the guilty author of their death confessed the conspiracy by which he had implicated them.

THE FLEMISH CURATE.

Another victim of a plot of this nature was a Flemish curate, who lived near the commencement of the eighteenth century. He was a man of remarkable piety, and exhibited in his conversation and deportment all the virtues which ought to adorn the character of him who assumes to be a teacher of others. In his parish resided a man of violent passions, who entertained a mortal enmity against another parishioner and neighbour, and resolved to assassinate him. Casting his eyes deliberately about him to discover a mode of doing this with safety, this wretch noticed a habit which the curate had of throwing off his walking-coat whenever he entered his own house, and of putting on a short cassock in its stead, leaving the coat carelessly in an outer room or lobby, which was open to friend or stranger at almost any time. Observing this custom, the man alluded to resolved upon taking a diabolical advantage of it. He fixed upon a time when he knew the curate to be usually engaged in composing the sermon for the following Sunday's service, and entered the lobby, whence he carried off the coat, and a neckerchief which he found also there. He knew that, immediately after this time, the person whose assassination he meditated would pass by a retired spot near the village. The villain had planned his time well. The victim came up to the spot as expected, and perished beneath the knife or dagger of his enemy, who afterwards returned, without delay, to the curate's house. Favoured by the dusk, he placed the coat, neckerchief, and dagger, in the lobby whence he had taken them, and then went off to the nearest magistrate, and denounced the curate as a murderer, declaring that he himself, from a little distance, had beheld the commission of the crime. The magistrate hurried to the reported scene of the deed, saw and recognised the body, and then proceeded to the house of the unfortunate and unconscious clergyman. Half hidden in the lobby were found the coat, the kerchief, and the dagger, all of them more or less stained with blood. The curate was arrested and thrown into prison.

When the matter sustained a judicial examination, the "bold, bad man" who had projected this double murder, adhered to his story, and as nobody was with the curate at the time in his dwelling, the accused had no exculpatory evidence to offer, excepting what was afforded by his simple protestation of innocence, and the sanctity of his former character. All his flock, and indeed all who knew him, believed him to be utterly incapable of such a crime; but the law, and the judges of the law, regarded the criminatory testimony as too strong to be doubted, and held it to be their duty to condemn the accused. The best of men, it was argued by the public prosecutors, have been known to be hurried by the violence of temporary passion into the commission of crime, and such was but too probably the case here. When the sentence was known, a great sensation was excited over the whole country. The whole community were in favour of the curate, but this could not save him from the stake, to which he was doomed. He died with a degree of calm resignation, which drew tears of admiring pity from all who saw him.

Four years after his execution, the villain who had caused his end, involved himself in another murder, and on this occasion the crime was brought home to him. He was condemned to be broken on the wheel

—a death too horrible for even such a criminal as he was. Before he died, he confessed the whole facts of the curate's case. The memory of the latter was thenceforth honoured like that of the saints.

HAWKINS AND SIMPSON.

Cases have occurred, both where accusations have been established, and where they have been refuted, by the observation of some peculiarity in the ink with which documentary evidence was written. If the assertion has been made that all parts of a particular document were written at one and the same period, with the same ink, and if it is discovered that the ink has a different appearance at one place from that which it presents at another, judges and jurymen would be generally inclined to regard this as a strong proof of the falsity of the document, or at least of the assertion made regarding it. But the following case, which we find quoted in a little work entitled "The Theory of Presumptive Proof," shows how cautious people ought to be in running hastily to such a conclusion.

"John Hawkins and George Simpson were indicted for robbing the mail, on the 16th of April 1722. Hawkins, in his defence, set up an *alibi*; to prove which, he called one William Fuller, who deposed that Hawkins came to his house on Sunday the 15th of April, and lay there that night, and did not go out until the next morning. Being asked by the court, 'By what token do you remember that it was the 15th* of April?' he replied, 'By a very good token, for he owed me a sum of money for horse-hire, and on Tuesday, the 10th of April, he called upon me and paid me in full, and I gave him a receipt; and I very well remember that he lay at my house the Sunday night following.' The receipt was now produced. 'April the 10th, 1722. Received of Mr John Hawkins the sum of one pound ten shillings, in full of all accounts, per me William Fuller.' Upon inspecting the receipt, the court asked Fuller who wrote it; he replied, 'Hawkins wrote the body of it, and I signed it.' Court—'Did you see him write it?' Fuller—'Yes.' Court—'And how long was it after he wrote it, before you signed it?' Fuller—'I signed it immediately, without going from the table.' Court—'How many standishes do you keep in the house?' Fuller—'Standishes?' Court—'Ay, standishes; it is a plain question.' Fuller—'My lord, but one; and that is enough for the little writing we have to do.' Court—'Then you signed the receipt with the same ink that Hawkins wrote the body of it with?' Fuller—'For certain.' Court—'Officer, hand the receipt to the jury. Gentlemen, you will see that the body of the note is written with one kind of ink, and the name at the bottom with another very different; and yet this witness has sworn that they were both written with the same ink, and one immediately after the other. You will judge what credit is to be given to his evidence!'

Thus the authenticity of the receipt, and the credit of the witness, were overthrown by the sagacity of the court! But while the judge, Lord Chief Baron Montague, was summing up the evidence, he was interrupted by the following occurrence:—The person who reports the trial was then taking notes of the proceedings; his ink, as it happened, was very bad, being thick at the bottom, and thin and watery at the top, so that, accordingly as he dipped the pen, the writing appeared very pale or pretty black. This circumstance being remarked by some gentlemen present, they handed the book to the jury: the judge perceiving them very attentively inspecting it, called to them—'Gentlemen, what are you doing! What book is that?' They told him that it was the writer's book, and that they were observing how the same ink appeared pale in one place and black in another. The judge then told them—'You ought not, gentlemen, to take notice of any thing but what is produced in evidence; and, turning to the writer, demanded 'What he meant by showing that book to the jury?' And being informed by the writer that it was taken from him, he inquired, 'who took it, and who handed it to the jury?' But this the writer could not say, as the gentlemen near him were all strangers to him, and he had not taken any particular notice of the person who took his book.

That a jury ought not to take notice of any thing but what is produced in evidence, has been said to be law; but, on the contrary, it has been held, and surely very properly, that a jurymen may find from his own knowledge; indeed, what evidence can convince a person that that is which he knows not to be!

Hawkins and Simpson were convicted and executed; indeed, the evidence against them was very strong; but had the fate of Hawkins depended upon the single testimony of Fuller, he would, but for this occurrence, have fallen a sacrifice to the acuteness of the judge! who appears to have been much displeased at the accidental confutation of his remarks on the receipt, although it was an accident in favour of life."

THE BARBER'S APPRENTICE.

In an earlier number of the present periodical, a sketch of a humorous kind appeared, under the title of the General Face, in which an individual is made to deplore the annoyances arising from the peculiar conformation of his countenance, which seemed rather to have the blended characters of the whole *genus* man, than the distinct lineaments of an individual variety thereof. He was incessantly mistaken for somebody else, and suffered frequently for the peccadilloes of

* The robbery was committed about two o'clock on the morning of the 16th.

somebody else. The subjoined anecdote would lead one to suppose that this case of the General Face was less fanciful than the writer of the sketch himself most probably imagined it to be. "September 14, 1772, came on, at the sessions in the Old Bailey, the trial of one Male, a barber's apprentice, for robbing Mrs Ryan of Portland Street, on the highway, on the 17th of June last. The witnesses swore positively to the identity of the lad, and the whole court imagined him guilty. He said nothing in his defence, but that he was innocent, and his evidences would prove it. His evidences were the books of the court, to which reference being made, it appeared that on the day and hour when the robbery was sworn to be committed, the lad was on his trial at the bar where he then stood, for another robbery, in which he was likewise unfortunate enough to be mistaken for the person who committed it; on which he was honourably acquitted."

In another number we shall present a few more cases of circumstantial evidence. Those now given, we hope, will have had sufficient interest in the eyes of our readers to make the promise of an early continuation acceptable.

POINTS OF ETIQUETTE.

A SMALL volume entitled "The Laws of Etiquette," of American authorship (Philadelphia, 1838), having fallen under our notice, we propose to make a selection of a few passages from it, with observations on their purport.

In the Introduction, the author favours us with the following view of the gradations of rank in the States, which will be new to many of our readers. "There is perfect freedom of political privilege; all are the same upon the hustings, or at a political meeting; but this equality does not extend to the drawing-room. None are excluded from the highest councils of the nation, but it does not follow that all can enter into the highest ranks of society. In point of fact, we think that there is more exclusiveness in the society of this country than there is in that even of England—far more than there is in France. There being there less danger of permanent disarrangement or confusion of ranks by the occasional admission of the low-born aspirant, there does not exist the same necessity for a jealous guarding of the barriers as there does here. The distinction of classes, also, after the first or second, is actually more clearly defined, and more rigidly observed in America, than in any country of Europe. Persons unaccustomed to look searchingly at these matters, may be surprised to hear it; but we know from observation, that there are among the respectable, in any city of the United States, at least ten distinct ranks. We cannot, of course, here point them out, because we could not do it without mentioning names. Every man is naturally desirous of finding entrance into the best society of his country, and it becomes therefore a matter of importance to ascertain what qualifications are demanded for admittance. A writer, who is popularly unpopular, has remarked, that the test of standing in Boston is literary eminence; in New York, wealth; and in Philadelphia, purity of blood. To this remark we can only oppose our opinion, that none of these are indispensable, and none of them sufficient. The society of this country, unlike that of England, does not court literary talent. We have cases in our recollection, which prove the remark, in relation to the highest ranks, even of Boston. Wealth has no pretensions to be the standard any where. In New York, the Liverpool of America, although the rich may make greater display and *bruit*, yet all of the merely rich will find that there does exist a small and unchanging circle, whether above or below them, 'it is not ours to say,' yet completely apart from them, into which they would rejoice to find entrance, and from which they would be glad to receive emigrants." The writer in this paragraph seems to infer that "literary talent" is courted in England; which is true only in a limited sense. It is notorious that neither men of science nor literature are courted or held in esteem in this country, to the same degree as men possessing hereditary or naval and military rank. If we substitute France for England, the inference is correct.

The passages on dress are good. "What style is to our thoughts, dress is to our persons. It may supply the place of more solid qualities, and without it the most solid are of little avail. Numbers have owed their elevation to their attention to the toilet. Place, fortune, and marriage, have all been lost by neglecting it. Your dress should always be consistent with your age and your natural exterior. That which looks outré on one man, will be agreeable on another. As success in this respect depends almost entirely upon particular circumstances and personal peculiarities, it is impossible to give general directions of much importance. We can only point out the field for study and research; it belongs to each one's own genius and industry to deduce the results. However ugly you may be, rest assured that there is some style of habiliment which will make you passable. If, for example, you have a stain upon your cheek, or are afflicted with a nose whose lustre dims the ruby, you may employ such hues of dress, that the eye, instead of being shocked by the strangeness of the defect, will be charmed by the graceful harmony of the colours. Every one cannot indeed be an Adonis, but it is his own fault if he is an Æsop. If you have bad eyes, which have lost their lashes, and are bordered with red, you should wear spectacles, if

the defect be great, your glasses should be coloured. In such cases emulate the sky rather than the sea; green spectacles are an abomination, fitted only for students in divinity. Almost every defect of face may be concealed by a judicious use and arrangement of hair. Take care, however, that your hair be not of one colour and your whiskers of another; and let your wig be large enough to cover the whole of your red or white hair. It is evident, therefore, that though a man may be ugly, there is no necessity for his being shocking. When we speak of excellence in dress, we do not mean richness of clothing, nor manifested elaboration. Faultless propriety, perfect harmony, and a refined simplicity, these are the charms which fascinate here. It is as great a sin to be finical in dress as to be negligent."

The rules for bowing come next. "The salutation, says a French writer, is the touchstone of good breeding. According to circumstances, it should be respectful, cordial, civil, affectionate, or familiar; an inclination of the head, a gesture with the hand, the touching or doffing of the hat. It is a mark of high breeding not to speak to a lady in the street, until you perceive that she has noticed you by an inclination of the head. Some ladies *curtsey* in the street, a movement not gracefully consistent with locomotion. They should always *bow*. If an individual of the lowest rank, or without any rank at all, takes off his hat to you, you should do the same in return. A bow, says La Fontaine, is a note drawn at sight. If you acknowledge it, you must pay the full amount. The two best bred men in England, Charles II. and George IV., never failed to take off their hats to the meanest of their subjects. If you have any thing to say to any one in the street, especially a lady, however intimate you may be, do not stop the person, but turn round and walk in company; you can take leave at the end of the street." This last sentence contains a good advice. Standing to talk with an acquaintance in the street, is one of the most likely means for catching cold, and therefore, independently of other reasons, ought if possible to be avoided.

There is some agreeable chit-chat matter on the subject of visiting. "Of visits there are various kinds: visits of congratulation, ceremony, condolence, and friendship. To each belong different customs. Upon the appointment of one of your friends to any office or dignity, you call upon him to congratulate, not him, but the country, community, or state, on account of the honour and advantage which it derives from the appointment.

Visits of condolence are paid within the week after the event which occasions them. Visits of ceremony should be very short. Go at some time when business demands the employment of every moment. In visits of friendship, adopt a different course. If you call to see a friend who is staying at lodgings, however intimate you may be with him, wait below until a servant has carried up your name and returned to tell you whether you can be admitted. If you cannot find any one to announce you, you should knock gently at the door of his chamber, and wait a little while before entering. If you are in too great a hurry, you might find the person drawing off a nightcap. These decent formalities are necessary even in the most unreserved friendships: they preserve the 'familiar' from degenerating into the 'vulgar.'

The style of your conversation should always be in keeping with the character of your visit. You must not talk about literature in a visit of condolence, nor lecture on political economy in a visit of ceremony. After a ball or a dinner, you visit during the week.

If you should happen to be paying an evening visit at a house, where, unknown to you, there is a small party assembled, you should enter and present yourself precisely as you would have done had you been invited. To retire precipitately with an apology for the intrusion would create a *scene*, and be extremely awkward. Go in, therefore, converse with ease for a few moments, and then retire. Take care to let it be known the next day, in such a way as that the family shall hear of it, that you were not aware that there was any company there. Likewise, if you are intending to enter one house, and find that you have got by mistake into another—a blunder very easily and very often committed in Philadelphia, in consequence of the singular uniformity of the houses—it is better, provided you have fairly entered the parlour before perceiving your error, and provided, also, that you are not an utter stranger to the family—it is better, I say, to remain for a short time as if you had intended to pay a visit there, and say nothing whatever about the matter; but your visit should not be quite as long, nor your manner so confused, as this sentence.

During the administration of General Washington, Mr Jefferson was one evening invited to a dance at the house of a distinguished military officer in Philadelphia. At about eight o'clock he got into his carriage, and gave the coachman what he thought was an accurate direction as to the place where he was to be driven. By mistake he was set down at the door of the house directly opposite, which happened to be the residence of a member of Congress, whom he had never visited, and who was very warmly opposed to him in politics. It was not until the Secretary of State was in the middle of the drawing-room that he discovered that he was, as it has lately been expressed, quite 'in the wrong box.' The lady of the house chanced to be sitting there alone, the gentleman being ill. The person of Mr Jefferson was of course known,

and under that assurance he presented himself with admirable ease and self-possession, and sat down. He conversed, making himself very agreeable, drank tea, and staid till half-past nine o'clock, when he took leave. Inquiring from the servant at the door where he should find the house to which he had been invited, he made his way thither, and communicated to the ladies the error into which, through the stupidity of his coachman, he had been led; and they, the next day, informed their neighbours. This anecdote may be relied upon; and if there is no other on record respecting Mr Jefferson's manners, there is enough in it to convince us that he was a high-bred gentleman."

It is the height of vulgarity to say, on taking your departure after a visit, that you "have spent a happy evening," or to make any similar remark; for it is presumed you could not have been otherwise than happy.

"In leaving a card for a stranger, do not forget to add your address; and do not omit it, if you leave a card for another in a city where you are a stranger." It is reckoned improper to put your address on a card which you leave at the house of an inhabitant of the same town, for it is presumed that your place of residence is known to your friend. "The card of a man should be small, plain, unglazed, and ungilt. A gilded and glazed card is agreeable only as belonging to a woman. I should be glad to exhibit to the host of American *parvenus* their own broad, glittering cards—bearing upon them names reeking with plebeianism, gewgawed with some paltry title, the synonyme and passport of insignificance—in contrast with the plain and modest cards of some of the highest peers of the British realm." The author concludes with a useful admonition, "A visit and an umbrella should always be returned."

On the subject of epistolary correspondence, the following hints occur:—"Wafers are now entirely exploded. A letter of business is sealed with red wax, and marked with some common stamp. Letters to gentlemen demand red wax, sealed with your arms." Every body knows that these are correct enough rules as respects England, but who could have expected to see an American recommending the use of *arms*? These relics of a barbarous age continue in use only to mark family distinction, and, therefore, as things purely aristocratic, can have no proper place in the social customs of a republican people. Are we to understand from the recommendation to use heraldic emblems, that the Americans are democratic only in their political relations, and aristocratic in the common concerns of life? Have they a heralds' college with a king-at-arms to grant armorial bearings? or do they seize hold of any arms that suit their fancy? The subject is involved in mystery."

A few more "points" will be given at the first opportunity.

SPECULATIONS ON WORDS.

SECOND ARTICLE.

To drive at, To treat of.—There is one peculiarity in the style of our old writers, which makes it sound very rugged to modern ears, and certainly cannot always be admired, although it is strictly idiomatic. We refer to the placing of the preposition at the end of the clause, instead of before the relative. For example, South says, "As to the matters which he is here to treat of," &c. Now, we should say, of which he is here to treat. He speaks of "a sordid and supine dullness, which they so much affect to distinguish themselves by, and which we by no means desire to vie with them in." The longer the clause, the uglier it sounds: here, for instance, *by which*, and *in which*, would greatly improve the sentence. The shorter the clause, the better it is: in fact, sometimes in very short clauses it is necessary to put the preposition at the end, to avoid stiffness or affectation. For example, "the book which you were speaking of, is not yet published:" of which would be stiff. Perhaps *mentioned* would be better; but the idea is not exactly the same. Better still to omit the relative altogether, and say "the book you were speaking of is not yet published." When we omit the relative, which we generally do in short clauses of this kind, the preposition must come at the end. Some object to the omission of the relative at all; but that is unreasonable. Our best writers omit it, and it is strictly idiomatic. For instance, South speaks of "the text we are upon." You cannot say "upon which we are." Again, he says, "is the grave a place to dress ourselves for heaven?" Try in which to dress ourselves: you spoil the sentence. It becomes Latin, not English. So Julius Charles Han says, "the first school I was at:" alter it, and you spoil it. You can't say the first school at which I was, unless you wish to be laughed at. But there are other cases in which the preposition must come last, if we would preserve the force of the sentence. South says, "This was the main point which they then drove at:" you cannot say, "at which they then drove." The phrase is to drive at, not to drive. It would not be recognised, if the at were removed from its place. Lord Brougham has very good instances of the retention of this truly English idiom: as, for example, in his speech at Dover, lately published; "then," he says, "would be seen—what God forbid I should live to witness the occasion for—Wellington coming forth a

* Captain Murray alleges that the Americans who visit England apply at the heralds' college for coats of arms; but this wants confirmation.

veteran warrior, and adding one bright superfluous page to the history of his imperishable renown." Perhaps this is the best rule to observe: if the preposition belongs to the verb, and forms one phrase with it, completing its sense, it should go with the verb; and if this make the sentence weak from the number and position of the little words, omit the relative.

An, A. Ladies. Y, ie.—The proper indefinite article in English is *an*; an book or an egg; an apple or an pear. When we say, as we do now, "a pear," we have lost the *n* in *an*. We do not add *n* when we say an apple. The grammars tell us *a* is made *an* before a vowel. It is not so. *An* is made *a* before a consonant. The *n* is dropped. *An* is the indefinite article, in German *ein*, and in the French *un*; in these languages the *n* is not dropped as it is in English. The numeral *one* is the same word; and an apple means *one apple*. We may often hear foreigners talk about giving *one shilling* to a man, for a shilling, or seeing *one play*, for a play. In the same way we are told that in forming the plural of *lady*, *y* is changed into *ie*. Now, this is not the right way of putting it. The old way of spelling *lady* is *ladie*, and the plural of course *ladies*. Well, in the plural the old way is kept; no change is made. But in the singular, the *ie* has been altered to *y*; so that it is the singular, not the plural, that has been changed. Now we spell the plural of *day*, *days*; but formerly it was *daies*, and the possessive singular *daies* also. The old writers were not always regular in the spelling, but that was the rule. Thus, in Fell's Life of Hammond, we have "two and fifty quarter-daies," and in the same page "a daies-work."

In the same way the nouns heaviness, hardness, &c., and the adjectives plentiful, beautiful, &c., have not changed the *y* to *i*: they have lost the *e* from *heavie*, *hardie*, *plentie*, *beautie*; and *heavie*, *hardie*, *plentie*, *beautie*, have changed *ie* to *y*.

In the same way in the plural of *church*, *e* is not added; it is taken away in books. The old ending was *is* or *es*, and in *churches*, *classes*, it is retained, because the word cannot be pronounced without it. In books *e* is dropped.

Wilderness.—The word *wilderness* is rather a curious word in two ways. Words in *ness* generally denote a quality, as in *hardness*, *strangeness*, *fondness*, &c. But in a few instances it denotes a place, as in *fastness* and *wilderness*. This is curious. But the *er* in *wilderness* is more so. From *wild*, "wildness" is the word we should expect, and we have that word denoting "the being wild." The *er* is merely euphonic, like the *b* in number (*numerus*).

The *ness* in these words must not be confounded with the *ness* in *Sheerness*, *Shellness*, and *Dungeness*: this *ness* is in fact the same word as *nose* and the French *nez*, and denotes a point or nose of land. We speak of a neck of land and a tongue of land, and why should we not speak of a nose of land? So the *naze* in Norway. Latin *nasus* "nose."

But to return to *wilderness*, and the insertion of *er*, &c. There is a verb *wilder*, and *bewilder*, but the *er* in *wilderness* is not likely to have come from these. *Wilder* seems to be a later word, and we find in old writers *wyldenes* used in the sense of *wilderness*. Another letter inserted in English to relieve the bluntness of the sound is *s*, as in huntsman, tradesman, seedsman. The *s* is merely euphonic. As in German, the wedding-day is not *hochzeittag*, but *hochzeitstag*.

Villain, Clown, Knave, Boor.—In many languages there is a transition, not altogether unnatural, from lowness of condition to lowness of character. It is so in Greek, and it is so in English. A *villain* was originally only a *villanus* or inhabitant of the ville, dependent on the great man or lord of the soil; now, a villain is a *knave*. But a *knave* was formerly only a *servant*, nay, before that, only a *boy*. The German *knabe* is now a *boy*, but the English, after becoming a *servant*, (Wickliffe's Version of the Bible has "Paul, a knave of Jesus Christ," that is, a servant of, &c.), has now become a *rogue*. In the same way, though *colere* in Latin meant to till the land, and *colonus* a tiller of the land, the English *clown* means not merely a *countryman*, but a *countryified* or rustic man. So, though the German *bauen* means to till the land, and *bauer* a countryman or peasant, the English *boor*, which is the same word, means more, and implies something of the clown, and the adjectives *boorish* and *clownish* are nearly synonymous. In the word neighbour, that is *nigh-boor*, the word has lost its peculiar meaning. Now, on the other hand, while *countryified*, *clownish*, *boorish*, and *rustic*, imply something coarse, *cityified* implies something polite, as we see in the word *urbane*, from *urbs* "a city," or civil, from *civis*, "a citizen."

Do.—The word *do* has undergone many curious changes. It is the same in origin as the Greek *do*, the Latin *da*, and the Sanscrit *da*; and the primary meaning is to put; hence the senses of *make*, *give*, &c. In English, *do* had the meaning of "to put" commonly, and still retains it in the compounds *to don*, *to doff*, *to do*, that is, to do on, to do off, and to do out. As we should say now, to put on, and put off, or *do* put out. In a passage in the New Testament, *do* is used just as we now use *make*: "I do you to wit," &c., that is, I make you to know, or I give you to understand, &c. But the usage most remote from the original meaning is the auxiliary, thus, I do think, &c., I do

not believe, where the words think and believe are in fact in the infinitive mood equivalent to substantives, as if we were to say, "I do the believing that," &c.

The Germans had formerly the same phrase, which is now obsolete; for example, *Ich thue glauben*, *Ich thue erwarten*, &c. The modern phrases "to do a person," or "to be done for," &c., are only technical applications of the common meaning.

Chap, Core, Fish, Phoggy, &c.—It is curious to observe the terms which are commonly used to describe persons of whom we wish to speak. The ancients were content with their *homo* and *tir*, or when they wished to be indefinite, with their simple *quidam*; but moderns, and especially we believe the English, are not satisfied with so meagre a supply of synonyms. In the sense of person, we may find probably some scores of words employed every day of our lives. We hear a person described indiscriminately as a nice body, or a good old soul, or we are informed that there was not a *soul* in the house when some *body* broke in, and ran away with all the plate. We hear of a queer chap, a rum old coddger, a strange cove, or my young covey, a clever fellow, an odd fish, a facetious bird, a dirty little urchin, a young rogue, a young Pickle, an eccentric being, a dear creature, a clever young monkey, an idle dog, a lazy young hound, a young buck, a young blade, a young blood, the old boy, old squaretoes, an old sobersides, an old joker, an old file, an old phoggy, and half a hundred circumlocutions besides.

SKETCHES OF SUPERSTITIONS.

SCANDINAVIAN MYTHOLOGY.

The superstitions of the European Northmen, or Scandinavians, under which term are included the early inhabitants of Denmark, Norway, Sweden, and Iceland, were of a kind remarkably accordant with the cold and stern character of the regions which they occupied. Like the ancient Greeks, the Scandinavians had seats of the gods and of the blest which they called Asgard and Walhalla (or Valhalla), and these bore the same relation, in their character, to the Olympus and Elysium of the Greeks, that the countries of the north, with their stormy climes, their icy mountains, and perilous waters, bore to the perfumed and verdant plains of Hellas, and the fair blue skies overhanging the smooth Ionian Sea. Nothing could afford better proof of the utterly fanciful nature of all these mythologies, than the fact, that they were thus modelled and modified in every case by the earthly habits, likings, territorial position, and ignorance of geography and astronomy of the individual tribes among whom they respectively originated.

The deification of one or more great princes or rulers seems to have constituted the basis of the Scandinavian as well as of every other pagan mythology. Odin, the supreme deity of the Scandinavians, and the ruler of heaven and earth, appears, like the Hellenic Jupiter, to have been a distinguished chief and warrior of early times. Although it is asserted by some that a divinity of the name of Odin was worshipped from the most remote ages, there is reason to believe that the worship of this personage, in the north at least, had its real origin a few centuries before the commencement of the Christian era, when a powerful chieftain of the name was driven by the Romans from his dominions between the Euxine and Caspian, and took refuge in Scandinavia, the whole of which he subjected to his sway. Like Mahomet, this chief appears to have established a new religion, of which he himself assumed to be the earthly head, as the servant or minister of a divine being of the same name. In the course of time, however, this distinction was entirely lost, and the persons and acts of the divine and earthly Odin became inextricably blended in the mythology and traditions of the north. The great records of the religious and legendary knowledge of the Scandinavians, are the Eddas and Sagas of Iceland, partly written in poetry and partly in prose. The oldest of the Eddas, a series of poetical fragments, was collected from oral tradition in the eleventh century, and the others are of later date. The acts of the deities and heroes of the north, the creation of the world, and prophetic revelations, form the general subject of these pieces.

The Scandinavians, like the Greeks, believed that the universe was originally a chaos, or mass of confused vapours, peopled by a race of Rimthursar, or evil spirits of gigantic bulk. A being of nobler nature sprang up among these, named Bure, from whom were descended Odin and his two brothers Vile and Ve. These younger divinities followed exactly the same course with the northern giants that was pursued by Jupiter and his brothers with regard to the Titans, or older and gigantic deities of Greece. Odin began to war with the Rimthursar, and having at last overcome their great chief Ymer, he created the

world out of that giant's body. His flesh became the mould, his bones the rocks, his hair the vegetable tribes, his blood the ocean, and his skull the heavens, at the four corners of which were placed certain dwarfs, called North, South, East, and West, whose duty it was to sustain the celestial dome. After this, the luminaries of the sky were set in their places, and the order of the seasons appointed. Natt (night) wedded one of the Aser, or celestial family of Odin, and gave birth to Dag (day). These deities travel alternately round the world in cars, drawn by single horses. Every great body, as in the Grecian mythology, was represented by a divinity. Frigga, or the earth, was the daughter of Odin, and also became his wife. The inhabitants of the earth, or mankind, were created by Odin and his brothers. Two pieces of wood, the one of ash and the other of elm, formed the materials of the first pair of mortals, who were distinguished for personal beauty and intellectual ability.

The race of deities inhabited Asgard, a place supposed by some to have been the city in Asia whence the real or mortal Odin was expatriated. The fabulous Asgard was pictured as containing numerous palaces and halls, the largest of which was the Mansion of Joy, where Allfader (Odin) sat on his throne amid his divine family. This throne was named Lidskialfa, or the Terror of Nations, and from it he could overlook the whole earth. Two ravens, Hugin (Spirit) and Muninn (Memory), sat always at his ear, and communicated to him intelligence of all things that were going on in the universe. Among the deities who dwell in Asgard, one of the most important was Thor, or Asa-thor, son of Odin by Frigga, and the Mars, or warrior-god, of the Scandinavians.

Thor is described as the god of thunder, and the strongest of beings, earthly or heavenly. He is the son of Odin and Frigga, or, in other words, of the Sun and the Earth. When he moves, the earth trembles. He holds in his hand a powerful hammer, called the Crusher (*mjølner*), with which he annihilates all who oppose him, and who offend the gods. In battle Thor is always girt with a magic girdle, which has the power of inspiring him with a divine fury, and redoubling his strength. On his right hand he wears an iron gauntlet, with which he grasps and wields the formidable crusher. This latter instrument was forged by a dwarf, named Sindri, the prototype of the deformed blacksmith-deities of the Greeks, Vulcan and his Cyclops. The hammer possesses the wonderful power of never missing its aim, and when launched at any object, returns to the hand of Thor, after having destroyed his foe. Thor is sometimes called Aukistor, or Thor of the Car, from his riding on a chariot, drawn by two powerful he-goats, named Sangniost and Tangrisner. His deity has a spouse named Sipa, famous for her beautiful hair.

After Odin, Thor was the most cherished deity of Scandinavia, and had statues and temples erected to him every where. The statues of him were usually formed of clay, and represented a tall figure, with a red-painted beard, indicative of the lightning, which he was supposed to wield. Bread and meat were supplied daily to the god by his worshippers, and at stated times, libations were poured out in his honour.

Balder, the second son of Odin, was the most beautiful and amiable of the Aser or gods. Unlike the rest of his brethren, he was fond of peace, and had the power of allaying tempests, and acting as a mediator, to avert divine wrath. His decrees were irrevocable. In some points he resembled the Apollo of the Greeks, but the general qualities of that personage found a closer representative in Braga or Bragi, the god of eloquence and poetry. Niord, the god of the sea, and his son Freys, the god of rain, were also important deities of the north. Every element, or important natural phenomenon, was under the guidance, in like manner, of some celestial personage. Frigga, the Scandinavian Juno, was the bestower of fertility and plenty. Freia, or Freya, the daughter of Niord, was the Venus of Asgard, and the patroness of matrimony. Freia was assisted in her duties by Siona and Sofna, the first of whom made lovers faithful, while the other reconciled them when they quarrelled. Eyra was the physician of the gods. There were various other minor divinities in the Scandinavian mythology, though not nearly so many as in the Grecian roll. The deficiency was made up among the northerners by the assignment of more multitudinous duties to the greater deities. Thus Odin, from the extent of his government, received as many as one hundred and twenty distinct names, each indicating some individual quality ascribed to him.

The great hall appointed for the reception of the spirits of the brave, when they left earth for the seat of the gods, was called Valhalla. Twelve beautiful yet terrible nymphs, named Valkyries (*choosers of the slain*), were the guides of the good spirits to the hall of Valhalla, and supplied them with mead. The occupation of drinking this northern nectar, and of eating the fat of the wild boar Serimmer, which, after serving as the daily food of thousands, became whole again every night, filled up all those intervals of time in Valhalla that were not passed in fighting. None but those who had shown surpassing bravery on earth were admitted into this Scandinavian paradise, and when there, their daily amusement was to fight with one another till all or nearly all were cut in pieces. But little harm was done in this way, for the spiritual bodies soon reunited, and enabled the warriors to appear, entire in lithe and limb, at the feasts that

* Nish is the word in the island of Skye and other parts of the Western Islands and West Highlands. Thus Trotternish, Ross-shire, &c.—Ed.

followed these extraordinary engagements. The skulls of enemies were the drinking-cups used at the entertainments of Valhalla, and the guests are described as being almost perpetually in a state of inebriation. It was only when the cock announced the arrival of morning that these terrible heroes arose from table, to issue to the field of battle through the five hundred and forty gates of Valhalla, and hack each other to pieces anew. Such was the never-ending round of employment destined for the departed heroes of Scandinavia.

The conception of a paradise so gloomy and terrific as this, illustrates strongly the character of the Norsemen on earth, and the nature of their habits and enjoyments. Perpetual fighting and perpetual intoxication—such were the highest delights they could imagine, for the filling up of the long ages of eternity; and such, doubtless, were their prime occupations in the forms of mortals. They assigned the same tendencies to their gods. Odin himself took no nourishment but wine, and the whole history of himself and his brethren exhibits but one continuous scene of battling with giants and demons. Of the latter class Loki was the head or chief, being in fact the Devil of the Scandinavians. He was remarkable for his cunning, with which he intermingled a sort of malicious trickiness, that made him resemble the Momus of the Greeks, or the Puck of the fairy mythology, though with a darker shade of evil in his character than was assigned to either of these frolicsome personages. Whatever of good Odin was either executing or projecting, Loki made it his constant business to countermine and undo the work. He figures in this light in every Scandinavian legend, with scarcely a single exception.

As a sample of the subject-matter of the Eddaic poems, and of the pure absurdity of the superstitions which they nourished, we offer the following account of Thor's expedition in search of his lost hammer, *Mjölnir*.* "On awakening one morning, Thor missed his hammer: in a rage he shook his head and beard, and groped about after his implement; then calling to Loki, at that time his friend, told him his loss. They set out together for the abode of Freya, and asked her to lend her feather-dress to aid in the recovery of the hammer. Freya willingly consents.

Give it would I unto thee
E'en if of gold it were;
And unto thee commit it
E'en if of silver it were.

Loki put on the dress, flew away from Asgard, and came to Giant-land. Here he found Thrym, a prince of the giants, sitting on a hill, twisting gold collars for his dogs, and trimming the manes of his horses. He asks Loki how it goes with the Aser and the Alfs, and what has brought him to Giant-land. Loki makes answer that it goes ill with them, and asks him if he had hidden Hlorida's (Thor's) hammer. Thrym acknowledges having done so, and adds, that it is eight *meils* (miles) under the ground, and that he will not restore it till they give him Freya for his bride. As Freya was the northern Venus, we need not be surprised that she was a favourite object of desire with the giants; and when we further consider that she was the moon-goddess, a very plain reason will appear why the dwellers of the sunless region of Giant-land or Utgard were so anxious to obtain her.

Loki flew back, and was met on the way by the anxious Thor. They went again to 'fair Freya,' and Thor abruptly bade her get on her bridal dress, and he would drive her in his chariot to Giant-land. Freya was incensed at this proposal; she snorted so loud that the whole Asa-hall shook under her; her celebrated *Men-brisinga*, or jewel, burst; and she positively refused. A council of all the Aser, and all the Asynier, was forthwith summoned to deliberate how the hammer might be recovered. Heimdall, 'the whitest of the Aser,' proposed that Thor should put on him 'the bridal fine linen, wear the great *Men-brisinga*, have jingling keys fastened to his belt, women's clothes falling about his knees, broad stones on his breast, and handsome head-gear.' Thor strongly objects to this arrangement, lest the gods should hereafter regard him as a woman; but Loki reminds him that if he did not recover his hammer, the giants would make themselves masters of Asgard. Thor at length consents, dons his female attire, and Loki proposes to accompany him as his maid. The buck-goats are driven home and yoked to the chariot, and mistress and maid drive off for Giant-land; rocks burst, and the earth burns beneath their wheels. Thrym, desecrating their approach, calls to his brethren to make ready to receive his lovely bride, to drive home his gold-horned cows and coal-black oxen, declaring that he abounded in treasure, and wanted only Freya.

Early in the evening the guests assembled; plenty of ale was there for the giants. The bride ate an ox, eight salmon, all the sweetmeats prepared for the ladies, and quenched her thirst with three huge measures of mead. Thrym is rather astonished at these feeding powers of his bride, and exclaims,

Didst thou ere see a bride
Bite more greedily?
I ne'er saw a bride
Bite more broadly,
Nor more of mead
A maiden drink.

The maid at once replied that Freya had tasted nothing for the last eight days, such had been her anxiety to reach Giant-land. Thrym now thinking himself privileged to kiss his bride, raised her veil, but instantly sprang back the length of the hall.

Why are so fierce
The eyes of Freya?
Methinks that flame
Flashes from her eyes.

Freya has had no sleep for the last eight nights, such had been her anxiety to reach Giant-land. The sister of the giant now comes in, and after northern fashion claims bride-money.

Give me from thy hands
Thy rings so ruddy,
If thou wilt win
My friendship all—
My friendship all,
My whole affection.

Thrym calls to bring forth the hammer, that the marriage may be performed over it. *Mjölnir* is laid in the lap of Thor, 'his heart laughs in his breast,' he grasps its well-known short handle, crushes first Thrym, then the rest of the giant race, finally the sister, who had ventured to ask him for bride-money.

A stroke she got
Instead of shillings,
A blow of the hammer
Instead of rings.
Thus did Odin's son
Regain his hammer."

Such was the trash sung by the skalds or bards, and incorporated in the Scandinavian Eddas, along with references to the domestic superstitions of the Norsemen. Of these wild and familiar delusions, it is unnecessary to offer any lengthened explanation. There was a common belief in the existence of an inferior order of supernatural beings, the more prominent of which were deformed dwarfs, called *Dwärgs* or *Trows*, who invisibly intermingled in the affairs of mortals. These stunted and grotesque demons were ugly and malicious, and had their dwelling-place in caves or rocks in the earth. The Scandinavians likewise believed in the powers of magical incantation, especially if performed by a particular kind of wand, and accompanied by the chaunt of Runic rhymes. In other points, also, the domestic superstitions of the north were of a wild and terrible character. To them we owe the original ideas of mermaids, serpents, and krakens, the belief in which is scarcely yet exploded. The kraken is described by Pontoppidan, in his History of Norway, as an animal of enormous bulk, often seen in the northern seas, and Milton gives a fine description of it, in all its imaginary size, in the lines,

Him haply slumbering on the Norway foam,
The pilot of some small night-founder'd skiff,
Deeming some island, oft, as seamen tell,
With fixed anchor in his scaly rind
Moor'd by his side under the lee, while night
Invests the sea, and wished morn delays.

The air, too, was peopled by the Scandinavians with gigantic demons. All their fancies of this order were dark, gloomy, and savagely grand.

The mythology of the Scandinavians survived till a much later date than any other system of heathen worship in Europe. It was not abolished till the eleventh century. St Olaf, king of Norway, and a zealous supporter of Christianity, usually receives the credit of having overturned this most barbarous form of religion. In the course of his efforts to Christianise his subjects, he ordered a statue of Thor, and the pedestal on which it stood, to be broken in pieces, and showed the people that the meat which had been laid down for the use of the god was not eaten by him, but by a host of rats and other vermin that had formed a lodge-meat about the foundation of the colossal image. Whatever might have been the influence of the mythology of the Scandinavians in Britain, it disappeared shortly after its overthrow on the continent of Europe, or only lingered in a kind of traditional existence amidst the remote islands of Orkney and Shetland, till finally banished by the progress of a more general intelligence. The dread names of Odin, Thor, and other deities of the north, who for centuries weighed down the human faculties, and kept up the reign of superstition, are now only perpetuated in the appellations affixed to some of the days of the week. Thus, our term *Wednesday* is derived from Odin's or Wodin's day, that being the day of the week in which the northern Jupiter or supreme ruler of the gods was most honoured and worshipped. *Thursday* is from Thor, the second in dignity among these fabulous deities; as this day was called *Dies Jovis* by the Romans, we have here a confirmation that Thor the thunderer was equivalent either to Mars, or the thundering Jove of the Grecian mythology. *Friday* takes its appellation from Freya, the daughter of Niord, and corresponds with the *Dies Veneris*, or Venus day of the Greeks and Romans. *Saturday* is derived in the same manner from the god *Sæter* of the Scandinavians, and Saturn of the Greeks. *Tuesday*, or anciently *Tiesday* (a pronunciation still preserved in Scotland), is supposed to be from Tisa, the wife of Thor, and the reputed goddess of Justice. *Sunday* and *Monday* were respectively named from the Sun and Moon, both by the northern and southern nations of Europe, from a remote period of time. The circumstance of there being such a marked resemblance

between the characters of the deities whose names were employed to distinguish the same days of the week both by Greeks and Scandinavians, is not a little remarkable, and has never, as far as we know, been the subject of explanation by philologists or antiquaries. The fact is only certain, that the names of the days of the week now used by every civilised people, are based upon the mythological observances of either the Grecian or Scandinavian races.

SHIPWRECK OF THE MENTOR.

In the year 1831, the whale-ship *Mentor*, of New Bedford, in New England, sailed for the Indian Ocean, to prosecute the fishing in the southern hemisphere. The ship's company, officers and men, consisted of twenty-six persons, Edward C. Barnard master. The *Mentor* doubled the Cape of Good Hope, and traversed the Indian Ocean in safety, but adverse winds and currents then began to impede its course, and, on the 21st of May 1832, while running for the Ladrões, the vessel, after being tossed about at the mercy of the winds for three days, struck upon a coral reef, which afterwards proved to lie near one of the Pelew Islands. This group lies six or seven degrees north of the equator, in the middle of the numerous isles on the south-east of the Asiatic continent.

The mishap of the *Mentor* took place in the night. In the first impulse of terror, ten men left the wreck in a boat, and were never again heard of; the continuance of the storm renders it but too probable that they speedily perished. In attempting to put off in a second boat, another man was drowned. The survivors, eleven in number, remained on the wreck till daybreak, when they saw land at the distance of twenty or thirty miles. Collecting a few arms and a small stock of provisions, they left the ship in their only remaining boat, and, after sailing three or four miles, reached a rock, or islet, about sixteen rods in length, where they rested all that day and night to refresh themselves with food and sleep, preparatory to the attempt to make the land in sight. But, in the morning, they were visited by twenty-two natives in a large canoe, the wreck having been noticed from shore. These savages were entirely naked, and frightful in aspect, being fantastically tattooed, and having long coarse black hair hanging over their shoulders. They were well armed, besides, with battle-axe, spear, and tomahawk. Though not openly unfriendly, these savages robbed the sailors of the greater part of their rescued property, and, finally, made sail for the wreck, signing to the shipwrecked band to follow them. The Americans, however, wished to get rid of their visitors, and took this opportunity to launch their boat, and steer in another direction than that of the nearest land. Thirty canoes came in the way to interrupt them, but after a little skirmish they got past, and rowed on during the whole remaining part of that day and night. On the ensuing afternoon, they came to another island, on which, being exhausted and dispirited, they resolved to land. On entering a small bay or harbour, they were met by numerous canoes, and taken on shore in triumph.

The isle on which they now were, proved to be Bumbelthouap, the largest of the Pelew group, and about 120 miles in length. The inhabitants, supposed to be about 2000 in number, held a solemn consultation on the case of the poor mariners whom fate had thrown into their power. They were brought before the great chiefs of the island, who were found seated on a platform between two buildings of considerable size, made of bamboo sticks and leaves, and which seemed to be the national places of council and carousal. On this occasion the deliberation continued for about an hour, in the midst of a great assemblage, male and female, young and old. The unfortunate captives had an ominous object, meanwhile, before their eyes. In front of the platform stood a beheading block, and the question under consideration obviously was, whether or not the instrument should now be put to its legitimate uses. At length the women began to wail and howl, and this seemed to decide the matter in favour of the strangers. A cup of peace or mercy was handed to them, containing sweetened water, rendered doubly sweet by the respite from death which it betokened. All this while, the natives behaved indifferently but not cruelly to them, and they were taken, at the close of the council, to a neighbouring village, where resided a prophetess, one of the women who had been chiefly instrumental in causing a verdict of mercy to be given. On the way to this village, the American seamen were equally delighted and surprised to meet a strange-looking old man, with long grey hair, and unlike the other natives except in the tattooing, who addressed them in tolerable English. "My God!" he exclaimed, "you are Englishmen!" The sound of his voice, uttering language so unexpected, excited the most lively emotions in the minds of the seamen. "This person," says the narrative of the survivors of this expedition, "was by birth an Englishman, and had been on the island about twenty-nine years. He told us that he had been a hatter by trade, and that his name was Charles Washington. He had been a private in the British naval service, on board of the *Lion* man-of-war." Some trifling offence led him to leave the ship in fear of punishment, and take up his abode on the island, where he had attained to great celebrity, and had become the sixth chief in the nation. He had adopted all their habits, and was quite content with

* We use the translation of the story in the *Foreign Quarterly Review*, article *Scandinavian Mythology*, vol. iv.

his situation, having no wish ever to see his own country again.

The authority of this strangely-placed individual, whose friends in Britain have probably given him up long since as dead, made the situation of the mariners comparatively easy and comfortable. Indeed, the natives, though a very rude and primitive race, seem to have been of good general dispositions. They were of a light copper complexion, and the females only wore a sort of girdle of bark. They tattooed their bodies abundantly, and anointed themselves to excess with cocoa oil. The ladies were excessively fond of ornament, and one of their articles of this order deserves notice, as especially novel and ingenious. "In their noses they wear a stem of the kabooa leaf, which answers the double purpose of an ornament and a smelling bottle." At last, after a stay of several months with these people, a negotiation was entered into by the mariners for their release and departure. Upon the stipulation of sending to the island three hundred muskets, ten casks of powder, and various other lesser articles, they got a canoe built, and in this and their own boat, eight of the shipwrecked crew left the island, three being left behind as hostages. At the same time, three natives, two of them chiefs, accompanied the party, in the hope of bringing home the reward.

Perhaps never did men venture upon a great ocean in such miserable vessels as these two boats were, the one holding a crew of five, the other of six men. Their main hope lay in the chance of speedily finding, in the open sea, some vessel engaged in the China trade. Scarcely, however, were they fairly afloat, when bad weather came on; the boat was dismasted; the rudder of the canoe was unshipped; and the same boat sprang a leak, which was only kept under by constant baling. At the end of five days of fearful toil and danger, the canoe overset, and the whole party were driven into the single remaining boat. Their stores of water and provisions, too, were running low, yet they continued to stand out for four days more, when they unexpectedly came in sight of land, as well as of a fleet of canoes, which soon came up to them. A barbarous scene was then commenced by the savages contained in these canoes. "They attacked us with brutal ferocity, knocking us overboard with their clubs, in the meantime making the most frightful grimaces, and yelling like so many incarnate devils. They fell upon our boat and immediately destroyed it, breaking it into splinters, and taking the fragments into their canoes. While this was going on, we were swimming from one canoe to another, entreating them by signs to spare our lives, and permit us to get into their canoes. This they for a long time refused, beating us most unmercifully, whenever we caught hold of any thing to save ourselves from sinking." They were ultimately taken in, and were stripped naked on the instant, though the sun was shining so vividly that their bodies were almost immediately blistered by exposure to it. On reaching the shore, a crowd of women and children met them, yelling like "Bacchanals or Bedlamites." Fights and quarrels immediately began for the ownership of the several captives, and in the contest the latter were sadly abused. At length, each man got a master, and was taken home by him.

This unpromising beginning was not belied by its end. The island upon which the mariners had unfortunately stumbled, was a low, barren, miserable rock, scarcely three-quarters of a mile long by half a one in breadth. From seamen it has received the names of Lord North's, Nevil's, or Johnston's Island, and has been believed to be uninhabited. The natives call it To-bee. They are of a light copper colour, and the men go almost entirely without clothing. They have high cheek-bones and flat noses, and are far more wild in appearance than the Pelew islanders. In character "they are cowardly and servile, yet most barbarous and cruel, combining in their habits, tempers, and dispositions, the most disgusting and loathsome features that degrade humanity."

The position of the poor Americans was dreadful under these savages. The only vegetable cultivated on this sandy coral rock was a species of the well-known *taro*-root; and for the growth of this, proper soil had to be gathered from all quarters and mixed up like a compost. The indolent natives threw the whole labour of doing this upon the poor captives. Nearly naked, they were kept constantly at work, under a broiling sun, at no time having a sufficiency of food, and at different times reduced to all but the last extremity of famine. To many other inflictions they were wantonly subjected. After being two months, indeed, on the island, two of the party succeeded in getting their release. An English ship came in sight, and the

captain (Barnard), with Rollins, one of the crew, persuaded the islanders to put them on board, promising that iron and various other articles would be immediately given from the vessel in return. Only a small quantity of iron was sent, and the consequence was that the natives were highly dissatisfied, and increased their severity towards the remaining prisoners. Unfortunately, the English captain was not (as he afterwards alleged) in circumstances that permitted of further exertions to obtain the release of the rest, and he sailed away, leaving them to a worse fate than before. Among other incidental cruelties inflicted on them, in addition to their ordinary sufferings, they were compelled to undergo the tattooing process, which is thus described:—"We were in the first place securely bound down to the ground, and there held fast by our tormentors. They then proceeded to draw with a sharp stick the figures designed to be imprinted on the skin. This done, the skin was thickly punctured with a little instrument, made of sharpened fish-bones, and somewhat resembling a carpenter's adze in miniature, but having teeth, instead of a smooth sharp edge. This instrument was held within an inch or two of the flesh, and struck into it rapidly with a piece of wood, applied to it in such a manner as to cause it to rebound at every stroke. In this way our breasts and arms were prepared; and subsequently the ink, which was made of a vegetable found on the island, and called by them the *savvan*, was applied. The operation caused such an inflammation of our bodies, that only a small portion could be done at one time; as soon as the inflammation abated, another portion was done, as fast as we could bear it, till our bodies were covered. It was effectually done; for to this day the figures remain as distinct as they were when first imprinted, and the marks will be carried by us to the grave. They were exceedingly anxious to perform the operation on our faces; but this we would not submit to, telling them, that sooner than have it done, we would die in resisting them."

But this was comparatively a light item in the incessant sufferings of these poor mariners. Out of the six left after Captain Barnard escaped with Rollins, three sank under their afflictions. One of them died rather suddenly; but the other two, when reduced to the last extremity, and unable to move, were each put into a canoe, and set adrift to meet a horrible living death! A fourth of the band, for some trifling offence, was beaten to death, and it was with difficulty that the remaining two, Holden and Nute, to the former of whom we owe this narrative, escaped the same fate. As for the three poor islanders of Pelew, who in the simplicity of ignorance had set sail for an unknown land of promise, one of them was charged with stealing food, and turned adrift in a canoe on the wide ocean with his *hands tied*! A second was literally starved to death. The third was one of the miserable trio of survivors.

Seeing their captives perishing one by one, and getting totally unserviceable, the brutal savages in whose hands these poor men were, began to see that it would be their interest to complete some bargain for their release before the death of the whole made it too late. Accordingly, the captives got a promise that they should be put on board the first passing vessel, on condition of a present of iron being made to them. On the 24th of December 1834, the British barque *Britannia*, bound for Canton River, came in view, and the captives obtained their release. When Nute came on board the *Britannia*, he was in such a deplorable state that it was believed two days more would have ended his life. Unhappily, the British captain did not think it consistent with prudence to take the poor Pelew islander on board, though the others, who had got greatly attached to him, prayed earnestly for his reception. The Americans were taken away, and in due time got on board another vessel, which conveyed them to their own land in safety.

It gives us pleasure to add that the Pelew islander was released after all. The American sloop of war *Vincennes* released him from North's Island, in the course of the year 1835, and took him safely back to his own country. The sloop also brought home the men who were left as hostages at the Pelew Isles. It is said that the captain of the *Vincennes*, whether by orders or otherwise, made a difficulty of paying the full promised ransom to the Pelew natives, a proceeding equally impolitic and ungenerous. The impression that the promises made by the distressed mariners of civilised nations will be scrupulously fulfilled, either in the way of reward or punishment, affords the only security for good treatment, at the hands of such savages, under the like circumstances. Generous conduct, above all, should ever meet a reward above the stipulation rather than below it. The future should always be kept in view, as shipwrecks will occur, to a greater or less extent, while navigation lasts.

TOILET OF A PAWNEE INDIAN DANDY.

He began his toilet, about eight in the morning, by greasing and smoothing his whole person with fat, which he rubbed afterwards perfectly dry, only leaving the skin sleek and glossy; he then painted his face vermilion, with a stripe of red also along the centre of the crown of the head; he then proceeded to his "coiffure," which received great attention, although the quantum of hair demanding such care was limited, inasmuch as his head was shaved close, except one tuft at the top, from which hung two plaited "tresses." (Why must I call them "pig-tails?") He then filled his ears, which were bored in two or three places, with rings and wampum, and hung several strings of beads round his neck; then, sometimes painting stripes of vermilion and yellow upon his breast and shoulders, and placing armlets above his elbows and rings upon his fingers, he proceeded to adorn the nether man with a pair of moccasins, some scarlet cloth leggings fastened to his waist-belt, and bound round below the knee with garters of beads four inches broad. Being so far prepared, he drew out his mirror, fitted into a small wooden frame (which he always, whether hunting or at home, carried about his person), and commenced a course of self-examination, such as the severest disciple of Watts, Mason, or any other religious moralist, never equaled. Nay more, if I were not afraid of offending the softer sex by venturing to bring man into comparison with them in an occupation which is considered so peculiarly their own, I would assert that no female creation of the poets from the time that Eve first saw "that smooth watery image," till the polished toilet of the lovely Belinda, ever studied her own reflected self with more perseverance or satisfaction than this Pawnee youth. I have repeatedly seen him sit, for above an hour at a time, examining his face in every possible position and expression; now frowning like Homer's Jove before a thunder-storm, now like the same god, described by Milton, "smiling with superior love;" now slightly varying the streaks of paint upon his cheeks and forehead, and then pushing or pulling "each particular hair" of his eyebrows into its most becoming place! Could the youth have seen any of those in that mirror half so dangerous as the features of the glassy wave gave back to the gaze of the bold Narcissus, I might have feared for his life or reason; but, fortunately for these, they had only to contend with a low receding forehead, a nose somewhat simian, a pair of small sharp eyes, with high cheek-bones, and a broad mouth, well furnished with a set of teeth, which had at least the merit of demolishing speedily every thing, animal or vegetable, that came within their range.

His toilet thus arranged to his satisfaction, one of the women or children led his buffalo-horse before the tent; and he proceeded to deck his steed, by painting his forehead, neck, and shoulders, with stripes of vermilion, and sometimes twisted a few feathers into his tail. He then put into his mouth an old-fashioned bridle, bought or stolen from the Spaniards, from the bit of which hung six or eight steel chains, about nine inches long; while some small bells, attached to the reins, contributed to render the movements of the steed as musical as those of the lovely *Sonnante*, in the incomparable tales of Comte Hamilton.

All things being now ready for the promenade, he threw a scarlet mantle over his shoulders; thrust his mirror in below his belt; took in one hand a large fan, of wild goose or turkey feathers, to shield his fair and delicate complexion from the sun; while a whip hung from his wrist, having the handle studded with brass nails. Thus accoutred, he mounted his jingling palfrey, and ambled through the encampment, envied by all the youths less gay in attire, attracting the gaze of the unfortunate drudges who represent the gentler sex, and admired supremely by himself!—*Travels in North America, by the Hon. C. A. Murray. 1839.*

NATURAL CURIOSITY.

We were favoured the other day with a sight of a beautiful antediluvian specimen of the fir tribe, just dug from the Stevenson freestone quarry, on the estate of Mr Warner of Ardeer. The trunk, stems, and leaves, are as perfectly formed and portrayed in this piece of solid rock as those now growing in the neighbourhood of the quarry. This geological curiosity, along with a cluster of nuts, five in number, which composed part of the stone, was thirty feet from the surface, being twenty feet below the present level of the sea. The nuts and the leaves, stem and trunk of the fir, are of a dark brown colour, while the surrounding body of the stone is a bluish white, which gives these fragments the appearance of the finest fresco painting. Many interesting curiosities of the like description have been found during the working of this extensive quarry. The antiquarian geologist would certainly be highly gratified by repeated visits to this excavation.—*Ayr paper.*

The present number of the Journal completes the eighth volume of the work, for which a title-page and copious index are prepared, and may be had on application to the Publishers or their Agents, at the usual price of a number. Any odd or past numbers of the Journal can also be had for the purpose of completing sets.
